In 1882 he was appointed adjutant-general to the forces, and in the following year was appointed vice-admiral of the fleet. In 1884 he was again called away from his duties as adjutant-general to command the expedition for the relief of General Gordon and the besieged garrison of Khartum. The expedition arrived too late: Khartum had fallen, and Gordon was dead; and in the spring of 1885 complications with Russia over the Penjdeh incident occurred, and the withdrawal of the expedition followed. For his services he received two clasps to his Egyptian medal, the thanks of parliament, and was created a viscount and a knight of St Patrick. He continued at the war office as adjutant-general to the forces until 1896, when he was given the command in Ireland. He was promoted to be field marshal, and in 1898 was made colonel of the Royal Horse Guards in 1895, in which year he was appointed by the Unionist government to succeed the duke of Cambridge as commander-in-chief of the forces. This was the position to which his great experience in the field and his previous signal success at the war office itself had fully entitled him. His powers were, however, limited by a new order in council, and after holding the appointment for over five years, he handed over the command-in-chief to Earl Roberts at the commencement of 1901. The fact that the unexpended large force required for South Africa was mainly furnished by means of the system of reserves which Lord Wolseley had originated was in itself a high tribute to his foresight and sagacity; but the new conditions at the war office had never been to his liking, and on being released from responsibility he brought the whole subject before the House of Lords in a speech which resulted in some remarkable disclosures.

Lord Wolseley had been appointed colonel-in-chief of the Royal Irish Regiment in 1888, and in 1901 was made gold-stick in waiting. He was married in 1867 to Louisa, daughter of Mr A. Erskine, his only child, Frances, being heiress to the viscountcy under special remainder. A frequent contributor to periodicals, he also published The Decline and Fall of Napoleon (1859), The Life of John Churchill, Duke of Marlborough, to the Accession of Queen Anne (1894), and The Story of a Soldier's Life (1903), giving in the last-named work an account of his career down to the close of the Ashanti War.
WOLSEY, Thomas (c. 1475-1530), English cardinal and statesman, born at Ipswich about 1475, was son of Robert Wolsey (or Wuley, as his name was always spelt) by his wife Joan. His father is generally described as a butcher, a fact which must be set against the evidence of his property and a churchwarden of St Nicholas, Ipswich, his character seems to have borne a striking resemblance to that of Thomas Cromwell's father. He was continually being fined for allowing his pigs to stray in the street, selling bad meat, letting his house to doubtful characters for illegal purposes, and generally infringing the by-laws respecting weights and measures (extracts from the Ipswich records, printed in the Athenæum, 1900, i. 400). He died in September 1496, and his will, which has been preserved, was proved a few days later.

Thomas was educated at Magdalen College, Oxford; but the details of his university career are doubtful owing to the defective nature of the university and college registers. He is said to have graduated B.A. at the age of fifteen (i.e. about 1490); but his earliest definite appearance in the records is as junior bursar of Magdalen College in 1498-1500, and senior bursar in 1499-1500, an office he was compelled to resign for applying funds to the completion of the great tower without sufficient authority (W. D. Mace, Reg. of Magdalen College, i. 29-30, 133-134). He must have been elected fellow of Magdalen some years before; and in 1501 he was made one of the four proctors of the college. He was the son of seven sons of Thomas Grey, first marquess of Dorset. Dorset's beneficent intentions for his sons' pedagogue probably suggested Wolsey's ordination as priest at Marlborough on March 10, 1498, and on October 10, 1500, he was instituted, on Dorset's presentation, to the rectory of Limington in Somerset. His connexion with Magdalen had perhaps terminated with his resignation of the bursanship, though he supplicated for the degrees of B.D. and D.D. in 1510; and the college appears to have derived no advantage from Wolsey's subsequent greatness.

At Limington he came into conflict with law and order as represented by the sheriff, Sir Amsa Paulet, who is said by Cavendish to have placed Wolsey in the stocks; Wolsey retaliated long afterwards by confining Paulet to his chambers in the Temple for five or six years. Dorset died in 1501, but Wolsey found other patrons in his pursuit of wealth and fame. Before the end of that year he obtained from the pope a dispensation to hold two livings in conjunction with Limington, and Archdeacon of Canterbury also appointed him his domestic chaplain. Deane, however, died in 1503, and Wolsey became chaplain to Sir Richard Nanfan, deputy of Calais, who apparently recommended him to the king, and the king made Wolsey his chaplain and employed him in diplomatic work. In 1508 he was sent to James IV. of Scotland, and in the same year he pleaded Henry by the extraordinary expedition with which he crossed and recrossed the Channel on an errand connected with the king's proposal of marriage to Margaret of Savoy. His ecclesiastical preferments, of which he received several in 1506-1509, culminated in his appointment by Henry to the deanery of Lincoln on February 2, 1509.

Henry VIII. made Wolsey his chaplain immediately on his accession, and the receipt of some half-dozen further ecclesiastical preferments in the first two years of the reign marks his growth in royal favour. But it was not till the end of 1511 that Wolsey became a privy councillor and secured a controlling voice in the government. His influence then made itself felt on English policy. The young king took little pains with the government, and the control of affairs was shared between the clerical and peace party led by Richard Fox (q.v.) and Archbishop Warham, and the secular and war party led by Surrey. Hitherto pacific counsels had on the whole prevailed; but Wolsey, who was nothing if not turbulent, turned the balance in favour of war, and his marvellous administrative energy first found full scope in the preparations for the English expedition to Biscay in 1512, and for the campaign in northern France in 1513. He brought about the peace with France and marriage between Mary Tudor and Louis XII. in 1514, and reaped his reward in the bishoprics of Lincoln and Tournai, the archbishopric of York, which was conferred on him by papal bull in September, and the cardinalate which he had sent Polydore Vergil to beg from Leo X. in May 1514, but did not receive till the following year. Nevertheless, when Francis I. in 1515 succeeded Louis XII. and won the battle of Marignano, Wolsey took the lead in assisting the emperor Maximilian to oppose him; and this revival of warlike designs was resented by Fox and Warham, who retired from the government, leaving Wolsey supreme. Maximilian proved a broken reed, and in 1518 Wolsey brought about a general pacification, securing at the same time his appointment as legate à latere in England. He thus superseded Warham, who was legalis notius, in ecclesiastical authority; and though legates à latere were supposed to exercise only special and temporary powers, Wolsey secured the practical permanence of his office.

The election of Charles V. as emperor in 1519 brought the rivalry between him and Francis I. to a head, and Wolsey was mainly responsible for the attitude adopted by the English government. Both monarchs were eager for England's alliance, and their suit enabled Wolsey to appear for the moment as the arbiter of Europe. England's commercial relations with Charles V.'s subjects in the Netherlands put war with the emperor almost out of the question; and cool observers thought that England's obvious field of action was to stand by while the two rivals enfeebled each other, and then make her own profit out of their weakness. But, although a show of force with a flotilla of English ships kept up at the Field of Cloth of Gold in 1520, it had been determined before the conference of Calais in 1521, at which Wolsey pretended to adjudicate on the merits of the dispute, to side actively with Charles V. Wolsey had vested interests in such a policy. Parliament had in 1513-1515 showed signs of strong anti-clerical feeling; Wolsey had in the latter year urged its speedy dissolution, and had not called another; and he probably hoped to distract attention from the church by a spirited foreign policy, as Henry V. had done a century before. He had, however, been unable to prevent the emperor, who was at that time engaged with France, from exercising further Wolsey's candidature for the papacy; and although he protested to Henry VIII. that he would rather continue in his service than be ten popes, that did not prevent him from secretly instructing his agents at Rome to press his claims to the utmost. Charles, however, paid Wolsey the sincere compliment of thinking that he would not be sufficiently subservient on the papal throne; while he wrote letters in Wolsey's favour, he took care that they should not reach their destination in time; and Wolsey failed to secure election both in 1521 and 1524. This ambition distinguishes his foreign policy from that of Henry VII., to which it is often likened. Henry VIII. carded only one hand with France; Wolsey's object was to play a great part on the European stage. The aim of the one was national, that of the other was occumematical.

In any case the decision taken in 1521 was a blunder. Wolsey's assistance helped Charles V. to that position of predominance which was strikingly illustrated by the defeat and capture of Francis I. at Pavia in 1525; and the balance of power upon which England's influence rested was destroyed. Her efforts to restore it in 1526-1528 were ineffectual; her prestige had depended upon her reputation for wealth derived from the fact that she had acted in recent years as the paymaster of Europe. But Henry VIII.'s accumulations had disappeared; parliament resisted in 1533 the imposition of new taxation; and the attempts to raise forced loans and benevolences in 1526-1528 created a storm of opposition. Still more unpopular was the brief war with Charles V. in which Wolsey involved England in 1528. The sack of Rome in 1527 and the defeat of the French before Naples in 1528 confirmed Charles V.'s supremacy. Peace was made in 1529 between the two rivals without England being consulted, and her influence at Wolsey's fall was less than it had been at his accession to power.

This failure reacted upon Wolsey's position at home. His domestic was sounder than his foreign policy: by his development of the star chamber, by his firm administration of justice and maintenance of order, and by his repression of feudal jurisdiction, he rendered great services to the monarchy. But the inevitable opposition of the nobility to this policy was not
mitigated by the fact that it was carried out by a churchman; the result was to embitter the antagonism of the secular party to the church and to concentrate it upon Wolsey's head. The control of the papacy by Charles V., moreover, made it impossible for Wolsey to succeed in his efforts to obtain from Clement VII. the divorce which Henry VIII. was seeking from Charles V.'s aunt, Catherine of Aragon. An inscription on a contemporary portrait of Wolsey at Aras calls him the author of the divorce, and Roman Catholic historians from Sanders downwards have generally adopted the view that Wolsey advocated this measure merely as a means to break England's alliance with Spain and confirm its alliance with France. This view is untenable, and besides, the painstaking and patriotic motives which lay behind that movement. There is no evidence that Wolsey first suggested the divorce, though when he found that Henry was bent upon it, he pressed for two points: (i.) that an application should be made to Rome, instead of deciding the matter in England, and (ii.) that Henry, when divorced, should marry a French princess.

The appeal to Rome was a natural course to be advocated by Wolsey, whose despotism over the English church depended upon an authority derived from Rome; but it was probably a mistake. It has been suggested that at the time, when he was again in the captivity of Clement VII., that England and France should set up independent patriarchates; and its success depended upon the problematical destruction of Charles V.'s power in Italy. At first this seemed not improbable; French armies marched south on Naples, and the pope sent Campeggio with full powers to pronounce the divorce in England. But he had hardly started when the French were defeated in 1528; their ruin was completed in 1529, and Clement VII. was obliged to come to terms with Charles V., which included Campeggio's recall in August 1529.

Wolsey clearly foresaw his own fall, the consequent attack on the church and the triumph of the secular party. Parliament, which he had kept at arm's length, was hostile; he was hated by the nobility, and his general unpopularity is reflected in Skelton's satires and in Hall's Chronicle. Even churchmen had been alienated by his suppression of monasteries and by his monopoly of ecclesiastical power; and his only support was the king, who had now developed a determination to rule himself. He surrendered all his offices and all his prelates except the archbishopric of York, receiving in return a pension of 1000 marks (equal to six or seven thousand pounds in modern currency) from the bishopric of Winchester, and retired to his see, which he had never before visited. A bill of attainder, passed by the Lords, was rejected at Cromwell's instigation and probably with Henry's goodwill by the Commons. The last few months of his life were spent in the exemplary discharge of his archepiscopal duties; but a not altogether unfounded suspicion that he had invoked the assistance of Francis I., if not of Charles V., and the pope, to prevent his fall involved him in a charge of treason. He was summoned to London, but died on his way to Leicester abbey on November 30, and was buried there on the following day.

The completeness of Wolsey's fall enhanced his former appearance of greatness, and, indeed, he is one of the outstanding figures in English history. His qualities and his defects were alike exhibited on a generous scale; and if his greed and arrogance were colossal, so were his administrative capacity and his appetite for work. "He is," wrote the Venetian ambassador Giustiniani, "very handsome, learned, extremely eloquent, of vast ability and indefatigable. He alone transacts the business which occupies the ears and intellects of Venice, both civil and criminal; and all state affairs are managed by him, let their nature be what it may. He is grave, and has the reputation of being extremely just; he favours the people exceedingly, and especially the poor, hearing their suits and seeking to despatch them instantly." As a diplomatist he has had few rivals and perhaps no superiors. But his pride was equal to his abilities. The familiar charge, repeated in Shakespeare, of having written Ego et meus rex, while true in fact, is false in intention, because no Latin scholar could put the words in any other order; but it reflects faithfully enough Wolsey's mental attitude. Giustiniani explains that he had to make proposals to the cardinal before he broached them to Henry, lest Wolsey "should resist the precedence conceded to the king." "He is," wrote another diplomatist, "the proudest prelate that ever breathed." He arrogated to himself the privileges of royalty, made servants attend him upon their knees, compelled bishops to tie his shoelatches and dukes to hold the basin while he washed his hands, and considered it condensation when he allowed ambassadors to kiss his fingers; he paid little heed to their sacrosanct character, and himself laid violent hands on a papal nuncio. His egoism equaled Henry VIII.'s; his jealousy and ill-treatment of his predecessor, Rich, of Ppace, has been excused by the historian, but vehemently denied by Dr Brewer, has been proved by the publication of the Spanish state papers; and Polydore Vergil, the historian, and Sir R. Sheffield, speaker of the House of Commons, were both sent to the Tower for complaining of his conduct. His morals were of the laziest description, and he had as many illegitimate children as Henry VIII. himself. For his son, before he was eighteen years old, he procured a deannery, four archdeaconries, five prebends and a chancellorship, and he sought to thrust him into the bishopric of Durham. For himself he allowed, in addition to his chancellorship, the abbey of St Albans, reputed to be the richest in England, and the bishopric first of Bath and Wells, then of Durham, and finally that of Winchester. He also used his power to extort enormous pensions from Charles V. and Francis I. and lavish gifts from English suitors. His New Year's presents were reckoned by Giustiniani at 15,000 ducats, and the emperor paid—or owed—him 18,000 livres a year. His palaces outshone those of his king, and few monarchs could afford such a display of plate as commonly graced the cardinal's table. His foundations at Oxford and Ipswich were, nevertheless, not made out of his superabundant revenues, but out of the proceeds of the dissolution of monasteries, not all of which were devoted to those laudable objects.

That such a man would ever have used the unparalleled powers of ecclesiastical jurisdiction with which he had been entrusted for a genuine reformation of the church is only a pious opinion cherished by those who regret that the Reformation was left for the secular arm to achieve; and it is useless to plead lack of opportunity on behalf of a man who for sixteen years had enjoyed an authority never before or since wielded by an English subject. Wolsey must be judged by his deeds and not by doubtful intentions. During the first half of his government he materially strengthened the Tudor monarchy by the vigorous administration of justice at home and by the brilliance of his foreign policy abroad. But the prestige he secured by 1521 was delusive; its decline was as rapid as its growth, and the expense of the policy involved taxation which seriously weakened the loyalty of the people. The concentration of civil and ecclesiastical power by Wolsey in the hands of a churchman provided a precedent for its concentration by Henry VIII. in the hands of the crown; and the personal example of lavish ostentation and loose morals which the cardinal-archbishop exhibited cannot have been without influence on the king, who grew to maturity under Wolsey's guidance.

The Letters and Papers of Henry VIII., vols. i.-iv., supplemented by the Spanish and Venetian Calendars, contain almost all that is known of Wolsey's public career, though additional light on the divorce has been thrown by Stephen Eeles's Römische Dokumente (1893). Cavendish's brief Life, which is almost contemporary, and has been often edited. Fiddeles's huge tome (1724) is fairly exhaustive. Duppa's fine edition of his claims to the see of York (as his History of the Reign of Henry VIII.), originated modern admiration for Wolsey; and his views are reflected in Creighton's Wolsey, the "Two" of Marney's fine Life, and in Gairdner's careful articles in the Dict. Nat. Bio., and Cambridge Modern History. A less enthusiastic view is adopted in H. A. L. Fisher's volume (v.) in Longman's Political History (1906) and in A. Couty's England's History (1902 and 1903).

WOLTER, CHARLOTTE (1834-1897), Austrian actress, was born at Cologne on the 1st of March 1834, and began her artistic career at Budapest in 1857. She played minor parts at the Karl
theatre in Vienna, and soon obtained an engagement at the Victoria theatre in Berlin, where she remained until 1861. Her performance of Hermione in the Winter's Tale took the playgoing world by storm, and she was given in 1862 an appointment at the Vienna Hofburg theatre, to which she remained faithful until her death on the 14th of June 1895. According to her wish, she was buried in the costume of Iphigenia, in which rôle she had achieved her most brilliant success. Charlotte Wolter was one of the representatives of modern Scotch Nonconformity, in Wolverhampton, and coming of a Liberal nonconformist family took a prominent part in politics. In 1868 he was elected Liberal member of parliament for Wolverhampton, and was re-elected for the east division at successive contests. In 1884–1885 he was under-secretary for the Home Office, and in 1886 financial secretary to the treasury. In Mr Gladstone's 1862–1864 ministry he was president of the local government board, and in Lord Rosebery's cabinet, 1894–1895, secretary of state for India. In these and the succeeding years of opposition he was recognized as a sound economist and a sober administrator, as well as a universal respected representative of nonconformist type. In Sir Henry Campbell-Bannerman's cabinet, 1905–1908, he was chancellor of the Exchequer of Lancaster, and he retained this office in Mr Asquith's ministry, but was transferred to the House of Lords with a viscountcy (April 1908). He retired in 1910. His daughter, Ellen Thorneycroft Fowler, who married Mr A. L. Felkin in 1903, became well known as a novelist with her Concerning Isabel Carnaby (1899) and other books.

**Wolverhampton, a town market, and municipal, county, and parliamentary borough of Staffordshire, England, 125 m. N.W. from London by the London & North-Western railway, served also by the northern line of the Great Western and by a branch of the Midland railway. Pop. (1891) 82,622; (1901) 94,187. It lies at the north-western edge of the group of great manufacturing towns extending S.E. to Birmingham, but there are pleasant residential suburbs to the west, where the country is rich and well wooded. The situation is elevated and healthy. The church of St Peter is a fine cruciform building, with S. porch and central tower. The lower part of the tower and the S. transept date from the 13th century; the nave, clerestory, upper part of the tower and N. transept from the 14th; the chancel was rebuilt in the restoration, completed in 1865, with an apsidal termination. The chief public buildings are the town hall (1871), exchange, agricultural hall, free library and theatres. A large free grammar school, founded in 1515 by Sir Stephen Jermyns, a native of the town and alderman of London, occupies modern buildings (1876). There are a Blue Coat school (1710) and a school of art. The benevolent institutions include a general hospital, the eye infirmary, orphan asylum, nursing institution and institute of the society for outdoor blind. In Queen Square is an equestrian statue of Albert, Prince Consort, unveiled by Queen Victoria in 1866, and on Snow Hill a statue (1879) of Charles Pelham Villiers. There are parks on the east and west of the town, and a new racecourse (1887) replaces that formerly on the site of the west park. In the district S. and E. of Wolverhampton (the Black Country) coal and ironstone are mined. Ironmongery and steel goods of all kinds, especially locks, machinery, tools and cycles, are produced; there are also tin and zinc works. Large agricultural markets are supplied from the districts W. and N. of the town. An annual fair is held at Whitsun-tide. In 1902 an industrial and art exhibition was held. The parliamentary borough of Wolverhampton has three divisions, each returning one member. The town is governed by a mayor, 12 aldermen and 36 councillors. Area, 3525 acres. Wednesfield (pop. 4883), Heath Town or Wednesfield Heath (9441) and Willeshall (18,515) are neighbouring urban districts, with populations employed in the manufacture of locks, keys and small iron goods, in iron and brass foundries, varnish works, &c.

The town of Wolverhampton (Handon, Wolverhampton, Wolverhampton) seems to have grown up round the church of St Mary, afterwards the royal free chapel of Wolverhampton, probably founded in 906 by Wulftruna, widow of the earl of Northampton, who in that year endowed it with extensive lands. The estates of the clerks of Handon are enumerated in Domesday. In 1204 John granted the manor of Wolverhampton to the church, and at the Reformation it was held by the dean of the collegiate body; in 1553 Edward VI. granted the college and manor to Dudley, duke of Northumberland, but Mary, at the beginning of her reign, refounded the college and restored to it its property, and this arrangement was confirmed by Elizabeth. Henry III. (1255) granted the Wednesday market, which is still held, and a fair for eight days, beginning on the eve of the feast of SS. Peter and Paul (June 29). During the Great Rebellion the sympathies of Wolverhampton were royalist. In 1645 it was for a time the headquarters of Prince Rupert, while Charles I. lay at Bushbury to the north. At the end of the 17th century the market was esteemed the second market in the county. An account of Wolverhampton published in 1751 stated that the chief manufacture was locks, "here being the most ingenious locksmiths in England," and attributed the slow growth of the town to the fact that most of the land was church property. Wolverhampton was incorporated in 1848 as a municipal borough. It was not represented in parliament until after the passing of the Reform Bill (1832), under which it returned two members until in 1885 the representation was increased to three. The county borough dates from 1888.

**Wolverton, a town in the Buckingham parliamentary division of Buckinghamshire, England, near the river Ouse, 543 m. N.W. by N. of London by the London & North-Western railway. Pop. (1901) 5323. Its modern growth and importance are the result of the establishment of carriage works by the Railway company. There are also printing works. A steam tramway connects the town with the old market town of Stony Stratford on the Ouse, 2 m. W.

**Wombat, the title of the typical representatives of the marsupial family Phascolomyidae (see Marsupialia). They have the dental formula: $i_1 \,, c_1 \,, p_3 \,, m_3 = 24.$ All the teeth are of continuous growth, having persistent pulps. The incisors are large and chisel-like, much as in rodents. The body is broad and depressed, the neck short, the head large and flat, the eyes small and the tail rudimentary and hidden in the fur. The

![Tasmanian Wombat (Phascolomyus ursinus).](image-url)
limbs are equal, stout and short. The feet have broad, naked, tuberculated soles; the forefeet with five distinct toes, each furnished with a long, strong and slightly curved nail, the first and fifth considerably shorter than the other three. The hind-feet have a very short nailless first toe; the second, third and fourth toes partially united by integument, of nearly equal length; the fifth distinct and rather shorter; these four are provided with long and curved nails. In the typical group of the genus Phascolomys we find the following characters: fur rough and coarse; ears short and rounded; muzzle naked; postorbital process of the frontal bone obsolete; ribs fifteen pairs. Vertebrae: C. 7, D. 15, L. 4, S. 4, Ca. 10-12. The womb of Tasmania and the islands of Bass's Straits (P. urinus), and the closely similar but larger P. platyurus of the southern portion of the mainland of Australia, belong to this group. On the other hand, in the hairy-nosed wombat (P. latifrons) of Southern Australia, the fur is smooth and silky; the ears are large and more pointed; the muzzle is hairy; the frontal region of the skull is broader than in the other section, with well-marked postorbital processes; and there are thirteen ribs. Vertebrae: C. 7, D. 13, L. 6, S. 4, Ca. 15-16.

In general form and action wombats resemble small bears, having a somewhat similar shuffling manner of walking, but they are still shorter in the legs, and have a broader and flatter back. They live entirely on the ground, or in burrows or holes among rocks, and feed on grass, roots and other vegetable substances. They sleep during the day, but wander forth at night in search of food, and are shy and gentle, though they can bite strongly when provoked. The only noise the Tasmanian wombat makes is a low hissing, but the hairy-nosed wombat is said to emit a short quick grunt when annoyed. The prevailing colour of the last-named species, as well as P. urinus of Tasmania, is brownish grey. The large wombats of the mainland is variable in colour, some individuals being pale yellowish brown, others dark grey and some black. The length of the head and body is about 3 ft. Fossil remains of wombats, some of larger size than any now existing, have been found in caves and Pleistocene deposits in Australia.

WOMBWELL, an urban district in the Barnsley parliamentary division of the West Riding of Yorkshire, England, 4 m. S.E. of Barnsley, on the Great Central and Midland railways. The inhabitants are chiefly employed in the extensive collieries. Pop. (1901) 13,252.

WOMEN. The very word "woman" (O. Eng. wißmann), etymologically meaning a wife (or the wife division of the human race, the female of the species Hemo), sums up a long history of dependence and subordination, from which the women of to-day have only gradually emancipated themselves in such parts of the world as come under "Western civilization." Though married life and its duties necessarily form a predominant element in the woman's sphere, they are not necessarily the whole of it; and the "woman's movement" is essentially a struggle for the recognition of equality of opportunity with men, and for equal rights irrespective of sex, even if special relations and conditions are willingly incurred under the form of partnership involved in marriage. The difficulties of obtaining this recognition are obviously due to historical causes combined with the habits and customs which history has produced.

The dependent position of women in early law is proved by the evidence of most ancient systems which have in whole or in part descended to us. In the Mosaic law divorce was a privilege of the husband only; the vow of a woman might be disallowed by her father or husband, and daughters could inherit only in the absence of sons, and then they must marry in their tribe. The guilt or innocence of a wife accused of adultery might be tried by the ordeal of the bitter water. Besides these instances, which illustrate the subordination of women, there was much legislation dealing with, inter alia, offences against chastity, and marriage of a man with a captive heathen woman or with a purchased slave. So far from second marriages being restrained, as they were by Christian legislation, it was the duty of a childless widow to marry her deceased husband's brother. In India subjection was a cardinal principle. "Day and night must women be held by their protectors in a state of dependence," says Manu. The rule of inheritance was agnostic, that is, descent traced through male to the exclusion of females. The gradual growth of stridhana, or property of a woman given by the husband before or after marriage, or by the wife's family, may have led to the suite, for both the family of the widow and the Brahmans had an interest in getting the live estate of a woman out of the way. Women in Hindu law had only limited rights of inheritance, and were disqualified as witnesses.

In Roman law a woman was even in historic times completely dependent. If married she and her property passed into the power of her husband; if unmarried she was (unless a vestal virgin) under the perpetual tutelage of her father during his life, and after his death of her agnates, that is, those of her kinsmen by blood or adoption who would have been under the power of the common ancestor he had lived. Failing agnates, the tutelage probably passed to the gens. The wife was the purchased property of her husband, and, like a slave, acquired only for his benefit. A woman could not exercise any civil or public office. In the words of Ulpian, "feminae ab omnibus officiis civilibus vel publicis remotae sunt." A woman could not continue a family, for she was "incapax et infirmus," she could not be a witness, surety, tutor, or curator; she could not adopt or be adopted, or make a will or contract. She could not succeed ab intestato as an agnate, if further removed than a sister. A daughter might be disinherited by a general clause, a son only by name. On the other hand, a woman was privileged in some matters, but rather from a feeling of pity for her bodily weakness and presumed mental incapacity than for any more worthy reason. Thus she could plead ignorance of law as a ground for dissolving an obligation, which a man could not as a rule do; she could accuse only in cases of treason and witchcraft; and she was in certain cases exempt from torture. In succession ab intestato to immovable property Roman law did not, as does English, recognize any privilege of males over females.

Legal disabilities were gradually mitigated by the influence of fictions, the praetorian equity and legislation. An example of the first was the mode by which a woman freed herself from the authority of her tutor by fictitious cession into the authority of a tutor nominated by herself, or by sale of herself into the power of a nominal husband on the understanding that he was merely nominal heir to another person, who then emancipated her. The action of equity is illustrated by the recognition by the praetor of cognatic or natural as distinguished from agnatic or artificial relationship, and of a widow's claim to succeed on the death of her husband intestate and without relations. Legislation, beginning as early as the Twelve Tables, which forbade excessive mourning for the dead by female mourners, did not progress uniformly towards enfranchisement of women. For instance, the Lex Voconia (about 169 B.C.), called by St Augustine the most unjust of all laws, provided that a woman could not inherit, nor be instituted heir to a man who was registered as owner of a fortune of 100,000 asses. A constitution of Valentinian I forbade bequests by women to ecclesiastics. But the tendency

1 But in the earliest extant code, however, that of Khammurabi, the position of women was free and dignified. See Babylonian Law.

6 Ch. ix. § 2 (Sir W. Jones's translation).
7 Whether this was the oldest rule of inheritance has been much debated. That birth of a child gave the mother certain legal rights in a primitive stage of society is the view of many writers. See especially, H. Morshead of J. J. Bachofen (Zurich, 1880).

11 Imbecilitas is the term used more than once in the texts of Roman law.
12 The way in which this law was evaded was by non-enrolment of the testator in the census (see Montesquieu, Esprit des lois, bk. xxvii.). Another way was by leaving her the inheritance by fiduciarium (see Trust).
rule of the English common law after the Reformation. The ceremony was not to be performed during Lent. The woman was to be veiled during the ceremony. A promise of marriage was so sacred that it made a subsequent marriage with another person void. Spiritual cognition was a bar to marriage. The sentence of the church was made necessary for divorce. As to women in general the law does not say very much. Women, even relatives, were not to live with priests unless in case of necessity. They were not to approach the altar or fill any public office in the church; nor might they lend money on usury. Baptism might be valid although administered by a woman. Women who had professed religion could not be forced to give evidence as witnesses. In some cases the evidence of women was not receivable.4

The early law of the northern parts of Europe is interesting from the different ways in which it treated women. In the words of Sir H. Maine6 the position of women in these barbarous systems of inheritance varies very greatly. Sometimes they inherit, either as individuals or as classes, only when the same generation have failed. Sometimes they do not inherit, but transmit a right of inheritance to their male issue. Sometimes they succeed to one kind of property, for the most part movable property, which they probably took a great share in producing by their household labour; for example, in the real Salic law (not in the imaginary code) there is a set of rules of succession which, in my opinion, clearly admit women and their descendants to a share in the inheritance of movable property, but confine land exclusively to males and the descend-

ance of males. That the proper mode of providing for a woman is by giving her a marriage portion; but, when she is once married into a separate community consisting of strangers in blood, neither she nor her children are deemed to have any further claim on the parent group.7 Among the Scandinavian races women were under perpetual tutelage, whether married or unmarried. The first to obtain freedom were the widows. As late as the code of Christian V., at the end of the 17th century, it was enacted that if a woman married without the consent of her tutor he might have, if he wished, administration and usufruct of her goods during her life. The provision made by the Scandinavian laws under the name of a marriage gift was perhaps the parent of the modern settled property. The Breton law of Ireland excepted women from the ordinary course of the law. They could distrain or contract only in certain named cases, and distress upon their property was regulated by special rules. In the pre-Conquest codes in England severe laws were denounced against unchastity, especially procurement and incest. It was a capital crime to carry off or offer violence to a nun. A wife could not commit furtum of her husband's goods, even from his own house, under penalty of execution. By several sumptuary constitutions, contained in the Code of the year 586, women as well as men were subject to penalties for wearing dress or ornament (such as rings) imitating those reserved for the emperor and his family. A woman who wore a dress of gold in public was to be veiled by the dress of virgins devoted to Heaven. If a consul had a wife or mother living with him, he was allowed to incur greater expense than if he lived alone. The interests of working women were protected by enactments for the regulation of the gymnasia, or workshops for spinning, dyeing, &c.

The canon law, looking with disfavour on the female independence prevailing in the later Roman law, tended rather in the opposite direction. The Decretum specially inculcated subjection of the wife to the husband, and obedience to his will in all things. The chief differences between canon and Roman law were in the religious aspect, and in the greater latitude in the introduction of publicity and of the formalities of the ring and the kiss. The benediction of a priest was made necessary part of the ceremony, as indeed it had been made by the civil power, as has been already stated, in the post-Justinian period of Roman law. But in practice this rule appears to have fallen into disuse until it was again revived by the council of Trent. It was, however, the

7 Bk. iii. ch. xvi. § 1. 2.

8 The development of the bride-price no doubt was in the same direction. Its original meaning was, however, different. It was the sum paid by the husband to the wife's family for the purchase of part of the family property, while the morning-gift was paid as pretium virginisatis to the bride herself. In its English form morning-gift occurs in the laws of Canute; in its Latinized form of morgagnia it occurs in the Leges Henrici Primi.
WOMEN

period. The laws of Edmund to that of her husband's property; the laws of Edmund as to betrothal allowed this to be increased to half by antenuptial contract, to the whole if she had children and did not re-marry after her husband's death. No doubt the dower ad estium ecclesiae favoured by the church generally superseded the legal rights where the property was large (in fact the credit of the dower is c. 7). "Proviso hominis tollit provisionem legis." The legal rights of a married woman apart from contract were gradually limited, until by the time of Glanvill her person and property had become during her husband's lifetime entirely at his disposal, and after his death limited to her dower and her pars rationabilis.

A few of the more interesting matters in which the old common and statute law of England placed women in a special position may be noticed. A woman was exempt from legal duties more particularly attaching to men and not performable by deputy. She could apparently originally not hold proper feud, i.e. one of which the tenure was by military service. 1 The same principle appears in the rule that she could not be endowed of a castle maintained for the defence of the realm and not for the private use of the owner. She could receive homage, but not render it in the form used by men, and she was privileged from suit and service at the sheriff's tourn. She was not sworn to the law by the oath of allegiance in the leet or tourn, and so could not be outlawed, but was said to be waived. She could be constable, either of a castle or a vill, but not sheriff, unless in the one case of possession of a castle and the other by actual exercise in person in the 17th century by the famous Anne, countess of Dorset and Montgomery. In certain cases a woman could transmit rights which she could not enjoy. On such a power of transmission, as Sir H. Maine shows, 2 rested the claim of Edward III. to the crown of France. The claim through a woman was not a breach of the French constitutional law, which rejected the claim of a woman. The jealousy of a woman's political influence is strikingly shown by the case of Alice Perrers, the mistress of Edward III. She was accused of breaking an ordinance by which women were forbidden to do business for hire and by way of maintenance in the king's 3

By Magna Carta a woman could not accuse a man of murder except of that of her husband. This disability did not arise from the fact that in trial by battle she naturally did not appear in person but by a champion. She was not admitted as a witness to prove the statement of a man in the question arising whether he were free or a villein. She could not petition the king against her guardian, only be a guardian even of her own children to a limited extent. Her will was revoked by marriage, that of a man only by marriage and the subsequent birth of a child. By Magna Carta, c. 5, a widow or daughter of a knight was not to wear veils above twelvemonth in value. Handicraftsmen's and yeomen's veils were not to wear cloths veils. The use of fur was confined to the ladies of knights with a rental above 200 marks a year. Careful observance of difference of rank in the dress was also inculcated by Magna Carta, c. 9. The widow or daughter of a knight was not to wear cloths of gold or sable fur, of a knight-bachelor not velvet, of an esquire or gentleman not velvet, linen or ermine, of a labourer not clothes beyond a certain price or a girdle of silk. 4

The woman's daily dress was also a well-determined matter by the legislature. By 3 Edw. IV. c. 6, handicraftsmen were to use only one mystery, but women might work as they had been accustomed. 3 Edw. IV. c. 3

1 It is remarkable that the great fiefs of France, except the Isle of France, the special appanage of the crown, all became in time female Red. This is shown by the table at the end of Laboulaye's Recherches.

2 Early Law and Custom, ch. v.

4 It forbade importation of silk and lace by Lombards and other alien strangers, imagining to destroy the craft of the silk spinners and all that craft's occasions for women. In some cases the wives and daughters of tradesmen were allowed to wear what their husbands and fathers; see, for instance, the act concerning tailors, 1 Jac. I. c. 22. Some trading corporations, such as the East India Company, were allowed to have women among their members. The disabilities imposed on women by substantive law sometimes traceable in the early law of procedure. For instance, by the Statute of Uses (12 Edw. II. st. 2), essoin de veloir regit did not lie where there was a woman; that is, a woman (with a few exceptions) could not excuse her absence from court by alleging that she was on public duty. The influence of the church is very clearly traceable in the development of legislation. Thus by 13 Edw. I. st. 1, c. 34, it was punishable with the loss of all her movable property by a nun, even with her consent. The Six Articles, 31 Hen. VIII. c. 14, forbade marriage and concubinage of priests and sanctioned vows of poverty by women.

In Scotland, as early as Regim Majestatem (12th century) women were the object of special legal regulation. In that work the mercheta mulieris (where a tax paid to the lord on the marriage of his tenant's daughter) was fixed at a sum differing according to the rank of the woman. Numerous ancient laws dealt with trade and sumptuary matters. By the Leges Quatuor Burgessorum female brewers making bad ale were to forfeit eightpence and be put on the cucullus-stool, and were to set an ale-ward outside their houses to prevent any of fourpence. The same laws also provided that a married woman committing a trespass without her husband's knowledge might be distrained for it, as "trenchant a woman." The child of a woman who was not a nun, the defensor, was made to eat a girl to the value of a pound of the flesh of a gild-bridelet unable to provide for herself the"bag of a child" of the case, and to put her in a convent. By the act 1429, c. 9, wives were to be arrayed after the estate of their husbands. By 1457, c. 13, no woman accused of theft to church was to be imprisoned in a convent, but was to be tried as if she were a layman. Modern English law specially affecting women; see, for instance, EVIDENCE, DIVORCE, MARRIAGE, CHILDREN (Law relating to), INFANT, HUSBAND AND WIFE. The movement for removing the older disabilities has progressed at such different rates in various countries that it is impossible to do more than note here the chief distinctions remaining under English law in 1910.

Civil Rights.—The age at which a girl can contract a valid marriage, and marriage, is the same in England now as it was 200 years in advance of a boy, who must be fourteen. Under the Infants Settlement Act 1855, a valid settlement could be made by a woman at any time before the approval of the court, the age for a man being twenty; by the Matrimonial Settlements Act 1882, partial settlements by a husband of his wife's property is not valid unless executed by her if she is of full age, or confirmed by her after she attains full age. An unmarried woman is liable for the support of illegitimate children till they attain the age of sixteen. She is generally assisted in the absence of agreement, by an affiliation order granted by magis-

A married woman having separate property, is, under the Married Women's Property Acts 1882 and 1908, liable for the support of her parents, husband, children and grandchildren becoming chargeable to any union or parish. At common law the father was entitled to maintain his children against his wife, but was a legitimate child up to the age of sixteen, and could only forfeit such maintenance for misconduct. But the Court of Chancery, wherever there was trust property and the infant could be made a ward of court, took a less rigid view of the parent's liability than at common law, and allowed the mother the right to support, and educate the child, and consequently in some cases to the extension of the mother's rights at common law. Legislation has tended in the same direction. The Matrimonial Causes Act 1857, the Court of Chancery was empowered to enforce a prenuptial agreement for the upkeep the custody or control of a child to the mother. The Judicature Act 1873, § 25 (10), enacted that in questions relating to the custody of a child the decision of the court was to be had by the legislature. By 37 Edw. IV. c. 6, handicraftsmen were to use only one mystery, but women might work as they had been accustomed. 3 Edw. IV. c. 3

5 It is remarkable that the great fiefs of France, except the Isle of France, the special appanage of the crown, all became in time female Red. This is shown by the table at the end of Laboulaye's Recherches.
The most remarkable disabilities under which women were still placed in 1910 were (1) the exclusion of female heirs from intestate succession; (2) the doctrine of coverture, under which the husband alone could enter into any contract or convey title; (3) the law of Inheritance; Succession; and (2) the fact that a husband could obtain a divorce for the adultery of his wife, while a wife could only obtain it for her husband's adultery if coupled with some other cause, such as cruelty.

Suits in which either necessarily or practically only women are plaintiffs are: breach of promise, afflication (q.v.) and (though not necessarily so) infringement of a woman's personal rights.

The action for breach of promise 1 may indeed be brought by a man, but this is very rare, and its only real interest is as a protection for women. It may be brought by but not against an infant, and not against a married woman (with certain exceptions, such as the case of a child born during infancy; it may be brought against but not by a married man or woman (in spite of the inherent incapacity of such a person to have married the plaintiff), and neither by nor against the personal representatives of a deceased party (the plaintiff will usually receive special damages have accrued to the personal estate of the deceased).

The promise need not be in writing. The parties to an action are by 32 and 33 Vict. c. 68: competent witnesses; the plaintiff cannot, however, recover a verdict without his or her testimony being corroborated by other material evidence. The measure of damages is to a greater extent than in most actions at the discretion of the judge: they may be into consideration the injury to the plaintiff, the feelings, especially if the breach of promise be aggravated by seduction. Either party has a right to trial by jury under the rules of the Supreme Court, 1889. The action cannot be tried in a county court, unless it be for a nominal sum, as in any action for damages, where the amount is under £5.

Unchastity of the plaintiff unknown to the defendant when the promise was made and dissolution of the contract by mutual consent is stipulated is not usually regarded as a valid defense for the action. Bodily infirmity of the defendant is no defense to the action, though it may justify the other party in refusing to marry the person thus affected. Where the party's are within prohibited degrees of consanguinity or affinity, there can be no valid promise at all, and so no action for its breach.

Criminal Law.—There are some offences which can be committed only by women, others which can be committed only against them. Among the former are concealment of birth (in nineteen out of the hundred), the now obsolete offense of being a common scold, and prostitution (q.v.) and kindred offenses. Where a married woman was the subject of the complaint, it was generally supposed to have acted by his coercion, and so to be entitled to acquittal. This presumption, however, was never made in witchcraft cases, and is not now made in cases of treason, murder, and other grave crimes, or in crimes in which the principal is not usually taken by the wife, such as keeping a brothel. In fact, the exceptions to the old presumption are now perhaps more numerous than those falling within it. The doctrine of coercion and the practice of separate acknowledgment of deeds by married women have given rise to a number of cases. Any attempt to bring them to be vestiges of the period when women, besides being chattels, were treated as chattels. Formerly a wife could not steal her husband's property, but since the Married Women's Property Act this has become possible. Adultery is no crime. England is, in this respect, the only country where such is the case. It was punished by fine in the ecclesiastical courts up to the 15th century, and was made criminal by the statute De lavando effectus (1417). The offenses which can be committed only against women and which the women themselves commit, are such as the solicitude of the witchcraft (see Witchcraft, and Drowning), and the learned are ingenious in finding in these offenses. The law on this subject is naturally very complex, but the English system is, in substance, the same as that of any other civilized country.

The whole idea of women's position in social life, and their ability to take their place, independently of any question of sex, in the work of the world, was radically changed in the English-speaking countries, and also in the more progressive nations beyond their bounds, during the 19th century. This is due primarily to the movement for women's higher education and its results. To deal in detail with this movement in various countries would here be too intricate a matter; but in the English-speaking countries at all events the change is so complete that the only curious thing in the whole matter may be the apparent contradiction in the course of events. The education of women in England, which was practically confined to the sons of the clergy, was brought within the reach of the daughters of the middle and lower classes by the efforts of such men as Sir George Gilboy, who in 1836 published a pamphlet for the separate education of boys and girls; by the opening of the University of Oxford, which was abolished in 1828; Chastisement of a wife by a husband, possibly at one time lawful to a reasonable extent, would now certainly constitute an assault. The husband's rights are limited to restraining the wife's liberty in case of her misconduct.

In Scotland the criminal law differs slightly from that of England. At one time drowning was a punishment specially reserved for women. Incest (q.v.), or an attempt to commit incest, has always been punishable as a crime. Adultery and fornication are still nominally crimes, but criminal proceedings in these cases have fallen into desuetude. The age of testamentary capacity is still twelve, not fourteen, as in England.

Higher education and its results.

1 The action for breach of promise of marriage is in some of its incidents peculiar to English law. In Roman law, betrothal, sponsosia, imposed a duty on the betrothed to become husband and wife within a reasonable time, subject to the termination of the obligation by death, repudiation by the words condiciones tuae mun suer, or lapse of time. If the woman were within twenty years of age at the time of the promise to marry unless arroha sponsosiae had been given, is, earnest of the bargain, to be forfeited by the party refusing to carry it out. The arroha might also be given by a parent, and was equally liable to repudiation. In this case, a refusal to marry the wife of his or her husband was in most cases to recover any arroha that might have been given, for being supposed that he or she was in a position of authority and able to extort a promise from the plaintiff. In the case of the breach of law breach of the promise made by the sponsosia, whether de praesenti or de futuro, a division unknown to Roman law, does not without more appear to have sufficed to found an action for its breach, except so far as it fell under ecclesiastical cognizance as laeta fide, but it had the more serious legal effect of avoiding as a canonical disability the subsequent marriage, while the original sponsosia continued, of a betrothed person to any other than the one to whom he or she was already engaged. This disability became absolute, either by mutual consent or by certain supervening impediments, such as ordination or a vow of chastity. The canonical disability of so long duration fell in England by 1871, and was re-established in the reign of Edward VI., and finally abolished in 1753. In England the duty of the parties is the same as in other countries. The law of 1871, c. 51, s. 20, s. 28, is a proper cause to a decree for the declaration of marriage and equivalent to marriage, unless declared void during the lifetime of the parties.
WOMEN

Catholic university in Ireland, it was provided that two members of the senate should be women; and Queen's University, Belfast, had three women in 1910 in its senate. Women may point with justifiable pride to the fact that within a very few years of their admission to university examinations, they provided at Cambridge both a senior classic and a senior wrangler. In America (see Co-education) the movement has gone much farther than in Great Britain.

There is a delicate, calm, earnest demeanour of women, both in the schools and in university life, awakened admiration and respect from all; and the movement brought into existence a vast number of women, as well-educated as men, hard-working, persevering and capable, who invaded many professions, and could hold their ground where a sound education was the foundation of success. The pioneers of female education spent their energies in developing their higher and more intellectual ideals, but later years opened up other positions which better education has enabled women to fill. In the literary field they soon invaded journalism (see Newspapers), and took an important place on the staffs of libraries and museums. They form an important (and in America, the predominating) section of the teaching profession in the state schools, and in all research work play an increasing vitally important part. It is not possible for every woman to be a scholar, a doctor (see below), a lawyer, or possibly to attain the highest position in professions where competition with men is keen, but the development of women's work has opened many other outlets for their energies. As members of school boards, factory inspectors, poor law guardians, sanitary inspectors, they have been able to make a wide and ample scope for gratifying their ambition and energy. The progress made in philanthropy and religious activity is largely due to their devotion, under the auspices of countless new societies. And increasing provision has been made, in the arts and crafts, for the furtherance of their careers. There are successful women architects now working in England, and in 1903 a woman won the silver medal of the Royal Society of British Architects; a large number of women travel for business firms; in decorative work, as silversmiths, dentists, law copyists, proof-readers, and in plan tracing women work with success; wood-carving has become almost as recognized a career for them as that of typewriting and shorthand, in which an increasing number are finding employment. Agriculture and gardening have opened up a new field of work, and, with it, kindred occupations.

Women have always found a peculiarly fitting sphere as nurses, though it is only in recent years that nursing (q.v.) has been professionalized by means of proper education. Medicine. But their admission to the medical profession itself was one of the earliest triumphs of the 19th-century movement. It began in America, but was quickly followed in England. After having been refused admission to instruction by numerous American medical schools, Miss Elizabeth Blackwell was allowed to enter as a student by the Geneva Medical College, N.Y., in 1847, from which she graduated in 1849. Hers was the first woman's name to be placed on the Medical Register of the United Kingdom (1859).

In Great Britain the struggle to obtain admission to the teaching schools and to the examinations for medical degrees and diplomas was long and bitter. Though the Society of the Apothecaries admitted Mrs Garrett Anderson (q.v.) to their diploma in 1865, it was only after a series of rebuffs and failures that women were admitted to the degree examinations of the various universities. In August 1876 an "enabling" act was passed, empowering the nineteen British medical examining bodies to confer their degrees or diplomas without distinction of sex. In 1908 the Royal College of Physicians and Surgeons decided to admit women to their diplomas and fellowships. In the meantime women doctors had become a common phenomenon.

Women in England may fill some of the highest positions in the state. A woman may be a bishop, a regent, and as queen regent has, by Mary, sess. 3, c. 1, as full rights as a king. Among the public offices a woman may hold are those of county, borough, parish and rural or urban district councillor, overseer, guardian of the poor, churchwarden and sexton. In 1908 Mrs Garrett Anderson was elected mayor of Aldeburgh, the first case of a woman holding that position. Women have also been nominated as members of Royal Commissions (e.g. those on the Poor Law and Divorce). A woman cannot serve on a jury, but may, if married, be one of a "jury of matrons" appointed to determine the condition of a female prisoner on a writ de ventre inspiciendo. She can vote (if unmarried or a widow) in county council, municipal, poor law and other local elections. The granting of the parliamentary franchise to women was, however, still withheld in 1970. The history of the movement for women's suffrage is told below.

It may be remarked that, with or without the possession of a vote on their own account, politics in England have in modern times been very considerably influenced by the work of women as speakers, canvassers and organizers. The great Conservative and Liberal political parties have been in the main successful in paying the women, and their success is due largely to their influence in the parliamentary party, in women's clubs and societies of middle-class women.

Women's suffrage.

The movement for the abolition of the sex distinction in respect of the right conferred upon certain citizens to share in the election of parliamentary representatives dates for practical purposes from the middle of the 19th century. The governmental systems of the ancient world were based, with or without exception, on the view that women could take no part in state politics, except in oriental countries as monarchs. Exceptional women such as Cleopatra, Semiramis, Arsinoe, might in the absence of men of the royal house, and by reason of royal descent or personal prestige, occupy the throne, and an Aspasia might be recognized as the able head of a political salon, but women in general derived thence no political status. Though Christianity and a broadening of men's theories of life tended to raise the moral and social status of women, yet Paul definitely assigns subservience as the proper function of the Christian woman. When the Universal Church was established in the United States and Australia many women have been appointed ministers, and in England the Rev. Gertrude von Petzold held in 1910 the post of minister of the Narborough Road Free Christian Church, Leicester.

1 Women have long practised law in the United States, and in 1869 the benches of the Ontario Law Society decided to admit them to the bar. In France in December 1900 an act was passed enabling women to practise as barristers, and Madame Petit was sworn in Paris, while a woman was briefed for the defence in a murder case in London as long ago as 1828. This being his first act, he was secured in a European criminal court. In Finland and Norway women have long practised as barristers, and in Denmark since 1908 they have been admitted as assistants to lawyers, the law laying down that the women are to be treated no less kindly towards them than the men. In Sweden and in the United States they are admitted as notaries. In England a special tribunal of the House of Lords presided over by the Lord Chancellor decided in 1903 not to admit women to the English bar, on the grounds that there was no precedent and that they were not desirous of creating one; but numbers of women take degrees in law in British universities, and several have become solicitors.

In the older times before the Reformation in England various religious communities absorbed a large number of the surplus female population, and in High Church and Roman Catholic circles many ladies still enter various sisterhoods and devote their lives to religious work. During the period of the Reformation the Church of England the only office which remained open to women was the modest one of churchwarden, and this office is not infrequently filled by women. The Convocation of Canterbury in 1908 resolved that no majority of the votes of the clergy or lay persons would be required in the future to prevent women from being admitted to the porch of the church councils, though qualified persons of the female sex may vote for parochial lay representatives on the church council. In the Independent Churches there are a few exceptions. Among the Congregationalists women have equal votes and can question, and may become deacons or even ministers; Miss Jane Brown has been recognized as pastor of Brotherton Congregational Church, Yorkshire, and as pastor of her church in Cardiff. The Methodist Church women frequently act as local preachers. The same equality and share in religious work is accorded to women by the Society of Friends and the Salvation Army, the success of which is due largely to the voluntary work of women, and in the United States and Australia many women have been appointed ministers, and in England the Rev. Gertrude von Petzold held in 1910 the post of minister of the Narborough Road Free Christian Church, Leicester.
idea are seen; many of the Great English Abbes discharges their territorial duties as landowners, and women as custodians of castles voted for knights of the shire. In the 17th and 18th centuries in England and America, under the influence of advancing political theory, and in France in the 18th century, this idea began to take shape. In England the writings of Mary Astell (Serious Proposal to Ladies, 1697) and others led to the gradual revision of the inherited idea of the education and the true sphere of women, while in 1799 Mary Wollstonecraft published her Vindication of the Rights of Woman. In America the dawning of a political consciousness is evidenced by the claim made in 1646 by John Milton to sit in the Assembly of Maryland as the executor of Lord Baltimore, and by the requests made by Abigail Adams (wife of John Adams), Mercy Otis Warren and Hannah Lea Corbin, that women taxpayers should enjoy direct representation. In France the movement towards democracy did not in the hands of Rousseau include the enfranchisement of women, and Comte taught that women were politically inferior to men; Condorcet, however, demanded equal rights for both sexes. Although, through an oversight, women could vote under the first constitution of New Jersey from 1775 to 1807, there is no doubt that the Revolution had given to women in any country till comparatively late in the 19th century. There has been considerable discussion as to whether women had constitutionally a right to vote in England prior to the Reform Act of 1832 (see Mrs C. C. Stopes, British Freewoman). The discussion, however, is one of purely antiquarian interest, and the Reform Act made quite clear what had certainly been the recognized custom before, by introducing specifically the word "male" in the new franchise law (2 and 3 Will IV., cap. 45, sections 19 and 20).

The earliest known handbill representing the modern "women's suffrage" movement in England dates from about 1847, and in 1857 the first society was formed in Sheffield, the "Sheffield Female Political Association," due largely to the work of a Quaker lady, Anne Kent of Chelmsford. In July of the same year Mrs John Stuart Mill published an article in the Westminster Review.

The earliest outstanding figure, however, is Lydia Ernestine Becker (1827-1896), descended on the mother's side from an old Lancashire family, her father being the son of a German who settled in England in early youth. She became a well-known botanist, and an intimate friend of Charles Darwin. In 1858 the Englishwoman's Journal was started, and by this time there was a vigorous agitation for the alteration of the law relating to the property and earnings of married women. Among the leaders of that movement were Barbara Leigh Smith (Mrs Bodichon) and Bessie Rayner Parkes (Madame Bello). At the same time a famous group of women, Emily Davies, Miss Beale and Miss Buss (founders respectively of the Cheltenham Ladies' College and the North London Collegiate School) and Miss Garrett (Dr Garrett Anderson), Miss Helen Taylor (John Stuart Mill's stepdaughter) and Miss Wolstenholme (afterwards Mrs Elmy), discussed women's suffrage at the "Kensington Society."

A new era began with the election in 1865, as member for Westminster, of John Stuart Mill, who placed women's suffrage in his election address. From that time the subject became more prominent in successive parliaments. Mill presented the first petition in May 1867. In 1868 the case of Chorlton v. Lings was decided against women applicants for the vote by the Court of Common Pleas, and a similar decision was given by the Supreme Court of Appeal in Scotland. From this time there were various local committees (in London, Manchester, Bristol, Edinburgh and Birmingham) were directed to promoting a bill in parliament, and to forwarding petitions (an average of 200,000 signatures a year was maintained from 1870 to 1880). The Women's Suffrage Journal was founded in 1870, and in the same year Jacob Bright moved the second reading of the Women's Disabilities Bill which was carried by a majority of 35 votes. Mr Gladstone then threw his opposition into the scale, and the bill was rejected in committee by 220 to 94. In 1871 the same bill was again lost by 220 to 135, in spite of a memorial headed by Florence Nightingale, Mary Carpenter, Augusta Webster, Harriet Martineau, Frances Power Cobbe and Anna Louisa Chisolm (Mrs H. W. Chisholm). G. O. Trevelyan's Household Franchise Bill in 1873 raised the hopes of the women's suffragist, and Mr Joseph Chamberlain at a great Liberal meeting in Birmingham carried a resolution in favour of the proposed change.

From 1874 to 1876 the bill was in charge of a conservative, Mr Forsyth, and, despite the opposition of John Bright and the efforts of a parliamentary committee for "maintaining the purity of the ballot," there were 13,000 signatures of supporters in the hands of the petitioners. The work proceeded uneventfully from 1876 to 1884, huge meetings being held in all the chief towns. In 1880 the franchise was conferred upon women owners in the Isle of Man, subsequently upon women occupiers also. In 1883 a great Liberal conference at Leeds voted in favour of women's suffrage under the leadership of Dr Crosskey and Walter S. B. M'Laren. The next notable event in the movement was the defeat of W. Woodall's amendment to the Reform Bill (1884), providing that words importing the masculine gender should include women, or the repeal of the duties of the justices of the peace. This appeal to his party to withdraw the support which they had given in the past. 104 Liberal members crossed over in answer to this appeal. Numerous bills and resolutions followed year by year in the names of W. Woodall, L. H. Courtenay (Lord Courtenay, whose bill was read a second time without a division, 1886), W. S. B. M'Laren, Baron Dimsdale, Caleb Wright, Sir Albert K. Rollit, F. Faithfull Begg (1897; second reading majority 71). Up to 1906 all those attempts had failed, in most cases owing to time being taken for government business.

The period 1896 to 1910 witnessed entirely new developments.

The suffragists of the existing societies still carried on their constitutional propaganda, and various bills were introduced. In 1907 Mr W. H. Dickinson's bill was talked out, and in 1908 Mr H. Y. Stanger's bill was carried on its second reading by a majority of 179, but the government refused facilities for its progress. Prior to this, however, a number of suffragists had come to the conclusion that the failure of the various bills was due primarily to government hostility. Furthermore the advent of a Liberal government in 1906 had aroused hopes among them that the question would be officially taken up. Questions were therefore put in the House of Commons, and a variety of meetings, and disturbances occurred, with the result that Miss Christabel Pankhurst and Miss Annie Kenney were fined in Manchester in 1906. A certain section of suffragists thereafter decided upon comprehensive opposition to the government of the day, until such time as one or other party should officially adopt a measure for the enfranchisement of women. This opposition took two forms, one that of conducting campaigns against government nominees (whether friendly or not) at bye-elections, and the other that of committing breaches of the law with a view to drawing the widest possible attention to their cause and so forcing the authorities to fine or imprison them. Large numbers of women assembled while parliament was sitting, in contravention of the regulations, and on several occasions many arrests were made. Fines were imposed, but practically all refused to pay them and suffered imprisonment. At a later stage some of the prisoners adopted the further course of refusing food and were forcibly fed in the gaols.

The failure of all the bills previously drafted on the basis of exact equality between the sexes, and the fact that both Unionists and Liberals refused to make the matter a party question, and coupled with a general feeling of discomfort at the relations between the so-called "militant" suffragists and the authorities, led in the spring of 1910 to the formation of a committee (called the Conciliation Committee) of members of parliament under the presidency of the earl of Lytton. This committee, consisting of some 25 members belonging to all parties, succeeded in agreeing upon a new bill based upon the occupier franchise established by the Municipal Franchise Act of 1884. It was urged on behalf of this bill that it would establish the principle on a sufficiently
representative basis without altering the numerical balance of parties in the country. It was calculated that slightly over 1,000,000 women would be enfranchised. After considerable pressure both inside the house and outside, Mr. Asquith consented to give two days of government time for the debate, and the second reading, moved by the Labour member, Mr. D. J. Shackleton, was carried by a majority of 110 votes. A further attempt to commit the bill to a Grand Committee failed by 175 votes; the bill was therefore sent to a committee of the whole house, and Mr. Asquith announced that he would not give further facilities by the way of subcommittee, as the opposition was as undemocratic by Mr. Lloyd-Greco and other Liberals, it was supported by 32 out of 40 of the Labour members, and evidence was given that a large proportion of the new voters would have been working women.

The leading women's suffrage societies may here be mentioned. All these societies have advocated precisely the same view, namely that women should have the same electoral privileges as men, whatever franchise system be adopted.

1. The National Union of Women's Suffrage Societies is the oldest organization. It began about 1867 as a number of separate local committees, and after various reorganizations a great body of all local societies was framed in 1896 under the present title. This union had 200 branches in 1910. All the early suffragists belonged to some of the latter-day women's movement, as Mrs. Henry Fawcett. The union gradually discarded the "constitutional" policy and stood apart altogether from the "militant" societies. Its official organ, The Common Cause, was founded in 1895.

2. The National Women's Social and Political Union, associated chiefly with the name of Mrs. Emmeline Pankhurst and Miss Christabel Pankhurst, formed in 1906, originated the more militant policy. Its income in 1900-1910 reached the figure of £5,000, and up to September 1910 some 900 of its members had undergone imprisonment. It undertook a widespread campaign of meetings, and though at first its speakers were subjected to an opposition of a violent character, there was no doubt that the movement received from its activities a wholly new stimulus. Its official organ, Votes for Women, obtained a large circulation.

Societies of various kinds multiplied. In 1907 were formed (3) the Women's Freedom League (chiefly associated with the name of Mrs. C. Despard, a prominent supporter of the Labour party), whose members objected to the internal administration of the Social and Political Union, but agreed in adopting its policy in a modified form; and (4) the Men's League for Women's Suffrage, a society which included men of all parties, and in September 1910 adopted the anti-government election policy. Numerous other party and non-party societies were formed, and resolutions supporting the principle, either in the abstract or as a part of adult suffrage, were passed by various Conservative, Liberal and Labour conferences and conventions.

The remarkable prominence of the movement and the fact that successive parliaments contained a majority of pledged suffragists led to the campaign for the opposition movement. In 1908 was formed the Women's National Anti-Suffrage League, of men and women, which drew into its ranks prominent persons such as Lord Cromer, Lord Curzon, Lady Jersey and Mrs. Humphry Ward; and about the same time the Men's League for Opposing Women's Suffrage came into existence. These two leagues amalgamated in December 1910, as the National League for Opposing Women's Suffrage, with Lord Cromer as president. The Anti-Suffrage Review was founded in 1909.

In New Zealand a measure for the enfranchisement of women, introduced by Richard Seddon, was carried in September 1893 (in the upper house by a majority of 2). In Australia the vote has been extended to all adult women both in the states (the first being South Australia, 1894, the last Victoria, 1908) and for the Commonwealth parliament. They have, moreover, the right to sit in the representative assemblies.

The movement assumed an organized form in the United States somewhat earlier than in the United Kingdom. It arose out of the interest of women by way of temperance agitation, and was fostered by the discussion on women's property rights. In 1840 the question was raised in a more acute form by the exclusion of women delegates from the World's Convention, and in 1848 the first women's suffrage convention was held at Seneca Falls, the leading spirits being Mrs. Elizabeth Cady Stanton, Martha C. Wright and Lucretia Mott. Later conventions at Salem and Worcester, Massachusetts, in 1850, were the predecessors of annual meetings, but the extravagant dress adopted by some of the women brought ridicule upon the movement, which was further thrown into the background by the Civil War. In 1869 were formed: (1) in New York, the National Women's Suffrage Association, and (2) in Cleveland, the American Woman's Suffrage Association. In 1870 these two societies amalgamated as the National American Woman's Suffrage Association, of which in 1900 Mrs. Carrie Chapman Catt became president. The question was considered by a select committee in the 43th Congress, and 200 petitions, representing a total of nearly 300,000 signatures of men and women from the 24 states of the union, were presented in 1900. The Labour and Socialist parties in general supported the women's claim, but there was considerable opposition in other parties. In 5 states (Wyoming since 1869; Colorado, 1893; Utah, 1896; Idaho, 1896; and Washington, 1910) women are electors, and in 25 states they have exercised the school suffrage. In Louisiana they obtained the suffrage in connexion with tax levies in 1898. Anti-suffrage societies have also been formed in Brooklyn (1894), Massachusetts (1895), Illinois (1897), Oregon (1899).

In Finland all adult men and women over the age of 24, excepting a few individuals, are citizens, and they have received the right to vote for members of the Diet in 1906, in which year nineteen women became members of the Diet. In Norway, where there is male suffrage for men over 25 years of age, women were entitled to vote by a law of 1907, provided they or, if married, their husbands (i.e. where property is jointly owned) had paid income tax on an annual income of 400 kroner (£2) in the towns, or 300 kroner (£1, 10s.) in county districts. In Sweden a suffrage bill was carried in the lower but rejected in the upper house in 1909. In all the chief countries there are suffrage societies of greater or less strength. In Russia the question was placed in the forefront of the demands made by the Duma in 1906, and in 1907 prepared women received the right to confer votes on their sons who would otherwise be unenfranchised. In France a feminist congress met at Lyons in 1909.

The International Woman Suffrage Alliance originated in the United States in 1888. Its membership increased steadily, and at the Convention held in London in 1909 delegates were present from twenty-two countries. In the United Kingdom this Alliance is represented by the National Union of Women's Suffrage Societies. A social and propagandist club was founded in London in 1909 with an international membership. An international journal under the title Jus Suffragii (Brussels) was founded in 1907.

Authorities.—It is impossible to do more than mention a few works out of many dealing with various phases of the modern movement: Among them are: "Suffrage in the Victorian Age," by M. H. Blinkhorn; "Education in England," by A. R. Clevelen; "Women under English Law" (1865); J. L. de Lassennan, "L'Education de la femme moderne" (1908); M. Ostrogorski, "Femme au point de vue du droit public" (1900); Mrs. C. P. Gilman, "Women and Economics" (1898); Miss C. E. Collot, "Report on Changes in the Employment of Women" (1898); Fenn, "The Women in the Trades" (1908); A. Loria, "Le Feminisme au point de vue sociologique" (1907); Helen Blackburn, "Record of Women's Suffrage," in the United Kingdom (1902); Susan B. Anthony, "History of Women's Suffrage," in the United States (4 vols., 1881-1902); C. C. Stopes, "British Women" (1896); and E. Lyon Beale, "The Emancipation of Women" (1910). The classical exposition of the arguments on behalf of women's suffrage is J. S. Mill's "Subjection of Women;" the most important statement in opposition is perhaps that of Professor A. V. Dicey, "The Law of the Constitution." (X.)

WOOD, ANTHONY À (1623-1695). English antiquary, was the fourth son of Thomas Wood (1580-1643), B.C.L. of Oxford, where Anthony was born on the 17th of December 1623. He was sent to New College school in 1641, and at the age of twelve was removed to the free grammar school at Thame, where his studies were interrupted by civil war skirmishes. He was then placed under the tuition of his brother Edward (1627-1653), at Oxford College, but he continued in this condition his mother would always be soliciting him to be an apprentice which he could never endure to hear of. He was entered at Merton College in 1647, and made postmaster. In 1652 he amused himself with ploughing and bell-ringing, but the Life he speaks of himself and his family as Wood or à Wood, the last form being a pedantic return to old usage adopted by himself. A pedigree is given in Clark's edition.
WOOD, MRS HENRY

WOOD, SIR H. EVELYN

and "having had from his most tender years an extraordinary
ravishing delight in music," began to teach himself the violin,
and he obtained the degree of B.A. He engaged a music-
master, and obtained permission to use the Bodleian, "the
which he took to be the happiness of his life." He was admitted M.A.
in 1655, and in the following year published a volume of sermons
by his late brother Edward. He began systematically to copy
monumental inscriptions and to search for antiquities in the city
and neighbourhood. He went through the Christ Church
registers, "at this time being resolved to set himself to the
study of antiquities." Dr John Wallis, the keeper, allowed him
free access to the university registers in 1660; "here he layd
the foundation of his knowledge which he afterwards published,
viz. Hist. et Antiq. Univ. Oxon." He also came to
know the Oxford collections of Brian Twyne to which he
was greatly indebted. He steadily investigated the muniments of
all the colleges, and in 1667 made his first journey to London,
where he visited Dugdale, who introduced him into the Cottonian
library, and Prynne showed him the same civility for the Tower
records. On October 22, 1669, he was sent for by the delegates of
the press, "that whereas he had taken a great deal of pains
in writing the Hist. et Antiq. of the University of Oxon,
for he would for his pains give him some worth. He was no acquaintance, contrary,
that he might be translated into Latin." He accepted the offer and set to work to prepare his English
MS. for the translators, Richard Peers and Richard Reeve,
both appointed by Dr Fell, dean of Christ Church, who under-
took the expense of printing. In 1674 appeared Historia et antiquitates Universitatis Oxoniensis, handsomely reprinted "e
Teatro Sheldoniano," in two folio volumes, the first devoted
to the university in general and the second to the colleges. Copies
were widely distributed, and university and author received
much praise. On the other hand, Bishop Barlow told a corres-
doping friend that the "entire history itself is in
many things ridiculously false" (Genuine Remains, 1893, p.183).
In 1678 the university registers which had been in his custody
for eighteen years were removed, as it was feared that he would
be implicated in the Popish plot. To relieve himself from
suspicion he took the oaths of supremacy and allegiance. During
this time he had been gradually completing his great work,
which was produced by a London publisher in 1691-1692,
2 vols. folio, Athenae Oxonienses: An exact History of all the Writers and Bishops who have had their Education in
the University of Oxford from 1570 to 1690, in the Latin and the English languages,
for which the 9th of July 1693 he was condemned
in the vice-chancellor's court for certain libels against the late
earl of Clarendon, fined, banished from the university until he
recanted, and the offending papers burnt. The proceedings
were printed in a volume of Miscellanies published by Curr in 1714.
Wood was attacked by Bishop Burnet in a Letter to the Bishop
of Lichfield and Coventry (1693, 4to), and defended by his nephew
Dr Thomas Wood, in a Vindication of the Historiographer, to
which is added the Historiographer's Answer (1693, 4to, reproduced
in the subsequent editions of the Athenae). The nephew also
defended his uncle in An Address to the Life of Bishop Seth Ward,
1697, 8vo. After a short illness he died on the 28th of
November 1695, and was buried in the inner chapel of St John
Baptist (Merton College), in Oxford, where he superintended the
digging of his own grave but a few days before.

He is described as "a very strong lusty man," of uncouth manners
and appearance, not so deaf as he pretended, of reserved and temper-
ate habits, not avaricious and a despiser of honours. He received
neither wealth, nor knowledge, and yet he made so much of
his labours. He never married, and led a life of self-denial, entirely
dedicated to antiquarian research. Bell-ringing and music were his
chief recreations. His literary style is poor, and his taste and judg-
ment are frequently warped by prejudice, but his two great works
and unpublished collections form a priceless source of information
on Oxford and her worthies. He was always suspected of being a Roman
Catholic, and the use of Papists and Dissenters in the Athenae,
but he died in communion with the Church
of England.

Wood's original manuscript (purchased by the Bodleian in 1846)
was first published by John Gutch as The History and Antiquities
of the Colleges and Halls in the University of Oxford, with a con-
tinuation (1786-1790, 2 vols. 4to), and The History and Antiquities
of the University of Oxford (1792-1796, 3 vols. 4to), with portrait of
Wood. To these should be added The Antient and Present State of
the City of Oxford, in two parts, edited by Andrew Clark, and
printed by More and Vprin (1737-1744, 2 vols. 4to), in the edition
by the Rev. Sir J. Peshall (1773, 4to; the text is garbled and the
editing very imperfect). An admirable edition of the Survey of the
Antiquities of the City of Oxford, composed in 1661-66 by Anthony Wood,
was collected by Lord Clarendon, and published (1693, 4to).
Modius Salium, a Collection of Pieces of Humour, chiefly ill-natured personal stories, was published
at Oxford in 1751, 12mo. Some letters between Aubrey and Wood were
published, viz. 2. Worlds and Wood's MS. of Aubrey's History of England,
for which a new edition was contemplated by the Press, and asked for
additional matter (see Notes and Queries, 2nd ser., vi. 514, and 6th
ser., vi. 51). Wood bequeathed his library (127 MSS. and
970 Printed Volumes) to the Bodleian Museum; Wood's MS. of
Huddeford, printed a catalogue of the MSS. in 1761. In 1858
the whole collection was transferred to the Bodleian, where 25
vols. of Wood's MS. of Aubrey's History of England, and
papers from which the Athenae was written, as well as several large
volumes of Wood's correspondence and all his diaries, are in the
Bodleian.

Wood was intimately acquainted with the most minute particulars
of Wood's life from his Diaries (1657-1695) and autobiography;
all earlier editions are now superseded by the elaborate work of
Andrew Clark, The Life and Times of Anthony Wood, antiquary
(1693-1695, described by himself (Oxford Historical Society,
1891-1900, 5 vols. 8vo). See also Reliquiae Hiberniae,
ed. Bliss (2nd ed., 1869, 3 vols. 12mo); Hearne's Remarks
and Collections (Oxford Historical Society, 1885-1907, 3 vols.
1-viii.; Mackay's Annals of the Bodleian Library (2nd ed., 1890);
Nichols's Literary Anecdotes, i. iv. viii.; Noble's Biog. History

WOOD, MRS HENRY [Ellen] (1814-1887), English novelist,
was born at Worcester on the 17th of January 1814. Her
maiden name was Price; her father was a glove manufacturer
in Worcester. She married Henry Wood in 1836, and after
her marriage lived for the most part in France, her husband,
who died in 1866, being at the head of a large shipping
and banking firm. In 1866 she wrote a temperance tale, Danesbury
House, which gained a prize of £100 offered by the Scottish
Temperance League; but before this she had regularly con-
tributed anonymous stories to periodicals. Her first great success
was made with East Lynne (1861), which obtained enormous
popularity. It was sold in several languages and many
number of dramatic versions were made. The Channings
and Mrs Halliburton's Troubles followed in 1862; Verner's Pride
and The Shadow of Ashbydai in 1863; Lord Oakburn's Daughters,
Oswald Croy and Trevlyn Hold in 1864. She became proprietor
and editor of the Argosy magazine in 1867, and the Johnny Ludlow
tales, published anonymously there, are the most artistic
of her works. Among the thirty-five novels Mrs Henry Wood
produced, the best of those not hitherto mentioned were
Roland Yorke (1866); Within the Maze (1872) and Edina (1876).
She continued to edit the Argosy, with the assistance of her son,
of whom Henry Wood, till her death, which occurred on the 10th
of February 1887.

Memorials of Mrs Henry Wood, by her son, were published in 1894.

WOOD, SIR HENRY EVELYN (1838—), British field
marshal, was born at Braintree, Essex, on the 9th of February
1838, the youngest son of Sir John Page Wood, Bart. Educated
at Marlborough, he entered the Royal Navy in 1852, and served
as a midshipman in the Russian war, being employed on shore
with the naval brigade in the siege operations before Sevastopol,
moreover Cossack despatches and had been severely wounded at the assault
on the Redan on June 18, 1855. Immediately afterwards he left
the navy for the army, becoming a cornet in the 13th Light
Dragoons. Promoted lieutenant in 1856, he exchanged into
the 17th Lancers in 1857, and served in the Indian Mutiny
with distinction as brigade-major of a flying column, winning the
Victoria Cross. In 1861 he became captain, in 1862 brevet-major, exchanging about the same time into the 73rd Highlanders (Black Watch), but returned to the cavalry three years later. Having meantime served as an aide-de-camp at Dublin, he was next employed on the staff at Aldershot until 1871, when he was appointed to the 90th (now 2nd Scottish Rifles) as a regimental major. In 1867 he had married the Hon. Mary Pauline Southwell, sister of the 4th Lord Southwell. In 1873 he was promoted brevet lieutenant-colonel, and in 1874 served in the Ashanti War (brevet-colonel). In 1874-1878 he was again on the staff at Aldershot, and in November 1878 he became regimental lieutenant-colonel, the 90th being at that time in South Africa engaged in the Kaffir War. In January 1879 he was in command of the left column of the army that crossed the Zulu frontier, and shortly afterwards he received the local rank of brigadier-general. Under him served Colonel Redvers Buller and also the Boer leader, Piet Uys, who fell at Inhlobana, but the re-pulse at that place was more than counterbalanced by the successful battle of Khambula. At the close of the war Sir Evelyn Wood, who received the K.C.B. for his services, was appointed to command the Chatham district. But in January 1881 he was again in South Africa with the local rank of major-general, and after Sir G. P. Colley’s death at Majuba it fell to his lot to negotiate the armistice with General Joubert. Remaining in Natal until February 1882, he then returned to the Chatham command, having meantime been promoted substantive major-general. In 1882 he was made a G.C.M.G. and commanded a brigade in the Egyptian expedition. He remained in Egypt for six years. From 1883 to 1885 he was Sirdar of the Egyptian army, which he reorganized and in fact created. During the Nile operations of 1884-85 he commanded the forces on the line of communication of Lord Wolseley’s army. In 1886 he returned to an English command, and two years later (January 1889), with the local rank of lieutenant-general, he was appointed to the Aldershot command. He became lieutenant-general in 1891, and was given the G.C.B. at the close of his tenure of the command, when he went to the War Office as quartermaster-general. Four years afterwards he became adjutant-general. He was promoted full general in 1895. He commanded the II. Army Corps and Southern Command from 1901 to 1904, being promoted field marshal on the 8th of April 1903. In 1907 he became colonel of the Royal Horse Guards. After retiring from active service he took a leading part, as chairman of the Association for the City of London, in the organization of the Territorial Force. Sir Evelyn Wood published several works, perhaps the best known of which to the soldier are Achievements of Cavalry (1897) and Cavalry in the Waterloo Campaign (1898). He also wrote The Crimean in 1854 and in 1893; an autobiography, From Midshipman to Field Marshal; and The Revolt in Hindustan.

WOOD, JOHN GEORGE (1827-1889), English writer and lecturer on natural history, was born in London on the 21st of July 1827. He was educated at Ashbourne grammar school and at Merton College, Oxford; and after he had taken his degree in 1848 he worked for two years in the anatomical museum at Christ Church under Sir Henry Acland. In 1852 he was ordained a deacon of the Church of England, became curate of the parish of St Thomas the Martyr, Oxford, and also took up the post of chaplain to the Boatmen’s Floating Chapel at Oxford. He was ordained priest in 1854, and in that year gave up his curacy to devote himself for a time to literary work. In 1858 he accepted a readership at Christ Church, Newgate Street, and he was assistant-chaplain to St Bartholomew’s Hospital, London, from 1856 until 1862. Between 1866 and 1876 he held the office of precentor to the Canterbury Diocesan Choral Union. After 1876 he devoted himself to the production of books and to delivering in all parts of the country lectures on zoology, which he illustrated by drawing on a black-board or on large sheets of paper with coloured crayons. These “sketch lectures” were so popular, as he called them, that they were widely known both in Great Britain and in the United States. In 1883-1884 he delivered the Lowell lectures at Boston. Wood was for a time editor of the Boy’s Own Magazine. His most important work was a Natural History in three volumes, but he was better known by the series of books which began with Common Objects of the Sea-Shore, and which included popular monographs on shells, moths, beetles, the microscope and Common Objects of the Country. Our Garden Friends and Foes was another book which found hosts of appreciative readers. He died at Coventry on the 3rd of March 1889.

WOOD, SEARLES VALENTINE (1798—1880), English palaeontologist, was born on the 14th of February 1798. He went to sea in 1811 as a midshipman in the East India Company’s service, which he left, however, in 1826. He then settled at Hasketon near Woodbridge, Suffolk. He devoted himself to a study of the mollusca of the Newer Tertiary (Crag) of Suffolk and Norfolk, and the Older Tertiary (Eocene) of the Hampshire basin. On the latter subject he published A Monograph of the Eocene Bivalves of England (1861-1871), issued by the Palaeontographical Society. His chief work was A Monograph of the Crag Mollusca (1848-1886), published by the same society, for which he was awarded the Wollaston medal in 1860 by the Geological Society of London; a supplement was issued by him in 1872-1874, a second in 1879, and a third (edited by his son) in 1882. He died at Martlesham, near Woodbridge, on the 26th of October 1880. His son, Searles Valentine Wood (1830-1884), was for some years a solicitor at Woodbridge, but gave up the profession and devoted his energies to geology, studying especially the structure of the deposits of the Crag and glacial drifts.

WOODBRIDGE, a market town in the Woodbridge parliamentary division of Suffolk, England; 70 m. N.E. by E. from London by the Great Eastern railway. Pop. of urban district, in (1901) 4640. It is pretty situated near the head of the Deben estuary, which enters the North Sea 10 m. S. by E. The church of St Mary the Virgin is a beautiful Perpendicular structure, with a massive and lofty tower of flint work. The large estate left by Thomas Seekford of Sekforde (1578) endows the grammar school and hospital. Woodbridge Abbey, built by Seekford, occupies the site of an Augustinian foundation of the 12th century. There is a large agricultural trade, and general fairs and horse fairs are held.

WOODBURY, CHARLES HERBERT (1864— ), American marine painter, was born at Lynn, Massachusetts, on the 14th of July 1864. He graduated at the Massachusetts Institute of Technology, Boston, in 1886, was a pupil of the Académie Julien, Paris. He was president of the Boston Water Color Club, and became associate of the National Academy of Design, New York. His wife, Marcia Oakes Woodbury, born in 1863 at South Berwick, also became known as a painter.

WOODBURY, LEVI (1780—1831), American political leader, was born at Francistown, New Hampshire, on the 22nd of December 1780. He graduated from Dartmouth College in 1809, was admitted to the bar in 1812, and was a judge of the superior court from 1816 to 1823. In 1823-1824 he was governor of the state, in 1825 a member and speaker of the state House of Representatives, and in 1825-1831 and again in 1841-1845 was a member of the U.S. Senate. He was secretary of the navy in 1831-1834, secretary of the treasury in 1834-1841, and associate justice of the U.S. Supreme Court from 1846 until his death, at Portsmouth, New Hampshire, on the 4th of September 1851. From about 1825 to 1845 Woodbury was the undisputed leader of the Jacksonian Democracy in New England. See his Writings, Political, Judicial and Literary (3 vols., Boston, 1852), edited by Nahum Capen; and an article in the New England Magazine, new series, xxxvi. p. 658 (February 1906).

WOODBURY, a city and the county-seat of Gloucester county, New Jersey, U.S.A., in the western part of the state, 9 m. S. of Philadelphia. Pop. (1900) 4087, including 246 foreign-born and 317 negroes; (1910) 4642. It is served by the West Jersey & Seashore Railroad. Among its public institutions is the Department Store. From the big upholstering manufactories. Woodbury is said to have been settled about 1684; it became the county-seat in 1787. It was chartered as a borough in 1854 and as a city in 1870.
WOOD-CARVING, the process whereby wood is ornamented with design by means of sharp cutting tools held in the hand. The term includes anything within the limit of sculpture in the round up to hand-worked mouldings such as help to compose the tracery of screens, &c.

Material.—The texture of wood limits the scope of the carver in that the substance consists of bundles of fibres (called grain) growing in a vertical direction without much lateral cohesive strength. It is therefore essential to arrange the more delicate parts of a design with the grain instead of across it, and the more slender stalks or leaf-points should not be too much separated. Wood is worked best in moist surroundings. The failure to appreciate these primary rules may constantly be seen in damaged work, when it will be noticed that, whereas tendrils, tips of birds' beaks, &c., arranged across the grain have been broken away, similar details designed more in harmony with the growth of the wood and not too deeply undercut remain intact. Oak is the most suitable wood for carving, on account of its durability and toughness without being too hard. Chestnut (very like oak), American walnut, mahogany and teak are also very good woods; while for fine work Italian walnut, lime, sycamore, apple, pear or plum, are generally chosen. Decoration that is to be bent and of not too delicate a nature is as a rule carved in pine.

Tools.—The carver requires but few kinds of tools:—(1) the gouge—a tool with a curved cutting edge—used in a variety of forms and sizes for carving hollows, rounds and sweeping curves; (2) the chisel, large and small, whose straight cutting edge is used for lines and cleaning up flat surfaces; (3) the "V" tool used for veining, and in certain classes of flat work for emphasizing lines. A special screw for fixing work to the bench, and a mallet, complete the carver's kit, though other tools, more or less legs mate, are, of course, needed as a router for bringing grounds to a uniform level, bent gouges and bent chisels for cutting hollows too deep for the ordinary tool.

Method.—The process for relief carving is usually as follows. The carver first fixes the wood to his bench by means of the screw already referred to. He then (a) sketches on the main lines of his idea, indicating the flowers, foliage, &c.; or (b) should the design be very intricate or of a geometrical character, he traces the whole design from a pattern first prepared on paper; or (c) he may combine the first two methods. Next he grounds out the spaces between the lines with a gouge to a more or less uniform depth. Then he "hosts" the upstanding pattern that remains, i.e. he models and shapes the details of his design, carefully balancing the lights and shadows; and finally, after having obtained the result he desires, he cleans up the whole. The quicker he works, the fewer times he goes over the same part, the more sketchy the subsidiary portions, the less high finish he puts into the detail, the better the result. Incised work, chip-carving, &c., are generally finished at once and not in stages. Much carved work, that of savage nations for instance, is of course carved without the assistance of a bench. Many small articles, too, are carved in the hand. Little models of antelopes or bears, so familiar in Switzerland, are carved in this way with a tool somewhat like a half-open knife but with the blade fixed.

Style.—From the remotest ages the decoration of wood has been a foremost art. The tendency of human nature has always been to ornament every article in use. Just as a child of to-day instinctively cuts patterns on the bark of his switch freshly taken from the hedgerow, so the primitive man, to say nothing of his more civilized successor, has from the earliest times cut designs on every wooden article he is accustomed to handle. The North American Indian carves his wooden fish-hook or his pipe stem just as the Polynesian works patterns on his paddle. The native of British Guiana decorates his cassava grater with a well-conceived scheme of incised scrobs, while the savage of Loango Bay distorts his spoon with a hopelessly unsuitable design of perhaps figures standing up in full relief carrying a hammock.

Figure-work seems to have been universal. The craving to represent one's god in a tangible form finds expression in numberless ways. The early carver, and, for that matter, the native of the present day, has always found a difficulty in giving expression to the eye, and at all times has evaded it by inlaying this feature with coloured material. Obsidian, for example, is used by the modern Easter Islander in common with the Egyptian craftsman of the earlier dynasties. To carve a figure in wood is not only more difficult but is less satisfactory than marble (for which see SCULPTURE), owing to the tendency of wood to crack, to be injured by insects, or to suffer from changes in the atmosphere. The texture of the material, too, prevents the expression of the features, especially in the classic type of youthful face. On the other hand, magnificent examples exist of the more rugged features of age: the beetling brows, the furrows and lines neutralizing the defects of the grain of the wood. However, in ancient work the surface was not of such consequence, for figures as a rule were painted.

It is not always realized at the present day to what extent colour has even from the most ancient times been used to enhance the effect of wood-carving and sculpture. The modern prejudice against gold and other tints is perhaps due to the fact that too much value is placed on the original untarnished appearance of the wood. The wood-carver's art was associated with coloured carvings too readily with theatre galleries and the triumphal car of the circus procession. The "restored" work too of some church screens does anything but encourage the revival of this time-honoured custom. The arrangement of a proper and harmonious scheme of colour is not the work of the house-painter, but of the specially trained artist. Witness the old coloured screens of Norfolk, the harmonious greens and reds, the proper proportion of gold, the panels adorned with saints on backgrounds of delicate diaper work, and compare these triumphs of decoration with the rougher blues and reds of the over-restored screen, and one ceases to wonder why we now prefer the wood plain.

Of late years carving has gone out of fashion; a change has come about. The work is necessarily slow, thus causing charges to appear high. Other and cheaper methods of decoration have driven carving from its former place. Machine work has much to answer for, and the endeavour to popularize the craft by means of the village class has not always achieved its own end. The gradual disappearance of the individual artist, elbowed out as he has been by the contractor, is fatal to the continuance of an art that is but a shadow of the great art of the past.

Long as the carver is expected to work to some one else's pattern—so long as he is, in detail at least, not his own designer—this art, which attained its zenith in the glories of the 15th-century cathedral and in the continental domestic work of the hundred years to follow, can never hope to live again.

Ancient Work before the Christian Era.—The extreme dryness of the climate of Egypt accounts for the existence of a number of wood-carvings from this remote period (see EGYPT: Art and ARCHAEOLOGY). Some wood panels from the tomb of Housil at Sakkara are of the III. dynasty (over 4000 B.C.). The carving consists of hieroglyphs and figures in low relief, and the style is extremely delicate and fine. A stool shown on one of the panels has the legs shaped like the fore and hind limbs of an animal, a form common in Egypt for thousands of years.

In the Cairo museum may be seen the statue of a man of 50 years of age, of the period of the great pyramid, possibly 4000 B.C. The expression of the face and the realism of the carriage have never been surpassed by any Egyptian sculptor of this or any other period. The figure is carved out of a solid block of sycamore, and in accordance with the Egyptian custom the arms are joined on. The eyes are inlaid with pieces of opaque white quartz, with a line of bronze surrounding to imitate the lid; a small disk of transparent rock crystal forms the iris, while a line of polished chert behind the crystal imparts to it a lifelike sparkle. "The IV., V. and VI. dynasties cover the finest period of Egyptian sculpture. The statues found in the tombs show a freedom of treatment which was never reached in later times. The features of the portrait statues are very much less exact than his model. For these are not, like modern statues, simply works of art, but had primarily a religious significance " (Maspero). As the spirits of the deceased might inhabit these "Ka" statues, the features and proportions were closely copied.

There are to be found in the principal museums of Europe many Egyptian examples of the utmost interest—mummy cases of human
WOOD-CARVING

being the face alone carved, animal mummy cases, sometimes boxes, with the figure of a bird, perhaps, carved in full relief standing on the lid. Sometimes the animal, a bird, or even a fish, was made into a mummy shape, with a face, and crouching on all four, would be carved in the round and its hollowed body used as the case itself.

Of furniture, folding seats like the modern campstool, and chairs with backs, were made, the backs being mere thin wooden panels, and the seats and arm rests slatted. Beds supported by lions' paws (XI. and XII. dynasties), from Gebelein, now in the Cairo Museum), headrests, 6 or 7 inches high, were still used. The legs of these tables, and the feet of the chairs, were ornamented with a relief decoration of flowers and leaves, quite Louis Quinze in character. There are incised ladles, the handle representing a bouquet of flowers, the bowl formed like the leaf of an aquatic plant with serrated edges (from Gurnah, XVIII. dynasty); but the most original and most magnificent of the wooden objects made by the hands of these ancient Egyptians were the wooden coffers, some very fine ones, were used during the whole of the New Kingdom period (the 19th dynasty). Artists of the New Kingdom period (the 19th dynasty) were the first to use the cypress and the cedar, and to concern themselves with the art of carving.

Furniture.——Late in the 4th dynasty, scenes from the New Testament in high relief were arranged on a large table in the Temple of Serapis at Philae. Nothing could exceed the beauty of the triptychs or retabules of Germany, Flanders (Plate I. fig. 1) or France; carved with scenes from the New Testament in high relief arranged under a delicate lace-like frame, with the heads of the different figures painted and highly polished, and brilliant colours. In Germany the effect was further enhanced by emphasizing parts of the gilding by means of a transparent varnish tinted with gold. For such work great artists were employed. A detailed account of the wooden objects made by the hands of these ancient Egyptians was the first to use the cypress and the cedar, and to concern themselves with the art of carving.

The style of design used during this great period owes much of its interest to the use of the wood. The objects were of the utmost beauty and interest, and the craftsmen who made them were of the highest order. The main feature of such objects was the use of fine carving. A great deal of the work was done by skilled craftsmen, and it was almost impossible to find anything better or more artistic. The style of design used during this great period was of the utmost beauty and interest, and the craftsmen who made them were of the highest order. The main feature of such objects was the use of fine carving. A great deal of the work was done by skilled craftsmen, and it was almost impossible to find anything better or more artistic.

Mummy cases.——The custom was practically universal, and enough remains to show how splendidly the coffins of the pharaohs were decorated. The coffins were made of a variety of materials, but the most common was the red quartzite, which was used for the majority of the mummy cases. The coffin was usually divided into two parts, one for the body, and the other for the mummy. The coffin was made of wood, and was usually decorated with gold and silver leaf, and sometimes with precious stones. The mummy case was sometimes made of linen, and was usually decorated with gold and silver leaf, and sometimes with precious stones.

Assyria.——Greece and Rome.

As for the Assyrians, they had little, if any, knowledge of carving. Although the name of Assyria is only known to us from the descriptions of the lotus stalk, sometimes surmounted by a head of Hathor (the Egyptian Venus) or of Bès (god of the toilet); pin-cushions, in the shape of a small round tortoise with holes in the back for toilet pins, which were also of wood with dog-head ends (XI. dynasty, Cairo Museum); and perfume boxes such as a fish, the two halves forming the bottom and top—the perfume or pomatum was removed by lifting the top and the perfume was poured into the fish. As another example of a fish-shaped perfume box, from a full-blown lotus, another shaped like the neck of a goose, a third consisting of a dog running with a fish in its mouth, the fish forming the bowl. The list might be prolonged, but enough has been said to show a general idea of the beauty and the excellence of Assyrian work. A style of carving, which had reached thousands of years before the birth of Christ.

Of the work of Assyria, Greece and Rome, little is actually known except a few fragments. Some of these fragments are of interest, and are known as the "Asiatic" style. These fragments are known as the "Asiatic" style, and are of interest, and are known as the "Asiatic" style. They are of interest, and are known as the "Asiatic" style.
Fig. 1.—CENTRE PANEL OF RETABLE IN DIJON MUSEUM. FLEMISH. 1301 A.D.
of St Benoît-sur-Loire, Lisieux, and Evreux are good 14th-century examples. But little Gothic work is now to be seen in the churches of this country. It is to the museums we have to look for traces of the old Gothic carvers. The two retabiles in Dijon Museum, the work of a school of Tournai, with angels carved of linden wood, is a profit example. A very large number of 15th-century work remains to us, but the briefest reference only can be made to some of the more beautiful examples that help to make this period so great.

The Gothic clerestory screen in the church of St Mary and St John on either side. This rood screen sometimes spanned the church in two continuous lengths (Beeston, Beds), but carved the first and chancel arches in three separate divisions (Church Handb., Oxford.). The loft was as a rule approached by a winding stair built in the thickness of the aisle wall. The lower part of the screen (Plate II. fig. 10) to which reference has already been made, the upper part of this panelling was filled in with tracerie (Carbrook, Norfolk), while the remaining flat surfaces of the panels were often painted with saints on a background of a delicate tracery of Maltese work. Suffolk rood screen. At the end of this period the employment of figures became less common as a means of decoration, and the panels were sometimes filled entirely with carved foliage (Swindon, Devon). The rood screen at Winchcombe, Gloucester, had the heads filled in with pierced tracery, often enriched with crockets (Scarning, Norfolk), embossed transoms (Castle Hedingham, Essex), or foliated cusps (Eye, Suffolk). The mullions were constantly carved with the foliage, and the incidents of the carving and the cavetto of the roof screen and was usually balanced and kept in position by means of a groined vaulting (Harberton, Devon) or a cove (Eddington, Somerset). The finest examples of vaulting are to be seen in Devon (Plate III. fig. 9). The base work of the ribs and the pierced tracery of the screen at Honiton stand unrivalled. Many screens still possess the beam which formed the edge of the loft floor and on which the gallery rested. It was here that the medieval rood-screen carving gave most play to its fancy, and carved the finest designs in foliage to be seen throughout the whole Gothic period. Although these moulded mullions, coves, and bands have the appearance of being carved out of one log, they were in practice the product of two parts, much of the foliage, &c., being pierced and placed in hollow moulded in order to increase the shadow. As a rule the arrangement consisted of a crest running along the top, with a smaller one dependent from the angle of the panel, and sometimes tracery between them (Feniton, Devon). The designs of vine leaves at Kenton (Plate IV. fig. 10), Bow and Dartmouth, all in Devon, illustrate three very beautiful treatments of this plant. At Swimbridge, near Tiverton, in Exon., an excellent combined example, plain beads which separate the bands are carved with twisted foliage also. At Abbots Kerswell and other places in the district round Totnes the carvers have often been bold. The variety of cresting used is very great. That at Winchcombe, Gloucester, consists of designs combined by vine leaves and foliage. It illustrates how Gothic carvers sometimes repeated their patterns in the same mechanical way as the worst workman of the present time. Little can be said of the galleries, so few remain to us. They were nearly all pulled down when the order to destroy the roods was issued. It is clear that the superstructure was the work of those below, the transepts, under naves (Llanano, Wales), or painted figures (Strecham, Worcestersh.), is certain from the examples that have survived the Reformation. At Atherington, Devon, the gallery front is decorated with the royal coat of arms, other heraldic devices, and with prayers. The Breton screen at St Fiacre-le-Faucon is a wonderful example of French work of this time, but does not compare with the best English examples. Its flamboyant lines and its small tracery never obtained any footing in England, though it was carried in this way (Cobleake, Devon) are sometimes to be found.

The rood was sometimes of such dimensions as to require some support for its base, and, in the latter years of the century, a small bay beam was used from which a chain connected the rood itself. At Cullompton, Devon, such a beam still exists, and is carved with foliage; an open creating ornaments the under side and two angels support the beam at the corners. Each panel has a field of clasped hands and skulls and bones, carved out of two solid logs averaging 18 in. wide and 21 in. high, and together measuring 15 ft. 6 in. long; there are round holes along the top which were probably used for lights.

No country in Europe possessed from its first in the 12th to the 14th century. The great rood of Westminster Hall (see ROOF) remains to the present day without an equal. In Norfolk and Suffolk roofs abound of the hammer-beam class; that at Woolpit, Suffolk, is of the first rank. Each bracket is carved with strongly designed foliage, the end of every beam terminated in a rood angel carved of linden wood, while each truss is supported by a canopied niche (containing a figure) resting on an angel corbel. Here, too, as at Ipswich and many other churches, there is a remarkable use of the targe or wall plate. This idea of angels in the roof is a very beautiful one, and the effect was of course much enhanced by the colouring. The rood at St Nicholas, King's Lynn, is a magnificent example of targe work; the angels are carved of linden, the ribs and the centres more or less open, and the beams, which are crested and embellished, contain a row of angels on either side. In Devon, Cullompton possesses a very fine semicircular ceiling supported at intervals by ribs pierced with foliage. Each rood fragment is cut up into small square panels, crossed by diagonal ribs of cresting, while every joint is ornamented with a boss carved in the decorative work peculiar to the Gothic craftsmen. The pulpit at Trull, Somerset, is a fine rood, with canopies continued to increase in magnificence. Manipher cathedral (middle of 15th century) and Henry VII.'s chapel in Westminster Abbey (early 16th) are good examples of the fashion of massing plain and carved canopies with richly carved imposts and cornices with the more simple beauty of the 14th-century work of Ely cathedral. The stalls of Amiens cathedral were perhaps the finest in the world at the beginning of the 15th century. They are still employed, though common on the Continent, is of a kind hardly known in England, consisting as it does of arches springing from arches, and decorated with crockets and finials, and the tabernacle works are on the same plan. Of all the fine roods in the country, stretches up towards the roof in tapering lines of the utmost delicacy.

The choir stalls (the work of Jorg Syrflin, 1408) in Ulm cathedral are among the finest specimens of 15th-century roods (Plates III. fig. 4). The front panels are carved with foliage of splendid decorative effect. The screen was held by an ornamental bracket; the panels are placed in compartments and bosses; the beams are supported by carved brackets resting on corbels with angels at each base.

In early times the choir alone possessed seats, the nave being left bare. Gradually benches were introduced, and during the 15th century became universal. The "poppy-head" form of ornament was continued, but was now worked in wood for seats other than those of the choir. The name refers to the carved finial which is so often used to complete the top of the bench end and is peculiarly English in character. In Devon and Cornwall it is rare to find in use, though (Islington, Devon). In Somerset it is more common, while in the eastern counties thousands of examples remain. The quite simple fleur-de-lys form of poppy-head, suitable for the choir seat, is seen in perfection at Truro cathedral, and the elaborate form when the poppy-head springs from a crocketed circle filled in with sculpture, at St Nicholas, King's Lynn. Often the foliage contained a face (Cley, Norfolk), or the poppy-head consisted of three dragons heads (Suffolk), or of leaves, as at Swinford (Great Brinton, Northampton); occasionally the traditional form was departed from and the final carved like a lemon in outline (Bury St Editha, Tamworth). This variety is the form of a large circle sometimes takes the place of the English poppy-head. In the Copenhagen Museum there is a set of bench ends of the 15th century with such a decoration carved with a circle of arms, or a strap-work, &c. But the old 15th-century bench end did not depend entirely on the poppy-head for its embellishment. The side was constantly enriched with elaborate tracery (Dennington, Norfolk) or with tracery and decorative scenes (North Cadbury, Somerset), or would consist of a mass of sculpture in perspective, with canopy work, buttresses and sculptured niches, while the top of the bench end would be crowned with figures carved in the round. In the later period, the rood screen became a cathedral is a marvellous alchemy of conception, design and execution. In the Kunstgewerbe Museum, Berlin, some beautiful stall ends are to be seen. Out of a dragon's mouth grows a conventional tree arranged and balanced in exquisite design. At Amiens, in the screen, the dragon is cut growing out of the mouth of a fool. This custom of making foliage grow out of the mouth or eyes is hardly defensible, and was by no means confined to any country or time. We have plenty of German examples to prove it.

Before the 15th century preaching had not become a regular institution in England, and pulpits were not so common. However, the Gothic work was of frequent use to which the Lollards and other sects put this method of teaching doctrine, and pulpits became a necessity. A very beautiful one exists at St John's, Devon. It is, as is generally the case, a plain solid piece of wood, with an upright column of foliage between pinacles, and the panels, which are painted with saints, are enriched with carved canopies and foliage; it is, however, much restored. A large figure standing under a canopy fills each of the panelled sides, while many other smaller
WOOD-CARVING

figures help to enrich the general effect. Examples of Gothic stencilled patterns, such as those cut, to give the effect of a pulpit, in the church of Winchester is of the time of Prior Silvester (1520), and is carved with his rebus, a skien of twisted silk.

The usual form of font cover, having the double form below the Evangelists, with the roll of the salient being angle to flat but for a little angle in kneeling on the top, with its hands clasped in prayer. But the most beautiful form is the massed collection of pinacles and canopy work, of which there is such a fine example in the church of Kent. It presents a very pleasing line work, and its surface ornamentation of a dove on the topmost pinnacle (Castleacre, Norfolk), in allusion to the descent of the Holy Spirit. The finest font in England is undoubtedly that in St. George's, Suffolks. This is truly a specimen of the Gothic style, and when the panels were painted with saints and the exquisite tabernacle work coloured and gilded, must have been a masterpiece of Gothic craftsmanship. A cordon of the tops of these covers with the round. This magnificent altar stand, in St. Albans Cathedral, something like a crane (Salle, Norfolk), was used to remove the cover on the occasion of baptism.

Many lecterns of the Gothic period do not exist to-day. They usually had a double stepping desk which revolved round a central moulded post. The lectern at Swanscombe, Kent, has a circle of foliage ornamenting each face of the book rest, and is of 15th century work. (The box that contained it being common in France than in England, the pedestal of such a lectern being surrounded by a casing of three or more sides. A good example with six sides is in the church of France, and one of them is a fine specimen. The Musée of Beauvais contains one which is still in use in the church of Lenham, Kent. The Gothic prayer desk, used for private devotional purposes, is hardly known in England, for it was not uncommon in France. A beautiful specimen in the Musée, Bourges; the front and sides of the part for kneeling are carved with that small tracery of flowing character so common in France and Belgium during the latter part of the 13th century, and the back, which rises to a height of 6 ft., contains a little crucifix with traceried decoration above and below.

A word should be said about the ciboria, so often found on the continent of Europe. In taping arrangement of tabernacle, the English form rivaled the French form of ciborium in delicacy of outline (Musée, Rouen).

Numbers of doors are to be met with not only in churches but also in private houses. But in the Middle Ages, and particularly in work done in France, the number of doors was exceedingly common on the Continent as well as in England. In France the doors towards the latter part of the 15th century were often one and occasionally one, and to the 16th century. In the 15th century doors were usually divided into some six or eight oblong panels of more or less equal size. One of the doors of Bourges Cathedral is treated thus, the panels being filled in with very good tracery enrichment. In almost every church in France, the number of doors of treatment is constantly employed, as at the church of St. Godard, Rouen, where the upper panels only are carved with tracery and coats of arms and the lower adorned with simple linenfold design.

The most important object of church decoration, the console; the Reformation accounting for the absence in England of any work of this kind. The most famous console was carved by Hans Bruggerman, and consists, like many others, of a number of panels fitted with figures standing some four or five deep. The figures in the foremost rows are carved entirely separate, and stand out by themselves, while the background is composed of figure work and architecture, &c., diminishing perspective. The panels are grouped together under canopy work forming the head of the console, and as the whole shows itself in the large variety of the facial expression of those wonderful figures all instinct with life and movement. In France few restables exist outside the museums. In the little church of Marissel, not far from Beauvais, there is a retable consisting of eleven panels, the crucifixion being, of course, the principal subject. And there is a beautiful example from Antwerp in the Musée Cluny, Paris; the pierced tracery work which decorates the upper part being a beautiful example of the type of panel with the usual haloes and circles so common on the Continent late Gothic times and but seldom practised in England. In Spain the cathedral of Valledolid was a very rich and picturesque church, and it was frequently used wood for large statuary, which was painted in a very realistic way with the most startlingly lifelike effect. Denmark also possessed a school of able wood-carvers who imitated the great and famous masters of the time. Among these, the carving of the portal to the church of Roskilde is worthy of note. Denmark also possesses a school of able wood-carvers who imitated the great and famous masters of the time. Among these, the carving of the portal to the church of Roskilde is worthy of note. treatment of the 16th-17th centuries already referred to. A pattern of Gothic foliage, often of beautiful outline, would be simply ground out to a shallow depth. The shadows, curves and twists only being emphasized by a few well-disposed cuts with a V tool. Such work was not only well-filled but, as a rule, during the 16th century. A Swiss door of the 15th century in the Berlin Museum, and some German, Swiss and Tirolean work in the Victoria and Albert Museum, offer patterns that might well be imitated to-day by those who wish to produce simple decoration while avoiding the hackneyed Elizabethan forms.

It is hard to compare the figure work of England with that on the Continent owing to the much better state of good decorative wood sculpture was used in England and the Low Countries in the 17th century. Not of a very high order, we have conspicuous exceptions in the stalls of Sherborne, and the pulpit of Trull, Somerset. Perhaps the oldest instance is the much-multiform and much-restored effigy of Sir John de Chaloner, at Gloucester Cathedral. If as a rule the figure work was very much a part of the whole scheme and, from its surroundings hardly an instance remains. At the little chapel of Cartmel Fell, in the wilds of Westmorland, there is a figure of Our Lord from a crucifix, some 2 ft. high, of which the arms are grooved, and the feet have been burnt off. A second figure of Our Lord (originally in the church of Keynes Inferior) is in the museum of Carlisle, and a third, from a church in the lake district, where the Swiss influence had been felt, some of the finest figure work is to be found in the retables, some of which are in the Victoria and Albert Museum. A Tirolean panel of the 15th century carved in relief, representing St John seated with his back to the onlooker, is a masterpiece of perspective and foreshortening, and the drapery folds are perfect. The same may be said of a small statue of the Virgin, carved in lime by a Swiss master, and now in the Victoria and Albert Museum. Wurzburg (1460-1531) shows that stone sculptures of medieval times were not ashamed of wood.

Renaissance Period (16th-17th Centuries).—With the beginning of the 16th century carvings were produced in a fine mixture of styles and types, to suit the requirements of the age of the Reformation and the end of the Gothic period, and the separation of the church from the state. The Roman and Italian influences, coming chiefly through the Netherlands, were not only confined to the decoration of churches and public buildings, but were now applied to the decoration of private houses, and even to household furniture. The style of carving of this period was therefore to be found on the Continent, France, Germany and the Netherlands producing numberless examples not only of house decoration but of furniture as well. The wealth of the newly discovered Americas enabled the wealthy to. The panel of the Jacobean period in the Victoria and Albert Museum, is a good example of decorative treatment without overloading. The brackets carved in the shape of monsters which support the projecting upper storey are typical of the Jacobean style. Plate 179 shows some examples of carved brackets of the Renaissance and early 17th century. Brackets. The panels, too, of Sir Paul Pinder's house should be noted as good examples of that Jacobean form of medallion surrounded by scroll work which is at once as decorative as it is simple.

In England that familiar style known as Elizabethan and Jacobean prevailed throughout the 16th and 17th centuries. At the present time hardly a home in the land has not its old oak chest carved with the familiar half circle or scroll border along the top rail, or the arch patterns known as 'Jacobean'. The paterae, acanthus leaves, under parts and upper corners surmounted by turned balusters of extravagant thickness, are to be seen wherever one goes. And chairs, real or those that look like them, are still in use. The bases of these chairs, the feet, are bought with an avidity inseparable from fashion. Four-post bedssteads are harder to come by. The back is usually broken up into small panels and carved, the best effect being seen in those elaborately-designed chairs. The term "Renaissance" is often used to denote this period, although the term 'Renaissance' was not applied until the 19th century; the term 'Renaissance' name is usually associated with a very heavy form of decoration which was copied direct from nature. Great swags of drapery and foliage with fruit and dead birds, &c., would be carved in lime a foot thick. For technical skill these examples are unsurpassed; each grape would be undercut, the finials and balusters are quite outstando
WOOD-CARVING

separate, and as a consequence now succumb to the energy of the horsepower. Good wood-carving is to the finest oriole what Petworth; Trinity College, Oxford; Trinity College, Cambridge; St Paul's cathedral; St James', Piccadilly; and many other London churches.

In those days of Louis XIV. and XV. the principal merit of carved design, i.e., its appropriateness and suitability, gradually disappeared. Furniture was often carved in a way hardly legitimate. The legs, the rail panels, and frames of cabinets, of loom instead of being first made for construction and strength, and then decorated, were first designed to carry cherubs' heads and "rococo" (i.e., rock and shell ornament), quite regardless of utility. A wealth of statuary was taken in veneration, applied to state carriages, to say nothing of bedsteads and other furniture. However, the wall panelling of the mansions of the rich, and sometimes the panelling of furniture, was decorated with rococo designs, but the ornament was superimposed on panels, and the surface would be left plain, while the centre would be carved with a medallion surrounded by foliage, vases or trophies of torches and muses. Even the upper edge of the panel would be thus treated. France led the fashion; which was more or less followed all over Europe. In England gilt chairs in the style of Louis XV. were made in some quantity. But Thomas Chippendale, Ince and Mayhew, Sheraton, Johnson, Hepplewhite and other cabinet-makers did not as a rule use much carving in their designs. Scrolls, shells, ribbon, ears of corn, &c., in very fine relief, were, however, used in the embellishment of chairs, &c., and the claw and ball foot was in vogue as a termination to the cabriole legs of cabinets and other furniture.

The mantelpieces of the 18th century were as a rule carved in pine and painted, and usually the top part of the shelf was ornate, by plasters often of flat elliptic plan, sometimes by caryatids, and the frieze would consist of a raised centre panel carved with a classic scene in relief, or with a mask alone, and on either side a swing of down-turning foliage.

Interior doorways were often decorated with a broken pediment more or less ornate, and a swing of foliage commonly depended from either side over a background of scroll work. The outer porches so often seen in Queen Anne houses were of a character peculiar to the 18th century. A small platform or curved roof was supported by two large and heavy brackets carved with acanthus scroll work. The panels and door frames were usually ornamented with brackets fixed to the "open strings" (i.e., the sides of the steps), giving a very pretty effect to the graceful balustrade of turned and twisted columns.

Plain and fine figure work calls for little comment. During the 16th century many good examples were produced—those priestly statues in the museum of Sens for example. But the figure work used in the decoration of cabinets, &c., seldom rose above the ordinary level.

In the 18th century cherubs' heads were fashionable and statuettes were sometimes carved in boxwood or ornaments, but as a means of decorating houses wood sculpture ceased to be. The Swiss, however, in the course of time, their reputation is divided, and the present day, and still turn out cleverly carved chiaro and obscura, &c.; as a rule the more sketchily cut the better the merit. Their more ambitious works, their groups of cows, &c., sometimes reach a high degree of perfection.

Of the work of the 19th century little can be said in praise. Outside and beyond the present-day fashion for collecting old oak there seems to be little or no market for carvings in general. In a certain number of carvers find occupation, as also for repairs or the production of imitations. But the carving one is accustomed to see in hotels or on board the modern ocean palace is in the main the work of the machine. There is no objection to the machine in itself, as it only works out and roughly models the design which is finished by hand. Its fatal drawback is that it of commercial value only when a large number of copies are produced at the same time. It is this repetition which takes away the life of good work, which places that gulf between the contract job and the individual effort of the artist. The price of all labour has so greatly increased that it is so much easier to copy and cut or by the day and the days of the trade union that none but the very rich can afford to beautify their home in the way to which our forefathers were accustomed.

Carving in the early medieval period, screens and other fittings were produced for the Coptic churches of Egypt by native Christian workmen. In the British Museum there is a set of ten small cedar panels from the church door of Stt Mariam, Cairo 13th century. The six sculptured figure panels are carved in very low relief and the four foliage panels are quite Oriental in character, intricate and fine both in detail and finish. In the Cairo Museum there is much wood work treated in the style of Arab style, from other doors of the Byzantine character. The figure work is not of a very high order.

Mohammedan Work.—Nothing can exceed the skill with which the Moslem wood-carvers of Persia, Syria, Egypt and Spain designed and executed their work. The panels of doors, panels of internal linings, ceilings, pulpits and all kinds of fittings and furniture. The mosques and private houses of Cairo, Damascus and other Oriental cities are all of the most elaborate and minutely delicate woodwork. A favourite style of ornament was to cover the surface with very intricate interlacing patterns, formed by finely moulded ribs; the ribs rise at the same time and the ribs were then filled in with small pieces of wood cut with foliation. The use of different woods such as ebony or box, inlaid so as to emphasize the design, combined with the ingenious richness of the patterns, give an effect of surpassing richness of work. Carved ivory is also often used for the filling in of the spaces. The Arabs are past masters in the art of carving flat surfaces in this way. A niche in the mosque of the sultan Bârûq (Cairo, 14th century) well ill the lines of the friezes and minbar (15th century) from a Cairo mosque, now in the Victoria and Albert Museum, is also a good example in the same style, the small proportion of wood being more than made up.

screens made up of labyrinths of complicated joinery, consisting of multitudes of tiny balusters connecting hexagons, squares or other forms, with the flat surfaces constantly enriched with small carvings, leaves, flowers, clover, &c., the screws are of very delicate work. In the mosque of Qous (12th century) of that finely arranged geometrical interlacing of curves with foliage terminations which distinctions of decorative design. Six panels in the Victoria and Albert Museum (15th century; Persia) show how deeply this form of decoration was ingrained in the Arab nature. Figure work and animals were sometimes introduced, in modern fashion, as in the six panels just referred to, and at the hôtel du Moristan (15th century) and the mosque of El Nesf eyyoun (14th century). There is a magnificent panel on the door of Beyet-el-Emry. This panel is a design of the 11th century; it portrays a frieze of vegetables of conventional treatment in low relief. The Arab designer was fond of breaking up his panelling in a way reminding one of a similar arrangement of frames and panels, with a rush of angles divided into number of hexagonal, triangular or other shapes, and each square decorated in with conventional scroll work. Much of this simple flat design reminds one of that Byzantine method from which the Elizabethan style was inspired.

Persia.—The Persian carvers closely followed Arab design. A pair of doors of the 14th century from Samarkand (Victoria and Albert Museum) are typical. Boxes, spoons and other small articles were often fretted with interlacing lines of Saracenic character, the delicacy and minuteness of the work requiring the utmost patience and skill. Many of the patterns remind one of the sandalwood work of Madras, with the exception of the geometric patterns, which are of a much lower relief. Sometimes a very beautiful result was obtained by the sparing use of fretted lattice pattern amongst foliage. A fine panel of the 14th century in the Victoria and Albert Museum shows how there was Arab influence even as to the use of naturalistic inspirations.

India and Burma.—Throughout the great Indian peninsula wood-carving of the most luxurious kind has been continuously produced for many centuries. The ancient Hindu temples were decorated with doors, ceilings and various fittings carved in teak and other woods with patterns of extreme richness and minute elaboration. We have architectural remains from Kashmir Smats (Punjab) dating from the 9th century, which are very remarkable; and the decorative character strongly resembling the best Elizabethan design. The doors of the temple of Somnath, on the north-west coast, were famed for their magnificence and were highly valued as such by the British. In the same temple there is a door with the conqueror, Sultan Mahomud, and are now lying at the fort at Agra. The gates which now exist are very fine specimens of ancient woodwork. The design of each panel is carefully arranged and is divided into four frames, with flowering plants and monsters with every space filled in with the minutest decoration. Many of the gong stands of Burma the highest skill; the arrangement of two figures on a gong door is very fine; on the gong hangs is familiar. The Burman are sculptors of proved merit.

China and Japan.—In these countries the carver is unqualified for defects of taste. Grotesque and imitation work of the utmost pernicious kind is popular with the class of people who pay for the work, and the Japanese have always been addicted to carving in phyllin, ivory, &c., and to framing squaws and filling up each
WOODCHUCK—WOODCOCK

797

panel with a circle, or diamond of conventional treatment with a spandrel in each corner (door of Tai-i-hê Hall, Pekin). A very Chinese feature is the finial of the newel post, so constantly left more or less straight in profile and deeply carved with monsters and scroll. A hereditary demand for change to the gardon pattern is commonly used to give emphasis to edges, and the dragon arranged in curves imitative of nature is frequently employed. Sometimes it is placed between ornamental colonettes. The general rule that in every country designers use much the same means whereby a pattern is obtained holds good in China. There are forms of band decoration here which closely resemble those of the design. But generally the form from Tai-i-hê Hall, Pekin, almost is Elizabethan, so like are the details. Screens of grill form, so familiar in Mahomedan countries, are common, and the deeply ground, closely arranged pattern of them may also be found in the carved doors of state in the Ch'en-Ch'ing Hall, Pekin, is a masterpiece of intricate design. The back consists of one central panel of considerable height, with two of lesser degree on either side lovely, and the way in which the two groups of dragons and scroll work; the throne also is a wonderful example of carved treatment, and the doors of a cabinet in the same building show how rich an effect of foliage can be produced without the employment of stalk or scroll. The Ch'in man, who is unequalled as a microscopic worker, does not limit himself to ivory or metal. One might almost say, he wastes his talent on such an ungrateful material as wood. In this matter, plans and other trilles are carved with a delicacy that borders on the mazerotic.In Japan much of the Chinese type is apparent. The native carver is fond of massing foliage without the stalk to lead him. He appears to like the irregularities of the branches and flowers, and to combine the whole. He takes the stalk here and there, thus reversing the order of the Western method. Such a treatment, especially when birds and beasts are introduced, has the highest decorative effect. But, as such close treatment borders on being decorative, upon painting or colour. A long panel in the Victoria and Albert Museum, depicting merchants with their packhorse (Plate IV., fig. 7), strongly resembles in design and workmanship the German or French Gothic, as, for example the panel of St Hubert in the museum at Châlons. The strength and character of Japanese figure work is quite equal to the best Gothic sculpture of the 15th century.

Savage Decorations.—There is a general similarity running through the carved design of most races of primitive culture, the chip form of ornament being almost universally employed. Decorated surfacing, depending as it does on the line and shape of every work of nature, and may no doubt be accounted for by the extensive use of stone-cutting tools. The savage carver shows the same tendency to over-exalt his art by crowding on too much design as the more civilized craftsmen of other lands, while he also on occasion exercises a good deal of restraint by a harmonious balance of decoration and plain space. So far as his chip designs and those patterns more or less depending on the line are concerned, his work is practically the same, but his desire to figure things and his attempts do not usually meet with success. Primitive carving, generally, shows that very similar stages of artistic development are passed through in every age. A very favourite style of "chip" pattern is that formed by small triangles and squares entirely covering a surface (Hervey Islanders), the monotony being varied by a band of different arranged with a few flats. There is also a great tendency of art is hardly of a kind calculated to enlarge the imagination, though so far as the cultivation of patience and accuracy is concerned, has no equal. But many natives, as for example the Fiji Islanders, employ chip designs rivaling those of Europe in variety. Upon occasion the savage appreciates the way in which plain surfaces contrast and emphasize decorated parts, and judiciously restricts his bands of decoration to special points, whereas islanders, Jos of the lower Niger design their paddles in a masterly way, and show a fine sense of proportion between the plain and the decorated surface. Their designs, though slightly in relief, are of the chip manner and are not geometric, though ground and curved lines, straight or curved, though often very effective and in every way suitable, is not a very advanced form of art and has decided limits as to the possibility of this form of art. The savage in relief is common enough, birds being produced in many forms, but savage relief work seldom calls for praise. The Kafir carves the handle of his spoon perhaps in the form of a giraffe, and in the round, with each leg cut separately and the four horns meeting at the bowl, hardly a comfortable form of handle to hold. The North American Indian shows a wider invention than some nations, the twist in various shapes being a favourite treatment say of pipe stems. The Eskimo and the North American Indian are said to use a form familiar in Indian shawls, and in some cases the scroll entwines in a way which faintly suggests the guilloche. The native of New Guinea or the Maori is not infrequently found with a form which resembles one of a similar method in use in Scandinavian countries. The work of the New Zealander is greatly in advance of the average primitive type: he uses a very good scheme of scroll work for decorative purposes, the lines of the scrolls often being enriched with a small pattern in a way reminding one of the familiar Norman treatment, as for example the prows of his canoes. The Maori sometimes carves not only the "bargboards" of his house but the gables also, snakes and grotesque figures being as a rule introduced: the main posts and rafters, too, of the inside receive attention. Unlike the Hindu he has a slight amount of decorative proposition and does not plan his scheme of design on too small a scale.

Hart, Specimens of Carved Oak Woodwork of the 16th and 17th Centuries (1883); Colling, Medieval Foliage and Decoration (1874); Bond, Screens and Galleries (1908); Pauckert, Die Zimmerei (1904); J. Lessing, Holz schnitzen (Berlin, 1882); Rouyer, La Renaissance; Rowe, Practical Wood-carving (1907).

WOODCHUCK, the vernacular name of the common North American representative of the marmots (see MARMOT), scientifically known as Arctomys monax. The typical race of this species ranges from New York to Georgia and westward to the Dakotas, but it is represented by a second and darker race in Labrador, and by a third in a variety; while several other North American species have been named. The ordinary woodchuck measures about 18 in. in length, of which the tail forms a third. In colour it is usually brownish black above, with the nose, chin, cheeks and throat tending to whitish, and the under parts brownish chestnut; while the feet and tail are black and blackish. Like other marmots it is a burrower.

WOODCOCK (O. Eng. wude-coe, wudu-coe, and wudu-smite), the Scolopax rusticola* of ornithology, a game-bird which is prized both by the sportsman and for its excellence for the table. Being a bulky bill, with a short tail, its plumage is suggestive of its nocturnal or crepuscular habits—with mottled plumage of black and umber-brown, ash-gray, buff and shining white—the last being confined to the tip of the lower side of the tail, but the rest intermixed for the most part in beautiful combination. Setting aside the most extreme aberrations from the normal colouring which examples of this species occasionally present (and some of them are extremely curious, not to say beautiful), there is much variation to be almost constantly observed in the plumage of individuals, in some of which richer tints prevail while others exhibit a greyer coloration. This variation is often, but not always, accompanied by a variation in size or at least in weight.3 The paler birds are generally the larger, but the difference, whether in bulk or tint, cannot be attributed to age, sex, season or, so far as can be ascertained, to locality. It is, notwithstanding, a very common belief among sportsmen that there are two "species" of woodcock, and many persons of experience will have it that, beside the differences just named, the "little red woodcock" invariably flies more sharply than the other. However, a sluggish behaviour is not really associated with colour, though it may be an additional observation that different specimens, some of which a fat bird will rise more slowly, when flushed, than one, which is in poor condition. Ornithologists are practically unanimous in declaring against the existence of two "species" or even "races," and, moreover, in agreeing that the sex of the bird cannot be determined from its plumage, though there are a few who believe that the young of the year can be discriminated from the adults by having the outer web of the first quill-feather in the wing marked with angular notches of a light colour, while the old birds have no trace of this "vandyke" ornament. Conjectural statements and offerings seems to show that the male varies most in size; on an average he is slightly heavier than the female, yet some of the oldest hens have proved to be cocks.4

Though there are probably few if any counties in the United Kingdom in which the woodcock does not almost yearly breed, especially since a "Scolopax time" has been afforded by the legislature for the protection of the species, there can be no doubt that by far the greater number of these shot in the British Islands have come from Scotland. The woodcock uses a large variety of places, and in some cases the scroll entwines in a way which faintly suggests the guilloche. The native of New Guinea or the Maori is not infrequently found with a form which resembles one of a similar method in use in Scandinavian countries. The work of the New Zealander is greatly in advance of the average primitive type: he uses a very good scheme of scroll work for decorative purposes, the lines of the scrolls often being enriched with a small pattern in a way reminding one of the familiar Norman treatment, as for example the prows of his canoes. The

1 By Linnaeus, and many others after him, misspelt rusticola. The correct form of Pliny and the older writers seems to have been first restor'd by Oken (Zoologie, ii. p. 596).

2 The difference in weight is very great, though this seems to have been exaggerated by some writers. A friend who has had much experience tells us that the heaviest bird he ever knew weighed 161 gr. and the lightest 9 oz. and a fraction.

WOOD ENGRAVING

Cold—mosty, is presumed, from Scandinavia. These arrive on the market when in full plumage, and the late spring, —often in an exhausted and impoverished state. If unmolested, they are soon rested, pass inland, and, as would appear, in a marvelously short time recover their condition. Their future destination seems to be London; where, in the early part of the frost stop their supply of food on the eastern side of Great Britain they press onward and, letting alone Ireland, into which the immigrant stream descends, is believed to be swept away into the sea as, as Devonshire and Cornwall, and to the Isles of Scilly, without a few but take themselves to the unknown ocean, finding there doubtless a watery grave, though instances are on record of estranged, perfectly undisturbed, and reaching Newfoundland, New Jersey and Virginia.

With regard to the woodcock which breed in Britain, pairs take place very early in February and the eggs are laid often before the end of the month. These are among the few birds which are marked with a soft cream-colour bled and spotted with reddish brown, and seldom take the pyriform shape so common among those of Limicoline birds.

The nest—always made on the ground amid trees or underwood, and usually near water or at least in a damp locality—is at first little more than a slight hollow in the soil, but as incubation proceeds dead leaves are collected around its margin until a considerable mass is accumulated. During this season the male woodcock performs at twilight flights of a remarkable kind, repeating evening after evening (and it is believed at dawn also) precisely the same course, which generally describes a triangle, the sides of which may be a quarter of a mile or three-fourths of a mile in length. This bird is not so much the wing is quite unlike that which it presents when hurriedly flying after being flushed, and though its speed is great the beats of the wing are few in number. At intervals the bird apparently recovers and a second flight is produced, whether from the throat of the bird, as is commonly averred, or from the plumeage is uncertain. This characteristic flight is in some parts of England called "roading," and the track taken by this bird is said to be very similar to that of the nightingale. 1

In England woodcocks perform their night flights, and were it not for the fact that the birds of this art to this custom is due to the fact that the birds of this habit of catching the simple performer in nets called "cock-shots," which were hung between trees across the open glades or rides of a wood. A still more interesting matter in relation to the breeding of woodcocks is the fact, finally established on good evidence, that the old birds transport their newly hatched offspring, presumably to places where food is more accessible. The young are chilled between the thicks of the parent, whose legs hang down during the operation, while the bill is to some extent, possible only at starting, brought into operation to assist in adjusting the load if not in lifting it through the air.

Woodcocks inhabit suitable localities across the northern part of the Old World, from Ireland to Japan, migrating southward towards autumn. As a species they are said to be resident in the Azores and other Atlantic Islands; but they are not known to penetrate very far into Africa during the winter; though in many parts of India they are abundant during the cold weather, and reach even Ceylon and Tenasserim. The popular belief that woodcock live by suction is by no means fully exploded; but the真空 have observed them in confinement know that they have an almost insatiable appetite for earthworms, which the birds seek by probing soil or sand to a distance of ten or more feet. The remarkable fact seems to have been first placed on record by Bowles, 2 who noticed it in the royal aviary at San Idelfonso in Spain, and it has been corroborated by other observers, and especially by Montagu, who has repeatedly observed and maintained that woodcocks are an excellent article of fish for their ordinary food. They also do well on chopped raw meat.

The eastern part of North America possesses a woodcock, much smaller, though generally (and especially in habits) similar to, that of the Old continent. It is the Sceloporus minor of most authors; but, chiefly on account of its having the outer three primaries remarkably attenuated, it has been placed in a separate genus, Philolea. In Java is found a distinct and curiously coloured species, described and figured by Horsfield (Trans. Linn. Society, xiii. p. 191, and Zoolog. Researches, pl. as S. satyrus). This is S. E.噼乒乓球 (Geographical Distribution of the Family Charadriidae, p. 506) referred the S. satyrus of Latham (Ibid. p. 117) and the S. clypeata of Temminck to S. satyrus.

Another species is S. rochussenii from the Moluccas; this has, like the snipe, the lower part of the tibia bare of feathers. (A. N.)

1 The etymology and consequently the correct spelling of these expressions seem to be very uncertain. Some would derive the word from Latin, "woodcock," others from Sanskrit. The first seems to be the most probable, and I have accordingly adopted it.

3 The pair of muscles said by Loche (Exps. Scient. de l'Algérie, ii. p. 293) to exist in the maxilla, and presumably to direct the movement of the maxilla to the palate, have been described by Horsfield and others.

4 Introduccion a la historia natural y a la geografia fisica de España, pp. 454, 455 (Madrid, 1775).

WOOD ENGRAVING, the art of engraving (g.t.) on wood, by lines so cut that the design stands in relief. This method of engraving was historically the earliest, done for the purpose of taking impressions upon paper or other material. It is natural that wood engraving should have occurred first to the primitive mind, because the manner in which woodcuts are printed is the most obvious of all the kinds of printing. If a block of wood is inked with a greasy ink and then pressed on a piece of paper, the ink from the block will be transferred at once to the paper, on which we shall have a black patch exactly the size and shape of the inked surface. Now, suppose that the simple Chinese who first discovered this was ingenious enough to go a step further, it would evidently occur to him that if one of the elaborate signs, each of which in his own language stood for a word, were drawn upon the block of wood, in relief, and then the whole of the white wood sufficiently cut away to leave the sign in relief, an image of it might be taken upon the paper much more quickly than the sign could be copied with a camel-hair brush and Indian ink. No sooner had this experiment been tried and found to answer than block-printing was discovered, and from the printing of signs to the printing of rude images of things, exactly in the same manner, the step was so easy that it must have been made insensibly. Wood engraving, then, is really nothing but that primitive block-cutting which prepared the way for woodcut printing with pins as often seen in illuminations, types, and the only difference between a delicate modern woodcut and the rude letters in the first printed books is a difference of artistic skill and knowledge. In Chinese and Japanese woodcuts we can still recognize traditions of treatment which come from the designing of their written characters. The main elements of a Chinese or a Japanese woodcut, uninfluenced by European example, are dashing or delicate outlines and markings of various thickness, exactly such as a clever writer with the brush would make with his Indian ink or vermilion. Often we get a perfectly block our woodenly and handsomely printed; and these broad vigorous blacks are quite in harmony with the kind of printing for which wood engraving is intended.

It has not hitherto been satisfactorily ascertained whether wood engraving came to Europe from the East or was re-discovered by some European artist. The precise date of the first European woodcut is also a matter of doubt, but here we have certain data which at least set limits to the possibility of error. European wood engraving dates certainly from the first quarter of the 15th century. It used to be believed that a rare leaf, "Prints to appear in the German Drucksachen," rudely executed and dated 1423, was the Adam of all woodcuts, but since 1844 investigations have somewhat shaken this theory. There is a cut in the Brussels library, of the "Virgin and Child," surrounded by four saints, which is dated 1418, but the composition is so elegant and the drawing so refined and beautiful, that one has a difficulty in accepting the date, though it is received by many as authentic, while it is repudiated by others in the belief that the letters have been tampered with. The "Virgin and Child" of the Paris library is without date, but is supposed, apparently with reason, to be earlier than either of the two mentioned; and Delaborde proved that two cuts were printed in 1406. The "Virgin and Child" at Paris may be taken as a good representative specimen of very early European wood engraving. It is simple art, but not bad art. The forms are drawn in bold thick lines, and the black blot is used with much effect in the hollows and recesses of the design. Beyond this there is no shading. Rude as the work is, the artist has expressed exquisite maternal tenderness in the chief details of the design. The Virgin is crowned, and stands against a blue background with pinnacles as often seen in Illuminations, and in manuscripts. In the woodcut this architectural decoration is boldly but effectively drawn. Here, then, we have real art, art in which appeared both vigour of style and tenderness of feeling.

The earliest wood engraving consisted of outlines and white spaces with smaller black spaces, cut with a knife, not with a graver, and shading lines are rare or absent. Before passing
to shaded woodcuts we may mention a kind of wood engraving practised in the middle of the 17th century by a French engraver (often called Bernard Millet, though his name is a matter of doubt) and by other engravers nearer the beginning of that century. This method is called the *cribule* a word for which there is no convenient translation in English, unless we call it *drilled*. It means riddled with small holes, as a target may be riddled with small shot. The effect of light and dark is produced in this kind of engraving by sinking a great number of round holes of different diameters in the substance of the wood, which, of course, all come white in the printing; it is, in effect, a sort of stippling in white. When a more advanced kind of wood engraving had become prevalent the *cribule* was no longer used for general purposes, but it was retained for the grounds of decorative wood engraving, being used occasionally in borders for pages, in printers' marks, and other devices, which were survivals in black and white of the ancient art of illuminating. Curiously enough, this kind of wood engraving, though long disused for purposes of art, was in recent times revived with excellent effect for scientific purposes, mainly as a method of illustration for astronomical books. The black given by the untouched wooden block represents the night sky, and the holes, small or large, and the distance between them is regulated by the amount of light that through them is admitted or not admitted. The process was perfectly adapted to this purpose, being rapid, and simple. It has also been used in a spasmodic and experimental manner by one or two modern engravers.

The earlier workmen turned their attention to woodcut in simple black lines, including outline and shading. In early work the outline is firm and very distinct, being thicker in line than the shading, and in the shading the lines are simple, without cross-hatchings, as the workmen found it easier and more natural to take out the lines of the wood between the little or nearly parallel black lines than to cut out the twenty or thirty small white lozenges into which the same space would have been divided by cross-hatchings. The early work would also sometimes retain the simple-black pattern which we find in Japanese woodcuts, for example, in the "Christmas Dancers," of Wohlgemuth, all the shoes are black patterns, though there is no discrimination of local colour in anything else. A precise parallel to this treatment is to be found in a Japanese woodcut of the "Wild Boar and Hare," given by Aimé Humbert in his book on "Quatre-vingt-treize," in which the boar has a complete black pattern, with the ears, tail, and other parts black though all other local colour is omitted. The similarity of method between Wohlgemuth and the Japanese artist is close; they both take pleasure in drawing thin black lines at a little distance from the patch and following its shape like a border. In course of time, as wood engravers became more expert, they were not so careful to spare themselves trouble and pains, and then cross-hatchings were introduced, but at first more as a variety to relieve the eye than as a common method of shading. In the 17th century a simple kind of wood engraving reached such a high degree of perfection that the whole work of that time has never been surpassed in its own line.

Wood engraving in the 16th century was much more conventional than it became in recent times, and this very conventionalism enabled it to express what it had to express with greater decision and power. The wood engraver in those days was free from many difficult considerations that were afterwards imposed on his modern successor. He did not care in the least about aerial perspective, and nobody expected him to care about it; he did not trouble his mind about local colour, but generally omitted it; sometimes, however, giving it here and there, but only when it suited his fancy. As for light-and-shade, if he had occasion, he would do without any other help than a tool called a "driller," and an instrument called a "crib," generally attaining, was a firm, clear, simple kind of drawing, conventional in its indifference to the mystery of nature and to the poetic sentiment which comes to us from that mystery, but by no means different to fact of a decided and tangible kind. The wood engraving of the 16th century was a singularly positive art, as positive as carving; indeed, most of the famous woodcuts of that time must have come from panels without much loss of character. Their complete independence of pictorial conditions might be illustrated by many examples. In Dürer's "Salutation" the dark blue sky above the Alpine mountains is translated by dark shading, but so far is this piece of local colour from being carried out in the rest of the composition that the important foreground figures, with their draperies, are shaded as if they were white statues. Again, the sky itself is false in its shading, for it is without gradation, but it is exaggerated upon in the spade which is a part of the composition from looking too empty, and the conventionalism of wood engraving was so accepted in those days that the artist could have recourse to this expedient in defiance alike of pictorial harmony and of nature. It is to the inventor of small well-filled compositions, the "Dance of Death," the firm and matter-of-fact drawing is accompanied by a sort of light-and-shade adumbration for effects of light and shade, which is referent to the truth as might be expected in a stained-glass window. There is a most interesting series of little woodcuts drawn and engraved in the 16th century by J. Amman as illustrations of the different kinds of wood-engraving. They are chiefly called "The Baker," "The Miller," "The Butcher," and soon. Nothing more striking in this valuable series than the remarkable closeness with which the artist observed everything in the nature of a hard fact, such as the shape of a hatchet or a spade; he sees no mystery anywhere—he can draw leaves but not foliage, feathers but not plumage, locks but not hair, a hill but not a landscape. In the "Witches' Kitchen," a woodcut by Bernard Picart, is quite a distinct art, being based on different principles, but from the pot is so hard that it has the appearance of two trunks of trees denuded of their bark, and makes a pendant to a composition in the form of a real tree on the opposite side which does not look more substantial than these. The best of the job was the way the engraver had his own way of engraving clouds and vapour, and all the engravings of that time followed it. Their conceptions were much more those of a wood engraver than of those of the Daniell brothers, and less in high relief, and Grin's "Witches' Kitchen" might be carved in the manner without loss. When the engravers were rather draughtsmen than carvers, their drawing was of a decorative character. For example, in the magnificent series of "Châteaux," of Jacob Binck, one of the very finest examples of old wood engraving, the face and beard are drawn with few lines and very powerfully, but the costume is treated strictly as decoration, the lines of the patterns being all given, with as little shading as possible, and what shading there is simple, without cross-hatching.

The perfection of simple wood engraving having been attained so early as the 16th century by the use of the graver, the art became extremely productive. During the 17th and 18th centuries it still remained a comparatively severe and conventional form of art, because the workmen shaded as much as possible either with straight lines or simple curves, so that there was never much appearance of freedom. Modern wood engraving is quite a distinct art, being based on different principles, but between the two stands the work of an original genius, Thomas Bewick (1753-1828). Although apprenticed to an engraver in 1767, he was never taught to draw, and got into ways and habits of his own which add to the originality of his work, though his defective training is always evident. His work is the more genuine from his frequent habit of engraving his own designs, which left him perfect freedom of interpretation; but the genuineness of it is not only of the kind which comes from independence of spirit, it is due also to his fidelity to the technical methods of the process.

The reader will remember that in wood engraving every cutting prints white, and every space left untouched prints black. Simple black lines are obtained by cutting out white lines or spaces between them, and crossed black lines have to be obtained by laboriously cutting out all the white lozenges between them. In Bewick's cuts white lines, which had appeared before him in the *Fables* of 1722, are abundant and are often crossed, but black lines are never crossed; the white lines, although they are black in the plate, have no power to draw the eye. In the figures of wood engravers and Dürer's master Wohlgemuth used to do. The side of the frying-pan in the vignette of "The Cat and the Mouse" is cut in white, and so is the line for the edge of the plate, and the line at the edge for a border. In the vignette of "The Fisherman," at the end of the twentieth chapter of the *Mémorial*, the space of dark shade under the bushes is left quite black, whilst the leaves and twigs, and the red and line too, are all drawn in pure white lines. Bewick, indeed, was more careful in his adherence to the technical conditions of the art than any of the primitive woodcutters except van den Berghe de Larivière, and perhaps his cutting was supported by this. Such a thing as a fishing-net is an excellent test of this disposition. In the interesting series by J. Amman already mentioned there is a cut of a man fishing in a river, from a small punt, with a rod and line, in which the rod and line are not drawn in pure white lines. Bewick, in one of his vignettes, represents a fisherman mending his nets by the side of a stream. A long net is hung to dry on four upright sticks, but to avoid the trouble of cutting out the lozenges Bewick artfully contrives his arrangement of light and shade so that the net shall be in light against a space of black shade under some

**WOOD ENGRAVING**
Woodcutting and engraving were both used to create images in the 17th century. Woodcutters created images by cutting into a wooden block, while engravers used a metal plate. The woodcutters' work was often more crude and less refined, while engravers could create more detailed and nuanced images. The technique of woodcutting was often used for illustrations in books, while engraving was used for more detailed and high-quality images.

An important extension of wood engraving was due to the invention of compound blocks by Charles Wells about the year 1860. Formerly a woodcut was limited in size to the dimensions of a block of boxwood cut across the grain, except in the primitive condition of the art, when commoner woods were used in the direction of the grain; but by this invention many small blocks were fitted together so as to form a single large one, sometimes of very large size. They could be separated or joined together again at will, and it was this facility which rendered possible the rapid production of large cuts for the newspapers, many cutters working on the same subject at once, each taking his own section.

The process employed for wood engraving may be briefly described as follows. The surface of the block is lightly whitened with Chinese white so as to produce a light yellowish-grey tint, and on this the artist draws, either with a pen if the work is intended to be in line, or with a hard-pointed pencil and a brush if it is intended to be in shade. If it is to be a line woodcut the cutter simply digs out the whites in its finest form by a sympathetic scalpel (he has these tools of various shapes and sizes), and that is all he has to do; but if the drawing on the wood is shaded with a brush, then the cutter has to work upon the tones in such a manner that they will come relatively true in the printing. This is by no means easy, and the result is often a disappointment, besides which the artist's drawing is destroyed in the process. It therefore became customary to have the block photographed before the engraver touches it, when the drawing is specially worth preserving. This was done for Leighton's illustrations to Ulysses. When the engraving the drawing, made upon paper, was by photography printed on the block, and the drawing remained untouched as a witness for or against the engraver.

In recent years the position of wood engraving in Great Britain has wholly changed. Up to 1880 and for a little while longer it was the chief means of book and newspaper illustration, and a frequent method of fine-art reproduction; but by the beginning of the 20th century it had been all but driven out of the field by "process" work of various kinds. It still flourishes in the commoner style for commercial and mechanical work; it is still occasionally seen in the more artistic work of the occasional publisher here and there, who deplores and would arrest its decay. But the photograph and its facsimile reproduction have captivated the public, who want "illustration" and who do not want "art." The great body of the wood engravers have therefore found their occupation entirely gone, while the minority who have found themselves forced to devote their skill to "re-touching" the process-block—sometimes carrying their work so far that the print from the finished block is a close imitation of a wood engraving. This system has been carried farthest in the United States. It is not only to considerations of economy that is due the supersession of engraving by "process." The apparent superiority of truthfulness claimed by the photograph over the artist's drawing is a factor in the case—the public forgetting that a photographic print shows us what a thing or a scene looks like to the undiscriminating lens, rather than what it looks like to the two eyes of the spectator, who unconsciously selects that part of the scene which he specially wishes to see. The rank and file of the engravers—even those who "can engrave" after a picture as well as "cut" a "fine artist's" sketch—succumbed not only to the public, but to the artists themselves, who frequently insisted upon the process-block for the translation of their work. They preferred the greater truth of outline (though not necessarily of tone) which is yielded by "process," to all the inherent charm of the beautiful (and expensive) art of xylography.
In Great Britain a few engravers of high rank and ability still followed the art which was raised to so high a pitch by W. J. Linton (d. 1898). Such were Mr. Charles Roberts, Mr. Biscombe Gardner, Mr. Comfort, Mr. Ulrich and a few more—the first two the better engravers, and more original in design and composition, more original in the conception of the process, and very ready to fear that if wood engraving as a craft, for ordinary purposes, ceases to exist, wood engraving as a fine art must disappear as well—as those of the younger group by more than thirty years of apprenticeship and practice required to make an "artist" of him, and nothing to compensate him if he fail to attain at once the highest accomplishment.

Another art which has contributed to the overthrow of wood engraving in England is the rapture begotten of the extraordinary executive perfection to which the art had been brought in America. These engravings, published in magazines and books having a high reputation for their literary or artistic excellencies, were treated with respectful admiration, but a foolish depreciation among the public. Just as the over-refinement of engraving on steel of Finden and his school killed his art and the trade of the English wood engravers, so it has on the American wood engraver, by the law of paradox, effectively stifled xylography in England, as it has since done to an almost equal degree in America. The reason is simple. With the object of "dis-individualizing" himself, as he called it, the engraver sought to suppress his own recognizable manner of craftsmanship when translating the work of the artist for the public; and the more he succeeded, the more he obscured the mode in which he defined and elaborated his technique and imitated textures, the more extreme minuteness and excessive dexterity (so as to secure faithfulness and smoothness), the more closely did the result approximate to a production of the brain and hand of the artist himself. This is redactus ad absurdum of the passion for the minute and the perfection of mere technique. The result was amazing in its completeness, but curiously grey and monotonous; and matter-of-fact publishers and public, who knew and cared little or nothing of art or craft, did not or could not perceive the difference between the work of the engraver and that of the artist, and the engraving as a craft was stifled, and the art of the engraver to a great extent extinguished. The engraver's work was elaborated, a craving of an acrobatic kind, defeated its own end. The public were pleased for a time, and the result has been disastrous for the art.

In England, in spite of the International Society of Wood Engravers, of which little is now heard, there are no signs of a general revival, and it seems as if the art must be born again, so long as the public interest in photographs continues. Charles Ricketts and Miss Hopecraft are the names which, among the modern wood engravers in England, are most closely associated with the name of the Early Renaissance woodcut, while others are striving to begin engraving where Bewick began it. If the true art is ever restored, the revival will rather be based on a revolt against the greeyness of the process-block, and the obsessively shiny surface of the chalk-coated paper on which it is printed, than on any aesthetic delight in intelligent wood engraving, its expressive line, its delicate, nearly tonal, and its rich black.

In America, where the power of resurrection is great, the miraculous technical perfection brought about by Timothy Cole and Louis Le Prince, or others of the school, has promptly given way to a greater feeling for the art as an art and the mechanical execution, and, within strict limits, wood engraving is saved. Curiously enough, Cole (an Englishman by birth) was equally a leader in mechanical engraving, and the principle of line engraving (intaglio) is very largely to be accounted for the revival. He and his contemporaries, to a very large extent, have helped to bring about the "decadent de luxe" who had overwhelmed his art in the refinements which threatened to destroy it, and who had been seconded by the splendid printing-presses of America (which might without exaggeration be called instruments of precision), gave up what may be termed hyper-engraving, and, surrendering his wonderful power of imitating surfaces and textures, changed his manner. He became broad and handling; his example was followed by others, and wood engraving in a very few hands still prospers in the United States.

In France, where the art has reached the highest perfection and is by no means likely to be eclipsed, it is one of the street trades, but has given the artists there a certain point on the true artistic instinct of the engraver, on the taste of an intelligent and appreciative public, and on official recognition; for it is an official art. Nevertheless, it was found necessary to establish a "Society of Wood Engravers," with a magistracy (of which I am its own) to protect it against the inroad of the process-block. The art doubtless produces more engravers of skill than it can provide work for; but that is evidence rather of vitality than of decay. Lepère, Baudé, Jonnard and Florian have been among the leaders who, in different styles of wood engraving, have sustained the extraordinarily high level which has been attained in France, and which is fairly well maintained, as also the excellence and purity of style which it is the aim of the school to perpetuate. But in rebelling against the mechanical style formerly fashionable in vogue in Germany, of indicating roundness of form by curved lines carried as far as possible at right angles to the convexity, and in substituting more or less longitudinal lines of shaded beracation of a good deal of the logic of form-rendering, and started a method that has not been entirely successful.

In Germany the artistic standard is lower than in France. It is true that few outside Germany could model a head as finely as M. Klinkrecht in his own style of a judicious mingling of the black line and the white line; but, as a rule, German engraving is far more ancient and more truthful than that of either France or America. The art has been injured by the great "studies" or factories designed to produce wood engravings on strictly business principles, workshops which, in the education of the craftsman, to some extent annihilated the artist. A few there are, however, of great ability and taste. The attempt to print wood engravings in colours has done little to improve the standard of wood engraving, and the few who have tried it have failed to raise the standard. Thus the work of Ehrlicl Kingsley, who would sit down in the woods and engrave the scene before him directly on to the block, exercised no little influence in America. The similar attempt in France, to print wood engravings from the leaves of Fontainebleau Forest or the palace of Westminster, has in its time been much appreciated in his own country and in England. The most striking block-printing by Charpentier and others, not only with colour, but by reinforcing it with blocks that print neither lines nor colour but "blind" pattern, raised or depressed upon the paper, are evidence of the movement by which new methods have been sought to interest the public. The immediate results have not been very serious, yet the fact shows the existence of a vitality that gives some hope for the future. But while the practice of dry-printing upon "surface paper" is maintained, it is hopeless to expect in the immediate future, in Germany or anywhere, any permanently good results from orthodox wood engraving.

Black, 1892), an extended reprint of the article on "Engraving" in the 9th edition of the Encyclopaedia Britannica; Lewis, History of Engraving in England (text and three portfolios of plates) (Low, 1893-1894); George and Edward Dalziel, The Dalziel Brothers: a record of 50 years' work, 1846-1896 (Methuen, 1901).

WOODFALL, HENRY SAMPSON (1739-1803), English printer and journalist, was born in London on the 21st of June 1739. His father, Henry Woodfall, was the printer of the newspaper the Public Advertiser, and the author of the ballad Darby and Joan, for which his son's employer, John Darby, and his wife, were the originals. H. S. Woodfall was apprenticed at the age of nine to the book-keeper of the Public Advertiser. In it appeared the famous letters of "Junius," Woodfall sold his interest in the Public Advertiser in 1793. He died on the 12th of December 1805. His younger brother, William Woodfall (1746-1803), also a journalist, established in 1789 a daily paper called the Diary, in which, for the first time, reports of the parliamentary debates were published on the morning after they had taken place.

WOODFORD, an urban district in the Walthamstow (S.W.) parliamentary division of Essex, England, 9 m. N.E. from London, a part of the metropolitan area, and on the Great Eastern railway. Pop. (1901) 13,768. Its proximity to the southern outskirts of Epping Forest has brought it into favour both with residents and with holiday visitors from London. A converted mansion, Woodford Hall, forms a convivial home. On high ground to the N. is the ecclesiastical parish (one of three) of Woodford Wells, where there is a mineral spring.

WOOD GREEN, an urban district in the Tottenham parliamentary division of Middlesex, England, suburban to London, 7 m. N. by E. of St. Paul's Cathedral, on the Great Northern railway. Pop. (1881) 25,831. (1901) 34,231. The name covers a populous residential district lying north of Hornsey and west of Tottenham. To the west lies Muswell Hill, with the grounds and building of the Alexandra Palace, an establishment somewhat similar to the Crystal Palace. It was opened in 1873, destroyed by fire almost immediately, and reopened in 1875. Muswell Hill
took name from a holy well, of high repute for curative powers, over which an oratory was erected early in the 12th century, attached to the priory of St John of Jerusalem in Clerkenwell.

WOOD-LOUSE, a name commonly applied to certain terrestrial Crustáceans of the order Isopoda (see MALACOSTRACA), which are found in damp places, under stones or dead leaves, or among decaying wood. They form the tribe Oniscidea and are distinguished from all other Isopoda by their habit of living on land and breathing air, and by a number of structural characters, such as the small size of the antennæ and the absence of the mandibular pulp. In most Isopods, the body is flattened, and consists of a head, seven thoracic segments which are always free, and six abdominal segments which may be free or fused. The "telson" is not separated from the last abdominal segment. The head bears a pair of sessile compound eyes as well as the minute antennæ and the longer antennæ. Each of the seven thoracic segments carries a pair of walking legs. The appendages of the abdomen (with the exception of the last pair) are flat membranous plates and serve as organs of respiration.

In many cases their outer branches have small cavities opening to the outside by slit-like apertures, and giving rise internally to a system of ramifying tubes filled with air. From their similarity to the air tubes or tracheae of insects and other air-breathing Arthropods these tubes are known as "pseudo-tracheæ."

The female wood-louse carries her eggs, after they are extruded from the body, in a pouch or "marsupium" which covers the under surface of the thorax and is formed by overlapping plates attached to the bases of the first five pairs of legs. The young, on leaving this pouch, are like miniature adults except that they are without the last pair of legs. Like all Arthropods, they cast their skin frequently during growth. As a rule the skin of the hinder half of the body is moulted some days before that of the front half, so that individuals in process of molting have a very peculiar appearance.

Some twenty-four species of wood-louse occur in the British Islands. Some, like the very common slaty-blue Perílaxus atrovirens, are practically confined to the distribution of the species, having been transported, probably by the unconscious agency of man, to nearly all parts of the globe. Equally common is the brown, yellow-spotted Oníclus asellus. Armadillidium vulgare belongs to a group which have the power of rolling themselves up into a ball when touched, and resembles the isopod Glomeris. It was formerly employed in popular medicine as a ready-made pill. The largest British species is Ligia oceanica, which frequently finds its way into the kitchen, just as the wood-louse does into the water mark. In many points of structure, for instance in the long, many-jointed antennae, it is intermediate, as in habits, between the truly terrestrial forms and their marine allies. Finally, one of the most interesting species is the little, blind, and colourless Platýlaxus hoffmannianus, which lives as a guest or commensal in the nests of ants. (W. T. Ca.)

WOODPECKER, a bird that pecks or picks holes in wood, and from this habit is commonly reputed to have its name; but it is in some parts of England also known as "Woodspight" or "Woodspite."—The latter syllable being cognate with Ger. Swächt and Fr. Épêche, possibly with Lat. Picis. More than 300 species have been described, and they have been very variously grouped by systematists; but all admit that they form a very natural family Picidae of Coraciiform

The number of English names, ancient and modern, by which these birds are known is very great, and even a bare list of them could not be here given. The Anglo-Saxon was higora or higere, and to this may plausibly be traced the modern "hedge," the woodpeckers used in some parts of the country, and the older "hickory," corrupted first into "highhow," and, after its original meaning was lost, into "hewhole," which in North America has been still further corrupted into "high hole" and more recently into "hollow" or "hole." Another common word includes "whtile" and "woodwale," which, different as they look, have a common derivation perceptible in the intermediate form "whole." The Māi, Eng. freedake (= woodback) is another name apparently identical in meaning with that commonly applied to woodpecker.

birds, their nearest allies being the toucans. They are generally of bright multicoloured plumage, in which black, white, brown, olive, green, yellow, orange or scarlet—the last commonly visible on some part of the head—mingled in varying proportions, and most often strongly contrasted with one another, appear; while the less conspicuous markings take the form of bars, splangles, tear-drops, arrow-heads or scales. Woodpeckers inhabit most parts of the world, with the exception of Madagascar and the Australian Region, save Celebes and Flores; but it may be worth stating that no member of the group is known to have occurred in Egypt.

Of the three British species, the green woodpecker, Gecinus or Picús viridis, though almost unknown in Scotland or Ireland, is the commonest, frequenting wooded districts, and more often heard than seen, its laughing cry (whence the name "Yaffil" or "Yaffil") and "Yall," by which it is in many parts known, and undulating flight afford equally good means of recognition, even when it is not near enough for its colours to be discerned. About the size of a jay, its scarlet crown and bright yellow rump, added to its prevailing grass-green plumage, make it a sightly bird, and hence it often suffers at the hands of those who wish to keep its studded skin as an ornament. Besides the scarlet crown, the cock bird has a patch of the same colour running backward from the base of the lower mandible, a patch that in the hen is black.2 Woodpeckers in general are very shy birds, and to observe the habits of the species is not easy. Its ways, however, are well worth watching. In the evening, after the other birds have retired to the core, whence it is pierced downward for nearly a foot. There a chamber is hollowed out in which the eggs, often to the number of six, white, translucent and glossy, are laid with no bedding but a few chips that may have not been thrown out.4 The young are not only hatched entirely naked, but seem to become fledged without any of the downy growth common to most birds. Their first plumage is dull in colour, and much marked beneath with bars, crescents and arrowheads.

Of the two woodpeckers which inhabit Britain—the pied or greater spotted and the barred or lesser spotted woodpecker—Dendrocopus major and D. minor—each of great beauty, from the contrasted white, blue-black and scarlet that enter into its plumage. Both of these birds have an extraordinary habit of causing by quickly-repeated blows of their beak on a branch, or even on a small bough, a vibrating noise, louder than that of a watchman's rattle, and enough to excite the attention of the most incurious.

Though the pied woodpecker is a resident in Britain, its numbers receive a considerable accession nearly every autumn.

2 A patch of conspicuous colour, generally red, on this part is characteristic of very many woodpeckers, and careless writers often use "mystacial," "mystaceus," "mystical," or some more barbarously "moust Paleiarchic." Considering that moustaches spring from above the mouth, and have nothing to do with the mandible or lower jaw, no term could be more misleading.

3 It often happens that, just as the woodpecker's labours are over, a pair of starlings take possession of the newly-bored hole, and, by conveying into it some nesting furniture, render it unfit for the rightful tenants, who thereby suffer ejectment, and have to begin all their troubles over. It has been stated of this and other woodpeckers that the chips made in cutting the hole are carefully removed by the birds to guard against their leading to the discovery of the nest. The present writer, however, had ample opportunity of observing the contrary as regards this species and, to some extent, the pied woodpecker next to be mentioned. Indeed there is no surer way of finding the nest of the green woodpecker than by scanning the ground in the presumed locality, for the tree which holds the nest is always recognizable by the chips scattered at its foot.
WOODS, SIR A.—WOODSTOCK

803

The three species just mentioned are the only woodpeckers that inhabit Britain, though several others are mistakenly recorded as occurring in the country—and especially the great black woodpecker, the Ficus martius of Linnaeus, which must be regarded as the type of that genus.1 This fine species considerably exceeds the green woodpecker in size, and except for its red cap is wholly black. It is chiefly an inhabitant of the forested regions of the Old World, from Lapland to Galicia and across Siberia to Japan. In North America this species is replaced by Ficus picus, there generally known as the logcog, an equally fine species, but variegated with white; and farther to the southward occur two other species of the genus, P. frontalis, which is the ivory-billed woodpecker, and P. subsellatus, the red-headed woodpecker. These species all flourish in the New World, nearly one-half of the described species being American, but of the large number that inhabit Canada and the United States we can mention only a few.

First of these is the California woodpecker, Melanerpes formicivorus, which has been said to display an amount of providence beyond almost any other bird in the number of acorns it fixes tightly in holes which it makes in the bark of trees, and that in pine forty or fifty feet high will present the appearance of being closely studded with brass nails, the heads only being visible. This is not done to furnish food in winter, for the species migrates, and only returns in spring to the forest where its supplies are laid up. It has been asserted that the acorns thus stored are always those which contain a mastog, and, being fitted into the sockets prepared for them cup-end foremost, the acorns and young birds escape, as they otherwise would, and are thus ready for consumption by the birds on their return from the south. But this statement has again been contradicted, and, moreover, it is alleged that these woodpeckers follow their instinct so blindly that they do not distinguish between an acorn and a pebble, so that they "fill up the holes they have drilled with so much labor, not only with acorns but occasionally with stones." (c.f. Baird, Brewer and Ridgway, North American Birds, t. pp. 560-571)

The next North-American form deserving notice is the genus Colaptes, represented in the north and east by C. auratus, the golden-winged woodpecker or flicker, in most parts of New England replaced by the allied C. mexicanus, but in the south and west replaced by the allied C. mexicanus, easily distinguishable among other characteristics by having the shafts of its quills red instead of yellow. It is curious, however, that, in the valleys of the upper Mississippi, commonly the pine and pine and the range of the two kinds overlap, birds are found presenting an extraordinary mixture of the otherwise distinctive features of each other. On the other hand, the small and hairy woodpeckers, small birds with spotted black and white plumage, which are very valuable as destroyers of harmful grubs and borers; the red-headed woodpecker, a very handsome form with strongly contrasted red, black and white plumage, common west of the Alleghany Mountains; and the yellow-bellied woodpecker ("sapsucker") are rare species.

Some other woodpeckers deserve especial notice—the Colaptes or Sereisus caseolus, which inhabits the treeless plains of Paraguay and in Brazil the multipassenger woodpecker or picul, and Dendrocopus, which lives almost entirely on the ground or rocks, and picks a hole for its nest in the bank of a stream (Zoologist, 1882, p. 208).

The woodpeckers, together with the wood-grouse (g.v.), form a very natural division of scansional birds with zygodontal feet, and were regarded by T. H. Huxley as forming a distinct division of birds to which he gave the name Teleomorphus, whilst W. K. Parker separated them from all other birds as Sauropsida.

WOODS, SIR ALBERT (1816-1904), English herald, son of Sir William Woods, Garter king-of-arms from 1838 to his death in 1842, was born on the 16th of April 1816. In 1838 he became a member of the chapter of the Herald's College, of which he was appointed registrar in 1866. In 1869 he was knighted and became Garter king-of-arms. In this capacity he was entrusted with many missions to convey the order to foreign sovereigns; he was also registrar from 1872 of the orders of the Star of India and of the Indian Empire; and from 1896 was knighted of the order of St Michael and St George. He officiated at the coronations both of Queen Victoria and of King Edward VII., and his authority on questions of precedence was unique. His later distinctions were K.C.B. (1897), K.C.M.G. (1899) and G.C.V.O. (1903). He died on the 7th of January 1904.

WOODS, LEONARD (1774-1854), American theologian, was born at Princeton, Massachusetts, on the 10th of June 1774. He graduated at Harvard in 1796, and in 1798 was ordained pastor of the Congregational Church at West Newbury. He was prominently among the first members of the Andover Seminary, and was its first professor, occupying the chair of Christian theology from 1808 to 1846, and being professor emeritus until his death in Andover on the 24th of August 1854. He helped to establish the American Tract Society, the American Education Society, the Temperance Society and the American Board of Commissioners for Foreign Missions. He was an orthodox Calvinist and an able dialectician. His principal works (5 vols., Andover, 1849-50) were Lectures on the Inspiration of the Scriptures (1820), Memoirs of American Missionaries (1833), Examination of the Historical Society's Documentary History of the South (1834), and Lectures on Swedenborgianism (1846); he also wrote a History of Andover Seminary (1848), completed by his son.

His son, Leonard Woods (1807-1878), was born in West Newbury, Mass., on the 24th of November 1807, and graduated at Union College in 1827 and at Andover Theological Seminary in 1830. His translation of Georg Christian Knapp's Christian Theology (1831-1833) was long used as a text-book in American theological seminaries. He was assistant Hebrew instructor (1832-1835) at Andover, and having been licensed to preach by the Londonbery Presbytery in 1830 was ordained an evangelist by the Third Presbyterian in New York in 1833. In 1834-1837 he edited the newly-established Literary and Theological Review, in which he opposed the "New Haven" theology. After being professor of sacred literature in the Bangor Theological Seminary for three years, he was president of Bowdoin College from 1836 to 1866, and introduced there many important reforms. From June 1867 to September 1868 Dr Woods worked in London and Paris for the Maine Historical Society, collecting materials for the early history of Maine; he induced J. G. Kohl of Bremen to prepare the first volume (1868) of the History of the Confederate States; and discovered a MS. of Hakluyt's Discourse on Western Planting, which was edited, partly with Woods's notes, by Charles Dean in 1877. He died in Boston on the 24th of December 1878. He was a remarkable linguist, conversationalist and orator, not only for his uncompromising independence, his opinion that the German reformation was a misfortune and that the reformation should have been within the church.

ALVA WOODS (1704-1887), a nephew of the elder Leonard and the son of Abel Woods (1765-1850), a Baptist preacher, graduated at Harvard in 1817 and at Andover Theological Seminary in 1821, and was ordained as a Baptist minister. In 1824-1828 he was professor of mathematics and natural philosophy at Brown University, acting as president in 1826-1827; in 1828-1832 he was president of Transylvania University, Lexington, Kentucky; and in 1831-1837 was president of the University of Alabama at Tuscaloosa, where he organized the Alabama Female Athenaeum. After 1839 he lived in Providence, R.I.

WOODSTOCK, a town and port of entry of Oxford county, Ontario, Canada, So m. S.W. of Toronto by rail, on Cedar creek, the Thames river and the Grand Trunk and Canadian Pacific railways. Pop. (1901) 8,533. It is in one of the best agricultural sections of the province, and has a large export trade in cheese, butter and farm produce. Organs, pianos and agricultural implements are manufactured. It contains a residential school, under the control of the Baptist church, affiliated with McMaster University, Toronto.
WOODSTOCK, a market town and municipal borough in the Woodstock parliamentary division of Oxfordshire, England, 724m. W.N.W. of London, the terminus (Blenheim and Woodstock) of a branch of the Great Western railway. Pop. (1901) 1684.

The little river Glyme, in a steep and picturesque valley, divides Woodstock into two parts and forms the source of St Mary Magdalen, in New Woodstock, is of Norman date, but has additions in the later styles, and a west tower built in 1275. The town hall was erected in 1766 after the designs of Sir William Chambers. The picturesque almshouses were erected in 1798 by Caroline, duchess of Marlborough. The town is dependent chiefly on agriculture, but a manufacture of leather gloves (dating from the 16th century) is carried on. Woodstock is governed by a mayor, 4 aldermen, and 12 councillors.

Area, 1,564 acres.

At the battle of Blenheim the manor of Woodstock was by Act 3 and 4 of Queen Anne, chap. 4, bestowed in perpetuity on John, duke of Marlborough. In 1732 it was destroyed, being already ruined, and the site levelled after the erection of Blenheim House, a princely mansion erected by Parliament for the duke of Marlborough in consideration of his military services, and especially his decisive victory at Blenheim. The sum of £500,000 was voted for the purchase of the manor and the erection of the building, a huge pile built by Sir John Vanbrugh (q.v.), in a heavy Italian-Corinthian style. The greater part of the architect's fee was paid in 1785, and the great library was formed by acquiring the finest collection of books made at the instigation of the first duke of Marlborough, in 1881. The magnificent park contains Fair Rosamund's well, near which stood her bower. On the summit of a hill stands a column commemorating the duke. Blenheim Park forms a separate parish.

Domesday describes Woodstock (Wodestock, Wodestok, Wode-stok) as a royal forest; it was a royal seat from early times and Ethelred is said to have held a council there, and Henry I. to have kept a menagerie in the park. Woodstock was the scene of Henry II.'s courtship of Rosamund Clifford (q.v. Rosamund (1)) and the royal residence towards the Civil War, when the manor house was "almost totally destroyed." In the Hundred Rolls of 1279 Woodstock is described as a villa, but a burgess is alluded to in the same document, and it returned two members to parliament as a borough in 1302 and 1305. A mayor of Woodstock was witness to a deed in 1398, but the earliest known charter of incorporation was that from Henry VI. in 1453, establishing the villa of New Woodstock a free borough, with a merchant guild and the same liberties and customs as New Windsor; and incorporating the town with the title of the "Mayor and Commonality of the Vill of New Woodstock." The mayor and a serjeant-at-mace were to be elected by the commonalty, and an independent borough court was to be held. The magnitude of the grant is exhibited by the fact that the borough was also exempted from the burden of sending representatives to parliament, but it again returned two members in 1553 and then regularly from 1570 until 1881, when the representation was reduced to one member. In 1885 the borough was disfranchised. The charter of Henry VI. was confirmed by Henry VII., Edward VI. and Elizabeth, but before 1586, when an ordinance was drawn up for the government of the borough, the corporation had considerably developed, including a high steward, recorder, mayor, 6 aldermen, 20 common councillors, a town clerk and a crier of the court; and the new charter granted by Charles II. in 1665 did little more than confirm this corporation. The hamlet of Old Woodstock is said to have been founded by Henry I., and was never included within the borough. The existing Tuesday market is stated in the Hundred Rolls of 1279 to have been granted by Henry II. and the St Matthew's fair by John. The latter was confirmed in 1453, with the addition of a fair at the feast of St Mary Magdalen. Queen Elizabeth in 1568 granted the mayor and commonalty a market on Friday, and two fairs of four days each at the feast of St Nicholas and Lady Day.

WOODSTOCK, JOHN (1665-1728), English naturalist and geologist, was born in Derbyshire on the 3rd of May 1665. At the age of sixteen he went to London, where he studied with Dr Peter Barwick, physician to Charles II. In 1692 he was appointed professor of physic in Gresham college. In 1693 he was elected F.R.S., in 1695 was made M.D. by Archbishop Tenison and also by Cambridge, and in 1702 became F.R.C.P.

While still a student he became interested in botany and natural history, and during visits to Gloucestershire his attention was attracted by the fossils that are abundant in many parts of that county; and he began to form the great collection with which his name is associated. His views were set forth in An Essay Towards a Natural History of the Fossils of England (2 vols., 1728 and 1729). This was followed by Brief Instructions for making Observations in all Parts of the World (1696). He was author also of An Attempt towards a Natural History of the Fossils of England (2 vols., 1728 and 1729). In these works he showed that the stony surface of the earth was divided into strata, and that the enclosed shells were originally generated at sea; but his views of the method of formation of the rocks were entirely erroneous. In his elaborate Catalogue he described his rocks, minerals and fossils in a manner far in advance of the age. He died on the 25th of April 1728, and was buried in Westminster Abbey.

By his will he directed that his personal estate and effects were to be sold, and that land of the yearly value of one hundred and fifty pounds was to be puchased and conveyed to the University of Cambridge. A lecturer was to be chosen, and paid £100 a year to read at least four lectures every year, on some one or other of the subjects treated of in his Natural History of the Earth. Hence arose the Woodwardian professorship of geology. To the same university he bequeathed his collection of English fossils, to be used under the care of the lecturer, and these formed the nucleus of the Woodwardian museum at Cambridge. The specimens have since been removed to the new Sedgwick museum.

A full account of Woodward’s life and views and a portrait of him are given in the Life and Letters of the Rev. Adam Sedgwick, by J. W. Clark and T. McK. Hughes, where it is mentioned that his paper, read before the Royal Society in 1869, entitled Some Thoughts and Experiments concerning Vegetation, "shows that the author should be ranked as a founder of experimental plant-physiology, for he was one of the first to employ the method of water-culture, and to make refined experiments for the investigation of plant-life."

See also The Lives of the Professors of Gresham College, by John Ward (1740).

WOODWARD, SAMUEL (1790-1838), English geologist and antiquary, was born at Norwich on the 3rd of October 1790. He was for the most part self-educated. Apprenticed in 1804 to a manufacturer of canquets and bombazines, a taste for serious study was stimulated by his master, Alderman John Herrig and by Joseph John Gurney. Becoming interested in geology and archaeology, he began to form the collection which after his death was purchased for the Norwich museum. In 1820 he obtained a clerkship in Gurney's (afterwards Barclay's) bank at Norwich, and in 1832 was elected a fellow of Gonville and Caius College, Cambridge. The collection of fossils and minerals was presented to the Royal Society, and an attempt was made to have them exhibited at a museum in Norwich. He communicated to the Archaeologia articles on the round church towers of Norfolk, the Roman remains of the country, &c., and other papers on natural history and geology to the Mag. Nat. Hist. and Phil. Mag. He died at Norwich on the 14th of January 1838. He was author of A Synopsis Table of British Organic Remains (1830), the first work of its kind in Britain; An Outline of the Geology of Norfolk (1833); and of two works issued posthumously, The Norfolk Topographer's Manual (1842) and The History and Antiquities of Norwich Castle (1847).

His eldest son, Bernard Bolingbroke Woodward (1816-1860), was librarian and keeper of the prints and drawings at Windsor Castle from 1860 until his death. The second son, Samuel Pickworth Woodward (1821-1865), became in 1845 professor of geology and natural history in the Royal Agricultural College, Cirencester, and in 1848 was appointed assistant in the department of geology and mineralogy in the British Museum. He was author of A Manual of the Mollusca (in three parts, 1851, 1853 and 1860).

S. P. Woodward's son, Horace Bolingbroke Woodward (b. 1848), became in 1863 an assistant in the library of the Geological Society, and joined the Geological Survey in 1867, rising to be assistant-director. In 1863-1864 he was president of the Geologists' Association, and he published many important works on geology. Samuel Woodward's youngest son, Henry Woodward
WOOL, WORSTED AND WOOLLEN MANUFACTURES

(b. 1832) became assistant in the geological department of the British Museum in 1858, and in 1860 keeper of that department. He became F.R.S. in 1873, LL.D. (New Zealand) in 1878, president of the Geological Society of London (1884-1896), and was awarded the Wollaston medal of that society in 1906. He published a Monograph of the British Fossilized Crustacea, Order Merostomata (Palaeontograp. Soc. 1866-1878); A Monograph of Carboniferous Trilobites (Pal. Soc. 1883-1884), and many articles in scientific journals. He was editor of the Geological Magazine from its commencement in 1864.

WOOL, WORSTED AND WOOLLEN MANUFACTURES.

Wool is a modified form of hair, distinguished by its slender, soft and wavy or curly structure, and, as seen under the microscope, by its highly imbricated or serrated surface. At what point an animal fibre ceases to be hair and becomes wool it is impossible to determine, because the one by imperceptible gradations merges into the other, so that a continuous chain can be formed from the finest and softest merino to the rigid bristles of the wild boar. Thus the fine soft wool of the Australian merino merges into the cross-bred of New Zealand; the cross-bred of New Zealand merges into the long English and lustre wool, which in turn merges into alpaca and mohair-materials with clearly marked but undeveloped scale structure. Again, such animals as the camel and the Cashmere goat yield fibres, which it would perhaps be difficult to class rigidly as either wool or hair.

Wool is one of the most important of the textile fibres. Owing to the ease with which it may be spun into thread, and the comfort derived from clothing made of wool, it would naturally be one of the first textiles used by mankind for clothing. Ancient records prove the high antiquity of wool textures and the early importance of the sheep. The different kinds of wool and the cloth made from them in antiquity are described by Pliny and referred to by other writers, and among the arts which the British Isles owe to the Romans not the least important is the spinning and weaving of wool. The sheep certainly was a domestic animal in Britain long before the period of the Roman occupation; and it is probable that some use was made of sheep skins and of wool. But the Romans established a wool factory where the wool was spun and woven in a manner that was improved upon by the Britons, and the value of the manufacture was soon recognized by the Britons, of whom Tacitus remarks, "Inde etiam habitus nostri honor et frequens toga" (Agric. c. 21). The product of the Winchester looms soon established a reputation abroad, it being remarked that "the wool of Britain is often spun so fine that it is in a manner comparable to the spider's thread." This reputation was maintained throughout the middle ages, and the fibre was in great demand in the Low Countries and other continental centres. There are many allusions to woolen manufactures in England in early times; but the native industry could not rival the products of the continent, although the troubles in various industrial centres, from time to time, caused skilled workers in wool to seek an asylum in England. In the time of William the Conqueror Flemish weavers settled under the protection of the queen at Carlisle, but subsequently they were removed to Pembroke, at various subsequent periods there were further immigrations of skilled Flemish weavers, who were planted at different places throughout the country. The cloth fair in the church yard of the priory of St Bartholomew was instituted by Henry II.; guilds of weavers were established; and the exclusive privilege of exporting woolen cloth was granted to the city of London. Edward III. made special efforts to encourage wool industries. He brought weavers, dyers and fullers from Flanders; he himself wore British cloth; but to stimulate native industry he prohibited, under pain of life and limb, the exportation of English wool. Previous to this time English wool had been in large demand on the continent, where it had a reputation exceeded only by the wool of Spain. The customs duties levied on the export of wool were an important source of the royal revenue. Edward III.'s prohibitory law was, however, found to be inoperative, and the custom that both he and his successors were able to effect was to hamper the export trade by vexatious restrictions and to encourage much smuggling of wool. Thus while Edward III. limited the right of exporting to merchant strangers, Edward IV. decreed that no alien should export wool and that denizens should export it only to Calais. Legislation of this kind prevailed till the reign of Elizabeth, when the free exportation of English wool was permitted; and Smith, in his Memoirs of Wool, points out that it was during this reign that the manufacture made the most rapid progress. In 1660 the royalists prohibited the export of wool to Ireland, and it was not till 1825 that this law was finally repealed. The results of the prohibitory law were exceedingly detrimental; the production of wool far exceeded the consumption; the price of the raw material fell; wool—"running" or smuggling became an organized traffic; and the whole industry became disorganized. Extraordinary expedients were resorted to for stimulating the demand for woolen manufactures, among which was an act passed in the reign of Charles II. decreeing that all dead bodies should be buried in woolen shrouds—an enactment which remained in the Statute Book, if not in force, for a period of two centuries. This law was designed to encourage the use of English cloth, and the manufacture was discouraged and even prohibited in Ireland.

It was not without reason that the attention of monarchs and legislators was so frequently directed to the wool industries. Wool was indeed "the flower and strength and revenue and blood of England," and till the development of the cotton trade, towards the end of the 18th century, the wool industries were, beyond comparison, the most important sources of wealth in the country. Towards the close of the 17th century the wool produced in England was estimated to be worth £2,000,000 yearly, furnishing £5,000,000 worth of manufactured goods, of which there was exported about £2,000,000 in value. In 1700 the official value of woolen goods exported was about £3,000,000, and in the third quarter of the century the exports had increased in value by about £500,000 only. In 1774 Dr Campbell (Political Survey of Great Britain) estimated the number of sheep in England at 10,000,000 or 12,000,000, the value of the wool produced yearly at £3,000,000, the manufactured products at £12,000,000, and the exports at £5,000,000 to £4,000,000. He estimated that there were 1,000,000 persons in the industry. These figures, in the light of the dimensions of present-day industries, may appear small, but they bore a predominant relationship to the other great sources of employment and trade of the period. In 1800 the native crop of wool was estimated to amount to 66,000,000 lb.; and, import duty not being imposed till 1821, the quantity brought from abroad was 8,600,000 lb., 6,000,000 lb. of which came from Spain. In 1835 the importation of colonial wool became free, the duty leviable having been for several previous years as high as 6d. per lb., and in 1844 the duty was finally remitted on foreign wool also.

Sheep were introduced at Jamestown in Virginia in 1600, and in 1633 the animals were first brought to Boston. Ten years later a fulling mill was erected at Rowley, Mass., "by Mr Rowley's people, who were the first that set upon making cloth in this western world." The factory woolen industry was, however, not established till the close of the 18th century, and it is recorded that the first carding machine put in operation in the United States was invented in 1794 under the supervision of John and Arthur Schofield.

For centuries the finer wools used for cloth-making throughout Europe had been obtained from Spain—the home of the famous merino breed developed from races of sheep originally introduced into the Peninsula by the Moors. Till early in the 16th century the superiority of Spanish merinos remained unchallenged, but the Peninsular War and its attendant evils produced a depreciation of quality concurrently
with the introduction of Saxon and Silesian woofs, which suddenly supplanted the product of Spain. The Spanish merino sheep had been introduced into Saxony by the elector in 1765, and by judicious crossing with the best native race developed the famous electoral breed. Merinos were next introduced into Hungary in 1775, and into France in 1776, and in 1786 Daubenton brought them to Rambouillet, whence a famous race developed. In 1802 the first merinos known to have left pure descendants were taken to the United States, and in 1809–1810 an importation (1000) of merino sheep was made.

The introduction of the merino sheep into the United States was an important move, but its results are not to be compared with the results of the introduction of the merino sheep into Australasia about the end of the 18th century and into South America a little later. It is probable that the marked improvement in the appearance of the first sheep taken out by the early colonists suggested the possibilities of Australia as a wool-growing country. As has been noted above, marked endeavours were being made at this time to extend the merino breed of sheep, so that it was but natural that this breed should be given the first chance. That marked success did not attend the first endeavours is shown by the fact that the London Colonial Wool Sales originated in the necessity of selling Australian woofs just for what they would bring under the hammer, as distinct from the private treaty method of selling and buying the more highly priced continental merinos. It should here be noted that the Australian fine woofs were first shipped from Botany Bay, hence the now universal term ‘botany’ for fine woofs. The colonists were not to be repressed however, and eventually, through the endeavours of Captain MacArthur, Sir J. Banks, the Rev. Samuel Marsden and others, the merino breed became established on a firm basis, and in a comparatively short time Australian woofs were no longer a drug on the market. The evolution was not to stop, however, with the development of merino flocks and the exportation of merino wool. Meanwhile the possibilities of raising larger sheep on the better coastal pasturage was naturally suggested. Until about 1853 this tendency was largely repressed owing to the demand for merino as distinct from cross-bred wool. In other words wool was the dominating factor. But with the possibilities and the development of the frozen meat trade from 1830 to 1850 this condition was changed, and the tendency to breed a large sheep with a valuable carcass and mediocre wool grew apace. New Zealand was specially adapted for this development; thus New Zealand frozen mutton completely dominated the market, and in this manner it came about that cross-bred wool supplanted merino wool to a very considerable extent throughout Australasia. This change would have been serious for the wool combers and spinner had not the Bradford combers, spinners and manufacturers put their shoulder to the wheel and developed a world-wide renown for their cross-bred tops, yarns and fabrics. Again the change was not altogether for the bad so far as the Australian sheep was concerned. Sheep-breeding developed into a real science, and remarkable results were obtained with such crosses as Merino-Lincoln, Merino-Leicester, Merino-Shropshire; all probably originating in the first place in the desire to produce a large-bodied early-fattening sheep, but later developing into a strenuous endeavour to develop more useful types of woofs. Thus the wool produced from the first cross Merino-Lincoln might be very defective judged from a pure merino standpoint, but by breeding back to the merino practically none of the useful merino characteristics were sacrificed, while length of staple was added and the weight of the fleece perhaps doubled.

A somewhat different evolution has taken place in later years with reference to the interior sheep stations. The merino sheep will thrive where a larger sheep would starve, hence its value for the stations where salt-bush dominates all vegetation. But the merino sheep is a "wool" sheep, not a "frozen mutton" sheep, hence all crossing here was carried out with the idea of simply developing the weight of fleece and if possible retaining the merino wool characteristics. The most marked development in this direction was effected by the introduction of the United States merino or Vermont breed. Opinions differ as to the wisdom of this introduction. The weight of fleece carried per sheep has been remarkably increased, and the fact that largely in the present weight multiplied by price per lb paid in London or elsewhere has been entirely in favour of first and second cross Vermonsts, has undoubtedly influenced breeders in its favour. Against this must be placed the fact that the Australian-Vermont merino cross produces a sheep of unstable physique, naturally unable to withstand drought, and—worst of all so far as London is concerned—producing a fleece very difficult to judge for yield of pure scoured wool. Again, the Australian-Vermont first cross is very liable to produce a very strong botany wool, while what is required is a long but fine wool technically termed a long and shifty 60's to 46's quality.

Hardly second in importance to Australia as a wool-growing country comes South America, or more correctly Argentina along with Patagonia, Punta Arenas and the Falkland Islands. In most years Australia has produced the greater bulk, but just occasionally S. America has come out top and is likely to do so more frequently in the future owing to the remarkable developments there taking place. The history of the introduction of the merino sheep into S. America is closely connected with the development of the merino sheep. In 1845 Henrici Solfanet, a Frenchman, began to ship the comparatively few sheep round Buenos Aires. His example was soon followed by Edouardo Olivera and Jose Planer. The idea almost at once came to these pioneers of importing well-bred rams, and as S. America is essentially a Latin country it was but natural that the French flocks of Rambouillet should be first drawn upon. With the development of the meat trade—just as in the case of Australia and New Zealand—a larger carcase was then sought after. This led to the introduction of the Lincoln ram and the development of cross-bred flocks about the year 1847. Perhaps this was a result of the influence exerted on the Spanish breeders by the skill of the Bradford spinners, who made excellent use of the cross-bred wool produced. Flocks of sheep were first introduced into the Falkland Islands in 1867. The pasturage here being limited, the flocks have probably attained their limit, but from the Falkland Islands flocks have been passed on to Punta Arenas, where there is practically unlimited pasturage. The chief centres from which wool from S. America comes to Europe are Buenos Aires, which exports chiefly long and cross-bred woofs, Montevideo, which exports chiefly merino woofs, and the Falkland Islands and Punta Arenas, which export chiefly cross-bred and Patagonia wool.

The newly acclimatized sheep appears to have cast its wool at about the fifth generation and to have generally deteriorated, necessitating the reintroduction of fresh blood form Europe. In this manner have been developed the Cape flocks and the considerable Cape wool trade—largely centred at Port Elizabeth, East London, Cape Town, Mossel Bay and Port Natal. The country is evidently specially adapted for the rearing of the merino type of sheep, as cross-bred Cape wool is practically unknown. The term snow-white Cape wool, on the other hand, betokens a quality of whiteness no doubt due to the atmosphere and pasturage conditions. Cape woofs are also known as non-felting woofs, and consequently are largely employed in the manufacture of flannels. In 1897 most marked endeavours were being made to develop the Cape flocks by the introduction of some thousands of Australian merino sheep. The opinion of wool experts was that the Cape had a great future before it as a wool-producing country.
Wool, Worsted and Woollen Manufactures

Large quantities of wool also come from the East and from Russia, while even Iceland contributes its quota. It is interesting to note that, notwithstanding all the developments instanced, Europe still maintains its supremacy as the chief wool-producing continent, though, as the wool is largely manufactured locally, one hears little of European wools.

The following statistics give an idea of the development of the colonial and foreign wool trade as gauged by the London wool sales:

It must not be forgotten, however, that a large quantity of South American, W. Indian, Russian, &c., wool, along with mohair and alpaca, come through Liverpool, and consequently are not taken into account here.

With reference to wools grown in the United Kingdom the truth seems to be that a fine short wool has never been produced. English wool known as a ‘short’ wool is simply a long and lustrous type, which was doubtless that so much in demand in the middle ages. That it was as long and lustrous as the typical Leicester or Lincoln of to-day is doubtful, as the new Leicester breed of sheep was only fully developed by Mr. Bakewell after the year 1747, and the latter day Lincoln was even a later development of a similar character. The exact type of English wool or wools was prior to the 18th century will probably never be decided, but from the closing years of that century there is no difficulty in being fairly precise. As already remarked, the long and lustrous wools are the typical English, being grown in Lincolnshire, Yorkshire, Nottinghamshire, Devonshire, &c., in fact in all those districts where the pasturage is rich and specially fitted for carrying a heavy sheep. It is claimed that the lustre upon the wool is a direct result of the environment, and that to take a Lincoln sheep into Norfolk means the loss of the lustre. This is partially true, but it is perhaps better to take a larger view and remember that the two influencing factors are race and environment: which is the more potent it is impossible to say. Attempts were made in the 18th century to develop a fine wool breed in England, particularly by importing a number of merino sheep from Spain. The discovery was soon made that it was impossible to maintain a breed of pure merinos in Great Britain, but the final outcome was by no means unsatisfactory. By crossing with the indigenous sheep a race of fairly fine woolled sheep was developed, of which the present day representative is the Southdown—a sheep which feeds naturally on the Downs of Sussex, &c., forming a marked contrast to the artificially turnip-fed Lincoln, Leicester, &c., sheep. Following the short, curly Southdown, but rather longer, come such as the Sussex, Oxford and Hampshire Down sheep; these are followed by such as the Shropshires and Shropshire crosses. Kent and Romney Marsh, until at last the chain from the Southdown to the Lincoln is completed. Of course there are several British wools not included in this chain. Scotch or black-face wool is long and rough, but well adapted for being spun into carpet yarns. Welsh wool has the peculiarity of early attaining its limit of shrinkage when washed, and hence is specially chosen for flannels. Shetland wool is of a soft nature specially suited for knitting yarns, while Cheviot wool—said to be a cross between merino sheep: saved from the wreck of the Great Armada and the native Cheviot sheep—has made the reputation of the Scottish manufacturers for twills. North wool—wool from an animal of the Border Leicesters and Cheviot breed—Ripon, Wensleydale and Teasdale wools are also specially noted as lustre wools, Ripon and Wensleydale wools being, by many judges, considered superior so far as lustre is concerned to Lincoln and Leicester.

Such remarkable advances have been made in the weights of fleeces carried by sheep of particular breeds that it is difficult to say if finity has been reached. The following list gives average weights:

In 1885 the average weight of wool per sheep per year was about 5 lb, while 7 to 8 lb is now the average weight. Roughly speaking the weights of Australian fleeces are to-day about as compared as those of wools grown in England.

The prevailing colour of sheep's wool is white, but there are races with black, brown, fawn, yellow and grey shades of wool. For manufacturing purposes generally, while wool is, of course, most valuable, but for the homespun, which in earlier times absorbed the bulk of wool, natural colours were in many cases used with good effect. In domestic spinning, knitting, and weaving, natural colours are still largely taken advantage of, as in the cases of rough yarns, Shetland knitted shawls, Highland tweeds, &c.

As has already been indicated, the distinction between wool and hair lies chiefly in the great fineness, softness, and waved delicacy of wool fibre, combined with a highly serrated surface. These characteristics are precisely the characteristics which give the fibre its distinctive value as a textile fibre, the most distinctive characteristic of all being the serrated structure which especially belongs to wool and markedly aids the important property of felting, upon which many of its applications depend. The serrations of wool and the wavy structure it assumes are closely connected, those wools which have the greatest number of serrations being usually most finely waved in structure. The appearance presented by wool under the microscope is shown in figs. 1-6 (Plate). Under the influence of moisture and pressure, aided by alkalis or acids, masses of wool thoroughly mat together, by the mutual interlocking of the fibres. It is interesting that the structure of the fine wool fibres under washing is accounted for, the capacity of wool cloth for felting or fulling being due to this condition of the fibre, possibly along with a certain shrinkage of the true fibre mass. The serrations are most numerous, acute, pointed and distinct in fine merino wools, as many as 2800 per in. being counted in specimens of the finest Saxony wools.

In the Leicester wool of England, on the other hand, which is a long bright staple, the serrations are not only much fewer in number, counting about 1600, but they are also less pronounced in character, so that the staple presents a smoother, less waved character. In some wools the wavy serrations are not so many as 500 per in. A similar difference may be noted in the fineness of the fibres. The finest wool has a diameter of from 25 to 25 1/2 in., whilst coarse Algerian wools may rise to a maximum diameter of about 2 in.

Other distinguishing qualities of good wool consist in uniformity and strength of fibre from freedom from tender or weak portions in its length, a condition which not unfrequently arises from ill health in the sheep, or is due to violent climatic changes. In ill-bred wool there may also be found intermixed "kemps" or dead hairs—straight, coarse, dull fibres which show considerable among the wool, and become more prominent in the manufactured and dyed goods, as they will not take dye. Wool also possesses a softness of touch and an elasticity both in the raw and manufactured condition which distinguish it from all other fibres.

In length of staple it varies very much, attaining in combing wools to a length of as much as 15 to 20 in. In dealing with wool from a practical point of view it must be recognized that it is by no means a simple body, but has a somewhat complex physical structure. Its composition in the raw state may be said to be threefold.

Thus there is the wool-yolk—what may be termed a natural impurity; the wool-fat, which is not only present in the yolk but also permeates the fibre and seems to give it its plastic and soft handle; and the cell structure proper of the fibre. The natural impurity or wool-yolk is truly a skin product and is a protector of the wool-fibre rather than part of the true fibre substance. The wool-fat also may be regarded as...
independent of the true fibrous substance, but it is well to recognize that if the wool-fat be entirely freed from the wool-fat it loses its plastic and elastic nature and is considerably damaged. In cleansing wool the true fibre mass may be disturbed and partially destroyed not only by dry but also by " wet " heat, and may be entirely disintegrated by means of alkalis, &c., with heat. The wool-fat will almost free itself from the natural impurities—the yolk, in the presence of water. This is taken advantage of in the various steeping machines placed upon the market, which partially scour the wool by means of its own yolk—principally through the potash salts present.

According to Hummel the composition of the average wool-yolk is as follows:

<table>
<thead>
<tr>
<th>Ingredient</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moisture</td>
<td>4 to 24%</td>
</tr>
<tr>
<td>Yolk</td>
<td>12 to 47%</td>
</tr>
<tr>
<td>Wool-fat</td>
<td>3 to 24%</td>
</tr>
</tbody>
</table>

The potash salts are usually recovered from the wash-water products and a marked economy thereby effected.

The natural wool-fat—popularly known as " lanoline "—may be partially freed from the wool, but is almost entirely necessary to free the wool still further from it by actually scouring the wool on either the " emulsion " or " solvent " method, in either case the action being largely physical. As previously pointed out, however, the wool must not be washed away by the action of the yolk of the fibre will lose its " nature." According to Dr Bowman, the chemical composition of the cell structure of the average wool-fibre is:

<table>

It is said to be a most complex body of which the probable formula is CaH44n NO4.1 or 2. This fat largely resolves itself into ammonia gas—whereby it derives its characteristic odour—and carbon "beads" or "cables," which serve to distinguish wool from cotton, which, upon being burnt, does not smoulder but burns with a flash and leaves no black soot. For particulars on the organic nature of the wool-fibre see FIBRES.

The bulk of the wool of commerce comes into the market in the form of fleece wool, the product of a single year's growth, cut from the body of the living animal, the first and finest clip, called lambs' wool, may be taken from the young sheep at about the age of eight months. When the animal is not shorn, it will retain the fleece of twelve or fourteen months and the wool is known as hogg or hogget, and, like lambs' wool, is fine and tapers to a point. All subsequently cut fleeces are known as wether wool, and possess relatively somewhat less value than the first clip. Fleece wool as it comes into the market is " washed "—the grease," that is, unhawed, and with all the dirt which gathers to the surface of the greasy wool present; or it is received as " washed " wool, the washing being done as a preliminary to the sheep-shearing, or, in some few cases, it is scoured and is subsequently stated as " scoured." Skin wool is that which is obtained from sheep either die or are killed. Typical skin wool is that which has been removed by a sweating process. The worst type of skin wool—technically known as " slipe "—is removed from the skins by lime, which naturally affects the handle of the wool and renders it difficult to bring into a workable condition later.

Mazamet in France is the great continental centre for skin wool.

Where there is abundance of water and other conveniences it is the practice to wash or half-wash sheep previous to shearing, and the fleece wool obtained in this way is described as wether wool or half-washed fleece. The surface of a fleece has usually a thick coating of dirt, and in the case of merino breeds the fleece surface is firmly caked together into solid masses, from the adhesion of dirt to the wool constantly moist with the exudation from the skin of the greasy yolk or " sweat," so that in an unwashed very greasy fleece 30% of weight may represent dirt, and about 40% the grease " sweat " which lubricates the fleece, while the pure wool is not more than one-third the weight of the fleece. Washing consists in washing the fleeces are panned by the side of the water, and taken one by one and held in the stream while they are washed, one man holding and the other washing. The stream is very pure in many waters, as it pollutes the stream, and it dissipates no mean amount of potash salts, valuable for manure or for other chemical purposes. Sheep washing appliances are now largely employed, the arrangement consisting of a pen into which the sheep are driven and then exposed to a strong spray of water either hot or cold, which soaks the fleece and softens the dirt. This done, they are caused to swim along a tank which narrows towards the exit, and just as they pass out of the pen they are caught and subjected to a strong douche of pure water. They should then be kept on grass land free from straw, sand, &c., so that the wool may be sheared free from vegetable matter, &c. After a few days the wool of the sheared sheep is ready for sorting or clipping.

The relative advantages of shipping wool in the gross or washed state have been fiercely debated. Although there are naturally exceptions, the superiority of greasy wool is now generally recognized. The wool, although more clean, retains its natural grease but because it is more readily judged for " yield " and its spinning qualities are, perhaps, more readily estimated.

The following list gives an idea of the yield in clean wool of the chief commercial varieties. It must be noted that roughly merino greasy wool yields about 50% clean wool and English about 76% clean wool.

A skilful shearer will clip the fleece from a sheep in one unbroken course, without the aid of a " sorter " or " stapler " or stapling which all wool undergoes for the separation of the several qualities which make up the fleece. Mechanical shears have almost revolutionized the shearing industry, a good shearer shearing from 20 to 25 sheep per day.

On the great Australian sheep stations wool clipping is one of the most important operations, largely taking the place of sorting in the English wool trade. This is no doubt due to the wonderful success which has attended the efforts of the Australian sheep breeders to breed a sheep of uniform staple through-out. Thus the fleeces as taken from the sheep are skirted and trimmed into one tag and then passed on to the " classifier " or stapler where all wool undergoes for the separation of the several classes by which it is supposed to be sorted. The shorter Australian wool not coming into the " clipper " is the basis of the superfine and ordinary clothing, &c., being more suitable for the woolen industry.

The art of sheep shearing, skirting, grading, packing and transporting has been brought up to a wonderful state of perfection in Australia, and the " get up " of the wool is usually much superior. WOOL clashing.

The woolen trade is a distinct industry, and to some extent it is in operation the world over, having its premises in the countries of the drapers of the world in the English trade. Wool clashing.

Wool sorting.

In the woolen trade short-staple wool is separated into qualities, known, in descending series from the finest to the most worthless, as picklock, prime, choice, super, head, seconds, ab and breec, and the proportions in which the higher and lower qualities are present are determined by the "class" of the fleece. In the worsted trade the classification goes, also in descending series, from fine, blue, neat, brown, breech, downright, seconds, to ab for English wools. The last three are short and not commonly used in the worsted trade. The greater proportion of good English long wool will be classified as blue, neat and brown; it is only in exceptional cases that it will be classified from 5 to 8 s. fine "fleece." The wool is scoured, dried and carded by hand, or of lower quality than breek on the other. Generally speaking, the best portion of a fleece is from the shoulders and side of the animal. The quality decreases towards the tail end of the sheep, the " britch " being frequently long, strong and irregular. The belly wool is short, worn and dirty, as is also the front of the throat, while on the head and shins the product is short, stiff and white, more like the wool of the dog and is liable to come in grey hairs. The various fleeces come " classified," and consequently are only as ruled into three or four qualities. Thus a 60's fleece may be sorted into 56's, ordinary 60's, super 60's and skirtings.

The wool to be sorted is laid out at a table or framed over with fine netting through which dust and dirt fall as he handles the wool. Fleeces which have been raw, put in bales, especially if unwashed, go into dense hard masses, which may be opened up and made to melt and dissolve. The wool and washing of the fleeces makes them pliable and easily opened up. When the fleece is spread out the stapler first divides it into two equal sides; then he picks away all straws, large burs, and tarry fragments which are visible; and then with marvellous precision and certainty he picks out his separate qualities, throwing each lot into
Photomicrographs of the most representative hairs and wools used in the textile industries.
Wool, Worsted and Woollen Manufactures

809

its allotted receptacle. Sorting is very far removed from being a mere mechanical process of selecting and separating the wool from certain parts of the fleece, because in each individual fleece qualities and proportions differ, and it is only by a patient process of trying and testing that a successful result is enabled, almost as it were by instinct, rightly to divide it up into its parts, and to produce each qualities of raw material. Cleanliness is most essential if the wool sort is to keep his health and not succumb to the dread disease known as "anthrax". Certain wools such as Persian, Van Mohair, &c., are known to be very liable to carry the anthrax bacillus, and must be sorted under the conditions imposed by government for "dangerous" wool. Non-dangerous wools are perfectly harmless from this point of view.

The washing which a fleece may have received on the live sheep is not sufficient for the ordinary purposes of the manufacturer. On the careful and comprehensive plan, which has been so aptly described, the effect of scouring should be soft and pure, both to save soap and still more because the insoluble lime soap formed in dissolving soap in hard water is deposited on the wool fibres and becomes so fixed that its removal is a laborious, and often extreme, difficulty. In former times stale urine was a favourite medium in which to soak the wool dried; but now a thing of the past, and a specially prepared potash soap there adopted determines this problem. Excess of alkali has to be guarded against, since uncombined caustic acts energetically on the wool fibre—especially in the presence of heat—and is indeed a solvent of it. A soap which will at the same time give the strength of the wool as required and the latitude in the soap solution is applied too hot.

In former days, when the method of hand-scouring prevailed, the wool to be washed was placed with hot bathed soap in the first "bowl" or vessel containing long poles kept stirring it gently about till the soap was dissolved and the separated the dirt and dissolved fat were drawn off. Another method, which is now the general process, is to pass the wool through a series of tanks of gradually increasing temperatures. This is called the "Jumbo Dryer." This consists of a large horizontal revolving cylinder which turns over the wool—a drum that turns butter—and owing to the revolution of the drum it is carried over to the other. A hot air blast follows the wool through the machine. In this and in all drying machines it is more important to get the moisture laden air away from the wool than to develop a great heat.

The dried wool may be in a partially matted condition. If so, it must be opened out and the whole material brought into a uniformly free and loose condition. This is effected in the Willey, which consists of a large revolving drum mounted in an enclosed frame. The drum is armed with ranges of powerful hooked teeth or spikes, and is geared to rotate with great rapidity, making about 500 revolutions per minute. The smaller cylinders, called rollers, are also provided, and when they are mounted over the drum and revolve more slowly in a direction contrary to the drum, the spikes of which just clear those of the drum, work the wool as the drum rotates, to a great velocity; but as it passes on, the locks are caught by the spikes of the workers, and in the contest for possessing the wool the matted locks are torn asunder till the whole wool is delivered in a light, free and disentangled condition. It is a debatable point as to whether the wool should precede scouring. Some scourers always willow prior to scouring, while others never subject the wool to this operation, which is advantageous in wool of no particular grade.

For certain classes of woollen, notably Bucilla, Buenos Aires, and other machine-made wools, a still another preparing operation is essential at this stage—that is, the removal of burrs or small persistently adherent seeds and other foreign matter which remain on the wool after scouring.

Two methods of effecting this—one chemical, the other mechanical—may be pursued. The chemical treatment consists in steeping the wool for about eighty minutes in a dilute solution of sulphuric acid (or other carbonizing agent) holding off the carbonization by the addition of urine, and then heat-drying in a temperature of about 250° F. The acid leaves the wool practically uninjured, but is concentrated on the vegetable matter, and the high heat causes it to act so that the vegetable matter becomes completely carbonized. The burrs are then brushed and the wool washed in water rendered sufficiently alkaline to neutralize any free acid which may remain.

The mechanical treatment involves the use of a solution of chloride of ammonia, a method said to be safer for the wool and less hurtful to the attendant workmen than the sulphuric acid treatment. Burs, which are the most absorbant vegetable matter, and, the high heat causes it to act so that the vegetable matter becomes completely carbonized. The burrs are then brushed and the wool washed in water rendered sufficiently alkaline to neutralize any free acid which may remain.

For English and cross-bred wools more agitation in the scouring bath may be desirable. If so, the eccentric fork action machine is employed, in which the agitation of the bath is satisfactorily controlled by the setting of the forks which propel the wool forward. An average wool will be in the scouring liquor about eight minutes, the temperature will vary from 120°F. to 110°F., and the length of bath through which it will have passed will be from 48 to 60 ft.

When interesting to the "emulsion" method of wool scouring as described above is practically universal in England. In the United States also the "solvent" method is largely in use, for the two points aimed at are quantity of production and cleanliness. Quality of wool is sacrificed to quantity, and in the case with which the agent employed—say carbon disulphide—is recovered by volatilizing and condensing, thus being used over and over again.

Botany, etc.

Wool Drying.

Botany should leave the wool-washing machine in a fit condition to be fed immediately on to the carder, provided that the first cylinders are clothed with galvanized wire. Cross-bred and English wools require scientific treatment.

The more gently and uniformly the drying can be effected the better the result attained; over-drying of wool has to be especially guarded against. By some manufacturers the wool from the drum is conveyed to the hand-scouring rollers; this which drives out so much of the moisture that the further drying is easily effected. The commonest way, however, of drying is to spread the wool away from it as possible over a framework of wire netting, under or over which is a range of steam-heated pipes. A fan blast blows air over these hot pipes, and the heated air passes up and is forced upwards through the layer of wool which rests on the pipes. If the wool is properly prepared for the purpose, the wool is spread with great evenness, it goes unequally, and at points where the hot air escapes freely it may be much over-dried. A more rapid and uniform result may be obtained by the use of the "Jumbo Dryer," a cylinder is divided into sections, the floors of which have alternate fixed and movable bars. Under the cylinder is a tubular heating apparatus, and a fan by which the air is blown up the side of the cylinder, and through all the shelves or compartments, either following or opposing the wool in its passage through the machine. The wool is introduced by a continuous feed at one side of the cylinder, and is discharged on the upper shelf, and by the action of the movable bars, which are worked by cranks, it is carried forward to the opposite end, where it passes to the next lower shelf, and so on it travels till at the extremity of the cylinder, where it is either driven out by the air and is dried and evenly dried. Another drying machine in extensive use is what is known as the "Jumbo Dryer." This consists of a large horizontal revolving cylinder which turns over the wool—as a drum turns butter—and owing to the revolution the drum it is carried over to the other. A hot air blast follows the wool through the machine. In this and in all drying machines it is more important to get the moisture laden air away from the wool than to develop a great heat.

10. The wool is dried to about 12°C. in the early part of the day and left to cool slowly. The wool is not, however, allowed to become injured from the heat of the sun or from over-drying, which would cause the wool to become brittle and ready to break. As the wool is dried, it becomes lighter and more absorbent, and the moisture is gradually driven out of it.
series of three burring rollers rotating in an opposite direction, the protruding ribs of which knock the burrs off the wool. The burrs fall on a grating and are ejected, with a certain amount of wool adhering to them, by another rotating cylinder. With wools not too burry the burrs are often located upon burring rollers, placed upon the first cylinder of the "carder," and possibly to one or other of the patent pulverizing processes applied further on in the card. In the latter process a complete pulverizing of the burrs is aimed at, and the fiber is reduced by the production of specially constructed pulverizing rollers between the first doffer and the last swift of the carding engine.

The processes hitherto described are common to merino, cross-bred or woolless and worsteds. From this point, however, differentiation starts. Wool may now be manipulated with the idea of converting it to a material suitable for worsted and worsted-like wools, in a manner which it may be said that woolen yarns are those made from short wools possessed of high felting qualities, which are prepared by the process of carding; whereby the fibres are as far as possible cross and interlaced with each other, and this carded result, though perhaps hard spun on the mule frame, form a light fluffy yarn, which suits the conditions when woven into cloth for being brought into the semi-felted condition by milling which is the distinguishing characteristic of woolen cloth. On the other hand, worsted yarns are generally made from the long lustrous varieties of wool; the fibres are so combed as to bring them as far as possible parallel to each other, the spinning of the yarn is a secretarial operation confined to this alone among all textiles, while for worsted yarn the fibres are treated, as in the case of all other textile materials, by processes designed to bring them into a smooth parallel relationship to each other.

To obtain a sliver which can be satisfactorily spun into a typical woolen thread the following operations are necessary: spinning, carding, blending, teasing, carding (two or three operations), condensing and roving. Spinning upon the woolen mule completes the series of operations described as being required to obtain the desired result. The foregoing operations the carding is perhaps the most important as it is certainly one of the most interesting. At the same time it must be fully realized that deficiencies in any one of these operations will result in a corresponding deficiency in the finished product. For instance, let an unsatisfactory combination of materials be blended together and there will be trouble in both carding and spinning. The roving operation includes the process known as roving, which is the operation of extracting the roved thread, as distinct from the condensed thread, which may occasionally be of use to the cloth constructor.

At the beginning of the 19th century woolen cloths were made of wool in some of the worsted manufactures. Woolen cloths are made from any and every kind of material, of which the following are the most important: mulls (cotton, broad-crested, English, alpaca and mohair), cotton, worsted, flax, wool (with or without worsted), wool and cotton, worsted and wool, cotton and wool in any proportion, and are not infrequently mixed with wool, cotton, worsted, and silk, &c. &c.; in fact it is said that anything which has two ends to it can be incorporated into a woolen thread and made into cloth. There are two main divisions of blending, the first one of which is that the material to be blended should be fairly finely divided. This is effected by passing each material, if necessary, through a series of rollers placed one after the other between the willow and card, and is termed "blending." The second is that the material to be blended should be finely divided. This is done by passing through a series of rollers placed one after the other between the willow and" card, and is termed "blending." Sometimes it may be that a blending of different colours of wools to obtain a definite "colour mixture" is necessary, more often it will be a blending of various materials, such as mulls, mungo, cotton, &c., to obtain a cheap blend which may be spun into a satisfactory warp or weft yarn. The blending precedes as follows: first a layer of No. 1 material—say wool—is spread over the required area on the floor; it is then run over a roller and is then passed through a roller which is turned in the opposite direction to that in which the wool was placed. The second layer, of another material—say mulls—is then added to the first layer; then another layer of wool with rather more mulls; then No. 2, then No. 1 with still more oil until all the material is built up into layers in the stack. The stack is now beaten down sideways with sticks and then the material is cut up into the desired lengths through the willow and leanthart and still further to mix it prior to carding, where the true and really fine mixing takes place. After passing through the leanthart the material is sheeted and left to mellow, this no doubt consisting in the oil applied distributing itself throughout the material. If wool and cotton are blended together the wool must be oiled first, or the blend will not work to the digitalization. The oil must be best and yellow oil—which should not turn rancid—but there are many good oils—and unfortunately many bad oils—placed on the market at a reasonable rate which the really skilled judge may use to advantage. The percentage of oil varies from 2 % to 10 %—this remark applies to the woolen and worsted trades and there is no guide as to the amount required, saving and excepting experience, observation and common sense. Automatic oiling arrangements have been applied in the woolen trade with only a moderate amount of success, the sprinkling of the oil by means of a watering-can on the stack, made as described above, still being most in favour. The oil serves to prevent the fibres from the two different materials from sticking more workable, and to bind the fibres mass together and thus prevent "fly" during the passage through the cards.

Carding was originally effected by hand, two flat boards with con-
coating of wool into the slowly retracting teeth of the doffer H, which carries it forward until angle stripper C strips the doffer, to be in its turn stripped by swift D and so on. The speeds of the cylinders are in the first place obviously dependent upon the principle of carding adopted. The greater speed always striping is (one of the factors of the fancy). As to whether the speed shall be obtained by actual revolutions or by a larger diameter of cylinder depends upon the nature of the wool to be carded and the part which each cylinder has to play in the card, and upon the question of wear of clothing and power consumed. As a rule the stripppers are all driven from a smaller circumference of the swift to obtain conveniently the requisite reduction in speed, and the slowly revolving workers are chain driven from the doffer, which indirectly recoils its motion from the swift. The principles involved in the relative inclinations of teeth are very apparent, but the principles involved in the relative densities of teeth on the respective cylinders are again much involved and little understood.

A complete scribbler or first card engine consists of a breast, or small swift, and two swifts with the accompanying workers, stripppers, fancies, doffers, &c. The wool is stripped from this card as a thin film by means of the drawing comb. This is usually weighed on the next machine—whether intermediate or condenser—a given weight giving a definite count of conditioned sliver. Should an intermediate be employed, there must be an automatic feed, taking the wool, as stripped from the last doffer of the intermediate, and feeding it perfectly evenly on to the feed sheet of the condenser. The con- denser is normally a one-swifted card, the only difference in principle being that, whereas the sliver comes out of the scribbler or inter- mediate in one breadth film, it is broken up into a number of small condenser slivers or films, each one of which ultimately be drafted or drawn out and twisted into a more or less perfect thread. These slivers—which are delicate and pith-like in substance—are wound on to light bosibins, and these bosibins are placed on the mule for the purposes of drawing and spinning operations. In the spin- ning of the elements, of course, there are my forms of condensing mechanisms such as the single-doffer, the double- doffer and the tape-condensers, but their construction is too complex to be described here. Whatever the type may be, the result is that noted above, but it should be noted that the tape enables a much finer sliver to be taken from the card than is possible with either the single- or double-doffer condenser.

The principles involved in mule spinning are comparatively simple, but the necessary machinery is very complex; indeed it is questionable if a more ingenious machine than the mule exists.

Mule spinning.

The pick-like slivers received from the card-loom must be attenuated until the correct count of yarn is obtained; they must be twisted while this attenuation or drafting is in process, otherwise they would at once break; and after being attenuated to the required fineness the requisite number of turns must be inserted. Great stress must be laid on the effects of what is termed the "drafting-twist" noted above; it is probably this simultaneous drafting and twisting which develops the most pronounced characteristics of the woolen yarn and cloth, and differentiates it entirely from the

Woolen Mules.

![Diagram](Fig. 9—Sectional View of the Woolen Mule.)

![Diagram](Fig. 10.—Plan and Section of a Preparing Box (Sheeter).)

A is the back-shaft receiving its motion from the driving shaft upon which are the pulleys. This back-shaft A drives the back- rollers B at a slow speed by the reducing train of wheels C; also the front rollers D at a much quicker speed through the train of wheels E, and the fellers F at an intermediary speed by means of the levels and screws G G. The wool is "made up" on the feed sheet and on emerging from the front rollers is built up into a layer into the tap H, which is finally broken across and feeds up at the next machine.

The yarn as delivered by the mule is "single" and will serve as warp or weft for the great bulk of woolen cloths, warp being as a rule twisted harder than weft. Sometimes for strength, sometimes for colour, however, it will be necessary to twist two or more of these single strands together. This is best effected on a twisting frame of the ring type, which consists of delivery rollers, to deliver a specified length of yarn in relationship to the turns of the spindles, and the spindles, which serve to put in twist and wind the yarn upon the bobbin or tube, which they carry by reason of the retarding action of the traveller. Fancy twists such as knops, loops, slubs, &c., may also be produced if the frame is fitted up with two pairs of delivery rollers and two or three special but simple appliances.

The essential feature of a worsted yarn is straightness of fibre. Prior to the introduction of automatic machinery there was little difficulty in attaining this characteristic, as long wool was invariably employed and the sliver was made up by hand and then twisted. With the introduction of Arkwright's water frame or "throttle" the necessity for prepared slivers became apparent, and with the later introduction of cap and mule spinning the necessity for perfectly prepared slivers has been so accentuated that the preparatory machinery has quite
WOOL, WORSTED AND WOOLLEN MANUFACTURES

exceeded the actual spinning machine in extent and complexity. To-day there are three distinct methods of producing worsted yarn. scour the slivers again, this being effected in what is termed a back-washing machine. This machine as shown in fig. 11 usually consists

**Fig. 11.—Sectional View of Back-washer.**

A are the delivering rollers, B, B are the immering rollers in the first tank, C, C are the press rollers to squeeze out superfluous liquors, D is the immering roller in the second tank, and C', C' are the press rollers for the second tank. Drying cylinders E to E'' may be arranged as "live-heat" cylinders, as secondary heated cylinders or as air drying cylinders. The roller F directs the slivers into the back rollers G of the gill-box, which in turn delivers up the slivers to the fallers H, which in turn delivers the wool to the front rollers I.

Firstly, there is the preparing and spinning of the true worsted of two scouring tanks with immersing rollers, drying cylinders, a thread, this being made from long English and colonial wool. In gill-box and oiling motion. The slivers on emerging from this machine

**Fig. 12.—Plan and Section of the Noble Comb.**

A, A is the large comb circle and B, B' the two small comb circles. The slivers are delivered by the mechanism C to the feed boxes D, being thrown across the pins of the large and small circles at position E. A stroke at F suitably directs the fringes of fibre as the circles separate and the combed fibres are taken hold of by drawing-off rollers G and G' and combined to form the "top." The brushes H, I and the metal knives J clear the small circles of the "noll." The feed knife J in conjunction with the inclined planes at K are instrumental in feeding a previously directed length of sliver over the two circles as they practically touch one another at the point E, and so the process is continued.

By the combined action of the drafting and doubling, which has taken place at each box.

Oil will have been added to the wool at the first preparing-box to cause the fibres to work well.

**Back-washing.** But the slivers during their passage through the preparing-boxes become sullied naturally, and in addition, owing to the opening out of the locks of wool, dirt which was not "got at" in the scouring now works out and further sullies the slivers. It is consequently necessary to oil the wool with a good oiling machine.
one or two more gill-boxes, prior to combing, to ensure straightness of fibre and even distribution of the lubricant.

Prior to the mechanical era wool was combed immediately after scouring; there was no preparatory process. As a matter of fact, the first combing process took the place of the processes just described and was termed “straightening,” the combing proper. Bright and Kitching, in 1792, conceived the notion of a really satisfactory mechanical comb, between 1850 and 1860, the combing operation was the limitation of the worsted trade. English wools could be satisfactorily combed by hand, and perhaps the results of combing wools by machine would have been lost. But as far as quality of result was concerned, but the cost was largely prohibitive.

The history of the colonial wool trade is inextricably bound up with the combing industry. How eventually botany wools were combed by machine and how the wool industry was thereby revolutionized can only be briefly referred to here. About 1779 Dr Edmund Cartwright invented two distinct types of combs, the vertical and the horizontal circular. The former type was developed on the continent by Helmann and others, and has only within the last five years taken its rightful place as a successful short wool comb in this country. Latter type was worked upon by Donisthorpe, Noble, Lister, the Holdens and others, and largely through the “driving” force of Lister (later Lord Masham) was made a truly practical success about the year 1850. Latter-day combs of this type may be readily grouped under three heads. The Lister or “nip” comb is specially suitable for long wools and mohair and alpaca. The Holden or square-motion comb is specially suited for short and very good quality wools. The last type, the Noble, is the most popular of all and, by a change of large and small circles, may be adapted to the combing of long, medium or short wools. As the great bulk of cross-bred and a considerable proportion of botany wool is combed upon the Noble comb a brief description is here called for. The object of all wool combing is to straighten the long fibres and to comb out from the slivers treated all the fibres under a certain length, leaving the long fibres or “top” to form the sliver which is eventually spun into the worsted yarn. The Noble comb, which so effectually accomplishes this, consists in the main of a large revolving circle A inside which revolve two smaller circles B, B’ as shown in fig. 12, each of which touches the larger comb circle at one point only. At this point the slivers of wool to be carded are firmly dabbed into the pins of both the large and small circles. As the circles continue to revolve revolving funnel into a can. The short fibres, or “noil,” are lifted out of the pins of the small circle by “noil knives.” The continuous slivers, the ends of which remain in the pins of the large circle after the drawing-off rollers have been passed, are now lifted up until these ends are above the pins, at the same time an additional length of sliver being drawn into the comb, so that, as they reach the second small circle, they are ready to be again dabbed into the pins of both circles and the combing operation repeated. Thus the combing on a Noble comb is absolutely continuous. All the movements of this machine—with the exception of the dabbing-brush motion—are circular, so that mechanically it is an almost perfect machine. As illustrating the extent of the combing industry, it is interesting to note that even the making of dabbing-brushes is a separate and by no means unimportant trade.

After combing it is usual to pass the “top” through two gill-boxes termed “finishers.” The last of these boxes, and often the first, delivers the “top” in the form of a ball, thus it is often spoken of as a “balling gill-box.” This stage marks one of the great divisions of the worsted trade, the comb taking the wool up to this point, but now handing it forward in the shape of top to the worsted spinner, who draws and spins the slivers into the most desirable worsted yarn.

English tops are usually prepared for spinning by seven or eight operations. Three of these operations are effected in gill-boxes of a somewhat similar type to the preparatory boxes, only lighter in build. The remaining four are drawing-boxes, i.e., as shown in figs. 13 and 14, they consist of back and front rollers with small carrying-rollers—not gills—to support the wool in between. Thus an English set of drawing-boxes consists of a single-can gill-box, a double-can gill-box, a two-spindle gill-box, a four-spindle drawing-box, a four-spindle weigh-box, a six-spindle drawing-box, two six-spindle finishers and three thirty-spindle rovers. About fifteen flyer frames of 100 spindles each will be required to follow this set, although the balance varies partly in accordance with the counts spun to, in this case 1/2’s English being the standard.

The object of drawing is to obtain firstly a level sliver from which an even thread may be spun, and secondly to reduce the comparatively thick top down to a relatively thin roving from which the required count of yarn may be spun. Of course parallelism of fibres must be retained throughout, so far as possible. To accomplish these objects doubling and drafting is resorted to. Thus the ends put up at the back of the above boxes will be 6, 6, 4, 3, 2 respectively, while the drafts may be 5, 6, 8, 9, 9 approximately.
Wool, Worsted and Woollen Manufactures

As the drafts markedly preponderate over the doublings, so in exactly this proportion will the sliver be reduced in thickness. The fly spinning frame is very similar to the drawing frame, consisting of back rollers, carriers and front rollers, with the necessary spindle and flyer to put twist into the yarn and to wind it upon the bobbin. From the two-spindle gill-box to the spinning frame the spindle, bobbin and flyer combination is employed with the object just mentioned. From fig. 15 the action of this combination will be clearly understood. Drafting takes place as usual between the back and front rollers, the carriers controlling the yarn between the two. On emerging from the front rollers the yarn usually passes through an eyeclet, to centre it over the centre of the spindle; it then takes a turn or two round the flyer leg, through the twistle or eyeclet on the flyer and on to the bobbin F. The flyer may be freely rotated by means of the whar J and through the spindle G upon the top of which it is screwed. The bobbin fits loosely over the spindle and rests upon the lifter plate L; this latter, being controlled by the flyer mechanism, slowly raises and lowers the bobbin during the "spin" past the fixed plane of delivery of the yarn, i.e. the eyeclet of the revolving flyer. Now, if for one moment it be considered that the bobbin may not revolve on the spindle but may be the operation of carding. On first thought it might be imagined that carding would result in broken fibres and a poor yield of top. That this is not so is evident from the fact that there is a tendency to card wools from 7 to 10 in. long. This tendency being due to the relative cheapness of carding as compared with preparing. If long wools were fed directly on to a swift, no doubt serious breakage of fibre would occur, but it is customary to place before the first swift of a worsted card a series of four opening rollers and dividers—with their accompanying "bugging rollers"—to open out the wool gradually, so that when it eventually reaches the first swift it is so opened out that further opening out instead of breakage occurs. Some carders use a breast or small swift in place of those opening rollers—mostly on account of economy. The swift is usually surrounded with four workers and strippers and is very similar to the woollen carder, save that the workers and doffer are larger, thereby effecting more of a combing action and working economically by reason of the greater wearing surface brought into play. As botany wool is usually brought directly from the wash bowl to the feed sheet of the card, it is usual to clothe the first cylinders with galvanized wire clothing. After the carding the wool is back-washed and gilled—on similar lines to English wool—and then is ready for combing. The largest combers of botany wools, Mears Isaac Holden & Co., employ the square-motion comb, in fact this comb is known in the trade as the Holden comb. Other combers, however, almost without exception employ the Noble comb with a fine "set over," i.e. fine spinning of the comb circles. After combing, the tops are "finished" by being passed

![Diagram](image)

**Fig. 15.** Section of Flyer Spindle.

C, C are the front rollers of a drawing or spinning frame, delivering the sliver to a centring board D, containing an eye for each sliver, from which the sliver passes to the flyer E and finally to the bobbin F, which rests on the lifter-plate L and is traversed up and down by this plate according to the length of the yarn employed. The flyer E is screwed on to the spindle G which is suitably held by the sheath, bolster, &c., shown at H, and in the footstep at K. The spindle is turned by a tape passing round the whar J and thence to an ordinary tin-drum.

slid up and down by the lifter motion, then, if the front rollers deliver the necessary yarn, the flyer will wrap it in successive layers upon the bobbin—but no twist will be inserted. On the other hand, if the bobbin is perfectly free upon the spindle and the front rollers cease delivering yarn, then the flyer, by means of the yarn, will pull the bobbin round at the same speed as it goes itself, and the yarn will be twisted but not wound upon the bobbin. By obtaining an action in between these two extremes both twisting and winding on to the bobbin is effected. The speed of the bobbin is suitably retarded by washers placed between it and the lifter plate, so that it just drugs sufficiently to wind up the yarn "paid out" by the front rollers. The turns per inch are in proportion to the yarn delivered and the revolutions of the flyer. Thus if, while 1 in. of yarn is delivered, the flyer revolves twelve times the turns per inch will be approximately twelve. This in brief is the theory of the spindle, flyer and bobbin action.

Wools not more than 7 in. long are usually prepared for combing by

Through two finisher-boxes, the last of which "balls" the tops ready for marketing.

Short wools are drawn and spun on very similar lines to the longer wools, save that the boxes are more in number and are in some cases lighter in build. The boxes usually employed in a botany set are as follows: two double-head can gill-boxes, two two-spindle gill-boxes, a four-spindle drawing-box, a six-spindle weigh-box, an eight-spindle drawing-box, two eight-spindle finishing-boxes, two twenty-four-spindle second finishers, three thirty-two-spindle dandy reducers, ten thirty-two-spindle dandy rovings, with ten two-hundred-spindle cap spinners to follow. The doublings as a rule are about 7, 6, 6, 5, 5, 4, 4, 2 and the drafts 5, 6, 6, 7, 7, 8, 8, 9 at the respective boxes, an endeavour as a rule being made to obtain a roving of which 40 yds. = 2 drams, this being the most convenient size for being spun into fine botany count of yarn.

Following the lead of the cotton trade endeavours have been made
to positively control the driving and speed of both flyer and bobbin in all the drawing frames of such sets as that described above. Such control is usually effected by the "cone" drawing, which system has taken its name, viz. cone drawing. In fig. 16 a usual type of cone drawing-box is illustrated. The chief advantages of this system seem to be the possibilities of employing larger bobbins, and thus obtaining greater productivity, with less power, and more particularly the production of a softer sliver with less twist, partaking more of the character of a French roving.

Spinning is usually effected upon the cap frame (see fig. 17)--a frame in which the bobbin or upon a fixed spinning frame, which is driven itself at say 5000 revolutions per minute to put in the twist, while the friction of the yarn passing on the cap which covers the bobbin enables the bobbin to wind up upon itself the yarn as delivered by the front rollers. The weakness and the strength of the cap frame is that to make reasonably hard bobbins the bobbins must be driven at a high speed.

The French are noted for a special system of worsted spinning, which producing soft botany yarns of a marked type, is worthy of more than passing criticism.

French drawing and spinning. The preparation is very similar to the preparation of botany yarns for the English system save that the order of the operations are carding, gilling, combing, back-washing and finishing. The characteristic feature of the method is the subsequent drawing and spinning. The drawing-box as shown in fig. 18 consists of back rollers, pounce or revolving gill boxes, front rollers, and a winding-up arrangement. There is no twist inserted, the slivers being treated softly and openly right away through the process. Set of this type usually consists of two gill boxes for combing, comb, back-washing machine and the two finishing gill boxes, first drawing frame, second drawing frame, the slubbing frame, the roving frame and the self-acting male. After leaving the last box as a fine soft gilt-like sliver, spinning is effected upon the worsted mule. The main differences between the worsted and the woolen mule are firstly, the worsted mule is fitted with preliminary drafting rollers, and secondly, there is little or no spindle draft. As the mule is an integral part of the machine it is natural to contrast it with the cap frame, which runs continuously. What the real advantage is it is difficult to say, but the mule in use has become from year to year of more importance, and it is pleasing to note that English spinners are at last doing a fair share of this business.

Upon whichever system the yarns have been spun it will frequently be necessary to twofold them and sometimes to three- and fourfold them. Again the fashion sometimes runs upon fancy twist, and then it is necessary to be able to produce the various styles of cloud, loop, curl, knop, &c., yawns. Twofolding is some of the most time consuming. The main difference between the cap and the ring frame is that in the latter a small beat piece of wire, termed a traverse, is necessary to be able to produce the various styles of cloud, loop, curl, knop, &c., yawns. Twofolding is some of the most time consuming. The main difference between the cap and the ring frame is that in the latter a small beat piece of wire, termed a traverse, is necessary to be able to produce the various styles of cloud, loop, curl, knop, &c., yawns. Twofolding is some of the most time consuming. Twofolding is some of the most time consuming.

The characteristic feature of wool and of wool yarns and cloths is the quality of felting. This quality has always been made use of in woolen cloths, but in worsted cloths, until comparatively recently, it has been largely ignored. To-day, however, cloths are made, ranging from the truest woolen to the typical worsted, of which it would be impossible to indicate the type of yarn employed without very careful analysis. As it is obviously impossible to give here every variety of finish...
WOOL, WORSTED AND WOOLLEN MANUFACTURES

press either hot or cold. After pressing dry steaming is frequently necessary to take away catkiness and a certain false lustre which sometimes develops. Final cutting completes the finishing operations.

Worsted cloth finishing

Of course the real difference between the woollen and the worsted cloth is due to the selection of the right material, to correct roving, spinning, and worsted fabric: finishing simply acts as a "developer" in the case of the woollen fabric, while in the case of the typical worsted fabric it simply serves as a "clearer," the cloth really being a "crabbed" worsted cloth as it leaves the loom is unsightly and in a sense may be said to be made in the finishing, although it is truer to say "developed" in the finishing: in the case of the worsted cloth it is altogether otherwise.

A cotton warp, lustre weft style, is treated altogether differently from either of the foregoing. It is first crabbed, then steamed, then scoured and dried, then singed by being passed over a red-hot copper plate or through gas jets, then scoured again, and if necessary dyed. It is then washed, dried, then tentered and finally pressed. Of course these operations are applied with discrimination to the varied styles of goods made in theBradford district. Thus, for instance, the finishing of an "Italian" may be considerably varied from the foregoing, being more complex, while other styles, such as plain all-wool goods, are treated very simply.

It will be gathered from the foregoing remarks that the varieties of woollen cloth are extremely many and very different in character. This is perhaps realized best by contrasting a heavy melton cloth weighing 24-30 oz. per yard with a fine mohair texture weighing 2-3 oz. per yard. None the less the remarkable variety of goods makes any complete classification impossible.

A rough Harris tweed, for example, contrasts strangely with a smooth fine wool Italian. Of course these differences are not created in any one process or merely by the selection of the raw material or yarn. Every process of manufacture must be directed to attain the desired end, and it is well to realize that huge businesses have been built up upon what, by the outsider, would only ever be regarded as unimportant details.

The principal styles of woollen cloth are tweeds, meltons, Venetians, beavers, doeskins, buckskins, cassimères and diagonals. The largest class is the tweeds, as this ranges from very expensive coats and trouserings to the cheaper styles made of the re-manufactured materials. Tweeds for ladies wear also form a large class.

The principal styles of worsted cloths are coatings and trouserings, delaines, voiles, merinos, cashmeres, lastings, crépe-de-chines, amazons, Orles, lustres of various types (plain and figured), alpacas, Italians, moreens, &c., &c. Many of these are made entirely of worsted yarns, but others are compounded so far as material or yarn is concerned.

Wool tops

The woollen industry of England, considered as the fostering care of several of the English monarchs— notably Edward III. and James I.—it was but natural to expect that favours would be shown to it, and Cropred 1675 the fostering care of several of the English monarchs— notably Edward III. and James I.—it was but natural to expect that favours would be shown to it, and Cropred 1675 the fostering care of several of the English monarchs— notably Edward III. and James I.—it was but natural to expect that favours would be shown to it, and Cropred 1675 the fostering care of several of the English monarchs— notably Edward III. and James I.—it was but natural to expect that favours would be shown to it, and Cropred 1675 the fostering care of several of the English monarchs— notably Edward III. and James I.—it was but natural to expect that favours would be shown to it, and Cropred 1675

Lustre finishing

Of course the real difference between the woollen and the worsted cloth is due to the selection of the right material, to correct roving, spinning, and worsted fabric: finishing simply acts as a "developer" in the case of the woollen fabric, while in the case of the typical worsted fabric it simply serves as a "clearer," the cloth really being a "crabbed" worsted cloth as it leaves the loom is unsightly and in a sense may be said to be made in the finishing, although it is truer to say "developed" in the finishing: in the case of the worsted cloth it is altogether otherwise.

WOOLLET, WILLIAM (1735-1785), English engraver, was born at Maidstone, of a family which came originally from Holland, on the 15th of August 1735. He was apprenticed to John Timmis, an engraver in Fleet Street, London, and studied in the St Martin's Lane academy. His first important plate was from the "Niobe" of Richard Wilson, published by Boydell in 1761, which was followed in 1763 by a companion engraving from the "Phaethon" of the same painter. After West he engraved his fine plate of the "Battle of La Hogue" (1781), and the "Death of General Wolfe" (1776), which is usually considered Woollett's masterpiece. In 1775 he was appointed engraver-in-common to George III.; and he was a member of the Incorporated Society of Artists, of which for several years he acted as secretary. He died in London on the 23rd of May 1785.

In his plates, which unite work with the etching-needle, the dry-point and the graver, Woollett shows the greatest richness and variety of execution. In his landscapes the rendering of water is particularly excellent. In his portraits and historical subjects the rendering of flesh is characterized by great softness and delicacy. His works rank among the great productions of the English school of engraving. Louis Fagan, in his Catalogue Raisonné of the Engraved Works of William Woollett (1885), has enumerated 125 plates by this engraver.

WOOLMAN, JOHN (1720-1772), American Quaker preacher, was born in Northampton, Burlington county, New Jersey, in August 1720. When he was twenty-one he went to Mount Holly, where he was a clerk in a store, opened a school for poor children and became a tailor. After 1743 he spent most of his time as an itinerant preacher, visiting meetings of the Friends in various parts of the colonies. In 1772 he sailed for London to visit Friends in the north of England, especially Yorkshire, and died in York of smallpox on the 7th of October. He spoke and wrote against slavery, refused to draw up wills transferring slaves, induced many of the Friends to set their negroes free, and in 1760 at Newport, Rhode Island, memorialized the Legislature to forbid the slave trade. In 1775 at Walloosing (now Wyasung) on the Susquehanna, he preached to the Indians; and he always urged the whites to pay the Indians for their lands and to forbid the sale of liquor to them.

Woolman wrote Some Considerations on the Keeping of Negroes (1754; part ii., 1756): Considerations on Pure Wisdom and Human Policy, on Labor, on Schools, and on the Right Use of the Lord's Outward Gifts (1768); Considerations on the True Harmony of Mankind, and How it is to be Maintained (1770); and A Word of Remembrance and Caution to the Rich (1793); and the most important of his writings, The Journal of John Woolman's Life and Travels in the Service of the Gospel (1775), which was begun in his thirty-sixth year and was continued until the year of his death. The best-known edition is that prepared, with an introduction, by John G. Whittier in 1871. The Works of John Woolman appeared in two parts at Philadelphia, in 1773-175, and have often been republished; a German version was printed in 1852.

Woolner, Thomas (1825-1892), British sculptor and poet, was born at Hadleigh, Suffolk, on the 17th of December 1825. When a boy he showed talent for modelling, and when barely thirteen years old was taken as an assistant into the studio of William Behnes, and trained during four years. In December 1842 Woolner was admitted a student in the Royal Academy, and in 1843 exhibited his "Eleanor sucking Poison from the Wound of Prince Edward." In 1844, among the competitive works for decorating the Houses of Parliament was his life-size group of "The Death of Boadicea." In 1846 he had at the Royal Academy a graceful bas-relief of Shelley's "Alastor." Then came (1847) "Feeding the Hungry," a bas-relief, at the Academy; and at the British Institution a brilliant statue
of "Puck" perched upon a toadstool and with his toe rousing a frog. "Eros and Euphrosyne" and "The Rainbow" were seen at the Academy in 1848.

Woollner became, in the autumn of 1848, one of the seven Pre-Raphaelite Brethren, and took a leading part in The Germ (1850), the opening poem in which, called "My Beautiful Lady," was written by him. He had already modelled and exhibited portraits of Carlyle, Browning and Tennyson. Unable to make his way in art as he wished, Woollner in 1852 tried his luck as a gold-digger in Australia. Failing in this, he returned to England in 1857, where during his absence his reputation had been increased by the creation of a series of "Love" as a damned lost in a damp day. He carried his second portraits of Carlyle, Tennyson and Browning, the figures of Moses, David, St John the Baptist and St Paul for the pulpit of Llandaff cathedral, the medallion portrait of Wordsworth in Grasmere church. the likenesses of Sir Thomas Fairbairn, Rajah Brooke of Sarawak, Mrs Tennyson, Sir W. Hooker and Sir F. Palgrave. The fine statute of Bacon in the New Museum at Oxford was succeeded by full-size statues of Prince Albert for Bacon, Macaulay for Cambridge, William III. for the Houses of Parliament, London, and Sir Bartle Frere for Bombay; busts of Tennyson, Dr Johnson, Trinity College Cambridge, Dr Whewell and Jerusalem Harrow; statues of Lord Lawrance for Calcutta, Queen Victoria for Birmingham, Field for the Law Courts, London, Palmerston for Palace Yard, the noble colossal standing figure of Captain Cook that overlooks the harbour of Sydney, New South Wales, which is Woollner's masterpiece in that class; the recumbent effigy of Lord F. Cavendish (murdered in Dublin) in Cartmel church, the seated Lord Chief Justice Whitside for the Four Courts, Dublin, and John Stuart Mill for the Thames Embankment, London; Landseer, and "Bishop Jackson for St Paul's, Bishop Fraser for Manchester, and Sir Stamford Raffles for Singapore. Among Woollner's busts are those of Newman, Darwin, Sedgwick, Huxley, Cabden, Professor Lushington, Dickens, Kingsley, and Sir William Gull, besides the repetition, with variations, of Gladstone for the Bodleian, Oxford, and Mansion House, London, and Tennyson. The last was acquired for Adelaide, South Australia. Woollner's poetic and imaginative sculptures include "Elaine with the Shield of Lancetol," three fine panels for the pedestal of the Gladstone bust at Cambridge, the noble and original "Moses" which was commissioned in 1861 and is on the apex of the gable of the Museum of Natural History, Assisi; and, for many years, on the gable of the Senate House. A series of "Sibyl of Egypt," "Cyclops" and "The Tale of an Englishman," 1870. The Discourses, comprising "Nelly Dale" (1886) and "Children," has been elected professor of sculpture in the Royal Academy, Woollner began to prepare lectures, but they were never delivered, for he resigned the office in 1870. He died suddenly on the 7th of October 1892, and was buried in the churchyard of St Mary's, Hendon.

WOOLSEY—WOOLSTON

WOOLSEY, THEODORE DWIGHT (1801–1889), American educationalist, was born in New York City on the 31st of October 1801. He was the son of a New York merchant, a nephew of Timothy Dwight, president of Yale, and a descendant of Jonathan Edwards. He graduated at Yale in 1820; was a tutor at Yale in 1823–1825; studied Greek at Leipzig, Berlin and Bonn in 1827–1828; became professor of Greek language and literature at Yale in 1831; and was elected president of the college and resigned the presidency of the college in 1846. He resigned the presidency in 1874, and died on the 1st of July 1889 in New Haven. During his administration the college grew rapidly, the scientific school and the school of fine arts were established, and the scholarly tone of the college was greatly improved. Much of his attention in his last years was devoted to the American commission for the revision of the authorized version of the New Testament, of which he was chairman (1871–1881). He prepared excellent editions of Alcestis (1834), Antigone (1835), Prometheus (1837) and Gorgias (1843). He published several works of sermons he wrote for the New Englander, in which he was a founder, for the North American Review, for the Princeton Review and for the Century, and his Introduction to the Study of International Law, designed as an Aid in Teaching and in Historical Studies (1860) and his Divorce and Divorce Legislation (1882) were among many editions. He also wrote Political Science, or the State Theoretically and Practically Considered (1871), and Communism and Socialism, in their History and Theory (1886).

His son, THEODORE SALISBURY WOOLSEY (b. 1852), became professor of international law at Yale in 1875. He was one of the founders of the Yale Review (1865), a continuation of the New Englander, and is the author of America's Foreign Policy (1892).

WOOLSTON, THOMAS (1669–1731), English deist, born at Northampton in 1669, the son of a "reputable tradesman," entered Sidney College, Cambridge, in 1685, studied theology, took orders and was made a fellow of his college. After a time, by the study of Origen, he became possessed with the notion of the importance of an allegorical interpretation of Scripture, and advocated its use in the defence of Christianity both in his sermons and in his first book, The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles Revised (1717). In many years he published in 1718 the publication of letters and pamphlets in advocacy of his notions, with open challenges to the clergy to refute them, brought him into trouble. It was reported that his mind was disturbed, and he lost his fellowship. From 1721 he lived for the most part in London, on an allowance of £50 a year from his brother and other presents. His influence on the course of the deistical controversy began with his book, The Moderator between an Infield and an Apostate (1725, 5th ed. 1729). The "infield" intended was Anthony Collins (q.e.), who had maintained in his book allied to that the New Testament is based on the Old, and that not the literal but only the allegorical sense of the prophecies can be quoted in proof of the Messiahship of Jesus; the "apostate" was the clergy who had forsaken the allegorical method of the fathers. Woolston denied absolutely the proof from miracles, called in question the fact of the resurrection of Christ and other miracles of the New Testament, and maintained that they must be interpreted allegorically, or as types of spiritual things. Two years later he began a series of Discourses on the same subject, in which he applied the principles of his Moderator to the miracles in France: the Discourses, comprising copies of which were said to have been sold, were six in number, the first appearing in 1727, the next five 1728–1729, with two Defences in 1729–1730. For these publications he was tried before Chief Justice Raymond in 1729 and sentenced (November 28) to pay a fine of £25 for each of the first four Discourses, with imprisonment till paid, and also to a year's imprisonment and to give security for his good behaviour during life. He failed to find this security, and remained in confinement until his death on the 21st of January 1731.
WOOLWICH—WOONSOCKET

Upwards of sixty more or less weighty pamphlets appeared in reply to his "Moderator and Discourses." Amongst the abler and most popular of them may be mentioned Z. Pearce's "The Miracles of Jesus Vindicated" (1779); T. Sherlock's "The Tryal of the Witnesses of the Resurrection of Jesus" (1779, 13th ed., 1783); and N. Lardner's "Vindication of Three of Our Saviour's Miracles" (1779), Lardner being one of those who did not approve of the prosecution of Woolston (see Lardner's "Life by Kippis, in Lardner's "Works," vol. 1.).

See Life of Woodston prefixed to his "Works" in five volumes (London, 1752; Memoirs of Life and Writings of William Whiston (London, 1749, pp. 231-335); Appendix to Vindication of the Miracles of our Saviour, etc., by J. Ray (2nd ed., 1724); J. Cairns, "Unicity in the Eighteenth Century" (1880); Sayous, Les Déserts anglais (1882); and the article DEISM, with its bibliography.

WOOLWICH, a S.E. metropolitan borough of London, England, bounded W. by Greenwich and Lewisham, and extending N., E., and S., to the boundary of the county of London. Pop. (1901) 171,178. Area, 8276-6 acres. Its N. boundary is in part the river Thames, but it includes two separate small areas on the N. bank, embracing a portion of the district called N. Woolwich. The area is second to that of Wandsworth among the metropolitan boroughs, but is not wholly built over. The most populous part is that lying between Shooter's Hill Road (the boundary) and S.E. Greenwich Road, and it was among this part that the 1815 battle of Waterloo was fought and the elevation of 418 ft. at Shooter's Hill to the river level. To the E. lies Plumstead, with the Plumstead marshes bordering the river to the N., and in the S. of the borough is Eltham. A large working population is employed in the Royal Arsenal, which occupies a large area on the river-bank, and includes the Royal Gun Factory, Royal Carriage Department, Royal Laboratory and Building Works Department. The former Royal Dockyard was made over to the War Office in 1872 and converted into stores, wharves for the loading of troopships, &c. The Royal Artillery Barracks, facing Woolwich Common, originally erected in 1775, has been greatly extended at different times, and consists of ranges of brick building, including a church in the Italian Gothic style erected in 1863, a theatre, and a library in connexion with the officers' mess-room. Opposite the barracks is the memorial to the officers and men of the Royal Artillery who fell in the Crimean War, a bronze figure of Victory cast out of cannon captured in the Crimea. Near the barracks is the Royal Artillery Institution, with a fine museum and a lecture hall. On the W. of the barracks field is the Royal Military Repository, within the enclosure of which is the Rotunda, originally erected in St James's Park, London, in 1775, for the preservation of cannon and shortly afterwards transferred to its present site. It contains models of the principal dockyards and fortifications of the British empire, naval models of all dates, and numerous specimens of weapons of war from the remotest times to the present day. On the Common is the Royal Military Academy, a castellated building erected from the design of Sir J. Wyattville in 1802, where cadets are trained for the artillery and engineer services. There are a number of other barracks. At the S.E. extremity of the Common is the Herbert Military Hospital. Among several military memorials, one in the Academy grounds was erected to the Prince Imperial of France, for two years a student in the Academy. Other institutions include the Woolwich Polytechnic and the Brook fever hospital, Shooter's Hill. The parish church of St Mary Magdalene was rebuilt, in 1766-1770, near the site of the old one dating from before the 12th century. Woolwich Common (142 acres) is partly within this borough, but mainly in Greenwich. South of it is Eltham Common (37 acres), and in the E. of the borough are Plumstead Common (103 acres) and Bostall Heath (134 acres). Behind the Royal Military Academy is a block of flats, "Battersea Hill," with a "tower" surmounted by a clock. Near Woolwich Common there are brick and tile kilns and sand and chalk pits, and there are extensive market-gardens in the locality. The parliamentary borough of Woolwich returns one member. The borough council consists of a mayor, 6 aldermen, and 60 councillors. It was only by the London Government Act 1890 that Woolwich was brought into line with other London districts, for in 1855, as it had previously become a local government district under a local board, it was left untouched by the Metropolitan Act 1853.

Woolwich (Wulwich) is mentioned in a grant of land by King Edward in 961 to the abbey of St Peter at Ghent. In Domesday the manor is mentioned as consisting of 63 acres of land. The Roman Watling Street crossed Shooter's Hill, and a Roman cemetery is supposed to have been in the site of the Royal Arsenal, numerous Roman urns and fragments of Roman pottery having been dug up in the neighbourhood. Woolwich seems to have been a small fishing village until in the beginning of the 16th century it rose into prominence as a naval dockyard. Some of the first of the naval dockyards were built at Woolwich in the reign of Henry VIII., but it was with the purchase by Henry VIII. of two parcels of land in the manor of Greenwich, that the foundations of the town's prosperity was laid, the launching of the "Harry Grâce de Dieu," of 1000 tons burden, making an epoch in its history. Woolwich remained the chief dockyard of the English navy until the time of the Great War. In the south part of the town is the Royal Navy's dockyard, and the military branch of the ordnance was established here. It was not until 1805, however, that the collection of establishments at Woolwich became the Royal Arsenal.

WOOLWICH-AND-READING BEDS, in geology, a series of argillaceous and sandy deposits of lower Eocene age found in the London and Hampshire basins. By the earlier geologists this formation was known as the "Plastic Clay" so called by T. Webster in 1816 after the Argile plastique of G. C. F. D. Cuvier and A. Brongniart. It was called the "Mottled Clay" by J. Prestwich in 1846, but in 1853 he proposed the name "Woolwich clay" for this formation. The name Woolwich clay was first proposed by a French geologist, and terms were not applicable to the different local aspects of the series.

Three distinct types of this formation are recognized: (1) The Reading type, a series of lenticular mottled clays and sands, here and there with pebbly beds and masses of fine sand converted into quartzite. These beds are generally unfoliaceous. They are found in the southern W. portions of the London Basin and in the Hampshire Basin. (2) The Woolwich type, grey clays and pale sands, often full of estuarine shells and in places with a well-marked oyster bed. At various points in the shell-bearing beds, the type is known as the "Reading Beds" or the "Reading Beds and Chalk," but the former term is more generally applicable. Among the fossils occurring in it are the remains of the Logate of the Eocene period. In the Woolwich beds occur in W. Kent, the E. borders of Surrey, the borders of E. Kent, in S. Essex and at Newhaven in Sussex. (a) A third type consisting of light-coloured clays, and these are the woolly beds, the sands occurring in the Woolwich beds. Of the Woolwich type, it rests on the Thanet beds and it is argillaceous with rounded flint pebbles; where it rests on the Chalk it is clayey with the flinty gravel being in great abundance. Except in the Hampshire basin the Woolwich-And-Reading beds usually rest on the Thanet beds, but they are found on the Chalk near Bromley, Charlton, Hurstmonceux, Hertford, Reading, &c. In Dorsetshire the Reading beds appear on the coast at Studland Bay and at other points inland. The "Hertfordshire Pudding Stone" is a well-known rock from near the base of the formation; it is a flint pebble conglomerate in a siliceous matrix. The fossils, estuarine, freshwater and marine in the Woolwich beds, are those of the British marine Corbicula, C. &c., and freshwater Nuculina, Planorbis lentus, Planorbis lentiscus, Melania (Melanaria) insignata, Neritina globulus, and the remains of turtles, crocodiles, and various other forms. The Woolwich-And-Reading beds consist of indurated clays, flint fragments and coarse pottery and occasionally firebricks have been made from the clay beds in this formation.

WOONSOCKET, a city of Providence county, Rhode Island, U.S.A., on both banks of the Blackstone river, about 16 m. N. by W. of Providence. Pop. (1900) 28,304; (1905, state census) 32,106 (17,734 foreign-born, including 8939 French Canadians and 1360 Irish); (1910) 35,125. Woonsocket is served by the New York, New Haven & Hartford railway and by an interurban electric line. Among its institutions are the Sacred Heart College and the Harris Institute Public Library, founded (1863) by Edward Harris, a local manufacturer. Woonsocket has ample
WOOSTER—WORCESTER, EARL OF

water power from the Blackstone river and its tributaries, the Mill and the Peters rivers. The value of its factory products in 1903 was $10,260,537. Worsted and woollen yarns are manufactured in Woosocket by the French and Belgian processes. Other manufactures are cotton goods and yarns, rubber goods, clothes wringers, silks, bobbins and shuttles, and foundry products.

The first settlement in the vicinity was made apparently about 1666 by Richard Arnold, who at about that time built a saw-mill on the bank of the Blackstone river. Woosocket was set off from Cumberland and was incorporated as a township in 1867; was enlarged by the addition of a part of Smithfield in 1871, and was chartered as a city in 1888.

WOOSTER, a city and the county-seat of Wayne county, Ohio, U.S.A., on Killbuck Creek, about 50 m. S. by W. of Cleveland. Pop. (1900) 6055 (407 foreign-born); (1910) 6136. Wooster is served by the Baltimore & Ohio and the Pennsylvania railways. It is the seat of the university of Wooster (co-educational; Presbyterian; founded in 1866 and opened in 1870), which in 1900 had 37 instructors and 1547 students. The Ohio Agricultural Experiment Station is in the city, which also has various manufactures. Wooster was laid out in 1808, was incorporated as a town in 1817, and became a city of the second class in 1869. It was named in honour of General David Wooster (1730-1777), who was killed in the War of Independence.

WOOTTON BASSET, a market town in the N. parliamentary division of Wiltshire, in the shire, county, and diocese of Salisbury, and the deanery of Marlborough, in the archdeaconry of Great Western shire. Pop. (1901) 2200. It is the junction of the direct railway (1903) between London and the Severn tunnel with the main line of the Great Western system. The town has large cattle markets and an agricultural trade.

Wotton Bassett (Wodeton, Wolton) was held in the reign of Edward the Confessor by one Levenod, and after the Norman Conquest was included in the fief of Miles Crispin. About a century later the manor was acquired by the Basset family. The town received its first charter from Henry VI., and returned members as a parliamentary borough from 1446-1447 until the passing of the Reform Act 1832. In 1551 Elian Bassett granted to the town a market on Tuesday and two fairs each to last two days, at the feasts of St George the Martyr and the Conception of the Virgin. In 1679 the town received a charter from Charles II., and the corporation consisted of a mayor, two aldermen and 12 capital burgesses, until abolished by the Municipal Corporations Act of 1886, under which the property is now vested in seven trustees, one of whom is appointed by the lord of the manor, and there are also two aldermen and four elected members. In 1856 fairs were instituted on the Tuesday before the last of April and on the Thursday before the 11th of October, which is 10th of October in the town calendar. Each fair begins at sunrise, and a large cattle market is held on the first Wednesday of every month. The manufacture of broadcloth was formerly carried on, but is now entirely decayed.

WORCESTER, EARS AND MARQUESSES OF. Urrso de Abitot, constable of Worcester castle and sheriff of Worcestershire, is erroneously said to have been earl of Worcester in 1076. Waleraud de Beaumont (1104-1160), count of Meulan in France, a partisan of King Stephen in his war with the empress Matilda, was probably earl of Worcester from 1136 to 1145. He was deprived of his earldom, became a crusader and died a martyr. From 1397 to 1403 the earldom was held by Sir Thomas Percy (c. 1343-1403), a brother of Henry Percy, 1st earl of Northumberland. Percy served with distinction in France during the reign of Edward III.; he also held an official position on the Scottish borders, and under Richard II. he was the admiral of a fleet. He deserted Richard II. in 1399, and was employed and trusted by Henry IV.; but in 1403 he joined the other Percys in their revolt; he was taken prisoner at Shrewsbury, and subsequently beheaded, the earldom becoming extinct. The title of earl of Worcester was revived in 1421 in favour of Richard Beauchamp, Lord Abergavenny, but lapsed on his death in 1422. The next earl was John Tiptoft, or Tibetot, a noted Yorkist leader during the wars of the Roses, who was executed in 1470 (see below). On the death of his son, Edward, in 1485 the earldom reverted to the crown.

In February 1514 the earldom was bestowed by Henry VIII.

On Charles Somerset (c. 1460-1526), a bastard son of Henry Beaufort, duke of Somerset. Having married Elizabeth, daughter of William Herbert, earl of Huntingdon, he was styled Baron Herbert in right of his wife, and in 1506 he was created Baron Herbert of Raglan, Chepstow and Gwent. He was chamberlain of the household to Henry VIII. His son Henry, 2nd earl (c. 1495-1548), obtained Tintern Abbey after the dissolution of the monasteries. The title descended in direct line to Henry, the 5th earl (1577-1649), who advanced large sums of money to Charles I. at the outbreak of the Great Rebellion, and was created marquess of Worcester in 1643.

Edward Somerset, 2nd marquess of Worcester (1601-1667), is better known by the title of earl of Glamorgan, this earldom having been conferred upon him, although somewhat irregularly, by Charles I. in 1644. He became very prominent in 1645 in connexion with Charles's scheme for obtaining military help from Ireland and abroad, and in 1645 he signed at Kilkenny, on behalf of Charles, a treaty with the Irish Roman Catholics; but the king was obliged by the opposition of Ormonde and the Irish loyalists to repudiate his action. Under the Commonwealth he was formally banished from England and his estates were seized. At the Restoration his estates were restored, and he claimed the dukedom of Somerset promised to him by Charles I., but he did not obtain this, nor was his earldom of Glamorgan recognized. He died in 1645, and his son, Edward, 3rd earl, was created in 1660 the earldom of Effingham.

His only son Henry (1660-1730), the 3rd marquess, abandoned the Roman Catholic religion, and was a prominent member of the Commons. He was but was privately loyal to Charles II., who in 1682 created him duke of Beaufort. As the defender of Bristol, the duke took a considerable part in checking the progress of the duke of Monmouth in 1685, but in 1688 he surrendered the city to William of Orange. He inherited Badminton, still the residence of the dukes of Beaufort, and died there on the 21st of January 1700. The Worcester title was henceforth merged in that of Beaufort (q.v.). Henry, the 7th duke (1792-1853), was one of the greatest sportmen of his day, and the Badminton hunt owed much to him and his successors, the 9th duke (1824-1891), who are so noted.

WORCESTER, JOHN TIPTOPT, EARL OF (1427-1470), was son of John Tiptoft (1375-1443), who was Speaker of the House of Commons in 1406, much employed in diplomacy by Henry V., a member of the council during the minority of Henry VI., and created Baron Tiptoft in 1426. The younger Tiptoft was educated at Oxford, where John Rou says that he was one of his fellow-students; he is stated to have been a member of Balliol College. He married Cicely, daughter of Richard Neville, earl of Salisbury, and widow of Henry Beauchamp (d. 1449), duke of Warwick. In 1449 he was created earl of Worcester. His wife died in 1450, but he continued the association with the Yorkist party. During York's protectorate he was treasurer of the exchequer, and in 1456-1457 deputy of Ireland. In 1457 and again in 1459 he was sent on embassies to the pope. He was abroad three years, during which he made a pilgrimage to Jerusalem; the rest of the time he spent in Italy, at Padua, where he studied law and Latin; at Ferrara, where he made the acquaintance of Guarino of Verona; and at Florence, where he heard the lectures of John Argyropoulos, the teacher of Greek. He returned to England early in the reign of Edward IV., and on the 7th of February 1462 was made constable of England. In this office he had at once to try the earl of Oxford, and judged him by "lawe padowe" (sic. of Padua; Warkworth, 5). In 1463 he commanded at sea, without success. In the following year as constable he tried and condemned Sir Ralph Grey and other Lancastrians. In 1467 he was again appointed deputy of Ireland.
WORCESTER, W.—WORCESTER 821

During a year's office there he had the ear of Desmond attainted, and cruelly put to death the earl's two infant sons. In 1479, as constable, he conducted twenty of Warwick's adherents, and kept the earl, "for which ever afterwards the earl was greatly hated among the people, for their disproportionate death that he used contrary to the law of the land" (Warkworth, 6). On the Lancastrian restoration Worcester fled into hiding, but was discovered and tried before the earl of Oxford, son of the man whom he had condemned in 1462. He was executed on Tower Hill on the 18th of October 1479.

Worcester was detested for his brutality and abuse of the law, and was called "the butcher of England" (Fabyan, 650). More than any of his contemporaries in this country he represents the combination of culture and cruelty that was distinctive of the Italians of the Renaissance. Apart from his moral character he was an accomplished scholar, and a great purchaser of books in Italy, many of which he presented to the university of Oxford.

He translated Cicero's De amicitia and Buonaccorso's Declara
tion of Nobleness, which were printed by Caxton in 1481. Caxton in his epilogue eulogized Worcester as superior to all the temporal lords of the kingdom in moral virtue as well as in science. Worcester is also credited with a translation of Caesar's Commentaries printed in 1530. His ordinances for justes and triumphs, made in 1473, were engraved in 1485 and printed in Harring
ton's Nuremberg Chronicle. Worcester was a patron of the early English humanist John Free, and his Italian friends included, besides those already mentioned, Lodovico Carbo of Ferrara, and the famous Florentine bookseller Vespasiano da Bisticci.

AUTHORITIES.—For Worcester's English career see especially the contemporary accounts in Three Fifteenth Century Chronicles, Collections of a London Citizen (Gregory's Chronicle), and Wark
worth's Chronicle—all three published by the Camden Society. Vespasiano da Bisticci gave an account of him in his Vita di uomini illustri, i. 322-328. See also, for the Life of Caxton, i. 79, ii. 73. (C. L. K.)

WORCESTER, WILLIAM (c. 1416-1482), English chronicler, was a son of William of Worcester, a Bristol citizen, and is some
times called William Botoner, his mother being a daughter of Thomas Botoner. He was educated at Oxford and became secretary to Sir John Fastolf. When the knight died in 1439, Worcester, although one of his executors, found that nothing had been bequeathed to him, and with one of his colleagues, Sir William, he took action to contest the will. How
ever, an amicable arrangement was made and Worcester obtained some lands near Norwich and in Southwark. He died about 1482. Worcester made several journeys through England, and his Itinerarium contains much information. The survey of Bristol is of the highest value to antiquaries. Portions of the work were printed by James Nasmith in 1778, and the part relating to Bristol is in James Dallaway's Antiquities of Bristol (Bristol, 1834).

Worcester also wrote Annales rurum Angliae, a work of some value for the history of England under Henry VI. This was published by T. Hearne in 1728, and by Joseph Stevenson for the Rolls series with his Letters and Papers Illustrative of the Wars of the English in France during the Reign of Henry VI. (1864). Stevenson also printed here collections of papers made by Worcester respecting the wars of the English in France and Normandy. Worcester's other writings include Don Syncellus and the Churches of the Seven Bells. See the Past and Present Letters edited by J. Gairdner (1904); and F. A. Gasquet, An Old English Bible and other Essays (1897).

WORCESTER, a town of the Cape province, S. Africa, 100 m. by rail (58 in a direct line) N.E. of Cape Town, and the starting point of the railway to Mossel Bay and Port Elizabeth. Pop. (1904) 7585. It lies in the Little Karroo, about 800 ft. above the sea at the foot of the Hex River mountains. Tanning and wagon-building are among the principal industries, but the chief wool growing country extends to the east, and is connected by a large wine and brandy producing district in the province. In Brandvlei, 9 m. S., near the Breede river are thermal springs with a temperature of 145° F.

WORCESTER, an episcopal city and county of a city, munici
pal, parliamentary, and county borough, and county town of Worcestershire, England, on the river Severn, 120 m. W.N.W. of London. Pop. (1901) 46,624. It is served by the Great Western railway and by the Bristol-Birmingham line of the Midland railway. Branches of the Great Western diverge to Malvern and Hereford, and to Leominster. Worcester lies mainly upon the left (E.) bank of the Severn, which is here a broad and placid river, the main part of the city lying on a ridge parallel with its banks. The city is governed by a mayor, 12 aldermen and 36 councillors. Area 3422 acres.

The cathedral church of Our Lord and the Blessed Virgin Mary is beautifully placed close to the river. The site was founded by the advice of Archbishop Theodore of Canterbury about 679 or 680, though, owing to the opposition of the bishop of Lichfeld it was not finally established till 780. In its formation the tribal division was followed, and it contained the people of the Hwicas. Nunnery was founded in 683 with two canons, was re-founded by Bishop Oswald into the monastery of St Mary. The canons became monks, and in 683 Oswald finished the building of a new monastic cathedral. After the Norman Conquest the saintly bishop of Worcester, Wulfstan, was the only English prelate who was left in possession of his see, and it was he who first undertook the building of a great church of stone according to the Norman pattern. Of the work of Wulf
stan, the outer walls of the nave, aisles, a part of the walls of the transepts, some shafts and the crypt remain. The crypt (1052) is one of the finest basilical crypts in England, the others being in Winchester, Gloucester, and York cathedrals. Wulfstan's building seems to have extended no farther than the transepts, but the nave was continued, though much of it was destroyed by the fall of the central tower in 1175. The two W. bays of the nave date from about 1160. In 1203 Wulfstan, who had died in 1095, was canonized, and on the completion and dedication of the cathedral in 1218, his body was placed in a shrine, which became a place of pilgrimage, and thereby brought wealth to the monks. They devoted this to the building of a lady chapel at the E. end, extending the building by 50 ft.; and in 1247 was begun the choir and apse, with the splendid Early English style. The nave was remodelled in the 14th century, and, excepting the W. bays, show partly Decorated but principally early Perpendicular work. The building is cruciform, and is without aisles in the transepts, but has secondary choir-transcets. A Jesus chapel (an uncommon feature) opens from the N. nave aisle, from which it is separated by a very beautiful modern screen of stone, in the Perpendicular style. Without, the cathedral is severely plain, with the exception of the ornate tower, which dates from 1374, and is 126 ft. in height. The principal dimensions of the cathedral are—extreme length 253 ft. (nave 170 ft., choir 180 ft.), extreme width 115 ft. (choir 78 ft.), height of nave 68 ft. The monastic remains lie to the S. The cloisters are of Perpendicular work engulfed upon Norman walls, being entered from the S. through a fine Norman doorway.

In them the effect of the warm red sandstone is particularly beautiful. An interesting Norman chapter house adjoins them on the E., its Perpendicular roof supported on a central column, while on the S. lies the Refectory, a fine Decorated room (1372) now devoted to the uses of the Cathedral School.

There are also picturesque ruins of the Guten Hall (1520), and in 1554 extensive demolition was begun in 1557, upwards of £100,000 being spent. Among the monuments in the cathedral, that of King John, in the choir, is the earliest sepulchral effigy of an English king in the country. There is an altar tomb, in a very fine late Perpendicular chantry chapel, of Arthur, Prince of Wales, son of Henry VII., who died in 1502. There are also monuments of John Gauden, the bishop who wrote Icon basilique, often attributed to Charles I., of Bishop Hough by Roubillac, and of Mrs Digby by Chantrey.

Of the eleven parish churches, St Alban's has considerable Norman remains, St Peter's contains portions of all Gothic styles, St Helen's, with a fine peal of bells commemorating the victories of Marlborough, has also Gothic portions, but the majority were either rebuilt in the 18th century, or are modern. St Andrews has a beautiful spire, erected in 1731, 135 ft. 6 in. in height. Holy Trinity preserves the ancient roof of the Gufen Hall. St John's in Bedwardine was made a parish church in 1371.
There are no remains of the old castle of Worcester; it adjoined the monastery so closely that King John gave its yard to the monks, and after that time it ceased to be a stronghold. The Commandery, founded by St Wulstan in 1085, was a hospital, and its name appears to lack authority. It was rebuilt in Tudor times, and there is a present seat in 1633. In 1647 it was burned, and a new mansion, canopied dais, and a fine bay window, together with other parts. The wood-carving is exquisite. There are many old half-timbered houses. The guild-hall (1732) is an admirable building in the Italian style; it contains a portrait of George III., by Sir Joshua Reynolds, presented by the king to commemorate his visit to the city at the triennial musical festival in 1788. This, the Festival of the Three Choirs, is maintained here alternately with Gloucester and Hereford. The corporation possesses some interesting old charters and manuscripts, and good municipal regiments. Public baths include the shire-hall (1853), Corso Exchange and market-house. Fairs are held three annually. The Victoria Institute includes a library, museum and art gallery. The cathedral school was founded by Henry VIII. in 1541, Queen Elizabeth's, in a modern building, in 1563; there are also a choir school, and municipal art, science and technical schools. In the vicinity of the city there is a large Benedictine convent, at Stanbrook Hall, with a beautiful modern chapel. The Clothiers' Company possesses a charter granted by Queen Elizabeth; but the great industries are now the manufacture of gloves and of porcelain. A company of gloves was incorporated in 1661. The manufacture of porcelain is famous. The materials employed are china clay and china stone from Cornwall, felspar from Sweden, fire-clay from Stourbridge and Broseley, marl, flint and calcined bones. The Royal Porcelain works cover 5 acres. Among Worcester's other trades are those of iron, iron goods and engineering works, carriage making, rope spinning, boat building, tanning and the production of chemical manures and of cider and Perry. There is a considerable carrying trade on the Severn.

The charities are numerous, and include St Oswald's hospital, Nash's almshouses, Wyatt's almshouses, the Berkeley hospital, Goulding hospital, Shrew Ting's hospital, Inglethorpe's almshouses, Waldgrave's almshouses, Moore's blue-coat school, Queen Elizabeth's charity, and others.

Traces of British and Roman occupation have been discovered at Worcester (Wigeran Ceaster, Wigornia), but its history begins with the foundation of the episcopal see. Being the chief city on the borders of Wales, Worcester was frequently visited by the kings of England. In 1130 it was taken by the Empress Maud and retaken and burnt by Stephen in 1149. It surrendered to Simon de Montfort in 1262. In 1264, during the Great Rebellion, a handful of cavaliers was besieged here, and in spite of an attempted relief by Prince Rupert, the city was pillaged, as it was again in 1646. In 1651 Charles II. with the Scottish army marched into Worcester, where he was welcomed by the citizens. Cromwell took up his position on the Red Hill just outside the city gates. Lambert succeeded in passing the Severn at Upton, and drove back the Royalist troops towards Worcester. Charles, seeking an advantage of this division of the enemy on opposite sides of the river, attacked Cromwell's camp. At first it appeared that Cromwell was outmanoeuvred by Charles, but the latter was pursued by Cromwell's troops in time to drive back Charles's foot, who were not supported by the Scottish horse, and the rout of the King's force was complete.

In the reign of King Alfred, Æthelred and Æthelfrith, caldorman and lady of the Mercians, at the request of the bishop "built a burgh at Worcester" and granted to him half of their rights and privileges there "both in market and street within the borough and without." Richard I. in 1180 granted the town to the burgesses at a fee of £24, and Henry III. in 1227 granted a guild, merchant and exemption from toll, and raised the farm to £50. The first incorporation charter was granted by Philip and Mary in 1554 under the title of bailiffs, aldermen, chamberlains and citizens, but James I. in 1622 made the city a separate county and granted a corporation of a mayor, 6 aldermen, and a common council consisting of one body of 24 citizens, including the mayor and aldermen, and another body of 48, who elected the mayor from among the 24. By the Municipal Reform Act of 1835 the government was again altered. The burgesses returned two members to parliament from 1295 to 1885, when the number was reduced to one. As early as 1203 the men of the town paid 100s. for licence to buy and sell cloth there, and did from the time of Edward II., and in 1590 the weavers, walkers and clothiers received an incorporation charter, but the trade had already begun to decline and by 1789 had ceased to exist. Its place was taken by the manufacture of porcelain, introduced in 1751 by Dr Wall, and by the increasing manufacture of gloves, a trade in which is known to have been carried on in the 15th century.

See Victoria County History, Worcester; John Noake, Worcester in Olden Times (1849); Valentine Green, The History and Antiquities of the City of and County of Worcester (1752).

**WORCESTER**, a city and the county-seat of Worcester county, Massachusetts, U.S.A., about 44 m. W. of Boston on the Blackstone river, a branch of the Providence river. Pop. (1900) 118,421 (57,652 foreign-born); (1905, state census) 128,135; (1910) 145,086. Area, 39 sq. m. Worcester is served by the Boston & Albany, the New York, New Haven & Hartford and the Boston & Maine railways, and is connected with Springfield and Boston by interurban electric lines. The park system of the city comprises about twenty tracts with a total area of more than 1100 acres; among them are Elm Park (88 acres) in the W., including Newton Hill (760 ft. above sea-level), and Green Hill Park (300 acres) in the N.E. Other parks are Institute Park (18 acres) and Boynton Park (113 acres) in the N.W. on Salisbury Pond, given to the city by Stephen Salisbury; Dodge Park (13 acres, N.); Burncoat Park (42 acres, N.E.); Chandler Hill Park (80 acres, E.); Hadwen (50 acres), University (14 acres) and Crompton Park (15-25 acres) in the S.W. and S.; and Greenwood (12-65 acres), Beaver Brook (15-5 acres), Tatnuck (2-94 acres), Kendrick (14-87 acres) and Vernon Hill (16-4 acres). Two miles N.E. of the centre of the city lies lake Quinsigamond, 4 m. long, from which another branch of the river of the same name, a branch of the Blackstone. On its shores is Lake Park (110 acres). Fronting the Common, a wooded square in the centre of the city, is the City Hall, near which is a bronze statue, by D. C. French, of G. F. Hoar. On the Common there is a monument, designed by Randolph Rogers, to the soldiers and sailors of the Civil War, and one to Colonel Timothy Bigelow (1739-1790), one of Worcester's soldiers of the War of Independence. The E. side of the Common was the site of an old burying ground, and the W. side of the First Church, built in 1663. About ¹⁄₄ m. N. of the Common is Lincoln Square, adjacent to which is the granite monument, erected by subscription and presented by General Charles Devens (1820-1891) by French. The old Salisbury mansion, dating back to Colonial days, stands in this square. At Salisbury Street and Park Avenue are the library and museum (1910) of the American Antiquarian Society, established in 1812 by Isaiah Thomas, with a collection of interesting portraits, a library of 60,000 vols. and many thousands of pamphlets, particularly rich in Americana. The Art Museum was erected and endowed (1899-1903) by Stephen Salisbury, and contains a fine collection of casts, many valuable paintings, and the Bancker collection of Japanese art. The city has many fine churches.

Worcester is an important educational centre. Clark University was established here in 1889 by Jonas Gilman Clark as a purely graduate institution. In 1902 Clark College was opened for undergraduate work under the presidency of Carroll D. Wright, with a separate endowment of $1,300,000. In 1910 it had 30 teachers and 177 students. The university in 1910 had 13 instructors, 103 students and a library of 50,000 volumes. Under G. Stanley Hall, who was made president in 1888, the university became well known for its work in child-psychology.

Worcester Polytechnic Institute (founded in 1865 by John Boynton of Templeton, Massachusetts; opened in 1868) is one of the best-equipped technical schools of college rank in the country; in 1910 it had 44 instructors, 515 students and a library of 12,700 vols.; the buildings are near Institute Park.
WORCESTERSHIRE

On Packaacho Hill or Mt. St James (690 ft.) is the Jesuit college of the Holy Cross, with a preparatory school, founded in 1833 by Benedict J. Fenwick, bishop of Boston, and chartered in 1865; in 1910 it had 30 instructors and 450 students. There is a State Normal School (1875), and connected with it is a kindergarten training school (1910).

The city library (175,000 vols.), founded in 1859, was one of the first in the country to be open on Sunday. There are four daily newspapers, one printed in French. From 1775 to 1848 was published here the weekly edition of the Worcester Spy, established by Isaiah Thomas in 1770 in Boston. Worcester was established by him to Worcester at the outbreak of the War of Independence; a daily edition was published from 1845 to 1904. Early in the 16th century the city was an important publishing centre.

Worcester is one of the most important manufacturing centres in New England: in 1905 the value of the factory product was $52,144,695, ranking the city third among the cities of the state. Manufacturers of hardware and tools at an early date laid the foundation for the present steel and other metal industries, in which 42.8% of all the workers were employed in 1905. Several prominent firms are employed in the wire and wire-work industries, one plant, that of the American Steel and Wire Company, employing about 5000 hands; in 1905 the total value of wire-work was $1,726,088, and of foundry and machine shop products $7,527,005.

The first grant of land in this part of the Blackstone Valley was made in 1627, and the town, Quinsigamond (or Quinsigamond) Plantation, was laid out in October 1668. In 1675, on the outbreak of King Philip’s War, it was temporarily abandoned. In 1684 it was settled again and its name was changed to Worcester because several leaders in the settlement were natives of Worcestershire, England. In 1713 the vicinity was opened up to settlement, a tavern and a mill were constructed, and a turnpike road was built to Boston. Worcester was incorporated as a town in 1722. In 1755 a small colony of the exiled Acadians settled here. At the outbreak of the War of Independence Worcester was little more than a country market town. During Shays’s Rebellion it was taken by the rebels and the courts were closed. The first real impetus to its growth came in 1835 with the construction of the Boston & Worcester railway, and it received a city charter in 1848. The strong anti-slavery sentiment of the city led in 1850 to an attempt to introduce the Fugitive Slave Law. In Worcester, or within a radius of a dozen miles of it, were the homes of Elias Hove, inventor of the sewing machine; Eli Whitney, inventor of the cotton gin; Erastus Bigelow (1814-1879), inventor of the carpet weaving machine; Dr Russell H. Hawes, inventor of an envelope machine; Thomas Blanchard (1788-1864), inventor of the machine for turning irregular forms; Samuel Crompton (1753-1827) and Lucius James Knowles (1810-1858), the perfectioners of the modern loom; and Draper Ruggles, Joel Nourse and J. C. Mason, perfectioners of the modern plough and originators of many inventions in agricultural machinery.

WORCESTERSHIRE, a midland county of England, bounded N. by Staffordshire, E. by Warwickshire, S. by Gloucestershire, W. by Herefordshire, and N.W. by Shropshire. The area is 731 sq. m. It covers a portion of the rich valleys of the Severn and Avon, with their tributary valleys and the hills separating them. The Sever runs through the county from N. at Bewdley to S. near Tewkesbury, traversing the Vale of Worcester. Following this direction it receives from E. the Stour at Stourport, the Salwarpe above Worcester, and the Avon, whose point of junction is just outside the county. The Avon valley is known in this county as the Vale of Evesham, and is devoted to orchards and market gardening. The Cotonwold Hills rise sharply from it on the S.E., of which Bredon Hill, within this county, is a conspicuous spur. The Avon forms the county boundary with Gloucestershire for a short distance above its mouth. The Teme joins the Severn from the W. below Worcester, and forms short stretches of the W. boundary. Salmon and lampreys are taken in the Severn; trout and grayling abound in the Teme and its feeders. Besides the Cotswolds, the most important hills are the Malvern and the Lickey or Hagley, and those of Malvern, Worcestershire, and Wyre Forest. The Avon runs over the W. boundary, being partly in Herefordshire, and reach a height of 1395 ft. in the Worcester Beacon, and 1114 in the Hereford Beacon. They are divided by the Teme from a lower N. continuation, the Abberley Hills. The Lickey Hills cross the N.E. corner of the county, rarely exceeding 1000 ft. Their N. part is called the Clent Hills. Partly within the county are the sites of two ancient forests. That of Wyre, bordering the Severn on the W. in the N. of Worcestershire and in Shropshire, retains to some extent its ancient character; but Malvern Chase, which clothed the slopes of the Malvern Hills, is forestless.

Geology.—Achene gneisses and schists (Malvernian) and volcanic rocks (Uriconian) form the core of the Malvern Hills; being the most durable rocks in the district, they form the highest ground. Similarly the Lower Carboniferous limestones and sandstones (green rocks) crop out as roadsides and cliffs near Sutton Common or the Malvern Hills near Brocksone. They are succeeded by the Cambrian rocks (Hollybush Sandstone and Malvern Shales), which are well developed at the S. end of the Malvern Hills, where in places the Arkose rocks have been thrust over them. The Malvernian, probably of the same age as the Hollybush Sandstone, is extensively quarried for roadstone. Strata of Ordovician age being absent in Worcestershire, the Supergroup rocks rest uncomfortably on the earlier formations; they include the Upper Llandovery, Wenlock and Ludlow series. These dip steeply W. from the Malvern and Abberley axis and plunge under the Old Red Sandstone; some of the lower beds are represented at Aynho, while the Malvern beds are represented at Sparrow Clays, near Upton and at Malvern. The Silurian strata are rich in marine fossils, and the included limestones (Woolhope, Wenlock and Aymestry) are all represented in the Malvern district. The Old Red Sandstone succeeds the Silurian on the W. borders of the county. The Carboniferous Limestone and Millstone Grit were not deposited, so that the Coal Measures rest unconformably on the older rocks. These rocks are represented in the Wyre Forest coalfield near Bewdley and in the S. end of the S. Staffordshire coalfield near Halesowen; they contain rich seams of coal and ironstone and several intrusions of basalt (dhusstone, Rowley-rag). The so-called Permian red rocks are now grouped together with the Coal Measures on the Coleshill beds. The Clent Hills (1036 ft.). The Triassic red rocks—unconformable to all below—cover the centre of the county, and on the W. are faulted against the olivine gabbro of the Titterstone Clee hills. The dolomite and pebble-beds, and the Keuper sandstones and marls, the beds of rock-salt in the latter yielding brine-springs (Droitwich, Stowe Prior). A narrow and seldom-exposed outcrop of Rhietic beds separates the two formations, which may extend over one-hundredth part of the S.E. of the county; the Lower Liass consists of blue clays and limestone; the latter are burnt for lime and yield abundant ammunitions. The sand and limestones of the Middle Liass and the clays of the Upper Liass are present in the lower slopes of Bredon Hill and of the Cotteswolds, and are succeeded by the sands and oolitic limestones of the Inferior Oolite. Glacial deposits—boulder-clay, isolated boulders, sand and gravel—are met with in many parts of the county, while later valley-graves have yielded remains of mammoth, rhinoceros, &c. Coal, ironstone, salt, limestone and roadstone are the chief mineral products.

Climatic and Agricultural.—The climate is generally equable and healthy, and is very favourable to the cultivation of fruit, vegetables and hops, for which Worcestershire has long held a high reputation, the red marls and the rich loams being good both for market gardens and vineyards. About a fifth of the area of the county is given over to cultivation, and of this about five-eighths is in permanent pasture. Orchards are extensive, and there are large tracts of woodland. Although wheat and oats are the principal grain crops, a third of the county area is given over to grazing, and potatoes on about one-fourth. There is a considerable acreage under beans. In the neighbourhood of Worcester there are large nurseries.

Topography.—In the N. Worcs. the county includes a portion of the Black Country, one of the most active industrial districts in England. Dudley, Netherton and Brierley Hill, Stourbridge, Halesowen, Oldbury and the S. and W. suburbs of Birmingham, have a vast population, engaged in iron and coal mining, in all kinds of engineering works to nail-making, in the founding and conversion, galvanizing, finishing and extracting of metals, in chemical and glass works. Worcester is famous for porcelain, Kidderminster for carpets and
Worcestershire

Redditch for needles, fish-hooks, &c. Salt is produced from brine at Droitwich and Stoke. The fire-clays and limestone of the N. unite with the coal measures to form a basis of the industries in the Black Country. Furniture, clothing and paper-making and leather-working are also important.

Caruculture.—The Great Western railway serves Evesham, Worcester, Droitwich and Kidderminster, with branches from Worcester to Malvern and into Herefordshire, from Kidderminster to Bewdley, Worcester, and from Droitwich junctions to Alcester and Birmingham. The London & North-Western system touches Dudley. The midland company's line between Derby, Birmingham and Bristol runs from N. to S. through the county, with a branch diverging through Droitwich and Worcester, another serving Malvern from Ashchurch; and an alternative route from Birmingham to Ashchurch by Redditch and Evesham. The Severn is an important highway, though the campagna is broken up by Evesham, Irvine, Bewdley, and by pleasure-boats. Canals follow the courses of the Stour and the Salwarpe, and serve the towns of the Black Country.

Administration and Population.—The area of the ancient county is 480,550 acres, with a population in 1901 of 488,338. The area of the administrative county is 480,050 acres. The county is of very irregular shape, and has detached portions enclaved in Herefordshire, Staffordshire, Warwickshire and Gloucestershire. It comprises five hundreds. The municipal boroughs are Bewdley (2860), Droitwich (4701), Dudley (18,733), Evesham (7161), Kidderminster (24,681) and Worcester (46,624). Dudley and the city and county town of Worcester are county boroughs. The urban districts are Bromsgrove (8418), King's Norton and Northfield (57,122, forming a suburb of Birmingham), Lye and Wollescote (10,976), adjacent to Stourbridge, Malvern (16,449), North Bromsgrove (5688), Oldbury (25,191), Redditch (13,403), Stourbridge (16,302) and Stourport (4529). Halesowen (4057), Pershore (3384), Tenbury (2086) and Upton-upon-Severn (2225) may be mentioned among other towns. The county is in the Oxford circuit, and assizes are held at Worcester. It has one court of quarter-sessions, and is divided into 17 petty sessional divisions. Worcestershire and Dudley have separate quarter-sessions, and all the boroughs have commissions of the peace. The total number of civil parishes is 239. The ancient county, which is mostly in the diocese of Worcester, with a few parishes in that of Hereford, contains 231 ecclesiastical parishes or districts wholly or in part. The county contains five parliamentary divisions—West or Bewdley, East, South or Evesham, Mid or Droitwich, and North or Oldbury. The parliamentary boroughs of Kidderminster and Worcester return one member each, and parts of the boroughs of Dudley and Birmingham are in the county; the English settlers in the district now known as Worcestershire were a tribe of the Hwiccans of Gloucestershire, who spread along the Severn and Avon valleys in the 6th century. By 679 the Hwiccan kingdom was formed into a separate diocese with its see at Worcester, and the Hwiccans had made themselves masters of the modern county, with the exception of the N.W. corner beyond the Abberley Hills. From this date the town of Worcester became not only the religious centre of the district, but the chief point of trading and military communication between England and Wales. A charter of the reign of Alfred alludes to the erection of a "burh" at Worcester by Edward and Æthelred, and it was after the recovery of Mercia by the Danes by Edward that the shire originated as an administrative area. The first political event recorded by the Saxon Chronicles in Worcestershire is the destruction of Worcester by Hardicanute in 1041 in revenge for the murder of two of his tax-gatherers by the citizens.

In no county has the monastic movement played a more important part than in Worcestershire. Foundations existed at Hereford, Evesham, Pershore, Upton-upon-Severn and in the 8th and 9th centuries; at Great Malvern in the 11th century, and in the 12th and 13th centuries at Little Malvern, Westwood, Bredonstone, Whistones, Cookhill, Dudley, Halesowen and Astley. At the time of the Domesday Survey more than half Worcestershire was in the hands of the church. The church of Worcester held the triple hundred of Oswaldslow, with such privileges as to exclude the sheriff's jurisdiction entirely, the profits of all the local courts accruing to the bishop, whose bullion in 1276 claimed to hold his hundred outside Worcester, at Dryhurst, and at Wimborne. The two hundreds owned by the church of Westminister, and that of the Priory of Pershore, have in the 13th century been the subject of much dispute; the hundred of Evesham owned by Evesham Abbey had been converted into Blakenhurst hundred; and the irregular boundaries and outlying portions of these hundreds are explained by their having been formed out of the scattered endowments of their ecclesiastical owners. Of the remaining Domesday hundreds, Came, Clent, Cresselaw and Esch had been combined to form the hundred of Halfhshire by the 13th century, while Doodtongg remained unchanged. The shire-court was held at Worcester.

The vast possessions of the church prevented the growth of a large town within its territory. In the 13th century, however, the town of Evesham was founded by William Fitz Owen, who passed from William Fitz-Ansculf to the families of Paynel and Someri, was the sole residence of a feudal baron. The Domesday bief of Urse d'Abitot, the sheriff, founder of Worcester Castle, and of his brother Robert le Despenser passed in the 12th century to the Beauchamps, who owned Elmley and Hanley Castles. The possessions of William Fitz Osbern in Doodtongg hundred and the Teme valley fell to the crown after his rebellion in 1074 and passed to the Mortimers. Hanley Castle and Malvern Chase were granted by Henry III. to Gilbert de Clare, in whose possession they continued to the 13th century, when they passed to the Crown.

The early political history of Worcestershire centres round the city of Worcester. In the Civil War of the 17th century Worcestershire was conspicuously loyal. On the retreat of Essex from Worcester in 1642 the city was occupied by Sir William Russell for the king, and only surrendered in 1646. In 1642 Prince Rupert defeated the parliamentary troops near Powick. Sudeley Castle surrendered in 1644, and Dudley and Hartlebury by command of the king in 1646.

The Droitwich salt-industry was very important at the time of the Domesday Survey, Bromsgrove alone sending 300 cartloads of wood yearly to the salt-works. In the 13th and 14th centuries Bordesley monastery and the abbey of Evesham exported wool to the Flemish and Flemish markets, and in the 16th century the Worcestershire clothing industry gave employment to 8000 people; fruit-culture with the manufacture of cider and Perry, nail-making and glass-making also flourished at this period. The clothing industry declined in the 17th century, but the silk-manufacture replaced it at Kidderminster and Blockley. Coal and iron were mined at Dudley in the 13th century.

As early as 1255 Worcestershire was represented by sixteen members in parliament, being supported by two knights for the shire and two burgesses each for the city of Worcester and the boroughs of Bromsgrove, Droitwich, Dudley, Evesham, Kidderminster and Pershore. The exception of the boroughs of Worcestershire lasted until 1311 and again recovered representation in 1554, the boroughs ceased to make returns. Evesham was re-enfranchised in 1604, and in 1666 Dudley returned one member. Under the Reform Act of 1867 Worcestershire, as a county, returned four members; the boroughs of Worcestershire, Dudley and Kidderminster were re-enfranchised, returning one member each. In 1897 Evesham lost one member.

Antiquities.—Remains of early camps are scarce, but there are examples at Berrow Hill near the Teme, W. of Worcester, at Round Hill by Spetchley, 3 m. E. of Worcester, and on the Herefordshire Beacon. Roman remains have been discovered on a few sites, as at Kempsey on the Severn, S. of Worcester, at Ripple, in the S. near Upton, and at Droitwich. There are remains of the great abbeys at Evesham and Pershore, and the fine priory church at Malvern, besides the cathedral at Worcester. There are further monastic remains at Halesowen and at Bordesley near Redditch, and there was a Benedicite priory at Astley, 3 m. S.W. of Stourport. There are fine churches in several of the larger towns, as Bromsgrove. The village churches are generally of mixed styles. Good Norman work remains in those at Astley, 8 m. N.W. of Worcester, Astley, Rous Lench in the Evesham district, and Albrighton, in the W. of Malvern, and in the N.W. of the county; while the Early English churches of Kempsey and Ripple are noteworthy. In domestic architecture, the half-timbered style adds to the picturesque quality of many streets in the towns and villages; and among country houses this style is well exemplified in Birts Morton Court and Eastington Hall, in the district S. of Malvern, in Elmley Lovett Manor between Droitwich and Kidderminster, and in Pirton Court near
Kempsey. Westwood Park is a mansion of the 16th and 17th centuries, with a picturesque gateway of brick; the site was formerly occupied by a Benedictine nunnery, Malvern College, between Worcester and Malvern, embodies remains of a fine Elizabethan moated mansion.

WORDSWORTH, CHARLES (1807–1885), English bishop and man of letters, youngest son of Christopher Wordsworth, Master of Trinity, was born in London on the 30th of October 1807, and was educated at Winchester and Trinity, Cambridge. He, like his brother Charles, was distinguished as an athlete as well as scholar; he was elected fellow and tutor of Trinity in 1830; shortly afterwards he took holy orders. He went for a tour in Greece in 1832–1833, and published various works on its topography and archaeology, the most famous of which is "Wordsworth's Greece" (1839). In 1836 he became Public Orator at Cambridge, and in the same year was appointed headmaster of Harrow, a post he resigned in 1844. He then became a canon of Westminster, and from 1850 to 1870 he held a country living in Berkshire. In 1862 he was made archdeacon of Westminster, and in 1869 bishop of Lincoln. He died on the 29th of March 1885, and was buried at Cambridge, where he had been a fellow and tutor, with a high ideal of ecclesiastical duty, and he spent his money generously on church objects. As a scholar he is best known for his edition of the Greek New Testament (1856–1860), and the Old Testament (1864–1870), with commentaries; but his writings were many in number, and included a volume of devotional verse, The Holy Year (1862), Church History up to A.D. 451 (1881–1883), and Memoirs of his uncle the poet (1851), to whom he was literary executor. His Inscriptions Pompeiana (1837) was an important contribution to epigraphy. He married in 1838 Susanna Hartley Feme (1812–1854) and had a son, John (b. 1843), bishop of Salisbury (1885), and author of Fragments of Early Latin (1874); the eldest daughter, Elizabeth (b. 1840), was the first principal (1879) of Lady Margaret Hall, Oxford.

His Life, by J. H. Overton and Elizabeth Wordsworth, was published in 1888.

WORDSWORTH, DOROTHY (1771–1855), English writer and diarist, was the third child and only daughter of John Wordsworth of Cockerouth and his wife, Anne Cookson-Crackanthorpe. The poet William Wordsworth was her brother, and a year her senior. On the death of her father in 1783, Dorothy found a home at Penrith, in the house of her maternal grandfather, and afterwards for a time with a maiden lady at Halifax. In 1787, on the death of the elder William Cookson, she was adopted by her uncle, and lived in his Norfolk parish of Fornett. She and her brother William, who dedicated to his sister the Evening Walk of 1792, were early drawn to one another, and in 1794 they visited the Lakes together. They determined that it would be best to combine their small capitals, and that Dorothy should keep house for the poet. From this time forth her life ran on lines closely parallel to those of her great brother, whose companion she continued to be till his death. It is thought that they made the acquaintance of Coleridge in 1797.

From the autumn of 1795 to 1797 William and Dorothy Wordsworth took up their abode at Racedown, in Dorsetshire. At the latter date they moved to a large manor-house, Allfoxden, in the N. slope of the Quantock hills, in W. Somerset, S. T. Coleridge about the same time settling near by in the town of Nether Stowey. On the 20th of January 1798 Dorothy Wordsworth began her invaluable manuscript of her life, used by successive biographers of her brother, but first printed in its quasi-entirety by Professor W. Knight in 1807. The Wordsworths, Coleridge, and Chester left England for Germany on the 14th of September 1798; and of this journey also Dorothy Wordsworth preserved an account, portions of which were published in 1807. On the 14th of May 1800 she started another Journal at Grasmere, which she kept very fully until the 31st of December of the same year. She

published, in 4 volumes, a work of Christian Institutes, selected from English divines. He married in 1819 Miss Priscilla Lloyd (d. 1851), a sister of Charles Lamb's friend Charles Lloyd; and he had three sons, John W. (1805–1839), Charles (q.v.), and Christopher (q.v.); the latter two both became bishops, and John, who became a fellow and classical lecturer at Trinity College, Cambridge, was an industrious and erudite scholar.

WORDSWORTH, CHRISTOPHER (1807–1882), English bishop and man of letters, youngest son of Christopher Wordsworth, Master of Trinity, was born in London on the 30th of October 1807, and was educated at Winchester and Trinity, Cambridge. He, like his brother Charles, was distinguished as an athlete as well as scholar; he was elected fellow and tutor of Trinity in 1830; shortly afterwards he took holy orders. He went for a tour in Greece in 1832–1833, and published various works on its topography and archaeology, the most famous of which is "Wordsworth's Greece" (1839). In 1836 he became Public Orator at Cambridge, and in the same year was appointed headmaster of Harrow, a post he resigned in 1844. He then became a canon of Westminster, and from 1850 to 1870 he held a country living in Berkshire. In 1862 he was made archdeacon of Westminster, and in 1869 bishop of Lincoln. He died on the 29th of March 1885, and was buried at Cambridge, where he had been a fellow and tutor, with a high ideal of ecclesiastical duty, and he spent his money generously on church objects. As a scholar he is best known for his edition of the Greek New Testament (1856–1860), and the Old Testament (1864–1870), with commentaries; but his writings were many in number, and included a volume of devotional verse, The Holy Year (1862), Church History up to A.D. 451 (1881–1883), and Memoirs of his uncle the poet (1851), to whom he was literary executor. resumed it on the 1st of January 1802 for another twelve months, closing on the 11th of January 1803. These were printed first in 1889. She composed *Recollections of a Tour in Scotland*, in 1803, with her brother and Coleridge; this was first published in 1854. Her next contribution to the family history was her *Journal of a Mountain Ramble*, in November 1803, an account of a walking tour in the Lake district with her brother. In July 1820 the Wordsworths made a tour on the continent of Europe, of which Dorothy preserved a very careful record, portions of which were given to the world in 1884, the writer having refused to publish it in 1824 on the ground that her "object was not to make a book, but to leave to her niece a neatly- penned memorial of those few interesting months of our lives." Meanwhile, without her brother, but in the company of Joanna Hutchinson, Dorothy Wordsworth had travelled over Scotland in 1822, and had composed a *Journal* of that tour. Other MSS. exist and have been examined carefully by the editors and biographers of the poets, but the records which we have mentioned and her letters form the principal literary relics of Dorothy Wordsworth. In 1829 she was attacked by very serious illness, and was never again in good health. After 1836 she could not be considered to be in possession of her mental faculties, and became a pathetic member of the interesting household at Grasmere. She outlined the poet, however, by several years, dying at Grasmere on the 25th of January 1855.

It would be difficult to exaggerate the importance of Dorothy Wordsworth's companionship to her illustrious brother. He had left numerous indications to the effect that sympathy was the motivating principle of her perceptions. "She," he said, "gave me eyes, she gave me ears; And humble cares, and delicate fears; A heart the fountain of sweet tears; A mind, love, and thought, and joy." The value of the records preserved by Dorothy Wordsworth, especially in earlier years, is hardly to be over-estimated by those who desire to form an exact impression of the revival of English poetry. When Wordsworth and Coleridge refashioned imaginative literature at the close of the 18th century, they were daily and hourly accompanied by a feminine presence exquisitely attuned to sympathize with their efforts, and by an intelligence which was able and anxious to move in step with theirs. "S. T. C. and my beloved sister," William Wordsworth wrote in 1832, "are the two beings to whom my intellect is most indebted." In her pages we can put our finger on the very pulse of the machine; we are present while the New Poetry is evolved, and the sensitive descriptions in her prose lack nothing but the accomplishment of verse. Moreover, it is certain that the sharpness and fineness of Dorothy's observation, "the shooting lights of her wild eyes," actually afforded material to the poets. Coleridge, for instance, when he wrote his famous lines about "The one red leaf, the last of its clan," used almost the very words in which, on the 7th of March 1798, Dorothy Wordsworth had recorded "One only leaf upon the top of a tree . . . danced round and round like a rag blown by the wind."

It is not merely by the biographical value of her notes that Dorothy Wordsworth lives. She claims an independent place in the history of English prose as one of the very earliest writers who noted, in language unadorned by ornament, and with no other object than to preserve their fugitive beauty, the little picturesque phenomena of homely country life. When we speak with very high praise of her art in this direction, it is only fair to add that it is called forth almost entirely by what she wrote between 1798 and 1803, for a decline similar to that which fell upon her brother's poetry early invaded her prose; and her later journals, like her Letters, are less interesting because less inspired. *A Life* by E. Lee was published in 1886; but it is only since 1897, when Professor Knight collected and edited her scattered MSS., that Dorothy Wordsworth has taken her independent place in literary history.

**WORDSORTH, WILLIAM (1770-1850), English poet, was born at Cockermouth, in Cumberland, on the 7th of April 1770. He was the son of John Wordsworth (1741-1783), an attorney, later agent to the first earl of Lonsdale, a prosperous man in his profession, descended from an old Yorkshire family of landed gentry. On the mother's side also Wordsworth was connected with the middle territorial class:**

his mother, Anne Cookson, was the daughter of a well-do mercer in Penrith, but her mother was Dorothy Crackanthorpe, whose ancestors had been lords of the manor of Newbiggin, near Penrith, from the time of Edward III. He thus came of "gentle kin, and was proud of it. The county squires and farmers whose blood flowed in Wordsworth's veins were not far enough above local life to be out of sympathy with it, and the poets of the towns and common folk of the North country hills and dales had a traceable hereditary bias. William Wordsworth was one of a family of five, the others being Richard (1768-1810), Dorothy (q.v.), John (1772-1805), and Christopher (q.v.).

Though his parents were of sturdy stock, both died prematurely, his mother when he was eight years old, his father when he was thirteen. At the age of eight Wordsworth was sent to school at Hawkshead, in the Esthwaite valley in Lancashire. His father died while he was there, and at the age of seventeen he was sent to St John's College, Cambridge. He did not distinguish himself in the studies of the university, and for some time after taking his degree of B.A., in January 1791, he showed what seemed to his relatives a most perverse reluctance to adopt any regular profession. His mother had noted his "stiff, moody and violent temper" in childhood, and it seemed as if this family judgment was to be confirmed in his manhood. After taking his degree, he was pressed to take holy orders, but would not; he had no taste for the law; he idled a few months aimlessly in London, a few months more with a Welsh college friend, and then in June 1792 embarked for Italy. He was in Venice during the last Cambridge vacation; then in the November of 1791 he crossed to France, ostensibly to learn the language, made the acquaintance of revolutionaries, sympathized with them vehemently, and was within an ace of throwing in his lot with the Girondins. When it came to this, his relatives cut off his supplies, and he was obliged to return to London towards the close of 1792. But still he resisted all pressure to enter any of the regular professions, published his poems *An Evening Walk* and *Descriptive Sketches* in 1793, and in 1794, still moving about to all appearance in stubborn aimlessness among his friends and relatives, had no more rational purpose of livelihood than drawing up the prospectus of a periodical of strictly republican principles to be called "The Philanthropist."

But all the time from his boyhood upwards a great purpose had been growing and maturing in his mind. *The Prelude* expounds in lofty impassioned strain how his sensibility for nature was "augmented and sustained," and how it never, except for a brief interval, ceased to be "creative" in the special sense of his subsequent theory. But it is with his feelings towards his poetry and the nature of his achievement that this book mainly deals; it says little regarding the history of his ambition to express those feelings in verse. It is the autobiography, not of the poet of nature, but of the worshipper and priest. The salient incidents in the history of the poet he communicated in prose notes and in familiar discourses. Commenting on the couplet in the *Evening Walk*—

"And, fronting the bright west, you oak entwines Its darkening boughs and leaves in stronger lines—"

he said:

"This is feebly and imperfectly express; but I recollect distinctly the very spot where this first struck me. It was on the way between Hawkshead and Ambleside, and gave me extreme pleasure. The moment was important in my poetical history; for I date from it my consciousness of the infinite variety of natural appearances which had been unnoticed by the poets of any age or country, so far as I was acquainted with them; and I made a resolution to supply in some degree the deficiency. I could not at that time have been above fourteen years of age."

About the same time he wrote, as a school task at Hawkshead, verses that show considerable acquaintance with the poets of his own country at least, as well as some previous practice in the art of verse-making.1 The fragment that stands at the

1. *Memoirs of William Wordsworth*, by Canon Wordsworth, vol. i. pp. 10, 11. According to his own statement in the memoranda dictated to his biographer, it was the success of this exercise that "put it into his head to compose verses from the impulsive of his own
WORDSWORTH, W.

beginning of his collected works, recording a resolution to end
his life among his native hills, was the conclusion of a long poem
written while he was still at school. And, undistinguished as
he was at Cambridge in the contest for academic honours, the
Evening Walk, his first publication, was written during his
vacations. ¹ He published it in 1793, to show, as he said, that
he could do something, although he had not distinguished himself
in university work. There are touches here and there of the
bent of imagination that became dominant in him soon after-
wards, notably in the moral aspiration that accompanies his
Remembrance of Collins on the Thames:

"Oh glide, fair stream! for ever so
Thy quiet soul on all bestowing,
Till all our minds for ever flow
To thy gay waters, and their swaying."

But in the main this first publication represents the poet in the
stage described in the twelfth book of The Prelude:

"Bent overmuch on superficial things,
Pampering myself with meagre novelties
Of colour and proportion; to the moods
Of time and season, to the moral power,
The affections, and the spirit of the place
Innsensible."

But, though he had not yet found his distinctive aim as a poet,
he was inwardly bent upon poetry as "his office upon earth."

In this determination he was strengthened by his sister
Dorothy (q.v.), who with rare devotion consecrated her life
henceforward to his service. A timely legacy enabled them to
carry their purpose into effect. A friend of his, whom he had
nursed in a last illness, Raisbrooke Colvert, son of the steward of
the duke of Norfolk, who had large estates in Cumberland, died
early in 1795, leaving him a legacy of £500. It may be well to
notice how opportunely, as De Quincey half-ruefully remarked,
money always fell in to Wordsworth, enabling him to pursue
his poetic career without distraction. Colvert's bequest came to
him when he was on the point of concluding an engagement
as a journalist in London. On it and other small resources he
and his sister, thanks to her frugal management, contrived to
live for nearly eight years. By the end of that time Lord
Lonsdale, who owed Wordsworth's father a large sum for pro-
fessional services, and had steadily refused to pay it, died, and
his successor paid the debt with interest. His wife, Mary
Hutchinson, whom he married on the 4th of October 1802, brought
him some fortune; and in 1813, when in spite of his plain living
his family began to press upon his income, he was appointed
stamp-distributor for Westmorland, with an income of £500,
afterwards nearly doubled by the increase of his district. In
1824, when he resigned his stamp-distributorship, Sir Robert
Peel gave him a Civil List pension of £500.

To return to Wordsworth the time when he resolved to labour with all his powers in the office of
poetry. The first two years, during which he lived with his self-
sacrificing sister at Racedown, in Dorset, were spent in half-
hearted and very imperfectly successful experiments, satires
in imitation of Juvenal, the tragedy of The Borderers; ² and a poem
in the Spenserian stanza, now entitled Guilt and Sorrow. How
much longer this time of self-distrustful endeavour might have
continued is a subject for curious speculation; an end was put to
it by a fortunate incident, a visit from Coleridge, who had
read his first publication, and seen in it, what none of the public
critics had discerned, the "prodigious hints of a poetic genius."
"Mind." The resolution to supply the deficiencies of poetry in the
exact description of natural appearances was probably formed while
he was in this state of boyish ecstasy at the accidental revelation of
his own powers. The date of his beginnings as a poet is confirmed by the
lines in The Idiot Boy, written in

"I to the Muses have been bound
These fourteen years by strong indentures."

¹ In The Prelude, between the idyllic and pastoral during his first
vacation as "harassed with the toil of verse, much pains and little
progress."

² Not published till 1842. For the history of this tragedy see
Memoirs, vol. i. pp. 118 to 121; a sound, if severe, criticism of H. A. C.
Swinburne's Miscellanies, p. 118. And yet it was of the blank verse of
The Borderers that Coleridge spoke when he wrote to Cottle that
"he felt a little man by the side of his friend."

Stubborn and independent as Wordsworth was, he needed some
friendly voice from the outer world to give him confidence in
himself. Coleridge rendered him this indispensable service.
He had begun to seek his themes in

"Sorrow, that is not sorrow, but delight;
And miserable love, that is not pain
But clear and pure, and rejoicing sounds
Therefrom to human kind, and what we are."

He read to his visitor one of these experiments, the story of the
ruined cottage, afterwards introduced into the first book of The
Excursion. ³ Coleridge, who had already seen original poetic
genius in the poems published before, was enthusiastic in his praise of them as having "a character, by books not hitherto
reflected."

June 1797 was the date of this memorable visit. So pleasant
was the companionship on both sides that, when Coleridge returned
to Nether Stowey, in Somerset, Wordsworth at his instance
changed his quarters to Axloxden, within a mile and a half of
Coleridge's temporary residence, and the two poets lived in
almost daily intercourse for the next twelve months. During
that period Wordsworth's powers rapidly expanded and matured;
ideas that had been gathering in his mind for years, and lying
there in dim confusion, felt the stir of a new life, and ranged
themselves in clearer shapes under the fresh quickening breath
of Coleridge's swift and discursive dialectic.

The Lyrical Ballads were the poetic fruits of their companions-
ship. Out of their frequent discussions of the relative value of
common English and supernatural incidents as themes in the imaginative
treatment grew the idea of writing a volume together, composed
of poems of the two kinds. Coleridge was to take the super-
natural; and, as his industry was not equal to his friend's, this
kind was represented by the Ancient Mariner alone. Among
Wordsworth's contributions were The Female Vagrant, We are
Seven, Complaint of a Forsaken Indian Woman, The Last
of the Floch, The Idiot Boy, The Mad Mother ("Her eyes are wild ")
The Thorn, Goody Blake and Harry Gill, The Revere of Poor
Susan, Simon Lee, Expostulation and Reply, The Tables Turned,
Lines left upon a Yew-tree Seat, An Old Man Travelling ("Animal
Transquility and Decay "), Lines about Tintern Abbey. The
volume was published by Cottle of Bristol in September 1798.

It is necessary to enumerate the contents of this volume in
fairness to the contemporaries of Wordsworth, for their cold
or scoffing reception of his first distinctive work. Those Words-
worthians who give up The Idiot Boy, ⁴ Goody Blake and The
Thorn as mistaken experiments have no right to triumph over
the first derisive critics of the Lyrical Ballads, or to wonder at
the dulness that failed to see at once in this humble issue from
an obscure provincial press the advent of a great master in
literature. It is true that Tintern Abbey was the least successful
of the volume, and that all the highest qualities of Wordsworth's imagination
and of his verse could be illustrated from the lyrical ballads proper in
this first publication; but clear vision is easier for us than it was when the revelation was fragmentary and
incomplete.

Although Wordsworth was not received at first with the
respect to which he was entitled, his power was not entirely
without recognition. There is a curious commercial evidence of
this, which ought to be noted, because a perversion of the
fact is sometimes used to enthrone the supposed neglect of
Wordsworth at the close of his career. When the Longmans

³ The version read to Coleridge, however, must have been in Spec-
enserian stanza, if Coleridge was right in his recollection that it was in
the same metre with The Female Vagrant, the original title of Guilt
and Sorrow.

⁴ The defect of The Idiot Boy is really rhetorical, rather than poetic.
Wordsworth himself said that "he never wrote anything with so much
glee," and, once the source of his glee is felt in the nobly affectionate
relations between the two half-witted irrational old women and the
glorious imbibe, the work is seen to be executed with a harmony
that should satisfy the most exacting criticism. Poetically, there-
fore, the poem is a success. But rhetorically this particular attempt
to "breath grandeur upon the very humblest face of human life,
must be pronounced a failure, inasmuch as the writer did not
use sufficiently forcible means to disabuse his readers of vulgar
prepossessions."
took over Cottle's publishing business in 1799, the value of the copyright of the Lyrical Ballads, for which Cottle had paid thirty guineas, was assessed at nil. Cottle therefore begged that it might be excluded altogether from the bargain, and presented it to the authors. But in 1800, when the first edition was exhausted, the London publishers Longman, Hurst, Rees, Orme, and Brown made a truth issue of a new edition with an additional volume and an explanatory preface. The sum was small compared with what Scott and Byron soon afterwards received, but it shows that the public neglect was not quite so complete as is sometimes represented. Another edition was called for in 1802, and a fourth in 1805. The new volume in the 1800 edition was made up of poems composed during his residence at Godal in Germany (where he went with Coleridge) in the winter of 1798-1799, and after his settlement at Grasmere in December 1799. It contained a large portion of poems neither that which followed: Ruth, Nattering, Three Years She Grew, A Poet's Epitaph, Hartley's Well, Lucy Gray, The Brothers, Michael, The Old Cumberland Beggar, Poems on the Naming of the Animals. But it contained also the famous Preface, in which he infuriated critics by presuming to defend his eccentricities in an elaborate theory of poetry and poetic diction.

This document (and let it be noted that all Wordsworth's Prefaces are of the utmost interest in historical literary criticism) is constantly referred to as a sort of revolutionary proclamation against the established taste of the 18th century. For one who has read Wordsworth's original, hundreds have read his Preface. Coleridge's fame was made in part by his declaration of the doctrine put forth by Wordsworth is taken from that. It is desirable, therefore, considering the celebrity of the affair, that Wordsworth's own position should be made clear. Coleridge's criticism of his friend's theory proceeded avowedly on the assumption that his words had been rightly interpreted, as purporting that the proper diction for poetry in general consists altogether in a language taken, with due exceptions, from the mouths of men in real life, a language which actually constitutes the natural conversation of men under the influence of natural feelings. Coleridge assumed that Wordsworth spoke of there being "no essential difference between the language of prose and metrical composition," he meant by language not the mere words but the style, the structure and the order of the sentences; on this assumption he argued as if Wordsworth had held that the metrical order should always be the same as the prose order. Given these assumptions, which formed the popular interpretation of the theory by its opponents, it was easy to demonstrate its absurdity, and Coleridge is very generally supposed to have given Wordsworth's theory in its bare and naked extravasation. But the truth is that neither of the two assumptions is warranted; both were expressly disclaimed by Wordsworth in the Preface itself. There is not a single qualification introduced by Coleridge that was not made by Wordsworth himself in the original statement. In the first place, it was not put forward as a theory of poetry in general, though from the vigour with which he carried the war into the enemy's country it was naturally enough for polemic purposes taken as such; it was a statement and defence of the principles on which his own poems of humbler life were composed. Wordsworth also assailed the public taste as "depraved," first and mainly in so far as it was adverse to simple incidents simply treated, being accustomed to "gross and violent stimulants," "craving after extraordinary incident," possessed with a "degrading thirst after outrageous stimulation," "frantic novels, sickly and stupid German tragedies, and deluges of idle and extravagant stories in verse." To represent the valleys and rocks as sighing and smiling in the circumstances would appear feeble and absurd in prose composition, and is not less so in metrical composition; "the occasion does not justify such violent expressions." These are examples of all that Wordsworth meant by saying that "there is no essential difference of the language of prose and metrical composition." So far is Wordsworth from contending that the metrical order should always be the same as the prose order, that part of the Preface is devoted to a subtle analysis of the peculiar effect of metrical language; the familiar and genuine departure from the structure of prose, but the assumption, which seemed to him to underlie the criticisms of his ballads, that a writer of verse is not a poet unless he uses artificially ornamental language, not justified by the strength of the emotion expressed. The furthest that he went in defence of prose structure in poetry was to maintain that, if the words in a verse happened to be in the order of prose, it did not follow that they were prosaic in the sense of being unpoetic—a side-stroke at critics who complained of his prosaisms for no better reason than that the words stood in the order of prose composition. Wordsworth was far from repudiating elevation of style in poetry. "I," he said, "the poet's subject be judiciously chosen, it will naturally, and upon fit occasion, lead him to passions the language of which, if selected truly and judiciously, must necessarily be dignified and variegated, and alive with metaphors and figures."
Such was Wordsworth's theory of poetic diction. Nothing could be more grossly mistaken than the notion that the greater part of Wordsworth's poetry was composed in defiance of his own theory, and that he succeeded best when he set his own theory most at defiance. The misconception is traceable to the authority of Coleridge. His just, sympathetic and penetrating criticism on Wordsworth's work as a poet did immense service in securing for him a wider recognition; but his proved friendship and brilliant style have done sad injustice to the poet as a theorist. It was natural to assume that Coleridge, if anybody, must have been the man to reveal the theory that he was natural also that readers under the charm of his lucid and melodious prose should gladly grant themselves a dispensation from the trouble of verifying his facts in the harsh and cumbrous exposition of the theorist himself.1

The question of diction made most noise, but it was far from being the most important point of poetic doctrine set forth in the Preface. If in this he merely enunciated a truism, generally admitted in words but too generally ignored in practice, there was real novelty in his plea for humble subjects, and in his theory of poetic composition. Wordsworth's remarks on poetry in general and on the construction of the imagination in depicting the humble and commonplace incidents, and on the need of active exercise of imagination in the reader as well as in the poet, are immeasurably more important than his theory of poetic diction. Such sayings as that poetry "takes its origin from emotion recollected in tranquillity," or that it is the business of a poet to trace "how men associate ideas in a state of excitement," are significant of Wordsworth's endeavour to lay the foundations of his art in an independent study of the feelings and faculties of men in real life, unbiased as far as possible by poetic custom and convention. This does not mean that the new poet was to turn his back on his predecessors and never look behind him to what they had done. Wordsworth was guilty of no such extravagance. He was from boyhood upwards a diligent student of poetry, and was not insensible to his obligations to the past. His purpose was only to use real life as a touchstone of poetic substance. The poet, in Wordsworth's conception, is distinctively a man in whom the beneficent energy of imagination, operative as a blind instinct more or less in all men, is stronger than in others, and is voluntarily and rationally exercised for the benefit of all in its proper work of increase and consolation. Not every imagination possesses the power of such a clear and pure life as necessarily poetical. It is the business of the poet to select and modify for his special purpose of producing immediate pleasure.

There were several respects in which the formal recognition of such elementary principles of poetic evolution powerfully affected Wordsworth's practice. One of these may be indicated by saying that he endeavoured always to work out an emotional motive from within. Instead of choosing a striking theme and working at it like a decorative painter, embellishing, enriching, dressing to advantage, standing back from it and studying effects, his plan was to take incidents that had set his own imagination spontaneously to work, and to study and reproduce with artistic judgment the modification of the initial feeling, the emotional motive, within himself. To this method he owed much of his strength and also much of his unpopularity. By keeping his eye on the object, as spontaneously modified by his own imaginative energy, he was able to give full and undistracted scope to all his powers in poetic coinage of the wealth that his imagination brought. On the other hand, readers whose nature or education was different from his own, were repelled or left cold and indifferent, or obliged to make the sympathetic effort to see with his eyes, which he refused to make in order that he might see with theirs.

"He is retired as noontide dew
Or fountain in a noon-day grove,
And you must love him ere you know,
He will seem worthy of your love.

From this habit of taking the processes of his own mind as the standard of the way in which "men associate ideas in a state of excitement," and language familiar to himself as the standard of the language of "real men," arises a superficial anomaly in Wordsworth's poetry, an apparent contradiction between his practice and his theory. His own imagination, judged by ordinary standards, was easily excited by emotional motives that have little force with ordinary men. Most of his poems start from humble, slighter, less generally striking themes than those of any other poet of high rank. But his poetry is not correspondingly imaginative. On the contrary, much of it, much of the best of it—for example, the Ode to Duty, and that on the Intimations of Immortality—is intricate, elaborate and abstruse. The emotional motive is simple; the passion has almost always a simple origin, and often is of no great intensity; but the imaginative structure is generally elaborate, and, when the poet is at his best, supremely splendid and gorgeous. No poet has built such magnificent palaces of rare material for the ordinary everyday homely human affections. It is because he has invested our ordinary everyday principles of conduct, which are so apt to be home truths, with such imperishable robes of finest texture and richest design that Wordsworth holds so high a place among the great moralists in verse.

His practice was influenced also, and not always for good, by his theory that poetry "takes its origin from emotion recollected in tranquillity." This was a somewhat doubtful corollary from his general theory of poetic evolution. A poem is complete in itself; there must be no sting in it to disturb the reader's content with the whole; through whatever agitations it progresses, to whatever elevations it soars, to this end it must come, otherwise it is imperfect as a poem. Now the poet, in Wordsworth, is often the most inanimate of humankind, and has the room of a poet's life. He is, after all, the poet's special art has thus no share in producing the effect, reaches the poetic end when it has so transfigured a disturbing experience, whether of joy or grief, that this rests tranquilly in the memory, can be recalled without disquietude, and dwell upon with some mode and degree of pleasure, more or less keen, more or less pure with pain. True to his idea of imitating real life, Wordsworth made it a rule for himself not to write on any theme till his imagination had operated upon it for some time involuntarily; it was not in his view ripe for poetic treatment till this transforming agency had subdued the original emotion to a state of tranquillity? Out of this tranquillity arises the favourite moment for poetic composition, some day when, as he contemplates the subject, the tranquillity disappears, an emotion kindled to the original emotion is re-instated, and the poet retraces and supplements with all his art the previous involuntary and perhaps unconscious imaginative chemistry.

When we study the moments that Wordsworth found favourable for successful composition, a very curious law reveals itself, somewhat at variance with the common conception of him as a poet who derived all his strength from solitary communion with nature. We find that the recluse's best poems were written under the excitement of some break in the monotony of his quiet life—change of scene, change of companionship, change of occupation. The law holds from the beginning to the end of his poetic career. An immense stimulus was given to his powers by his first contact with Coleridge after two years of solitary and abortive effort. Above Tintern Abbey was composed 1

1 Wordsworth was not an adroit expositor in prose, and he did not make his qualifications sufficiently prominent, but his theory of diction taken with those qualifications left him free from any inconsistency to use any language that was not contrary to "true taste and feeling." He acknowledged that he might occasionally have substituted "particular for general associations," and that thus language charged with poetic feeling to himself attached itself with the reader and ridiculous to others, as in The Idiot Boy and Goody Blake; he even went so far as to withdraw Alice Fell, first published in 1807, from some subsequent editions; but he argued that it was dangerous for a poet to make alterations on the simple authority of a few individuals or even classes of men, because if he did not follow his own judgment and feelings his mind would infallibly be debilitated.

2 The Prelude contains a record of his practice, after the opening lines of the first book; so make alterations on the simple authority of a few individuals or even classes of men, because if he did not follow his own judgment and feelings his mind would infallibly be debilitated.

3 Thus far, O friend! did I not used to make a present joy the matter of a song.

Pour forth," &c.
during a four days' ramble with his sister; he began it on leaving Tintern, and concluded it as he was entering Bristol. His residence amidst strange scenes and "unknown men" at Goslar was particularly fruitful: She Dwelt among the Untriedd Ways, Ruth, Nutting, There was a Boy, Wisdom and Spirit of the West, all was signalled in the poet's mind. The breeze that meets him as he issued from the city gates on his homeward journey brought him the first thought of The Prelude.

At the end of 1790 he was settled at Grasmere, in the Lake District, and seeing much of Coleridge. The second year of his residence at Grasmere was unproductive; he was "hard at work," then on The Excursion; but the excitement of a tour on the Continent in the autumn of 1802, combined perhaps with a happy change in his pecuniary circumstances and the near prospect of marriage, roused him to one of his happiest fits of activity. His first great sonnet, the Lines on Westminster Bridge, was composed on the roof of the Dover coach; the first of the splendid series "dedicated to national independence and liberty," the most generally impressive and universally intelligible of his poems, Fair Star of Evening, Once did She hold the Gorgeou East in Fee, Toussaint; Milton, thou shouldst be Living at this Hour; It is not to be Thought of the Flood, When I have Borne in Memory what has Tamed, were all written in the course of the tour, or in London in the month after his return. A tour in Scotland in the following year, 1803, yielded the Highland Girl and the Shepherdess, also the prid with its companion, The Preudle; and The Affliction of Margaret and the Ode to Duty, his greatest poems in two different veins, were coincident with the exaltation of spirit due to the triumphant and successful prosecution of the long-delayed work. The Character of the Happy Warrior, which he described to Harriet Martineau as "a chain of extremely valuable thoughts," though it did not fulfill "poetic conditions," was the product of a calmer period. The excitement of preparing for publication always had a rousing effect upon him; the preparation for the edition of 1807 resulted in the completion of the ode on the Intimations of Immortality, the sonnets The world is too much with us, Methought I saw the Footsteps of a Throne, Two Voices are there, and Lady, the Songs of Spring were in the Grove, and the Song at the Feast of Brougham Castle. After 1807 there is a marked falling off in the quality, though not in the quantity, of Wordsworth's poetic work. It is significant of the comparatively sober and laborious spirit in which he wrote The Excursion that its progress was accompanied by none of those casual sallies of exulting and exuberant power that mark the period of the happier Prelude. The completion of the Excursion and the conclusion of that part of the life-work which had occupied the summer months of the preceding year was in some respects the completion of the life-work of the poet.

The Excursion is a poem full of opinions of a poet living in retirement." He communicated the design to Coleridge, who gave him enthusiastic encouragement to proceed. But, though he had still before him fifty years of peaceful life amidst his beloved scenery, the work in the projected form at least was destined to remain incomplete. Doubts and misgivings soon that Wordsworth's reputation felt inspiration delayed their coming. To sustain him in his resolution he thought of writing as an introduction, or, as he put it, an antechapel to the church which he proposed to build, a history of his own mind up to the time when he recognized the great mission of his life. One of the many laughs at his expense by unsympathetic critics has been directed against his saying that he wrote this Prelude of fourteen books about himself out of diffidence. But in truth the original motive was distrust of his own powers. He turned aside to prepare the second volume of The Excursion, and completed it in the summer of that year. In 1807 appeared two volumes of collected poems. It was not till 1814 that the second of the three divisions of The Recluse, ultimately named The Excursion, was ready for publication; and he went no further in the execution of his great design.

The derisive fury with which The Excursion was assailed upon its first appearance has long been a stock example of critical blindness, yet the error of the first critics is seen to lie not in their indictment of faults, but in the prominence they gave to the faults and their generally disrespectful tone towards the poet, and ought to be regarded as an instance of the general spirit of the time. It is towards the latter part of his life that Wordsworth wrote his most individual and personal poetry, the poems which form the body of the Excursion. These poems, as he had told Coleridge, were written in the summer of 1802, and published in 1807. There have been many attempts to classify the content of the Excursion; but it is impossible to do so, and it is not intended to do so. The Excursion is a poem which has a meaning and a value for every reader, and it is impossible to sum up in its entirety or even to comprehend the whole of its meaning. It is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again. The Excursion is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again. The Excursion is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again. The Excursion is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again. The Excursion is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again. The Excursion is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again. The Excursion is a poem which is not intended to be read in one sitting, but which should be read over a period of years, and the reader should return to it again and again.
WORKINGTON—WORKSOP

Professor Knight brought out in 1882-1886 an eight-volume edition of the Poetical Works, and in 1889 a Life in three volumes. The Memoirs of the poet were published (1851) by his nephew, Bishop Christopher Wordsworth. The "standard text" of the classic edition of 1872 is "Wordsworth's Poetical Works," edited by Edward Dowden. The one-volume "Oxford" edition (1893), edited by Thomas Hutchinson, contains every piece of verse known to have been published on "Wordsworth's" Prefaces, &c., and a useful chronology and notes. Among critics of Wordsworth especially interesting for various reasons we may mention De Quincey (Works, vols. ii. and iv.), Sir Henry Taylor (A History of English Poetry), Matthew Arnold (preface to Selectors), Swinburne (Miscellaneous), F. W. H. Myers ("Men of Letters" series), Leslie Stephen (Hours in a Library, 3rd series, "Wordsworth's Ethics"), Walter Pater (Appreciations), Walter Raleigh (Wordsworth, 1903). Wordsworth was occasionally in high veneration, and "The White Doe of Ryston" has become the focus of an annual festival at Workington, in 1883.

WORKINGTON, a municipal borough, seaport and market town in the Cockermouth parliamentary division of Cumberland, England, 34 m. S.W. of Carlisle, served by the Cockermouth, Keswick & Penrith, the London & North-Western and the Manchester & Workington Junction railways. Pop. (1901) 26,143. It lies on the S. bank of the Work, a river in the Solway Firth, Irish Sea. The harbour is safe, being protected by a stony beach and by a breakwater. The Lonsdale dock is 4½ acres in extent. The port was made subordinate to that of Maryport in 1892. There are large collieries in the neighbourhood of the town, the workings in some cases extending beneath the sea, and blast-furnaces, engineering works, cycle and motor works, shipbuilding yards and paper mills. The borough is under a mayor, 7 aldermen and 21 councillors. Area, 2,245 acres. Near the town is Workington Hall, a castellated structure retaining some of the ancient rooms, including that in which Mary, queen of Scots, was held captive, and in which John, Lord Nithsdale, who escaped to England after the battle of Langside in May 1568.

WORKS AND PUBLIC BUILDINGS, BOARD OF, an administrative department in England. In 1832 the public works and buildings of Great Britain were for the first time placed under the control of a responsible minister of the crown, and were assigned to the commissioners of woods and forests. In 1851 the department of public works was erected into a board under the name of Office of Works and Public Buildings. The first commissioner of works is the head of the board, and has the power to make all necessary regulations and to appoint buildings not specially assigned to other departments; he is a member of the government and frequently has a seat in the cabinet.

WORKSOP, a market town in the Bassettlaw parliamentary division of Nottinghamshire, England, on the Great Central and the Midland railways, and on the Chesterfield Canal, 135 m. E.S.E. of Sheffield. Pop. of urban district (1901) 16,112. To the S. lies that portion of Sherwood Forest popularly known as the duceries. The church of St Mary and St Cuthbert is an old priory church, once divided internally into two parts, the E. dedicated to St Mary being for the use of the canons, and the W. as a chantry church for the use of the laity. In the Reformation only the W. portion of the church was spared, and for many years it was in a dilapidated condition until it was restored with Perpendicular additions. Behind it are the ruins of the lady chapel, containing some fine Early English work. The priory gatehouse, chiefly in the Decorated style, now forms the entrance to the precincts of the church. It is supposed to have been built early in the 14th century by the 3rd Lord Furnival, when the market was established. Of the priory itself the only remains are a wall at the N.W. corner of the church which includes the cloister gateway. There was formerly a Norman keep on the castle hill. The manor-house, built by John Talbot, 1st earl of Shrewsbury, and occasionally occupied by Mary, queen of Scots, during her captivity under the 6th earl, was in great part destroyed by fire in 1761, and when the estate came into the possession of the duke of Newcastle in 1840 the ruined portion was removed and a smaller mansion built.

For five years after the condemnation of The Excursion Wordsworth published almost nothing that had not been composed before. The chief exception is the Thanksgiving Ode of 1856. In 1815 he published a new edition of his poems, in the arrangement according to faculties and feelings in which they have since stood; and he sought to explain his purposes more completely than before in an essay on "The poetry as a Study." In the same year he was persuaded to publish The White Doe of Ryston, written mainly eight years before. In purely poetic charm The White Doe ought to be ranked among the most perfect of Wordsworth's poems. But Jefferies, who was too busy to enter into a vein of poetry so remote from common romantic sentiment, would have none of The White Doe: he pronounced it "the worst poem ever written," and the public readily endorsed his judgment. Two other poems, with which Wordsworth made another appeal, were not more successful. Peter Bell, written in 1798, was published in 1819; and at the instigation of Charles Lamb it was followed by The Waggoner, written in 1805. Both were mercilessly ridiculed and parodied. These tales from humble life are written in Wordsworth's most unconventional style, and with them emphatically "not to sympathize is not to understand." Meantime, the great design of The Recluse languished. The neglect of the poems Wordsworth himself conceived to be his best and most characteristic work was not encouraging; and there was another reason why the philosophical poem on man, nature, and society did not make progress. Again and again in his poetry Wordsworth celebrates the value of constraint, and the disadvantage of "too much liberty," of "unchartered freedom." The formlessness of the scheme prevented his working at it continuously. Hence his "philosophy" was expressed in casual disconnected sonnets, or in sonnets and other short poems connected by the simplest of all links, sequence in time or place. He stumbled upon three or four such serial ideas in the latter part of his life, and five short poems of considerable length, which may be regarded as fragments of the project which he had not sufficient energy of constructive power to execute. The Sonnets on the River Duddon, written in 1820, follow the river from its source to the sea, and form a partial embodiment of his philosophy of nature. The Ecclesiastical Sonnets, written in 1820-1821, trace the history of the church from the Druids onwards, following one of the great streams of human affairs, and exhibit part of his philosophy of society. A tour on the continent in 1820, a tour in Scotland in 1831, a tour on the French coast in 1832, revived him with other serial forms, serving to connect miscellaneous reflections on man, nature and society; and his views on the punishment of death were strengthened in still another series in 1840.

It was Coleridge's criticism in the Biographia Literaria (1817), together with the enthusiastic and unreserved championship of Wilson in Blackwood's Magazine in a series of articles between 1810 and 1822 (Recreations of Christopher North), that formed the turning-point in Wordsworth's reputation. From 1820 to 1830 De Quincey says it was militant, from 1830 to 1840 triumphant. On the death of Southey in 1843 he was made poet laureate. He bargained with Sir Robert Peel, before accepting, that no official verse should be required of him; and his only official composition, an ode on the installation of the Prince Consort as chancellor of Cambridge university in 1847, is believed to have been really written either by his son-in-law Edward Quilliam or by his nephew Christopher (afterwards bishop of Lincoln). He died at Rydal Mount, after a short illness, on the 23rd of April 1850, and was buried in Grassmere churchyard. His wife survived him till 1859, when she died in her 80th year. They had five children, two of whom had died in 1817; the two surviving sons, John (d. 1875) and William (d. 1883), had families; the other child, a daughter, Dora, Wordsworth's favourite, married Edward Quilliam in 1841 and died in 1847.

1 See the Sonnet, Nuns fret not, &c., The Pass of Kirkstone and the Ode to Duty.
The town hall and free library are the principal public buildings of Worms. Malting is the principal industry. A large corn market and a cattle and horse fair are held. The town also possesses brass and iron foundries, agricultural implement works, saw-mills and chemical works; and there is a considerable trade in Windsor chairs and wood for packing-cases for Sheffield cutlery. There are collieries at Shirrooks, 3 m. W.

WORLD, a word which has developed a wide variety of meanings from its original etymological sense of the "age of man," "course of man's life." In O. Eng. it appears under its true form worlde, being a compound of wer, man (cf. Lat. vir), and ylo, age, from eol, old. Of the various meanings the principal are: (a) world (q.v.), a planet, or a large division of the earth, such as the "old world," (b) world (q.v.), the part of the western hemisphere; the whole of created things upon the earth, particularly its human inhabitants, mankind, the human race, or a great division of mankind united by a common racial origin, language, religion or civilization, &c. A derived meaning is that of social life, society, as distinct from a religious life.

WORM, a term used popularly to denote almost any kind of elongated, apparently limbless creature, from a lizard, like the blindworm, to the grub of an insect or an earthworm. Linnaeus applied the term to the modern zoological divisions Mollusca, Coelentera, Protozoa, Tunicata, Echinodermata, as well as to those forms which more modern zoologists have recognized as worms. As a matter of convenience the term Vermes or Verminus is still employed, for instance in the International Catalogue of Zoological Literature and the Zoological Record, to cover a number of wormlike animals. In systematic zoology, however, the use of a division Verminus has been abandoned, as it is now recognized that many of the animals that even a zoologist would describe as worms belong to different divisions of the animal kingdom. The so-called flatworms (Platyelmia, q.v.), including the Planarians (q.v.) and Flukes (see Trematodes), Cestodes (see Tapeworm) and the curious Mesozoa (q.v.), are no doubt related. The marine Nemertine worms (see Nemertina) are isolated. The thick-skinned round worms, such as the common horse-worm and the threadworms (see Nematoda), together with the Nematomorpha (q.v.), Chaetosomatalia (q.v.), Desmoscolecida (q.v.) and Acanthocephala (q.v.), form a fairly natural group. The Rotifera (q.v.), with probably the Kinorhyncha (q.v.) and Gastrotricha (q.v.), are again isolated. The remaining worms are probably all coelomate animals. There is a curious Annelid group (see Annelida), including the Archianellida, the bristleworms (see Chaetoptera), of which the earthworm (q.v.) is the most familiar type, the Myzostomida (q.v.), Hirudinea (see Leech) and the armed Gephyreans (see Echiuridea). The unarmed Gephyreans (see Gephyrea) are now separated from their former associates and divided into two groups of little affinity, the Sipunculoidae and the Priapuloidae (q.v.). The Phoronida (q.v.) are now associated with Hemichordata (q.v.) in the line of vertebrate ancestry, whilst the Chaetognatha (q.v.) remain in solitary isolation.

Mention is made under Tapeworm of the worms of that species inhabiting the human body as parasites, and it will be convenient here to mention other parasitic varieties. The most common human parasite is the Ascaris lumbricoides or round worm, found chiefly in children and occupying the upper portion of the intestine. They are usually few in number, but occasionally occur in such large numbers that they cause intestinal obstruction. Unlike the tape-worms, no intermediate host is required for the development of this worm. It develops from direct ingestion of the larve. Various symptoms, such as diarrhea, anaemia, intermittent fever, restlessness, irritability and convulsions are attributed to these worms. The treatment is the administration of santonin, followed by a purgative. The threadworm or Oxyurus vermicularis is a common parasite infecting the rectum. The larvae of this worm are indirectly swallowed, and infection is usually due to passing the water, or possibly through lettuces and watercress. The symptoms caused by threadworms are loss of appetite, anaemia and intense itching. The cure is by means of a vermifuge containing quassia, carabolic acid, vinegar or turpentine or even common salt. In addition mild purgatives should be given.

WORMS, a city of Germany, in the grand-duchy of Hesse-Darmstadt, situated in a fertile plain called the Wonnegau, at the left bank of the Rhine, 25 m. S. of Mainz, 20 m. N.W. of Hanover, and 27 m. W.S.W. of the capital. Pop. (1895) 28,656; (1905) 43,841, about a third of whom are Catholics. The town is irregularly built, and some of the old walls and towers still remain, but its general aspect is modern. The principal church and chief building is the spacious cathedral of SS. Peter and Paul, which ranks beside those of Spires and Mainz among the noblest Romanesque churches of the Rhine (see Architecture: Romanesque and Gothic in Germany). This magnificent basilica, with four round towers, two large domes, and a choir at each end, has a specially imposing exterior, which is crowned by the imposing central tower of great dignity and simplicity, heightened by the natural colour of the red sandstone of which it is built. Only the ground plan and the lower part of the western towers belong to the original building consecrated in 1110; the remainder was mostly finished by 1181, but the west choir and the vaulting were built in the 13th century, the elaborate south portal was added in the 14th century, and the central dome has been rebuilt. The ornamental decoration of the older part is simple to the verge of rudeness; and even the more elaborate later forms show no high development either in respect to the construction or the ornamental work. The baptistery contains five remarkable stone reliefs of the late 15th century. The cathedral is 378 ft. long and 80 ft. wide, or including the transepts, which are near the west end, 118 ft. (inside measurements). It belongs to the Roman Catholic community, who possess also the church of St Martin and the church of Our Lady (Liebfrauenkirche), a handsome Gothic edifice outside the town, finished in 1467. The principal Protestant place of worship is the Trinity church, built in 1726. Second in interest to the cathedral is the church of St Paul, also in the Romanesque style, and dating from 1102-1116, with a choir of extraordinary beauty. The episcopal palace contains five remarkable stone reliefs of the late 15th century. The palace has been converted into an interesting museum of national antiquities. The late Romanesque church of St Andrew is not used. The old synodical, an unassuming building erected in the 11th century and restored in the 13th, is completely modernized. The Jewish community of Worms (about 1300 in number) claims to be the most ancient in Germany and to have existed continuously since the Christian era, though the earliest authentic mention of it occurs in 568. A curious tradition, illustrating the efforts of the dispersed people to conciliate their oppressors, asserts that the Jews of Worms gave their voice against the crucifixion, but that their messenger did not arrive at Jerusalem until after the event.

The town hall was rebuilt in 1884. The Bischofshof, in which the most famous diet of Worms (1521) was held, is now replaced by a handsome modern residence. The Lugnislund is an old watch-tower of the 13th century. In the Lutherplatz rises the imposing Luther monument (unveiled in 1868), on a platform 48 ft. sq. In the centre the colossal statue of Luther rises, on a pedestal, at the base of which are sitting figures of Peter Waldo, Wycliffe, Hus and Savaryolas, the heralds of the Reformation; at the corners of the platform, on lower pedestals, are statues of Luther's contemporaries, Melanchthon, Rechlin, Philip of Hesse, and Frederick the Wise of Saxony, between which are allegorical figures of Magdeburg (mourning), Spires (protesting) and Augsburg (concurring). The greater part of the work, which took nine years to execute, was designed by Rietschel, and carried out after his death in 1861 by Gustav Klette (1826-1908), Adolf von Donndorf (b. 1835) and Johannes Schilling (b. 1828).

The "Rosengarten" on the opposite bank of the Rhine.
associated with the stories of the wooing of Kriemhild (see infra), has been laid out in keeping with the old traditions and was opened with great festivities in 1906. Extensive burial-grounds, ranging in date from neolithic to Merovingian times, have recently been discovered near the city.

The trade and industry of Worms are important, and not the least resource of the inhabitants is vine-growing, the most famous vintage being known as Liebfraumilch, grown on vineyards near the Liebfrauenkirche. The manufacture of patent leather employs about 5000 hands. Machinery, wool, cloth, chesire, slates, &c., are also produced. Worms possesses a good natural harbour, and carries on a considerable trade by water.

Worms was known in Roman times as Borbetomagus, which in the Merovingian age became Wormatia, afterwards by popular etymology connected with Wurm, a dragon. The name Borbetomagus indicates a Celtic origin for the town, which had, however, before Caesar's time become the capital of a German tribe, the Vangiones. Drusus is said to have erected a fort here in 14 B.C. In 413 the emperor Jovinus permitted the Burgundians under their king Gunar or Gunthar to settle on the left bank of the Rhine between the Lauter and the Nahe. Here they founded a kingdom, which in the 6th century, Adalbrand Arian in 764 joined his kingdom to that of the Romans, and in 912 his kingdom to that of the Huns. The Gunahar or Gundric (the Gunder of the Nibelungenlied) rose in 435 against the Roman governor Aetius, which called in the Huns against them. The destruction of Worms and the Burgundian kingdom by the Huns in 436 was the subject of heroic legends afterwards incorporated in the Nibelungenlied (q.v.) and the Rosengarten (an epic probably of the late 13th century).

In the Nibelungenlied King Gunther and Queen Brunhild hold their court at Worms, and Siegfried comes hither to woo Kriemhild.

Worms was rebuilt by the Merovignians, and became an episcopal see, first mentioned in 614, although a bishop of the Vangiones had attended a council at Cologne as early as 347. There was a royal palace from the 8th century, in which the Frankish kings, including Charlemagne, occasionally resided.

The scene of the graceful though unhistorical romance of Einhard and Emma, the daughter of Charlemagne, is laid here.

Under the German kings the power of the bishops of Worms gradually increased, although they never attained the importance of the other Rhenish bishops. Otto I. granted extensive lands to the cathedral of St. Peter, and religious confects were held in his city. Burchard I. (bishop from 1000 to 1052) destined the castle of the Franconian house at Worms, built the cathedral and laid the foundations of the subsequent territorial power of the see. There were frequent struggles between the bishops and the citizens, who espoused the cause of the emperors against them, and were rewarded by privileges which fostered trade. Henry IV. granted a charter to Worms in 1074, and held a synod there in 1076, by which Pope Gregory VII. was declared deposed. Henry V. acquired Worms in 1121 by the treaty of Würzburg, built a castle and granted privileges to the city, which retained its freedom until 1801, in spite of the bishops, who ruled a small territory south of the city, on both sides of the Rhine, and resided at Landenburg near Mannheim till 1622.

The city of Worms was frequently visited by the imperial court, and won the title of "Mother of Diets." The concordat of Worms closed the investiture controversy in 1122. The "perpetual peace" (eisger Landfriede) was proclaimed by the emperor Maximilian I. at the diet of 1495, and Luther appeared before the famous diet of 1527 to defend his doctrines in the presence of Charles V. Four years later, Worms formally embraced Protestantism, and religious controversy was held there in 1540 and 1557. It suffered severely during the Thirty Years' War. After being sacked in turn by Mansfeld, Tilly and the Spaniards, it was taken by Oxenstierna in 1632, who held a convention here with his German allies. The imperialists again took Worms in 1635, and it admitted the French under Turenne in 1644. The French under Mélac burnt the city almost entirely in 1689, and it has only fully recovered from this blow in recent years. Thus the population, which in its prosperous days is said to have exceeded 50,000, had sunk in 1875 to 6250.

By the treaty of Worms in 1743 an offensive alliance was formed between Great Britain, Austria and Sardinia. The French under Custine took the city by surprise in 1792 and it was annexed by the peace of Lunéville in 1801 to France, together with the bishop's territories on the left bank of the Rhine. The remaining episcopal dominions were secularized in 1863 and given to Hesse-Darmstadt, which acquired the whole by the Vienna Congress in 1815. In 1849 the Baden revolutions seizing Worms, but were overthrown by the Mecklenburgers and Prussians in May of that year.

Soldan, Der Reichstag zu Worms, 1521 (Worms, 1883); Beiträge zur Geschichte der Stadt Worms (Worms, 1896); G. Wolf, Zur Geschichte der Juden in Worms (Breslau, 1862); Nover, Das alte und neue Worms (Worms, 1895).

**WORMWOOD**, the popular name for an aromatic herb known botanically as Artemisia Absinthium, a member of the family Compositae. It grows from 1 ft. to 3 ft. high and is slightly hairy; the leaves are small and much cut, and the flowers are small yellow hemispherical heads among the leaves at the end of the branches. It grows in waste places. It is a tonic and vermisgut, for it is said to have the power of expelling tapeworms, and as such it is known as an herb, but it is also a wormwood, also an aromatic herb, with larger and broader leaves, which are white woolly beneath, and erect woolly heads of reddish-yellow flowers.

**WORSBOROUGH**, an urban district in the Holmfirth parliamentary division of the W. Riding of Yorkshire, England, 3 m. S. of Barnsley, near the Sheffield & Barnsley branch of the Great Central railway, and on a branch of the Derne & Dove canal. Pop. (1901) 16,336. The church of St Mary is an interesting structure with remains of Norman work, but chiefly of Early English date. There are extensive collieries and gunpowder mills near, and in the town iron and steel works and corn mills.

**WORSHIP** (i.e. "worth-ship"), O. Eng. wordscipe), honour, dignity, reverence, respect. The word is used in a special sense of the service, reverence and honour paid, by means of devotional words or acts, to God, to the gods, or to hallowed persons, such as the Virgin Mary or the saints, and hallowed objects, such as holy images or relics. In this sense, however, it must be borne in mind that the Roman Catholic Church distinguishes three kinds of worship: (1) laetia, the worship due to God alone (from Gr. aoriste, service, esp. the service of the gods, worship), and (2) hyperdulia, the worship or adoration due to the Virgin Mary as the Mother of God (from Gr. ὑπερδοσία, above, and δωδεκά, service), and (3) diulia, that due to the saints. (See also ADORATION.)

The public service of God in church is known as "divine worship" or "divine service" (see LITURGY). In the sense of "reverence" or "respect," the verb "to worship" occurs in the English Prayer-book, in the phrase "with my body I thee worship" in the Marriage Service. In this sense the term "worship" is also used as a title of honour in speaking of or addressing other persons of position. Thus a mayor is spoken of as "his worship the mayor," or "the worshipful the mayor." Magistrates are addressed as "your worship."

**WORSLEY, PHILIP STANHOPE** (1835-1866), English poet, son of the Rev. Charles Worsley, was born on the 12th of August 1835, and was educated at Highgate grammar school and Corpus Christi College, Oxford, where he won the Newdigate prize in 1857 with a poem on "The Temple of Janus." In 1861 he published a translation of the Odyssey, followed in 1865 by a translation of the first twelve books of the Iliad, in both of which he employed the Spenserian stanza with success. In 1865 appeared a volume of Poems and Translations. Worsley died on the 8th of May 1866. His translation of the Iliad was completed after his death by John Conington.

**WORSLEY**, an urban district in the Eccles parliamentary division of Lancashire, England, 6 m. W.N.W. of Manchester by the London & North-Western railway. Pop. (1901) 12,462. Its growth is a result of the development of the cotton manufacture and of the neighbouring collieries.
WORTH, Charles Frederick (1825-1895), the famous dressmaker, was born at Bourne, Lincolnshire, in 1825. His father, a country solicitor, having lost his money in speculation, Charles was sent to London as an apprentice to Swan & Edgar, drapers. Thence, in 1846, he went to Paris, without capital or friends, and after twelve years, by the strenuous and hard work he began the business as a dressmaker in partnership with a Swede named Doberghi. His originality and skill in design won the patronage of the empress Eugénie, and, through her, of fashionable Paris. After the Franco-German War, during which he turned his house into a military hospital, his partner retired, and Worth continued the business, which employed 1,200 hands, with his two sons John and Gaston—both naturalized Frenchmen. For more than thirty years he set the taste and ordained the fashions of Paris, and extended his sway over all the civilized and much of the uncivilized world. He died on the 29th of March at the age of 70.

WÖRTH, a village of Alsace, on the Saar, 6 m. N. of Hagenaun, which gives its name to the battle of the 6th of August 1870, fought between the Germans under the crown prince of Prussia and the French under Marshal MacMahon. The battle is also called Reichshofen and Fröschweiler.

The events which led up to the engagement, and the general situation on the 6th are dealt with under FRANCO-GERMAN WAR. During the 5th of August the French concentrated in a selected position running nearly N. and S. along the Saar Bach on the left front of the German III. army which was moving S. Thence the battle position is marked from right to left by Marsbronn, the Niederwald, the heights W. of Wörth and the woods N.E. of Fröschweiler. E. of the Saar the German III. army was moving S. towards Hagenaun, when their cavalry found the French position about noon. Thereafter the German vedettes held the French under close observation, while the latter moved about within their lines and as far as the village of Wörth as if in peace quarters, and this notwithstanding the defeat of a portion of the army at Weissenburg on the previous day. The remnant of the force which had been engaged, with many of its wounded still in the ranks, marched in about noon, with so solidly a bearing that, so far from their depressing the morale of the rest, their appearance actually raised it.

About 5 P.M. some horses were watered at the Saar, as in peace, without escort, though hostile scouts were in sight. A sudden swoop of the enemy’s hussars drove the party back to camp. The alarm was sounded, tents were struck and the troops fell in along the line and remained under arms until the confusion died down, when orders were sent to fall out, but not to pitch the tents. The artillery therefore bivouacked, and but for the incident the battle position is marked from right to left by Kirchbach to Spachbach, the cavalry then took up the line to the Bech. Prussians were dug in to the aid of the digging artillery and shells were thrown in.

The Prussian guns, as strict orders had been given to avoid all engagement that day, soon withdrew and were about to return to camp, when renewed artillery fire was heard from the S. and presently also from the N. In the latter direction, the II. Bavarian corps had bivouacked along the Mattstall-Langen-sulzbach road with orders to continue the march if artillery were heard to the S. This order was contrary to the spirit of the III. army orders, and moreover the V. Prussian corps to the S. was in ignorance of its having been given.

The outpost battery near Wörth was heard, and the Bavarians at once moved forward. Soon the leading troops were on the crest of the ridge between the Saar and the Sulzbach, and the divisional commander, anxious to prove his loyalty to his new allies—his enemies in 1866—ordered his troops to attack, giving the spire of Fröschweiler, which was visible over the woods, as the point of direction. The French, however, were quite ready and a furious fusillade broke out, which was multiplied by the echoes of the forest-clad hills out of all proportion to the numbers engaged. The Prussian officers of the V. corps near Dieffenbach, knowing nothing of the orders the Bavarians had received, were surprised; but the Bavarians did not know that their comrades were being retiring, in some cases in great disorder, the corps commander, General von Kirchbach, decided that an effort must at once be made to relieve the Bavarians. His chief of staff had already ordered up the divisional and corps artillery (84 guns in all), and he himself communicated his intention of attacking to the XI. corps (General von Bose) on his left and asked for all available assistance. A report was also despatched to the crown prince at Sulz, 5 m. away.

Meanwhile the XI. corps had become involved in an engagement. The left of the V. corps, opportune to Occupied Gunstett and the bank of the Saar, and the French shortly after daylight on the 6th sent down an unarmed party to fetch water. As this appeared through the mist, the Prussians naturally fired upon it, and the French General Lartigue (to whose division the party belonged), puzzled to account for the firing, brought up some batteries in readiness to repel an attack. These fired a few rounds only, but remained in position as a precaution.

Hearing the firing, the XI. corps’ advanced guard, which had marched up behind in accordance with the general movement of the corps in changing front to the west, and had halted on reaching the Kreuzhecke Wood, promptly came up to Spachbach and Gunstett. In this movement across country to Spachbach some bodies appear to have exposed themselves, for French artillery at Elssachsenhausen suddenly opened fire, and the shrapnel bursting high, sent showers of bullets on to the house roofs of Spachbach, in which village a battalion had just halted. As the falling tiles made the position undesirable, the major in command ordered the march to be resumed, and as he gave the order, his horse ran away with him towards the Sauer. The leading company, seeing the battalion commander gallop, moved off at the double, and the others of course followed.

Coming within sight of the enemy, they drew a heavy shell fire, and, still under the impression that they were intended to attack, deployed into line of columns and doubled down to the river, which they crossed. One or two companies in the neighbourhood had already begun to do so, and the stream being too wide for the mounted officers to jump, presently eight or ten companies were across the river and out of superior control. By this time the French outposts (some 1,500 rifles), lining the edge of the Niederwald, were firing heavily. The line of smoke was naturally followed by all the other Prussian companies, who in confusion joined the French companies with a wild rush reached the edge of the wood.

The same thing had happened at Gunstett. A most obstinate struggle ensued and both sides brought up reinforcements. The Prussians, with all their attention concentrated on the wood in their front, and having as yet no superior commanders, soon exhibited signs of confusion, and thereupon General Lartigue ordered a counter attack towards the heights of Gunstett, when all the Prussians between the Niederwald and the Sauer gave way. The French followed with a rush, and, forcing the Prussians back, seized the Gunstett heights. One of the guns placed on the long line of German guns upon the heights in considerable danger. At this crisis a fresh battalion of the XI. corps arrived by the road from Surburg to Gunstett, and attacked the French on one flank whilst the guns swept the other. The momentum of the charge died cut, and the French drifted backwards after an effort which compelled the admiration of both sides.

In the centre the fight had gone badly for the V. corps. As soon as the 84 guns between Dieffenbach and Spachbach opened fire the French disappeared from sight. There was no longer a target, and, perhaps to compel his adversary to show himself, von Kirchbach ordered four battalions to cross the river. These battalions, however, were widely separated, and coming under fire as soon as they appeared, they attacked in two groups, one from Wörth towards Fröschweiler, the other from near Spachbach towards the Calvary spur, E. of
Elashausen. Both were overpowered by infantry fire. A fraction of the S. party maintained itself all day in the elbow of the Hagenaus chaussée, which formed a starting-point for subsequent attacks. But the rest were driven back in great confusion. Once more the dashing counter-attack of the French was thrown into confusion by the Prussian shell fire, and as the French fell back the Prussian infantry, now reinforced, followed them up (about 1 p.m.). The commander-in-chief of the German III. army (the crown prince Frederick) now appeared on the field and ordered Kirchbach to stand fast until the pressure of the XI. corps and Württemberg division could take effect against the French right wing. The majority of these troops had not yet reached the field. Von Bose, however, seeing the retreat of the troops of the V. corps, had independently determined to renew the attack against the Niederwald with such of his forces as had arrived, and had ordered General von Schkopp's brigade, which was then approaching, to join the troops collecting to the east of Gunstett. Schkopp, however, seeing that his present line of advance led him direct on to the French right about Morsbronn and kept him clear of the confusion to be seen around Gunstett, disregarded the order and continued to advance on Morsbronn. This deliberate acceptance of responsibility really decided the battle, for his brigade quietly deployed as a unit and compelled the French right wing to fall back.

To cover the French retreat Michel's brigade of cavalry was ordered to charge. The order was somewhat vague, and in his position under cover near Eberbach, General Michel had no knowledge of the actual situation. Thus it came about that, without
WORTHING—WOTTON, SIR H.

reconnoitring or manouevring for position, the French cavalry rode straight at the first objective which offered itself, and struck the victorious Prussians as they were crossing the hills between the Albrechtsäuscherhof and Morsbronn. Hence the charge was costly and only partly successful. However, the Prussians were ridden over here and there, and their attention was sufficiently absorbed while the French infantry rallied for a fresh counter-stroke. This was made about 1.30 p.m., with the utmost gallantry, and the Prussians were driven off the hillsides between the Albrechtsäuscherhof and Morsbronn which they had already won. But the counter-attack soon came under the fire of the great artillery mass above Gunstett, and, von Bose having at length concentrated the main body of the XI. corps in the meadows between the Niederwald and the Sauer, the French had to withdraw. Their withdrawal involved the retreat of the troops who had fought all day in defence of the Niederwald.

By 3 p.m. the Prussians masters of the Niederwald and the ground S. of it on which the French right wing had originally stood, but they were in indescribable confusion after the prolonged fighting in the dense undergrowth. Before order could be restored came another fierce counter-stroke. As the Prussians emerged from the N. edge of the wood, the French reserves suddenly came out from behind the Elssasshausen heights, and striking due S. drove the Prussians back. It was a grave crisis, but at this moment von Schoppk, who throughout all this had kept two of his battalions intact, came round the N.W. corner of the wood and brought in his battalions again brought the French to a standstill. Meanwhile von Kirbach, seeing the progress of the XI. corps, had ordered the whole of his command forward to assault the French centre, and away to the right the two Bavarian corps moved against the French left, which still maintained its original position in the woods N.E. of Fröschweiler.

MacMahon, however, was not beaten yet. Ordering Bonniers' cavalry division to charge, by squadrons to gain time, he brought up his reserve artillery, and sent it forward to case-shot range to cover a final counter-stroke by his last intact battalions. But from his position near Fröschweiler he could not see into the hollow between Elssasshausen and the Niederwald. The order was too late, and the artillery unlimbered just as the counter attack on the Niederwald alluded to above gave way before von Schoppk's reserve. The guns were submerged in a flood of fugitives and pursuers. Elssasshausen passed into the hands of the Germans. To rescue the guns the nearest French infantry attacked in succession of groups, charging home the bayonet with the utmost determination. Before each attack the Prussians immediately in front gave way, but those on the flanks of the Niederwald and those remaining under this converging fire each French attempt died out, the Prussians following up their retreat. In this manner, step by step, in confusion which almost defies analysis, the Prussians conquered the whole of the ground to the S. of the Fröschweiler-Wörtl road, but the French still held on in the village of Fröschweiler itself and in the woods to the N. of the road, where throughout the day they had held the two Bavarian corps in check with little difficulty. To break down this last stronghold, the guns of the V. and XI. corps, which had now come forward to the captured ridge of Elssasshausen, took part in the operation. The great crowd of infantry, now flushed with victory but in the dire confusion, defied the example of two horse artillery batteries which galloped boldly forward to case-shot range, delivered one final rush which swept all resistance before it.

The battle was won and cavalry only were needed to reap its consequences, but the Prussian cavalry division had been left behind without orders and did not reach the battlefield till late at night. The divisional cavalry squadrons did their best, but each pursued on its own account, and the results in prisoners and guns tell far short of what opportunity offered. Under cover of darkness the French escaped, and on the following day the cavalry division was quite unable to discover the direction of the retreat.

MacMahon received no support from the neighbouring French troops (see Franco-German War). The battle was won by over-powering weight of numbers. The Prussian general staff were able to direct upon the field no fewer than 75,000 infantry, 6,000 cavalry, 104 guns, of which 71,000 rifles, 4250 sabres and 234 guns came into action, against 27,000 rifles and 500 guns on the French side. The superiority of the French chassepot to the needle guns may reasonably be set against the superior number of the German chassepot to the French. The Germans were generally, thanks to their numbers, able to bring a converging fire on the French, the latter made nearly double the number of hits for about the same weight of ammunition fired, but the French had nothing to oppose to the superior German artillery, and in almost any instance it was the terrible shell fire which broke up the French counter attack. All of these attacks were in the highest degree directed to the French flanks, and many came nearer to imperilling the ultimate success of the Germans than is generally supposed. One other point deserves special attention. As soon as the fighting became general, all order in the skirmisher lines disappeared on both sides. In a few minutes the last of the bravest Prussian artillery for instance, it was the appearance of closed bodies of troops rear of the fighting line which determined the retreat of their opponents. Even in the confused fighting in the Niederwald, the mere sound of the Prussian drums or the French bugles induced the adversary to give way even though drums and bugles frequently appealed to non-existent troops.

The losses of the Germans were 9770 killed and wounded and 1370 missing, or 13%; those of the French were about 8000 killed and wounded, and perhaps 12,000 missing; and prisoners, representing a total loss of about 41%. Some French regiments retained a semblance of discipline; one battalion completely escaped, and one other battalion lost 93%, 1366 bussars 87%, and thirteen regiments in all lost 50% of their strength.

WORTHING, a municipal borough and seaside resort in the Lewes parliamentary division of Sussex, England, 61 m. S. by W. from London by the London, Brighton & South Coast railway. Pop. (1901) 20,015. It has a fine marine parade, and a broad, long range of firm sands. A public park, 21 acres in extent, was opened in 1899; several modern buildings are several modern churches, the town hall (1834), municipal buildings, free library, literary institute, infirmary and convalescent homes. The mother parish of Worthing is Broadwater, the church of which, 1 m. north of Worthing, is a cruciform building, and a fine example of transitional Norman work. A Roman villa, evidence of the existence of pottery works, and a so-called mile-stone, have been discovered at Worthing. The town was incorporated in 1850, and is under a mayor, 8 aldermen, and 55 councilors, and has a rateable value of 1450 acres.

Wotton, Sir Henry (1548-1615), English author and diplomatist, son of Thomas Wotton (1521-1587) and grandson of the diplomatist Nicholas Wotton (q.v.), was born at Boston Hall in the parish of Boston or Boughton Malherbe, Kent. He was educated at Winchester and at New College, Oxford, where he matriculated on the 5th of June 1564. Two years later he removed to Queen's College, graduating B.A. in 1588. At Oxford he was the friend of Albericus Gentilis, then professor of Civil Law, and of John Donne. During his residence at Queen's he wrote a play, Tancred, which has not survived, but his chief interests appear to have been scientific.

In qualifying for his M.A. degree he read three lectures De oculo, and to the end of his life he continued to interest himself in physical experiments. His father, Thomas Wotton, died in 1587, leaving to his son the very inadequate maintenance of a hundred marks a year. About 1589 Wotton went abroad, with a view probably to further his career as a diplomatist, and his travels appear to have lasted for about six years. At Altdorf he met Edward, Lord Zouch, to whom he later addressed a series of letters (1590-1593), which contain much political and other news. These (Reliquiae Wottonianae, London, 1699, 2 vol. 8°) provide a record of the journey. He travelled by way of Vienna 1 His elder half-brother, Edward Wotton (1548-1626), entered the service of Sir Francis Walsingham, and in 1585 was sent on an important errand to James VI. of Scotland. In 1602 he was made comptroller of the royal household, and in 1603 he was created Baron Wotton of Marley. The peerage became extinct on the death of his son Thomas, the 2nd baron (1588-1650).
WOUND

and Venice to Rome, and in 1593 spent some time at Geneva in the house of Isaac Casaubon, to whom he contracted a considera-
table debt. He returned to England in 1594, and in the next year
was admitted to the Middle Temple. While abroad he had
time from time to time provided Robert Devereux, second earl of
Essex, with information, and he now definitely entered his
service as one of his agents or secretaries. It was his duty to
supply intelligence of affairs in Transylvania, Poland, Italy and
Germany. Wotton was not, like his unfortunate fellow-secretary,
Henry Cuffe, who was hanged at Tyburn in 1601, actually in-
volved in Essex's downfall, but he thought prudent to leave
England, and within sixteen hours of his patron's apprehension
he was safe in France, whence he travelled to Venice and Rome.
In 1602 he was resident at Florence, and a plot to murder James
VI. of Scotland having come to the ears of the grand-duke of
Tuscany, Wotton was entrusted with letters to warn him of the
danger, and with Italian antidotes against poison. As "Ottavio
Baldis" he travelled to Scotland by way of Norway. He was well
received by James, and remained three months at the Scottish
court, retaining his Italian cognizance. He then returned to
Florence, but on receiving the news of James's accession hurried
to England. James knighted him, and offered him the embassy
at Madrid or Paris; but Wotton, knowing that both these offices
interested his patron, refused rather to represent James at
Venice. He left London in 1604 on embassies at Venice
head by Sir Gilbert Morton, his half-nephew, as secretary, and
William Bedell, the author of an Irish translation of the Bible, as
chaplain. Wotton spent most of the next twenty years, with two breaks (1612-1616 and
1619-1621), at Venice. He helped the Doge in his resistance
to ecclesiastical aggression, and was closely associated with
Paolo Sarpi, whose history of the Council of Trent was sent to
King James as fast as it was written. Wotton had offended the
scholar Caspar Schoppe, who had been a fellow student at
Altdorf. In 1611 Schoppe wrote a scurrilous book against James,
who was then residing in Venice. Wotton was domiciled in Venice
before which he had incursively written in a friend's album years
before. It was the famous definition of an ambassador as an
"honest man sent to lie abroad for the good of his country."
It should be noticed that the original Latin form of the epigram
did not admit of the double meaning. This was added as an
example of the morals of James and his servants, and brought
Wotton into temporary disgrace. Wotton was at the time on
leave in England, and made two formal defences of himself, one
a personal attack on his accuser addressed to Marcus Welser of
Strassburg, the other a refutation of Wotton's own. Wotton
secure further diplomatic employment for some time, and seems
to have finally won back the royal favour by obsequious support
in parliament of James's claim to impose arbitrary taxes on
merchandise. In 1614 he was sent to the Hague and in 1616 he
returned to Venice. In 1620 he was sent on a special embassy to
Ferdinand II. at Vienna, to do what he could on behalf of James's
daughter Elizabeth, queen of Bohemia. Wotton's devotion to
this princess, expressed in his exquisite verses beginning "You
meant beauties of the night," was sincere and unchanging.
At his departure the emperor presented him with a jewel of great
value, "which Wotton received with due respect, but before
leaving the city he gave it to his hostess, because, he said, he
would accept no gifts from the enemy of the Bohemian queen.
After a third term of service in Venice he returned to London
early in 1624 and in July he was installed as provost of Eton
College. This office did not relieve him from his pecuniary
embarrassments, and he was even on one occasion arrested for
debt, but he received in 1627 a pension of £200, and in 1630 this
was raised to £500 on the understanding that he should write
a history of England. He did not neglect the duties of his pro-
vostship, and was happy in being able to entertain his friends
lavishly. His most constant associates were Izaak Walton and
John Hales. A bend in the Thames below the Playing Fields,
known as "Black Potts," is still pointed out as the spot where
Wotton and Izaak Walton fished in company. He died at the
beginning of December 1639 and was buried in the chapel of
Eton College.

Sir Henry Wotton was not an industrious author, and his
writings are very small in bulk. Of the twenty-five poems
printed in Reliquiae Wottonianae only fifteen are Wotton's.
But of those fifteen two have obtained a place among the best
known poems in the language, the lines already mentioned "On
his Mistress, the Queen of Bohemia," and "The Character of a
Happy Life."

During his lifetime he published only The Elements of Architecture
(1624), which is a paraphrase from Marcus Vitruvius Pollio, and a
Latin prose address to the king on his return from Scotland (1635).
In 1651 appeared the Reliquiae Wottonianae, with Izaak Walton's
Life. An admirable Life and Letters; representing much new
material, by Logan Pearsall Smith, was published in 1907. See also
A. W. Wotton, Sir Henry Wotton, Biographical Sketch (1868).

Wotton, Nicholas (c. 1497-1567), English diplomatist,
was a son of Sir Robert Wotton of Boughton Malherbe, Kent,
and a descendant of Nicholas Wotton, lord mayor of London in
1415 and 1430, and member of parliament for the city from
1406 to 1420. He early became vicar of Boughton Malherbe and
of Sutton Valence, and later of Ickchurch, Kent; but, desiring a
more worldly career, he entered the service of Cuthbert Tunstall,
bishop of London. Having helped to draw up the Institution
of a Christian Man, Wotton in 1539 went to arrange the marriage
between Henry VIII. and Anne of Cleves and the union of
Protestant princes which was to be the complement of this union.
He crossed over to England with the royal bride, but, unlike
Thomas Cromwell, he did not lose the royal favour when the king
repudated Anne, and in 1541, having already refused the bishopric
of Hereford, he became dean of Canterbury and in 1544 dean of
York. In 1543 he went on diplomatic business to the Nether-
lands, and for the next year or two he had much intercourse
with the emperor Charles V. He helped to conclude the treaty of
Arras between England and France in 1546, and was assigned
ambassador in France from 1546 to 1549. Henry VIII. made
Wotton an executor of his will and left him £500, and in 1549,
under Edward VI., he became a secretary of state, but he only
held this post for about a year. In 1550 he was again sent as
envoy to Charles V., and he was ambassador to France during
the reign of Mary, doing valuable work in that capacity. He
left France in 1557, but in 1558 he was again in that country,
helping to arrange the preliminaries of the treaty of Cateau-
Cambresis. In 1560 he signed the treaty of Edinburgh on behalf
of Elizabeth, and he had again visited the Netherlands before
his death in London on the 26th of January 1567.

His brother, Sir Edward Wotton (1480-1551), was made
treasurer of Calais in 1540, and was one of those who took part
in the overthrow of the protector Somerset. His son, Thomas
Wotton (1521-1587) was the father of Sir Henry Wotton (q.v.).

Wotton, William (1666-1727), English scholar, son of
the Rev. Henry Wotton, was born in his father's parish of
Wrentham, Suffolk, on the 13th of August 1666. He was not
yet ten years old when he was sent to Catherine Hall, Cambridge,
having by this time a good knowledge of Latin, Greek and
Hebrew. He obtained a fellowship at St John's College, and
was elected an F.R.S. in 1687. Wotton is chiefly remembered
for his share in the controversy about the respective merits
of ancient and modern learning. In his Reflections upon Ancient
and Modern Learning (1694, and again 1697) he took the part
of the moderns, although in a fair and judicious spirit, and was
attacked by Swift in the Battle of the Books. During some of his
later years Wotton resided in Wales and gave himself to the study
of Celtic, making a translation of the laws of Howel Dda, which
was published after his death (1750). Having taken holy orders,
and a prebend of Salisbury from 1705 until his death at
Buxted, Sussex, on the 12th of February 1727.

Wotton wrote a History of Rome (1701) and Miscellaneous
Discoveries relating to the Traditions and Usages of the Scribes and
Pharsi-

Wound (O. Eng. wund, connected with a Teutonic verb, meaning
to strive, fight, suffer, seen in O. Eng. wynnan, whence Eng. "win"),
a solution in the continuity of the soft parts of the body. Con-
tused wounds, or bruises, are injuries to the cellular tissues in
which the skin is not broken. In parts where the tissues are lax
the signs of swelling and discoloration are more noticeable than
in the tender tissues. The discoloration is caused by haemorrhage into the tissues (ecchymosis), and passes from dark purple through green to yellow before it disappears. If a considerable amount of blood is poured forth into the injured tissues it is termed a haematoma. The treatment of a bruise consists in the application of cold lotion, preferably an evaporating spirit-lotion, to limit the subcutaneous bleeding. The haemorrhage usually becomes absorbed and subsides, and even in haematoma, but should suppuration threaten an incision must be made and the cavity aseptically evacuated.

Open wounds are divided into incised, lacerated, punctured and gunshot wounds. **Incised** wounds are made by any sharp instrument and have their edges evenly cut. In these wounds there is usually freedom of the vessels, and the edges of the wounds are those in which the edges of the wound are torn irregularly. Such injuries occur frequently from accidents with machinery or blunt instruments, and are mostly superficial. The haemorrhage is less than from incised wounds, and the edges may be bruised. **Punctured** wounds are those in which the depth is greater than the external opening. They are generally produced by sharp-pointed instruments. The chief danger arises from puncture of large blood-vessels, or injury to important structures such as occur in the thorax and abdomen. It is also difficult to keep such wounds surgically clean and to obtain apposition of their deeper parts, and septic gums and suppuration are frequent in the infected wounds.

The treatment of incised wounds is to arrest the bleeding (see **Haemorrhage**), cleanse the wound and its surroundings, removing all foreign matter, then dress the wound and keep it clean. The first dressing should be some soothing lotion, such as carbolic acid, or a salve containing astringent. Such lotions should be renewed frequently, the applications being renewed and the dressing changed whenever signs of infection appear. The wound is usually dry by the second dressing, although the first dressing is usually moist from the escape of serum. The dressings should be continued daily for a week. In the dressing of lacerated wounds that may be likely to absorb a foreign body, such as a splinter, it is advisable to remove it with a fine needle or forceps. If a foreign body has entered the wound, it should be thoroughly searched for with a probe or forceps.

**Gunshot wounds** are those which are due to the escape of the contents of a vessel, and the entry of the shot itself. The latter is sometimes accompanied by a splinter or other foreign body. The emanations from the vessel may be absorbed by the skin, or they may be mixed with the blood, and may be turned into nodes in the corresponding part of the body. The admission of a foreign body may produce a wound of the adjacent part, which may also be turned into a node. The wound is usually septic, and the patient is in severe pain. The patient should be kept in bed for a week, and the wound should be kept clean. The dressing should be continued as long as the septic symptoms are present, and until the wound is free from sepsis.

In the dressing of gunshot wounds, the employment of astringent lotions is often necessary, as the wound is often septic. The use of such lotions is therefore advisable, and the dressing should be continued as long as the septic symptoms are present, and until the wound is free from sepsis.
of which settled in Sweden, Russia and Germany. His father, Hermann von Wrangel (1587–1643), was a Swedish field marshal in Gustavus Adolphus's army. Karl Gustaf Wrangel was born on the 23rd of December 1613, and at the age of twenty distinguished himself as a cavalry captain in the war against the Army of the League. Three years later he was colonel, and in 1638 major-general, still serving in Germany. In 1644 he commanded a fleet at sea, which defeated the Danes at Denmarn on the 23rd of October. In 1646 he returned to Germany as a field marshal and succeeded Torstenson as commander-in-chief of the Swedish army in Germany, which post he held during the last three campaigns of the Thirty Years' War. Under Wrangel and Turenne the allied Swedish and French forces harried and fought in Bavaria with Wilhelm V, Duke of Bavaria.

At the outbreak of a fresh Polish war in 1653 Wrangel commanded a fleet, but in 1656 he was serving on land again and commanding, along with the Great Elector of Brandenburg, in the three days' battle of Warsaw. In 1657 he invaded Jutland and in 1658 passed over the ice into the islands and took Kronborg. In 1657 he was appointed admiral and in 1664 general of the realm, and as such he was a member of the regency during the minority of Charles XI. But his last campaign was unfortunate. Commanding, ineffectively owing to his broken health, in the war against Brandenburg at the battle of Styles, he was defeated, and Waldemar, Freiherr von Wrangel (1647–1657), had been defeated at Fehrbellin. He died at Rügen shortly afterwards, on the 3rd of July 1676.

WRASSE, a name given to the fishes of the family Labridae generally, and more especially to certain members of the family. They are very abundant in the tropical zone, less so in the temperate, and disappear altogether in the Arctic and Antarctic Circles. Their body is generally compressed, like that of a carp, covered with smooth scales, often iridescent, and pass along with the Great ELECTOR OF BRANDENBURG, in the three days' battle of the war of 1693.

Lips of Labrus festivus.

Of the British wrasses the ballan wrasse (Labrus maculatus) and the striped or red or cook wrasse (Labrus mixtus) are most common. Both belong to the genus Labrus, in which the teeth stand in a single series, and which has a smooth edge of the operculum and only three spines in the anal fin. The ballan wrasse is the larger, attaining to a length of 18 in., and, it is said, to a weight of 8 lb.; its colours are singularly beautiful, green or brown or black, and red and blue lines and spots; the dorsal spines are twenty in number. The cook wrasse offers an instance of well-marked secondary sexual difference—the male being ornamented with blue streaks or a blackish band along the side of the body, whilst the female has two or three large black spots across the back of the tail. This species possesses only from sixteen to eighteen spines in the dorsal fin. The goldfinny or cokwing (Ctenolabrus melops) is much more frequent on the coasts of England and Ireland than the ballan wrasse, and passes sometimes to a length of 10 in. As in other wrasses, its colours are beautiful, but variable; but it may be readily distinguished from the two preceding species by the toothed edge of the preoperculum. The three other British wrasses are much scarcer and more local, viz. Jago's goldfinny (Ctenolabrus jagoii), with a large black spot on the anterior dorsal fin and another on the base of the upper caudal rays; Acantholabrus falcifer, which is so rarely captured that it lacks a vernacular name, but may be easily recognized by its five anal spines and by the teeth in the jaws forming a band; and the rock-cook (Centro-

labrus exoletus), which also has five anal spines, but has the jaws armed with a single series of teeth.

On the Atlantic coasts of the N. states of the United States the wrasses are represented by the genus Tautoga. The only species of this genus, known by the names of tautog or blackfish, is much esteemed as food. It is caught in great numbers, and generally sold of a weight of about 2 lb.

WRAXALL, SIR NATHANIEL WILLIAM (1751–1831), English author, was born in Queen's Square, Bristol, on the 8th of April 1751. He was the son of a Bristol merchant, Nathaniel Wraxall, and his wife Anne, great niece of Sir James Thornhill the painter. He entered the employment of the East India Company in 1769, and served as judge-advocate and paymaster during the expeditions against Guzerat and Baroch in 1771. In the following year he left the service of the company and returned to Europe. He visited Portugal and was presented to the court, of which he gives a curious account in his Historical Memoirs; and in the N. of Europe he made the acquaintance of several Danish nobles who had been exiled for their support of the deposed Queen Caroline Matilda, sister of George III. Wraxall at their suggestion undertook to endeavour to persuade the king to act on her behalf. He was able to secure an interview with her at Zell in September 1774. His exertions are told in his Posthumous Memoirs. As the queen died on the 1st January 1775, it was impossible for him to let her know that he was out of pocket, but George III. took no notice of him for some time. In 1775 he published his first book, Cursory Remarks made in a Tour through some of the Northern Parts of Europe, which reached its fourth edition by 1807, when it was renamed A Tour Round the Baltic. In 1777 he travelled again in Germany and Italy. As he had by this time secured the patronage of important people, he obtained a complimentary lieutenant's commission from the king on the application of Lord Robert Manners, which gave him the right to wear uniform though he never discharged any military service. In 1772 he published his Memoirs of the Court of France; or the Reign of Valéry, to which he appended an account of his tour in the Western, Southern and Interior provinces of France. In 1778 he went again on his travels to Germany and Italy, and accumulated materials for his Memoirs of the Courts of Berlin, Dresden, Warsaw and Vienna (1790). In 1780 he entered parliament and sat till 1794 for Hinton in Wiltshire, Ludgershall and Wallingford, in succession. He published in 1795 the beginning of a History of France from the Accession of Henry III. to the Death of Louis XIV., which was never completed. Little is known of the years 1795–1799. In 1796 he was made a judge-advocate in the army of the Duke of York, and was made Baron Wraxall in 1813. His Historical Memoirs appeared in 1815. Both they and the Posthumous Memoirs (1830) are very readable and have real historical value. Wraxall married Miss Jane Lascelles in 1780, and died suddenly at Dover on the 7th of November 1831. His grandson, Sir F. C. Lascelles Wraxall (1828–1865), was a miscellaneous writer of some note.

WRECK (O. Engl. wrec), from arect, to twist, a band of leaves, flowers or metal, twisted into a circular form, and used either as a chaplet or diadem for the head or as an ornament to be hung upon or round an object. For the ancient usages of crowning victors in the games with wreaths, and the bestowal of them as marks of honour see Crown and Coronet.

WRECK, a term which in its widest sense means anything without an apparent owner that is adrift upon, sunk in, or cast ashore by the sea; in legal phraseology, as appears below, it has a narrower meaning. Old Norman forms of the word, were and werec, are to be found in charters of 1181 and later date; and the modern term is still in use in Normandy. In Archaic it becomes werecum, wreckum or warecum; and such phrases as maris ejectum, factura maris, adventura maris, shipbychre, are all used as descriptions of wreck. In Anglo-Saxon charters was-Æagpwr, and in the charters of the Cinque Ports inventiones, a translation of "findalls," probably a local word, are synonymous with wreck. Formerly an appreciable source of revenue to the crown, afterwards a valuable addition to the income of a landowner.
on the coast, wreck has almost within modern times ceased to be a perquisite of either, or to enrich the casual finder at the expense of its rightful owner. The history of the law as sketched below will indicate how this has come about.

Wreck was a general rule in the civilized maritime countries of Europe that the right to wreck belonged to the sovereign, and formed part of the royal revenue. This was so under the Roman, French and feudal law; and in England, according to Cooley (17 Edw. I., 1324), provided that the king had wreck of the sea, whales and sturgeons taken in the sea and elsewhere within the kingdom, except goods of the crown, and in other wrecks of the sea, vessels, or other vessels, the king's subjects, which were taken at a year or a year and a day alike by a decree of Antonine the Great, the feudal law, the general maritime law, the law of France and English law Richard I. released his prerogative right to wreck to the extent of allowing children, or if there were none, brothers and sisters of a perishing owner, to have his goods; and Henry III., by a charter of 1236, allowed the owner of wrecked goods to have his property again if he claimed within the year. This law, as is said had for its object the prevention of the practice of destroying the property of the shipwrecked, was, however, gradually relaxed; and the owner of wreck was allowed to recover it if he made claim to it within a year or a year and a day. This the court did, for instance, in a certain case where a wreck was lost at a year or a year and a day alike by a decree of Antonine the Great. In Scotland, it seems that the same law had been laid down in 1275, and there are indications that upon the instructions of a court, the owners of wreck, or what is termed the old law, the crown, or the vice-admirals, were allowed to take what they pleased from the wreck. Thus as early as 1269 a treaty with Norway provides that owners of ships wrecked upon the coasts of Scotland, and which were taken as wreck, might have the ship and cargo recovered according to the law of the place. The system under which the lord-admiral and the vice-admirals of counties had for more than three centuries taken charge of wreck never worked well. Their interest was directly opposed to the preservation of the wreck; for they, like the crown, were allowed to take what they pleased from the wreck, except the owners and crews of ships in distress, that nothing should land alive. Apart from this, the system discouraged legitimate salvors. The admirals and vice-admirals had by degrees assumed that all salvage operations were exclusively their business; they took possession of wreck brought or cast ashore, whether it was legal wreck or not, and this often gave rise to conflicts with outside working salvers. It was not until the 17th century that the salvors established the right, which they now have, to a lien upon property saved as a security for adequate remuneration of their exertions in saving it; and if the vice-admirals restored to its owner a wreck that they had destroyed, there was no price given to the salvors, and they were left to their own resources for the payment of extravagant demands for salvage, storage and often legal expenses. A curious side light is thrown upon their practices by the evidence of another statute; the English admiralty that by the law of England no "salvage" was payable to the crown or to the admiralty of England in the like case of a Prussian ship going ashore upon an English coast. The records of the admiralty court show that Frederick's action in this case was intended as a protest, not against the payment of a fair reward to salvors of Prussian ships, but against exactions by English vice-admirals. Stories of willful wrecking of ships and cargoes, or even more evil deeds are probably exaggerations, but modern research has authenticated sufficient abuses to show that further legislation was necessary to regulate the taking of wreck and the payment of salvage. The result of this act of 1816 was the only substantial protection against plunder which owners of a wrecked ship could get was to apply to the admiralty judge for a commission enabling them or their agent to take charge of what came ashore; but to obtain such a commission took time and cost money, and before the commissioners arrived at the scene of the wreck a valuable cargo would have disappeared and the value of the wreck would have decreased. Stories of the wrecks of the Cinque Ports were proceeded with under the jurisdiction for £1000 in addition to an annuity of £500 for the warden's life. At the close of the 17th century the vice-admirals were required to make affidavits as to the amount of their gains; in 1675 one of them swore that his office was worth less than £50 in the year.

The right of the warden of the Cinque Ports to wreck, above alluded to, was derived from charters granted to the ports by Edward I. and his successors; many of these safeguards in a similar right under early charters. It would seem that these rights were of some value, for in 1289 the little towns of Dunwich and Southwold litigated at a cost of £3000 the question whether a tub of whisky picked up at sea belonged to the admiralty jurisdiction of the one town or the other; and the town of Yarmouth is said to have spent no less than £2000 upon a similar question. It was partly in order to put an end to the frequent disputes with the admiralty that the Corporation Act of 1835 was passed, abolishing all of them, except that of the Cinque Ports.

Grants of wreck individuals are earlier than those to towns. Even before the conquest it seems to have been unusual for grants from the crown of lands adjoining the sea to get the franchise of wreck included in their grants. A charter purporting to be of the year 1062 contains a grant by King Canute to the Dean and Chapter of Canterbury of wreck found at sea below low-water mark as far as a
man could by wading touch it with a sprit (Kemble, Cod. Dipl., No. 729). There is reason to think that before the end of the reign of Henry II. the crown had granted away its right to wreck round a great part of the coast of England. Although a landowner of the present day may claim a grant of wreck on a given coast, the respect of wreck itself, derive no substantial benefit, nevertheless the grant may be of great value as evidence of his right to the shore; and even where no grant of wreck can be produced, if he can show that the ground has been in the possession of wreck on the foreshore, it is strong evidence as against the crown of his right to the foreshore, and a lost grant may be presumed.

unless there is a public road equally convenient, pass and repass with the same facility, so far as the carriage of live cattle, "the owner's or occupier's consent, doing as little damage as possible, and may also deposit there any things recovered from the ship; any damage so done is a charge on the ship, cargo or articles, and is recoverable by the shipowner or occupier of the wreck or 2nd party (as the case may be), as damages for trespass and for care or forbearance of the owner or occupier hindering the operations. The receiver has power to suppress any plundering or disorder, or any hindering of the preservation of the ship or cargo. Where a wrecked or in distress as above, is plundered, damaged or destroyed, by any riotous or tumultuous assembly ashore or afloat, compensation must be made to her owner in England and Scotland by the sum of 20l. per day; and in Canada, by the sum of 20l. per day. If he abandons her to any other person—e.g., an undertaker—who pays for her as for a total loss, that person does not become liable for her unless he takes possession or control in any way. Harbour authorities generally have by local statute, as they have by the general Harbours, Docks and Piers Clauses Act 1847 (if incorporated by a harbour authority), power to remove her from the port, and recouping themselves for their expenses from its proceeds. The general act also gives a personal right of action against the owner for any balance of expense over the value of the wreck; but if the vessel is worth less than 20l. she may be sold as a wreck, and any one else is liable. A particular or local act (as e.g., one of the State of Victoria) may, however, fasten this liability on the person who removes the wreck, in which case he is under an obligation to do so. Further statutory provision is now made in this respect by the Merchant Shipping Act, which empowers harbour authorities to raise, remove or destroy (and meantime buoy up at cost), any ship, which they consider may become a danger or menace to the safety of vessels or persons, or to the port or coast. No vessel must be removed if it is of interest as a salver, and in Ireland in cases of malicious injury to property. In the absence of the receiver, his powers may be exercised by the following officers or persons in successive order, viz., a chief officer or officer in charge of the port, or a knight or esquire knight of court, or a justice of the peace, or a sheriff, justice of the peace, or a naval officer on full pay. These persons act as the receiver's agent and put the salvage in his hands. The receiver has the right to any salvage, if there is any right to salvage by so doing. An examination is also directed to be held, in cases of ships in distress on the coasts of the kingdom, by a wreck receiver, wreck receiver-depositor and his deputy, at the request of the Board of Trade or a justice of the peace, by evidence on oath as to the name and description of ship, name of master, shipowner and owner of cargo, ports to and from which the ship was bound, the currency of the distress, time and place of the distress, and like facts. The act provides as follows for dealing with a wreck: As one fishing wreck, if he is the owner of it, must give notice of his having done so to the receiver of the district, and if he is not the owner he must deliver it, as soon as possible, to the person entitled for the purpose (as, e.g., if, as a salvor, he retains it with the knowledge of the receiver. No articles belonging to a wrecked ship found at the time of the casualty must be taken or kept by any person, whether their owner or not, until the salvor is paid for his services. If a person taking possession of any wreck must give notice of it, with a description, to the nearest customs-house; and if the wreck is in his opinion worth more than 20l. it is to be conveyed to Lloyd's. The owner of any wreck in the hands of a receiver must establish his claim to it within a year, and on so doing, and paying all expenses, is entitled to have it restored to him. Where a foreign ship has been wrecked on or near the coast, and any articles forming part of her cargo are found on or near the coast, or are brought into any port, the consular officer of the foreign country to which the ship or cargo belongs is deemed to be the agent for the owner so far as the custody and disposal of the articles is concerned, and any person may in like case, as a salver, small the wreck and hold the proceeds till claimed. The right to unclaimed wreck belongs to the crown, except in places where the crown has granted that right to others. Persons so entitled, such as admirals—vicars—vicars—vicars are mentioned in the act (sed quaerat)—lords of manors and the like, are entitled, after giving the receiver notice and particulars of their title, to receive notice from the receiver of the sums due for the wrecks. Where the wreck is in the hands of a receiver within a year after it was found, and has been in the hands of a receiver, it can be claimed by the person entitled to the wreck in the place where the wreck is, and so held by the receiver, and if the salvage is connected with it; if no such person claims it, it is sold by the receiver, and the net proceeds are applied for the benefit of the crown, either for the Duchy of Lancaster or the Duchy of Cornwall; or for the benefit of the crown, it goes, in the event. If unclaimed wreck is disputed, the dispute may be settled summarily as in cases of salvage; either party, if dissatisfied, may within three months after a year since the wreck came into the hands of the receiver proceed in any competent court to establish his title. Delivery of unclaimed wreck by the receiver discharges him from liability, but does not prejudice the title thereto. The Board of Trade has power to purchase rights of wreck. Any person exercising Admiralty jurisdiction as grantee of wreck may interfere with wreck otherwise than in accordance with the act. Duties are payable on wrecked goods coming into the United Kingdom or Isle of Man as if they were goods of British growth or manufacture, or, if wrecked on their outward voyage may be forwarded to their original destination, or, if wrecked on their outward voyage, to their port of shipment, on due security being taken for the protection of the revenue. Wreck commissioners may be appointed by the lord chancellor to hold investigations into shipping casualties, to act as judges of courts of survey, and to take examinations in respect of ships in distress.

Under the Merchant Shipping Act, it is a felony to take wreck found in territorial limits to a foreign port, and it is punishable by fine to interfere with a wreck. The receiver has power, by means of a search warrant from a justice, to search for wreck which he has reason to believe is concealed. By the general criminal law in Scotland plundering wreck is punishable at common law; and in England and Ireland it is a felony and may be a felony on a quittance after the time of the act of 1847, or acts or part thereof, to prevent or impede any person board a wreck from saving himself, and to exhibit any false signal with the intent of endangering any ship, or to do any thing tending to the immediate destruction of a ship for which no other punishment is provided.

WREDE, KARL PHILIPP, Prince von (1767-1838), Bavarian field-marshal, was born at Heidelberg on the 20th of April 1767, and educated for the career of a civil official under the Palatinate government, but on the outbreak of the campaign of 1790 he raised a volunteer corps in the Palatinate and was made its colonel. This corps excited the mirth of the well-drilled Austrians with whom it served, but its colonel soon brought it into a good condition, and it distinguished itself during Kray's retreat on Ulm. At Hohenlinden Wrede commanded one of the Palatinate infantry brigades with credit, and distinguished himself twice in the Bavarian army, which was entering upon a period of reforms. Wrede soon made himself very popular, and distinguished himself in opposing the Austrian invasion of 1805. The Bavarians were for several years the active allies of Napoleon, and Wrede was
engaged in the campaign against Prussia, winning especial distinction at Parnawa. But the continuous attitude of the French towards the Bavarian troops, and accusations of loot ing against himself, exasperated the general's fiery temper, and both in 1807 and in 1809 even outward harmony was only maintained by the tact of the king of Bavaria. In the latter year, under Lefebvre, Wrede conducted the rearguard operations on the Isar and the Alten, commanded the Bavarians in the bitter Tirolean war, was wounded in the decisive attack at Wagram, and returned to Tirol in November to complete the subjection of the mountaineers. Napoleon made him a count of the Empire in this year. But after a visit to France, recognizing that Napo lessons from France, recognizing that Napoleon's army was too weak, he returned to France, recognizing that Napoleon's army was too weak, he returned to Bavaria, and in 1660 elected Savilian professor of scholarship, and in 1665 became the opponent of Montalgon, whom he succeeded in power in 1671, and in 1675 he was made head of the council of regency during the king's absence. He died on the 12th of December 1675.

See lives by Riedel (1844) and Heilmann (1881).

WREN, SIR CHRISTOPHER (1632–1723), English architect, the son of a clergyman, was born at East Knoyle, Wiltshire, on the 20th of October 1632; he entered at Wadham College, Oxford, in 1646, took his degree in 1650, and in 1653 was made a fellow of All Souls. While at Oxford Wren distinguished himself in geometry and applied mathematics, and Newton, in his Principia, p. 19 (ed. of 1713), speaks very highly of his work as a mathematician. In 1657 he became professor of astronomy at Oxford; but in the same year, and in 1660 was elected Savilian professor of astronomy at Oxford. It is, however, as an architect that Wren is best known, and the great fire of London, by its destruction of the cathedral and nearly all the city churches, gave Wren a unique opportunity. Just before the fire Wren was asked by Charles II. to prepare a scheme for the restoration of the old St Paul's. In May 1666 Wren submitted his report and designs (in the All Souls collection), for this work; the old cathedral was in a very ruined state, and Wren proposed to remodel the greater part, as he said, "after a good Roman manner," and not, "to follow the Gothic Rudeness of the old Design." According to this scheme only the old choir was left; the nave and transepts were to be rebuilt after the classical style, with a lofty dome at the crossing—not unlike the plan eventually carried out. In September of the same year (1666) the fire occurred, and the old St Paul's was completely gutted. From 1668 to 1670 attempts were being made by the chapter to restore the ruined building; but Dean Sancroft was anxious to have it wholly rebuilt, and in 1668 he had asked Wren to prepare a design for a wholly new church. This first design, the model for which is preserved (in Ashmolean museum), is the only one that Wren ever left; and what Wren afterwards devised. In plan it is an immense rotunda surrounded by a wide aisle, and approached by a double portico; the rotunda is covered with a dome taken from that of the Pantheon in Rome; on this a second dome stands, set on a lofty drum, and this second dome is crowned by a tall spire. But the dean and chapter objected to the absence of a structural choir, nave and aisles, and wished to follow the medieval cathedral arrangement. Thus, in spite of its having been approved by the king, this design was happily abandoned—much to Wren's disgust; and he prepared another scheme with a similar treatment of a dome crowned by a spire, which in 1675 was ordered to be carried out. Wren apparently did not himself approve of this second design, for he got the king to give him permission to alter it as much as he liked, without showing models or drawings to any one, and the actual building bears little resemblance to the approved design, to which it is very superior in almost every possible point. Wren's earlier designs have the exterior of the church arranged with one order of columns; the division of the whole height into two orders was an immense gain in increased the apparent scale of the whole, and the external line of St Peter's is very superior to that of St Peter's in Rome, which is utterly dwarfed by the colossal size of the columns and pilasters of its single order. The present dome and the drum on which it stands, masterpieces of graceful line and harmonious proportion, were very important alterations from the earlier scheme. As a scientific engineer and practical architect Wren was perhaps more remarkable than as an artistic designer. The construction of the wooden external dome, and the support of the stone lantern by an inner cone of brickwork, quite independent of either the external or internal dome, are wonderful indications of his judgment. The external line of the new St Paul's was laid on the 21st of June 1675; the choir was opened for use on the 2nd of December 1677; and the last stone of the cathedral was set in 1710.

Wren also designed a colonnade to enclose a large piazza forming a clear space round the church, somewhat after the fashion of Bernini's colonnade in front of St Peter's, but space in the city was too valuable to admit of this. Wren was an enthusiastic admirer of Bernini's designs, and visited Paris in 1665 in order to see him and his proposed scheme for the rebuilding of the Louvre. Bernini showed his designs to Wren, but would not let him copy it, though, as he said, he "would have given his skin" to be allowed to do so.

After the destruction of the city of London Wren was employed to make designs for rebuilding its burnt churches, and he also prepared a scheme for laying out the whole city on a new plan, with a series of wide streets radiating from a central space. Difficulties arising from the various ownerships of the ground prevented the accomplishment of this scheme.

Among Wren's city churches the most noteworthy are St Michael's, Cornhill; St Bride's, Fleet Street, and St Mary-le-Bow, Cheapside, the latter remarkable for its graceful spire; and St Stephen's, Walbrook, with a plain exterior, but very elaborate and graceful interior. In the design of spires Wren showed much taste and wonderful power of invention. He was also very judicious in the way in which he expended the limited money at his command; he did not flatter it away in an attempt to make the whole of a building remarkable, but devoted it chiefly to one part or feature, such as a spire or a rich scheme of internal decoration. Thus he was in some cases, as in that of St James's, Piccadilly, content to make the exterior of an almost barnlike plainness.

The other buildings designed by Wren were very numerous. Only a few of the principal ones can be mentioned:—the Custom House, the Royal Exchange, Marlborough House, Buckingham House, and the Hall of the College of Physicians—now destroyed; others which exist are—at Oxford, the Sheldonian theatre, the Ashmolean museum, the Tom Tower of Christ Church, and Queen's College chapel; at Cambridge, the library of Trinity College and the chapel of Pembroke, the latter at the cost of Bishop Matthew Wren, his uncle. The western towers of Westminister Abbey are usually attributed to Wren, but they were in fact designed by Sir Christopher Wren, the elder, and were carried out till 1735–1745, many years after Wren's death, and there is no reason to think that his design was used. Wren (D.C.L. from 1666) was knighted in 1673, and was elected president for many years of the Royal Society in 1661. He was in parliament for many years, representing Plymouth from 1685, Windsor from 1689, and Weymouth from 1700. He occupied the post of surveyor of the royal works for fifty years, but by a shameful calumet was dismissed from this office a few years before his death.
WREN—WRESTLING

WRESTLING (O. Eng. wreselting), a sport in which two persons strive to throw each other to the ground. It is one of the most primitive and universal of sports. Upon the walls of the temple-loboms of Beni Hasan, near the Nile, are sculptured many hundred scenes from wrestling matches, depicting practically all the holds and falls known at the present day, thus proving that wrestling was a highly developed sport at least 3000 years before the Christian era. As the description of the bout between Odysses and Ajax in the 23rd book of the Iliad, and the evolutions of the classic Greek wrestlers, tally with the sculptures of Beni Hasan and Nineveh, the sport may have been introduced into Greece from Egypt or Asia. In Homer’s celebrated description of the match between Ajax and Odyssus the two champions were, not only each a great wrestler, but also two of the greatest Greek champions. Neither Homer nor Eustathius, who also minutely depicted the battle between Ajax and Odyssus, mentions the use of oil, which, however, was invariable at the Olympic games, where wrestling was introduced during the 18th Olympiad. The Greek wrestlers were, after the application of the oil, rubbed with fine sand, to afford a better hold.

Wrestling was a very important branch of athletics in the Greek games, since it formed the chief event of the pentathlon, or quintuple games (see Games, Classical). All holds were allowed, even strangling, but not kicking. The general classification was used especially in the panathen, a combination of wrestling and boxing. Wrestlers were taught to be graceful in all their movements, in accordance with the Greek ideas of aesthetics. There were two varieties of Greek wrestling, the ἀνάρι βοτρι, or upright wrestling, which was that generally practised, and the ἀνάρινες (κλιπαί, λεκτα νολατολαίρα) or squirming contest after the contestants had fallen, which continued until one acknowledged defeat. It was this variety that was employed in the panathen. The upright wrestling was very similar to the modern catch-as-catch-can style. In this three falls out of five decided a match. A variation of this style was that in which one of the contestants stood within a small ring and resisted the efforts of his adversary to pull him out of it. Other local varieties existed in the different provinces. The most celebrated wrestler of ancient times was Milo of Crotona (c. 520 B.C.), who scored thirty-two victories in the different national games, six of them at Olympia. Greek athletic sports were introduced into Rome in the last quarter of the 2nd century B.C., but it never attained to the popularity that it enjoyed in Greece.

The Teutonic peoples wrestling, at least as a method of fighting, was of course always known; how popular it had become as a sport during the middle ages is proved by the voluminous literature which appeared on the subject after the invention of printing, the most celebrated work being the Ringerkunst of Fabian von Auerswald (1530). Albrecht Dürer made 119 drawings illustrating the different holds and falls in vogue in the 15th and 16th centuries. These singularly resembled those used in the Greek games, even to certain brutal tricks, which, however, were considered by the German masters as not legallich (friendly) and were not commonly used. Wrestling was adopted by the German Turnvereine as one of their exercises, but with the elimination of tripping and all holds below the hips. At present the most popular style in Europe is the so-called Greco-Roman.

In Switzerland and some of the Tirolese valleys a kind of wrestling flourishes under the name of Schwein(e)ng (swinging). The wrestlers wear schwingshosen or wrestling breeches, with stout belts, on which the holds are taken. The first man downs the bout. In Styria, wrestlers stand firmly on both feet, and try to throw each other by standing. When the word is given each tries to push or pull the other from his stance, the slightest movement of a foot sufficing to lose. The popularity of wrestling has survived in many Asiatic countries, particularly in Japan, where the first match recorded took place in 23 B.C., the victor being Sukune, who has ever since been regarded as the tutelary deity of wrestlers. In the 8th century the emperor Shōmu made wrestling one of the features of the annual harvest "Festival of the Five Grains,"
the victor being appointed official referee and presented with a
fan bearing the legend, “Prince of Lions.” In 858 the throne
of Japan was wrestled for by the two sons of the emperor
Buntoku, and the victor, Koreshito, succeeded his father under
the name of Seiwa. Imperial patronage of wrestling ceased in
1175, after the war which resulted in the establishment of the
Shogunate, but continued to be a part of the training of the
samurai or military caste. About 1600, professional wrestling
again rose to importance, the best men being in the employ of
the great feudal lords of the provinces. It was codified and
kept up by the samurai, and eventually developed into the
peculiar combination of wrestling and system of doing bodily
injury called ju-jutsu (q.v.), which survives with wrestling as
a separate though allied art. The national championships
were re-established in 1624, when the celebrated Shigasonke
won the honour, and have continued to the present day. The
Japanese wrestlers, like those of India, lay much stress upon
weight and are generally men of great bulk, although surprisingly
light on their feet. They form a guild which is divided into several
ranks, the highest being composed of the joshiyori, or elders, in
whom the superintendence of the wrestling schools and
tournaments lies, and who in feudal times used to rank next
to the samurai. The badges of the three highest ranks are
damask aprons richly embroidered. Every public wrestler must
have passed through a thorough course of instruction under one
of the joshiyori and have undergone numerous practical tests.
The wrestling takes place in a ring 12 ft. in diameter, the wrestlers
being naked but for a loin-cloth. At the command of the referee
the two adversaries crouch with their hands on the ground and
watch for an opening. The method is very similar to that of
the ancient Greeks and the modern catch-as-catch-can style,
extcept that a wrestler who touches the ground with any part of
his person except the feet, after the first hold has been taken,
loses the bout.

Indian wrestling resembles that of Japan in the great size of
its exponents or Puluwans, and the number and subtility of its
attacks, called panches. It is of the “loose” order, the men
facing each other nude, except for a loin-cloth, and manoeuvring
warily for a hold. Both shoulders placed on the ground simulta-
neously constitute a fall.

In Great Britain wrestling was cultivated at a very early age,
both Saxons and Celts having always been addicted to it, and
English literature is full of references to the sport. On St James’s
and St Bartholomew’s days special matches took place throughout
England, those in London being held in St Giles’s Field,
whence they were afterwards transferred to Clerkenwell.
The lord mayor and his sheriffs were often present on these occasions,
but the frequent brawls among the spectators eventually brought
public matches into disrepute. English monarchs have not
disdained to patronize the sport, and Henry VIII. is known to
have been a powerful wrestler.

It was inevitable, in a country where the sport was so ancient
and so universal, that different methods of wrestling should
grow up. It is likely that the “loose” style, in which the con-
testants took any hold they could obtain, generally prevailed
throughout Great Britain until the close of the 18th century,
when the several local fashions became gradually coherent; but
it was not until well into the 19th that their several rules were
codified. Of these the “Cumberland and Westmorland” style,
which prevails principally in the N. of England (except Lan-
cashire) and the S. of Scotland, is the most important. In this
the wrestlers stand chest to chest, each grasping the other with
locked hands round the body with his chin on the other’s right
shoulder. The right arm is below and the left above the adver-
sary’s. When this hold has been firmly taken the umpire
gives the word and the bout proceeds until one man touches
the ground with any part of his person except his feet; or he
falls to retain his hold, in either of which cases he loses. When
both fall together the one who is underneath, or first touches
the ground, loses. If both fall simultaneously side by side, it is
a “dog-fall,” and the bout begins anew. The different
manoeuvres used in British wrestling to throw the adversary are
called “chips,” those most important in the “Cumberland
and Westmorland” or “North Country” style being the “back-
heel,” in which a wrestler gets a leg behind his opponent’s heel
on the outside; the “outside strike,” in which after a sudden
shift of his body to the left the opponent is struck with the left
foot on the outside of his ankle; the “bank,” or lifting
the opponent off the ground after a sudden turn, so that both fall
together, but with the opponent underneath; the “inside
kick,” a bank applied after jerking the opponent forward, the
presence of a man’s body; the “outside kick,” a back-
heel applied by a wrestler as he is on the point of being lifted
from the ground—it prevents this and often results in over-
setting the opponent; the “cross-buttock,” executed by getting
one’s hip underneath the opponent’s, throwing one’s leg across
both his, lifting and throwing him; the “buttock,” in which
one’s hip is worked still further under that of the opponent, who
is then thrown right over one’s back; the “hip” or “hype,”
executed by lifting the opponent, and, while swinging him to
the right, placing the left knee under his right leg and carrying
him as high as possible before the throw; the “swinging hip,”
in which the opponent is swung nearly or quite round before
the hip is applied; and the “breast-stroke,” which is a sudden
double twist, first to one side and then to the other, followed
by a throw.

In the “Cornwall and Devon” or “West Country” style the
men wrestle in stout, loosely cut linen jackets, the hold being
anywhere above the waist or on any part of the jacket. A
bout is won by throwing the opponent on his back so that two
shoulders and a hip, or two hips and a shoulder (three points),
shall touch the ground simultaneously. This is a difficult
manoeuvre and when both men are expert, a man, who
feels himself falling, will usually turn and land on his side
or face. Many of the “chips” common to other styles are used
here, the most celebrated being the “flying mare,” in which
the opponent’s left wrist is seized with one’s right, one’s back
turned on him, his left elbow grasped with the left hand and he
is then thrown over one’s back, as in the buttock. Until
comparatively recently there was a difference between the styles
of Cornwall and Devon, the wrestlers of the latter county having
worn heavily-soled shoes, with which it was legitimate to
beast the adversary’s shins. In 1826 a memorable match
took place between Polkinhorne, the Cornish champion, and
the best wrestler of Devon, Abraham Cann, who wore
“kicking-boots of an appalling pattern,” Polkinhorne,
however, encased his shins in leather, and the match was
eventually drawn.

The “Lancashire” style, more generally known as “catch-
as-catch-can,” is practised not only in Lancashire and the
adjacent districts, but throughout America, Australia, Turkey
and other countries. It is the legitimate descendant and repre-
sentative of the ancient Greek sport and of the wrestling of the
middle ages. A bout is won when both shoulders of one wrestler
reach the floor together. No kicking, striking or other foul
practices are allowed, but theoretically every hold is legitimate.
Exceptions are, however, made of the so-called strangle-holds,
which are sufficiently described by their designation, and any
hold resulting in a dislocation or a fracture. This style contains
practically all the manoeuvres known to other methods, and
in its freedom and opportunity for a display of strategy, strength
and skill, is the most preferable. A fall, though invariably
begun standing, is nearly always completed on the ground (mat).
Many of the holds and “chips” are used, and are complicated as
to doing anything but an elaborate description inadequate.
The best book on the subject is the Handbook of Wrestling by Hugh
F. Leonard (1897).

In Scotland a combination of the Cumberland and catch-as-
catch-can styles has attained some popularity, in which the
wrestlers begin with the North Country hold, but continue the
bout on the ground should the fall not be a clean one with two
shoulders down.

In Ireland the national style is called “collar and elbow”
in America, “back-wrestling”), from the holds taken to the
two hands. The man loses, any part of whose person, except the feet, touches the ground.

The style mostly affected by the professional wrestlers of Europe at the present day is the Greco-Roman (falsely so called, since it bears almost no resemblance to classic wrestling), which arose about 1860 and is a product of the French wrestling schools. It is a very restricted style, as no tripping is allowed, nor even from 1875 the hips, when being turned, and the shoulders, which are contested almost entirely prone on the mat, are usually tediously long. British and American wrestlers, being accustomed to their own styles, are naturally at a disadvantage when wrestling under Greco-Roman rules.

WREXHAM—WRIGHT, S.

The Industrial Evolution of the United States (1887); Outline of Practical Sociology (1899); Battles of Labor (1906); and numerous papers and monographs on social and economic topics.

WRIGHT, CHAUNCEY (1830–1875). American philosopher and mathematician, was born at Northampton, Mass., on the 20th of September 1830, and died at Cambridge, Mass., on the 12th of September 1875. In 1852 he graduated at Harvard, and became computer to the American Ephemeris and Nautical Almanac. He made his name by contributions on mathematical and physical subjects in the Mathematical Monthly. He soon, however, turned his attention to metaphysics and psychology, and for the North American Review and later for the National he wrote philosophical essays on the lines of Mill, Darwin and Spencer. In 1870–71 he lectured on psychology at Harvard. Although, in general, he adhered to the evolution theory, he was a free lance in thought. Among his essays may be mentioned The Evolution of Self-Consciousness and two articles published in 1871 on the Genesis of Species. Of these, the former endeavours to explain the most elaborate psychological activities of men as developments of elementary forms of conscious processes in the animal kingdom as a whole; the latter is a defence of the theory of natural selection against the attacks of both Sir John Herschel and of Dr. Mivart. This was the suggestion of Darwin. From 1863 to 1870 he was secretary and recorder to the American Academy of Arts and Sciences, and in the last year of his life he lectured on mathematical physics at Harvard.

His essays were collected and published by C. E. Norton in 1877, and some of his lectures on psychology were privately printed at Cambridge, Mass., in 1878 by James Bradley Thomas.

WRIGHT, JOSEPH (1734–1797), styled Wright of Derby, English subject, landscape and portrait painter, was born at Derby on the 3rd of September 1734, the son of an attorney, who was afterwards town-clerk. Deciding to become a painter, he went to London in 1751 and for two years studied under Thomas Hudson, the master of Reynolds. After painting portraits for a while at Derby, he again placed himself for fifteen months under his former master. He then settled in Derby, and varied his work in portraiture by the production of the subjects seen under artificial light with which his name is chiefly associated, and by landscape painting. He married in 1773, and in the end of that year he visited Italy, where he remained till 1775. While at Naples he witnessed an eruption of Vesuvius, which formed the subject of many of his subsequent pictures. On his return from Italy he established himself at Bath as a portrait-painter; but meeting with little encouragement he returned to Derby, where he spent the rest of his life. He was a frequent contributor to the exhibitions of the Society of Artists, and to those of the Royal Academy, of which he was elected an associate in 1781 and a full member in 1785. He, however, declined the latter honour on account of a slight which he believed that he had received, and severed his official connexion with the Academy, though he continued to contribute to the exhibitions from 1783 till 1794. He died at Derby on the 29th of August 1797. Wright's portraits are frequently defective in drawing, and without quality or variety of handling, while their flesh tints are often hard. He is seen at his best in his subjects of artificial light, of which the "Orery" (1760), the property of the corporation of Derby, and the "Air-pump" (1768), in the National Gallery, are excellent examples. His "Old Man and Death" (1774) is also a striking and individual production. An exhibition of Wright's works was brought together at Derby in 1883, and twelve of his pictures were shown in the winter exhibition of the Royal Academy in 1886.

His biography, by William Remrose, was published in 1885.

WRIGHT, SILAS (1795–1847). American political leader, was born at Amherst, Mass., on the 24th of May 1795. He graduated at Middlebury College, Vermont, in 1815, was admitted to the bar in 1819, and began practice at Canton, in western New York. He was appointed a surrogate of St Lawrence county in 1820, and was concurrently a member of the state Senate in 1824–1826, a member of the national House of Representatives in 1827–1829, comptroller of the state in 1829–1833,

His publications include The Factory System of the United States (1830); Relation of Political Economy to the Labor Question (1832); History of Wages and Prices in Massachusetts, 1752–1883 (1887);
U.S. senator in 1833–1834, and governor of New York in 1834–1846. During his public life he had become a leader of the Democratic party in New York, Martin Van Buren being his closest associate. He was an influential member of the so-called "Albany Regency," a group of Democrats in New York, including such men as J. A. Dix and W. L. Marcy, who for many years virtually controlled their party within the state. Wright's intolerance of his opponents, and other "troubles" (see New York) broke out and it seemed probable that the votes of the disappointed would decide the coming election.

The governor asked and obtained from the legislature the power to suppress the disturbance by armed force, and put an end to what was really an insurrection. When the national Democratic party in 1844 nominated and elected J. K. Polk to the presidency, instead of Martin Van Buren, Wright and the state organization took an attitude of armed neutrality towards the new administration. Renominated for governor in 1846, Wright was defeated, and the result was by many ascribed to the part claimed hostility of the Polk administration. He died at Canton on the 27th of August 1847.

The best biography is that by J. D. Hammond, Life and Times of Silas Wright (Syracuse, N.Y., 1848), which was reprinted as vol. i in the modern edition of his Historical Writings of the State of New York.

WRIGHT, THOMAS (1809–1884), British palaeontologist, was born at Paisley in Renfrewshire on the 9th of November 1809. He studied at the Royal College of Surgeons in Dublin, and qualified as a doctor in 1832. Soon afterwards he settled at Cheltenham, and graduated M.D. at St Andrews in 1846. He devoted his leisure to geological pursuits, became an active member of the Cottesloe Naturalists' Club (founded in 1845), and gathered a fine collection of Jurassic ammonites and echinoderms. He contributed to the Palaeontographical Society monographs on the Oolitic and Cretaceous formations (1855–1858); he also began (1878) a monograph on the Liassic ammonites of the British Islands, of which the last part was issued in 1883, after his death. He wrote many papers in the Ann. and Mag. Nat. Hist. and Proc. Cottesloe Club. The Wollaston medal was awarded to him by the Geological Society of London in 1878, and he was elected F.R.S. in 1879. He died at Cheltenham on the 12th of November 1884.

WRIGHT, THOMAS (1810–1877), English antiquary, was born near Ludlow, Shropshire, on the 21st of April 1810. He was descended from a Quaker family formerly living in Bradford, Yorkshire. He was educated at the old grammar school, Ludlow, and at Trinity College, Cambridge, where he graduated in 1834. While at Cambridge he contributed to the Gentleman's Magazine and other periodicals, and in 1835 he came to London to devote himself to a literary career. His first separate work was Early English Poetry in Black Letter, with Prefaces and Notes (1836, 4 vols. 12mo), which was followed during the next forty years by a very extensive series of publications, many of lasting value. He helped to found the British Archaeological Association and the Percy, Camden and Shakespeare societies. In 1838 he was elected corresponding member of the Académie des Inscriptions et Belles Lettres of Paris, and was a fellow of the Society of Antiquaries as well as member of many other learned British and foreign bodies. In 1839 he superintended the excavations of the Roman city of Uriconium, near Shrewsbury, of which he issued a description. He died at Chelsea on the 23rd of December 1877, in his sixty-seventh year. A portrait of him is in the Drawing Room Portrait Gallery for October 1st, 1890. He was a great scholar, but will be chiefly remembered as an industrious antiquary and the editor of many relics of the middle ages.

His chief publications are—Queen Elizabeth and her Times, a Series of Original Letters (1838, 2 vols.); Reliquiae antiquae (1839–1843, again 1845, 2 vols.), edited with Mr J. O. Halliwell-Phillipps; W. Mapes, 1560, 2 pts.; Old Ballads and Ballads, and Carols, published by the Percy Society (1841); Popular Treatises on Science (1841); History of Ludlow (1841, 2 vols.; again 1852, as Selection of Latin Stories (1842, Percy Society); The Vision and Crew of Flies Ploughman (1842, 2 vols.; 2nd ed., 1855); Biography Literaria, 2 pts. (1842), vol. ii. Anglo-Saxon Period (1846); The Chester Plays (1843–1847, 2 vols., Shakespeare Society); St Patrick's Purgatory (1844); Anecdota (1844); The Archaeological Album (1845, 4to); Essays connected with English in the Middle Ages (1847); Life, Engledor under the House of Hanover (1848, 2 vols., several editions published in 1850, 1856, etc.); The Bracton (1849); The Letters of the Georgius; Mapes, De nucibus curialium (1850, 4to, Camden Society); Geoffrey Gaimar's Metrical Chronicle (1850, Camden Society); The Sixth Secrecy (1850); Fryth's England and the Saxons (1852; 4th ed., 1885); History of Fulke Fitz Wain (1853); Jo. de Garandia, De triumphis ecclesiasticiis (1856, 4to, Roxburghe Club); Dictionary of Obsolete and Provincial English (1857); A Vocabulary of English Dialects (1857, 2nd ed., R. P. Willard); English Historical Documents (1860, 4to, Roxburghe Club); Essays on Archaeological Subjects (1861, 2 vols.); Domestic Manners and Sentiments in England in the Middle Ages (1862, 4to, reprinted in 1871 as The Homes of other Days); Roll of Arms of Edward I. (1864, 4to); Autobiography of Sir Thomas Wright (1736–1757), his grandfather (1864); History of Caxton (1865, 4to); Wonderkind in Western Europe (1869, 4to); Anglo-Latin Statirical Poets of 12th Century (1872, 2 vols., "Rolls" series).

WRIGHT, WILLIAM ALDIS (1836–1912), English man of letters, was educated at Trinity College, Cambridge, and in 1888 became vice-master of the college. He was one of the editors of the Journal of Philology from its foundation in 1868, and was secretary to the Old Testament revision company from 1870 to 1885. He edited the plays of Shakespeare published in the "Cassell's Press" series (1868–1887), also with W. G. Clark the "Cambridge" Shakespeare, which appeared in 1883–1893, and the "Globe" edition (1894). He published (1890) a facsimile of the Milton MS. in the Trinity College library, and edited Milton's poems with critical notes (1903). He was the intimate friend and literary executor of Edward FitzGerald, whose Letters and Literary Remains he edited in 1886. This was followed by the Letters of Edward FitzGerald to Fanny Kemble (1893), his Miscellaneous (1900), More Letters of Edward FitzGerald (1901), The Works of Edward FitzGerald (7 vols., 1903). He edited the metrical chronicle of Robert of Gloucester (1887), Genevra (1878) for the Early English Text Society, and other texts.

WRIST, in anatomy, the carpus or carpal articulation in man, the joint by which the hand is articulated with the fore-arm (see Anatomy: Superficial and Artistic; and Skeleton: Appendicular). The word means by origin "that which turns," and is formed from the O. Eng. wīrstan, to twist.

WRIT (O. Eng. gewrit, writ, from wrihtan, to write), in law, a formal order from the crown or a delegated executive officer to an inferior executive officer or to a private person, enjoining some act or omission. The word represents the Latin brevis of brevis (sometimes Englished into "brief" in the older authorities), so called, according to Bracton, and Flodoard, from its "shortly" expressing the intention of the framer (qua brevis et pauca verbis intentionem proferens exponit). The breve can be traced back as far as Paulus (about A.D. 200), who wrote a work Ad editum de brevibus, cited in the Vatican Fragment, § 310. In the Corpus juris the word generally means a summary or report. In Cod. vii. 44, brevisculum means a summary of the ground of a judgment. The interdictum of Roman law sometimes represents the writ of English law; e.g., there is considerable likeness between the Roman interdictum de libero homine exhibendo and the English writs of habeas corpus and de homine replegando. The Roman law the breve passed into the Liber feudorum et curiarum, in both a sense differing from that at present borne by the writ of English law. The breve testatum of the Liber feudorum was an instrument in writing made on the land; the times at which it was seen by the lord to the tenant, and attested by the seals of the lord

There seems to be no authentic definition of writ. That of Ross is "a settled form of precept applicable to the purpose, owing to the few compelling defendants to answer the charge alleged by plaintiffs" (1 Hist. of the Eng. Law, 445).

It is perhaps doubtful whether intentio is here used in its ordinary sense or in the technical signification which it bore as a part of the Roman formula.
and the pares curiae or other witnesses. In England such witnesses were passed in and joined in the verdict in case of disputed right up to 12 Edw. II. st. 1. c. 2. The breve testatum in England developed into the feufo, later into the deed of grant; in Scotland into the charter, and later into the charter party. The breve percutare was ridiculed as a leaf from the pope, sealed with the seal of the fisherman and less formal than a bull. In Old English ecclesiastical law a breve—still named in one of the rubrics of the Book of Common Prayer—was formerly offered to the collection of money for church or charitable purposes.1 (For counsel's brief see BREFE.)

The writ in English law still occupies a very important position, which can scarcely be understood without a sketch of its history.

History. The whole theory of pleading depends in the last resort upon the writ, the plaintiff's claim simply expanding its terms.

Writ or breve was at first used in a less technical sense than that which it afterwards assumed: thus in the Leges Henrici Primi it simply means a letter from the king, and in the Assize of Clarendon (1166) imbremtarius means to be registered. It became formalized by the reign of Henry II., and precedents are given by Glanvill. The writ process was at that date the foundation of all civil justice in the king's court, and to the lower courts, and was a profitable source of revenue to the exchequer. Writs were not framed on any scientific scheme, but as occasion arose, and were frequently the result of compromise in the struggle between the king and his subjects. The most familiar form of the breve, breve percutare, or breve promulgare, was the technical term). This purchase developed in later times into the payment of a fine to the king where the damages were laid above £10. The usual scale was £5, 8d., 4s., 2s. 6d., 6d., 1d., a mark, or a penny. The defendant, the basis of the proceedings in levying a fine, the king was entitled to his primer fine, i.e. one-twelfth of the annual value of the land concerned. The sale of writs was forbidden by Papal bulls and by Act of Parliament and in certain cases, especially that of the writ of odio et atia in favour of the liberty of the subject. A solicitor was so called because his original duty was to solicit or sue out a writ and take the due proceedings for laying the breaches of the writ. The costs of a writ purchased were first allowed to a successful demandant by the Statute of Lancaster, 1278. The counterpart of the writ (contra breve) was usually filed in court with the custos brevium. Through the Norman period the prerogative of issuing writs seems to have been undisturbed. Glanvill's precedents did not exhaust all possible forms, for in the time of Bracton, in the 13th century, it was still possible to frame new writs at the pleasure of the Crown. The Provisions of Oxford in 1258 put an end to this by enacting that the chancellor should not seal anything out of course (i.e. any writ for which there was no precedent) by the will of the king, but that he should do it by the council. In 1285 the Statute of Westminster the Second re-established the power of the crown within certain limits, that is, in cases of action in a similar case falling under the same law (in consuetudine casu cadente sub eodem jure) as those for which precedent existed already. The writs were recorded about 1227 in the Registrum breve, called by Sir Edward Coke the oldest book in the common law.2 Apart from the powers given by the statute, new writs could of course come into being by the king. Writs are sometimes found set out in statutes, especially in the Statutum Walliae, 1284, where precedents of the most usual writs will be found. The Statute of Westminster, itself composed of those precedents and of many others. The original flexibility of the writ was thus limited within comparatively narrow bounds. The right to the issue of the writ determined the right of action. For a writ was not sufficient to found an action, the writ was said to fail (cadere). So essential was the writ that it was a legal axiom in Bracton that no one could sue at law without a writ, and it was called by Coke, in his introduction to Littleton, that the strengthings of the old laws were a hand-om-passed an important place in some of the leading statutes dealing with constitutional rights. The Statute of Marlbridge, 1267, forbade a lord to detain his freeholders another for any wrong without a writ; and it was thus that a man's life was preserved without the king's writ. By 25 Edw. III. st. 5. c. 1434 (1422), it was accorded, asserted and established that none should be taken by petition or suggestion made to the king or his council unless by indenture or presentment in due manner. The writs are made by writ original at the common law. 42 Edw. III. c. 3 (1359) provided that no man should be put to answer without presentment before justices, or matter of record, unless by due process of law made by writ original at the common law. Both these statutes were recited and the general principle confirmed by 16 Car. I. c. 10 (1641). Uniformity of procedure was secured by 27 Hen. VIII. c. 24 (1536), by which writs were to be in the king's name in a county palatine or liberty, but tested by those who had the county palatine or liberty. It was not until 1731 that, by virtue of 4 Geo. II. c. 26, writs were framed in the English language. They had previously been in Latin; this accounts for the Latin names by which a large number are still known.

The writ was issued from the common law side of the chancery, and was in the special charge of the bananper and petty bag offices. Though arising from the rules of the writs court, the trial of the question in the king's court. In whatever court it was returnable, it was in the term of the sheriff in the event of disobedience, generally in those terms, et, nisi feceris, vicecomes de N. factit se amplius clamorem audium pro defectu justitiae. If the defendant failed in the court, the sheriff or the lord sat as the deputy of the king, not by virtue of his inherent jurisdiction. The writ was not necessary for the initiation of proceedings in these courts or before the justices of the peace. It was not a custom, that is, it was drawn from the king where the claim was above 40s. Cases were transferred from the lord's court to the county court by writ of tol. (so called because it removed, tolle, the case), from the latter to the king's court by writ of none (so called from its first word). By Magna Carta the power of bringing a suit in the king's court in the first instance by writ of grace was taken away, and the writ was thenceforward only returnable in the king's court, or to the sheriff of the county where the writ had been brought from the king where the claim was above 40s. Besides being used for the trial of disputes, writs addressed to sheriffs, mayors, commissioners or others were in constant use for financial and political purposes, e.g. for the collection of revenue, and for the purpose of removing judges and other officials and later parliaments, and for dissolving a parliament, the last by the means of the rarely occurring writ de revocatione parliamenti. See also 22 Geo. II. c. 4 (1732) about writs (excluding those purely financial and political), the most important being that into original and judicial, the former (testa de nomine missae) to bring a suit before the proper court, the latter (testa in the name of the judge) issued during the progress of a suit to enforce judgment. Original were either optional, i.e. giving an option of doing a certain act or of showing cause why it was not done, beginning with the words praecepe quod reddat, the presentment was called a spolium. Recovery (see FINIS) were based, or peremptory, i.e. calling on a person to do a certain act, beginning with the words st A. fecit te secum. Original were also either de cursu (also called by Bracton forma act) or magistra, the former those fixed in form and depending on precedent, the latter those framed by the masters in chancery under the powers of the Statute of Westminster the Second. They were also either general or special, i.e. the grounds of the demandant, not the particularity of the former. In regard to real estate they might be possessory or ancestral. By 5 Geo. II. c. 27 (1732) special writs were confined to the recovery of certain ancestral lands. There was also a division of writs into writs of right (ex debois justitia), such as habeas corpus, and prerogative writs (ex gratia), such as mandamus and prohibition. Coke and other authorities mention many other writs, but those which have been named appear to be the principal.

The most interesting form of writ from the historical point of view was the writ of right (breve de re celata) whether in its modern or its older form. The writ was used at first for debt and other personal claims, afterwards confined to the recovery of real estate as the writ of right par excellence. It was so called from the words plenum rectum contained in it, and was the remedy for obtaining justice for owner or possession or privation of the freehold. By it property as well as possession could be recovered. It generally lay in the king's court, as has been said, by virtue of a fictitious allegation. In that case it was not necessary to mention a defendant or to address to the lord and tried in his court, it was generally a writ of right patent. After the appearance of the tenant the demandant in a writ of right claimed as against the tenant in a word or in more precise terms, the writ being as it were the embryo of the future suit. The trial was originally by battle (see Trial), but in the reign of Henry II. an alternative and optional procedure was introduced, interesting as the earliest example of the substitution of something like the jury (q.v.) for the judicial combat. A writ de magnam assista eligendo was directed to the sheriff commanding him to return four knights of the county and vicinage to try the action on oaths, with the further instruction to try upon oath the question contained in the writ of right (technically called the mise). This mode of trial was known as trial by the grand assize. Generally a grand assize was used whenever there were six or more men who claimed by way of right to a sufficient number. The last occasion of trial by the grand

---

1 See W. A. Bewes, Church Briefs (1896). The lines in Cowper's "Charity Miser" allude to such a brief.

2 See article by F. W. Maitland in 3 Harward Law Rev. 177.
asize was in 1835. But long before that date possessory had from their greater convenience tended to supersede proprietary remedies, and in most cases the title was sufficiently determined by the asizes of other kinds of land. The common pleas of courts, and later by ejectment.

The oath of the champion on proceedings in a writ of right where the alternative of the judicial combat was accepted was regulated by statute, 3 Edw. I. c. 41 (1725). The writ of right began to be superseded by common pleas ejectment.

By the Statute of Merton (1226) no seisin could be alleged by the defendant or before the time of Henry II. By 3 Edw. I. c. 39 the time was fixed at the reign of Richard I., by 32 Edw. II. c. 4. Thereafter a two-writter or writer of rights with special names, e.g., the writ of right by the custom of London for land in London, the writ of right by advowson, brought by the patron to recover the advowson of his church, or the writ of right by the custum of dower, ne injuste vexes et de rationabili parte, the latter brought by coparceners or brothers in gavelkind. Coheirs and coparceners also had the super obil for disceiss by one of themselves. There was also writ from the nature of the writ of right, by a recovery on discontinuance by a tenant in tail and given by the statute De Donis Conditionalibus; escheat, brought by the lord where the tenant willed that it should come to his heirs; ne injuste vexes, to prohibit the lord from exacting services or rents beyond his due; de nativo habendo, to recover the inheritance in a villicen; and the little writ of right close according to the custom of the manor, to try in the inquiring court of the King's tenants in ancient demesne. They had also the writ of mononstrarenat.

Up to 1832 an action (except as against certain privileged persons, such as attorneys) began at law by original writ of ejectment or by any other writ. The practice of this is so used in old books of practice. The law was gradually altered by legislation and still more by the introduction of fictitious proceedings in the common pleas, which were superseded, except in real actions, which were of comparatively rare occurrence. The original writ is no longer in use in civil procedure, an action being now in all cases commenced by the writ of summons, a judicial writ, a procedure first introduced by Act 32 Edw. II. c. 29. In the following year an immense number of the old writs was abolished by the Real Property Limitation Act 1833. An exception was made in favour of the writ of right of dower, dowry non habet, quare impedit et ejectment, and of the plaints for free bench and dower in the nature of rights of property. Ejectment was remodelled by the Common Law Procedure Act 1852, and was abolished by the Common Law Procedure Act 1860, by which they were abolished. Other writs which have been superseded by simpler proceedings, generally by ordinary actions, are those of the four assizes of novel disseisin, juris utrum, mort d'exter and darein presentment, conspiracy, estrepement and waste, false judgment, monstrons de droit, nuisance, partition, presunminur, quo warranto, scire facias, subpoena and warranto chartae.

The number of writs, especially those connected with ecclesiastical procedure, was so large that any exhaustive list of them is almost impossible, but a few of those of more special interest are given. Some obsoleto writs.

Admissuratio lay against persons usurping more than their share of property. It was either dotis or pastothe, the latter, like the former, an action to be brought for the surcharge of common, for which also quod permettis lay. Alias and plurites writs were issued when a previous writ had been disobeyed. Apostata capiendo was the mode of apprehension of a monk who had fled his monastery. Attested, or ad testatum, the sheriff brought the party or an officer of chancery to gain possession of land. Attestat lay to inquire by a jury of twenty-four whether a jury of twelve had given a false verdict. Decies tantum also lay against a juror who had accepted a bribe, so called because he had to refund ten times the sum received. Audita querela was a means of relieving a defendant by a matter of discharge occurring after judgment. After having been long practically superseded by stay of execution it was finally abolished by the rules made under the Judicature Act 1873.

Beau pleas lay to prohibit the taking of a fine de pulcre placando, forbidden by the Statute of Marlbridge (1268).\(^1\) Capias, latitatum and querelles were interesting as showing the prevalence of fictitious allegation in the old procedure of the common laws before 1832. By capias ad respondentum followed by alias and pluries the court of common pleas was enabled to take cognizance of an action without the actual issue of an original writ. The capias was a judicial writ issued to follow an original writ of trespass quia clausum friget. The issue of the original writ and after a time the issue of capias ad respondentum was a matter of deep interest, and with the issue of another writ called capias testatum. On return of the writ the plaintiff elected to proceed with a cause of action other than trespass, and the real merits of the case were eventually raised in a new cause. In the end the plaintiff might find himself in the position of the defendant being bound to put in common or special bail, the former being sufficient in all but exceptional cases. Here again there was a

\(^1\) Relief from "miskening" or "mescheninga," or fine for bespauler, was often granted in charters to towns, as by that of Henry I. to London.
Writ was obsolete, and that the same relief could be obtained by injunction. On appeal this refusal was sustained by the privy council.

Of writs now in use, other than those for elections, all are judicial, or part of a civil proceeding, and do not concern convicts, or persons charged with crime. No writs now in use are employed for the redress of personal injuries. They are to be hereafter issued out of the central office of the supreme court, or the office of the clerk of the crown in chancery. By the Crown Office Act 1869 all writs having to do with the high court in chancery are in future to be procured from that office. Writs occurring in crown practice, such as quo warranto and certiorari.

In local civil courts, other than county courts, writs are usually issued on the judge's own motion, or at the instance of the party advantaged by the proceeding. Ordinary writs are the praecipe, and the placitum and praecipe. In county courts the warrant and praecipe, the former for the purpose of serving the latter. A writ cannot as a rule be served on Saturday. Some of the more important modern writs (other than those of an extrajudicial nature) may be shortly noticed. Habeas corpus, mandamus, prohibition, sequestration, and certiorari are separately treated. Writs are generally, unless where the contrary is stated, addressed to the sheriff. Abatement or nuncupatum amovendo enjoins the removal of a nuisance in pursuance of a judgment to that effect. Ad quod damnum is for the purpose of ensuring that the subject of the writ is still in being. It will not lie unless the damage of the crown or others. If the inquiry be determined in favour of the subject, a reasonable fine is payable to the exchequer by the sheriff or the county. This fine is in part used in the payment of the expense of the suit, and in part supporting the dignity of the court by punishment for contempt of its orders (see Contempt of Court).

Since the Judicature Acts a uniform practice has been followed in all the branches of the high court, and a writ of attachment can only be issued by leave of the court or a judge after notice to the party against whom it is to be issued. Copias: the old writs of capias ad satisfacendum and capias ulteriorum may still be used, but their importance has been much diminished since the alterations made in the law by the Debtor Act 1869 and the abolition of civil outlawry (see outlaw). Certiorari is a writ in very frequent use, by which the proceedings are directed to be reviewed by the court in which the process is issued. In general it lies for excess of jurisdiction as mandamus does for defect. The Summary Jurisdiction Act 1879 makes the writ no longer necessary when a special order has been made in the court of sessions. Decries forces a judgment for the delivery of property without giving the defendant (unless at the option of the plaintiff) power to retain it on payment of the assessed value. Distraint is used to distrain a person for a crown debt or for his appearance on a certain day. Its operation has been much curtailed by the substitution of other proceedings by the Sheriff Acts 1865 and the rules of the supreme court. It now seems to lie only against inhabitants for non-repair of a highway. Distragas nuper vicecomitem is a writing calling on an ex-sheriff to account for the proceeds of goods taken in execution. Eligens is founded on the Statute of Westminster of the Second, 1327, 8 Edw. III., c. i. It provides for the recovery of the debts of the late Edward I. on the words of the writ, that the plaintiff has chosen (eligens) this particular mode of satisfaction. It originally ordered the sheriff to seize a moiety of the debtor's land and all his goods, save his oxen and beasts of the plough. By the Judgments Act 1838, the elegens was extended to include the whole of the lands, and copthawks as well as freeholds. By the Bankruptcy Act 1883, an elegens no longer applies to goods. Error, the last remaining example of an original writ, was finally abolished by the Criminal Procedure Act 1877, 19 Geo. III., c. 76.

To the list of writs of execution issued by the sheriff must be added the proceedings for the collection of debts, and the Crown debt of record. The sale of chattels seized under an extant takes place under a writ of venditione exponas. A crown debtor is entitled to an extent in aid against a person indebted to him. Where a crown debtor has died a writ reciting his death, and so called dictum clausit extremum, issues against his property. Fierie facias is the ordinary writ of execution on a judgment commanding the sheriff to take and seize lands, goods, and personal effects of the defendant. Where the sheriff has not sold the goods, rendition exponas issues to compel him to do so. Where the party is a benefited clergyman, the writ is one of fierie facias de bonis ecclesiasticis or of sequestrae facias facias. The sheriff, instead of seizing goods, confines the defendant under an act of an exceptional nature, as against a corporation and to seize a pension. It is addressed to commissioners, not to the sheriff. Habere facias possessionem is given to the owner of a tithe or rent in reversion to place them in possession for the time being, until a pension after arrears due to him are paid. Indictment is still nominally grantable under the statute De Conjointum Feoffatis of 1366, and is a process of great antiquity being the ordinary mode of commencing a criminal proceeding. Inquiry issues for the assessment of damages by the sheriff or his deputy. It represents to some extent the old writ of justiciis, and the later writ of trial allowed by 3 & 4 Will. IV. c. 42, but is now mostly operating in the case of a whole case or issues under it could be tried. Before an inquiry the liability has been already established. Lexici facias is the means of levying execution. It is a part of the process against a person disobeying the order of an ecclesiastical court, and consists in a notification to the crown in chancery of the disobedience. Thereupon a writ de consuetude capiendo issues for his arrest. On his subsequent obedience or satisfaction, a writ of delinquere is granted. Precedents of these writs are given in the act named. Subpoena is the ordinary means of securing the presence of a witness in court, and is addressed to the sheriff, who is directed to serve the writ at the place of the defendant's last known abode. It reaches him wherever he may be, and is descriptive of the goods and kind.
outlawry, calling upon the party to appear. Under the old practice a sententia facias de novo was the means of obtaining a new trial. *Sententia ispispendo* appears still to be competent, and is a curious relic of antiquity. It issues on the application of an heir presumptive in order to obtain a new trial. Writs of summons are issued to the lords spiritual and temporal before every new parliament. Those to Irish representative peers are regulated by the Act of Union, those to archbishops and bishops by the Act of Ecclesiastical Commissioners Act 1847. New peers are no longer created by writ, but the eldest son of a peer is occasionally summoned to the House of Lords in the name of a barony of his father’s. With respect to creation of members of the House of Commons, the procedure differs as the election takes place after a dissolution or on a casual vacancy. After a dissolution the writ is issued, as already stated, by order of the crown in council. For a single election the writ was formerly for a number of counties and boroughs by the speaker after an order of the house made upon motion; during the recess by the speaker’s authority alone. The warrant is addressed to the clerk of the crown in chancery for Great Britain, to the Lord High Chancellor of Ireland. A writ is sometimes issued by the court as a matter of justice. But a writ has sometimes been ordered where the writ was improvidently issued. The time allowed to elapse between the receipt of the writ and the assembling of the grand jury is fixed by the sheriff for a county or a district borough, four days for any other borough. The writ is to be returned by the returning officer to the clerk of the crown with the name of the member elected endorsed on the writ. Scottish procedure is different. The writ is returned by the king himself. The returning officer is the sheriff in counties and counties of cities, generally the mayor in cities and boroughs, and the vice-chancellor in universities. Other writs for election are those for conviction, which is by 25 Hen. VIII, c. 10 summoned by the archbishop of the province on receipt of the king’s writ, and for election of coroners, verderers of royal forests, and some other officers. The king’s or Restoration was already made of old diligendo, addressed to the sheriff, is specially preserved by the Coroners Act 1887.

Offences relating to writs are dealt with by the Criminal Law Consolidation Act 1861 and the Criminal Process Statutes. The maximum penalty is seven years’ penal servitude.

**Scotland.**—Writs are of a more extensive term than in England. Writs are either judicial or extrajudicial, the latter including deeds and other instruments—as, for instance, in the Lord Clerk Register Act 1879, and in the common use of the phrase “oath or writ” as a means of proof. In the narrower English sense both “writ” and “writing” were used. The first was a substitute for the old procedure as it was in England, and many forms are given in *Regiam Majestatem et Quoniam Attachamenta*. It was a command issued in the king’s name, addressed to a judge, and ordering trial of the cause, and the party to bring the writ to the king’s signet, or the clerk to it, in the office of the secretary of state. Its conclusion was the will of the summons. In some cases proceedings wholly by writ were by writ in England took another form in Scotland. For instance, in *Spence v. Haldane* in Scotland. A similar end was reached by trial of the jury for wilful error.1 The English writ of ne exeunt regio is represented by the mediatio fuga warrant. Most proceedings by, being addressed to the sheriff, became obsolete after the institution of the court of session, when the sheriff lost much of that judicial power which they had enjoyed to a greater extent than the English sheriff (see SUMMONS).2 An English writ of execution is represented in Scotland by diligendo, chiefly by means of warrants to messengers-at-arms under the authority of signet letters in the name of the king. See the Writ of Execution.3 Writs of execution are to a large degree wholly dis- appeared. Briefs of tutorcy, terce and division among proprietors are still competent but not in use. Other kinds of brief have been superseded by simpler procedure, e.g. the brief of service of heirs, representing the older breve de mane necessitatis, a petition to the sheriff under the Titles to Land Consolidation Act 1668 and the brief of perambulation by a declaratory action. The brief of cognition of insane persons is now one of the few practical im- provements of the old practice. The brief of attaint was much used, and this new form was introduced by the act last named. Writs *de nomine* have been the subject of much modern legislation. The Writ of *De nomine* was expressly declared to be a writ not by other proceedings by the Exchequer Court Act 1856. The writ of *sententia ispispendo*, resignation and confirmation (whether granted by the crown or a subject superior) were regulated by the act of 1868. By the

1 An example occurring in the reign of James VI. will be found in *Pitcairn v. Cochrane* (1716), 2 S. & M. 116.

2 Explanations of many of the older writs will be found in Lord Clerk Register Skene’s *De verborum significatione* (1641), and styles in Spotswood, *Stile of Writs* (1715).

3 The same act crown writs are to be in the English language and registered in the register of crown writs. Writs need not be sealed unless at the instance of the party against whom they are issued. Writs of prescription and quiet title are the acts of 1662 and 1761. By the act of 1868 volt, the acknowledgment being abolished by the Conveyancing Act 1874. The *clare constat* writ is one granted by the crown or a subject superior for the purpose of completing title of a vassal’s heirs to lands held by the crown, and requires no acknowledgment under the Registration of Leases Act 1857 is used for the same purpose. By the Writs Execution Act 1877 the form of warrant of execution on certain extracts of registered writs is amended. Extracts of registered writs are to be, in the event of their being void, of -writs themselves. Writs registered in the register of sasines for preservation only may afterwards be registered for preservation and execution. By 22 Geo. II, c. 48, passed for the purpose of enabling Parliament to take time and process of execution of common pleas process of execution of common pleas for treason in Scotland to that in use in England, the court before which an indictment for treason or misprison of treason is found, is entitled on proper cause to issue a Proclamation of the court. Writs of administration for the proceedings in parliamentary elections differ from those in use in England. Thus the writ in university elections is directed to the vice-chancellors of Edinburgh and Glasgow respectively, but not to those of St Andrews and Aberdeen, and there is an extension of the time for the return in elections for Orkney and Shetland, and for the Wick burghs. Representative peers of Scotland were by the Act of Brevium (1685) elected ad hoc, and returned to the privy council of Scotland. On the abolition of the privy council, proclamation under the great seal was substituted by 6 Anne, c. 23.

**United States.—** Writs in United States courts are by Act of Congress.4 The common English form of the act is used. By the act of 1861, subject laws are generally bound to be in the name of the people of the state, in the English language, and tested in the name of a judge. Writs of error have been the subject of much legislation. Some states have abolished or suspended their use, but others have not. Writs of error and of no error have been abolished. Writs as parts of real actions have generally superseded, but in Massachu- setts are still issued in criminal cases. The Act of 1861 made a part of the law of the United States. Before the War of Independence it was issued to revenue officers to search premises for smuggled goods. It was on this writ that it was first contended in 1761 that a colonial court had jurisdiction to make a fine. The case is now well settled. See *Brevium* (1651); *Brevium et Mandatium* (1661); *Brevium* (1679). See also *Cook* on Littleton, 158, 159, 2 *Cook’s Inst.* 39; and *Du Cange*.5 Many precedents will be found in the collection of *Brevia* and *Facias*; 9 *Brevia* (1661); *Brevia* (1679). See also *Spence’s* *Equitable Jurisdiction*, vol. i. bk. ii. ch. viii.; *Forsey’s* *Hist* of *Trial by Jury*, *Stephen’s* *Pleading*, *Bigelow’s Hist. of Procedure*, ch. iv.; *Pollock and Maclan*., *Hist. of Eng. Law*; and W. S. M’Kechnie, *Magna Carta* may also be consulted. There appears to be no book dealing with the writ in modern practice, but sufficient information is contained in the ordinary treatises on procedure.

**TO THE SIGNET,** in Scotland, a society of law agents corresponding to solicitors in England. They were originally clerks in the secretary of state’s office and prepared the different writings passing the signet; every summons is still signed on its last page by a writer to the signet. By the Titles to Land Consolidation (Scotland) Act 1868, they have the exclusive privilege of preparing all crown writs, charters, precepts, &c., from the sovereign or the prince of Scotland. They have no charter but are usually considered a corporation by long custom; they have office-bearers and are members of the Common Justice. They are divided into three classes: members who may write to the writer to the signet should be eligible to the Scottish bench. It was finally decided that they should be eligible after ten years’ practice. But, with the exception of Hamilton of Pencaitland in 1712, no writer to the signet has ever had a seat on the bench.

4 A reference to Du Cange will show the variety of the non-legal uses of breve or brene. It may mean, in folio, an annual rent, an amulet, a notice of the death of a monk. *Brevium* signified what are now known as ship’s papers.
WRITING (the verbal noun of "to write," O. Eng. *written*, to inscribe), the use of letters, symbols or other conventional characters, for the recording by visible means of significant sounds; more specifically, the art of tracing by hand these symbols on paper or other material, by pen and ink, pencil, stylus or other such means, as opposed to mechanical methods such as printing. The principal features in the development of writing in its primary sense are dealt with in separate articles (see Alphabet, Palaeography, Inscriptions, Book, Manuscript, Shorthand, &c.). Here it is only necessary briefly to refer to the origins of a system which has eventually followed the history of the various languages and has been stereotyped by the progress of typography (q.v.). Very early in the history of man he found himself needing to make a record of events or the past, and this need led to the making of marks on the objects which he used; these are (a) to recall information at a particular time something that has to be done; (b) to communicate with some other person who is not present, nor for the moment easily accessible; (c) to assert rights over tools, cattle, &c., by a distinctive mark, or by a similar mark to distinguish one's own production (e.g. a special make of pottery) from that of others. The last-named use, out of which in time develops every kind of trade-mark, is itself a development of the earlier property mark. The right to property must be established before traffic, whether by way of barter or of sale, is possible. Every one is familiar with devices to achieve the first of these aims; one of the commonest is to tie a knot in a handkerchief. It is obvious that by multiplying the number of knots a number a number of points equal to the number of knots might in this way be referred to, though it is probable that the untrained memory would fail to recall the meaning attached to more than a very limited number of knots. The simplest application of these knots is in keeping a record of a number of days, as in the story related by Herodotus (iv. 98), to the effect that Darius, on crossing the Ister in his Scythian expedition, left with the Greeks appointed to guard the bridge a thong with a number of knots equal to the number of days that their watch over the bridge was to be continued. One knot was to be undone each day, and if the king had not returned by the time that all the knots were undone, the Greeks were to break down the bridge and go away. A development of this is found in the Peruvian *quipus*, which consists of a number of thongs or cords hanging from a top-hand or cross-bar. In its simplified form, knots are merely tied upon the individual cords. In its more elaborate forms the cords are of different colours, and are attached together so as to form open loops of various shapes. In the *Antiguedades Peruanas*¹ we are told that the knots of the *quipus* in all probability indicated only numbers originally, but that as time went on the skill of the makers became so great that historical events, laws and edicts could thus be communicated. In every place of any importance there was an official whose business it was to interpret *quipus* received from a distance, and to make *quipus* himself. If, however, the *quipus* which was received came from a distant province, it was not intelligible without an oral explanation. Unfortunately, the art of interpretation of *quipus* is lost, so that it is impossible to ascertain how far the knots were merely a mnemonic for the messenger, and how far they were intelligible without explanation to a stranger. Similar mnemonics are said to have been used in the remotest antiquity amongst the Chinese, the Tibetans, and other peoples of the Old World.²

Similar in character to the *quipus* is the message-stick, which is still in use amongst the natives of Australia. A branch of a tree is taken and notches made upon it. These are now cut with a knife; in earlier times they were made by beating them together about the inner part of the branch of a tree or the trunk in the presence of the messenger, who receives his instructions while they are being made. The notches are thus merely aids to memory, and not self-explanatory, though if messages frequently passed between two persons, practice would in time help the person to whom the message was sent to guess at the

marked pebbles.

for the purposes of communication with absent persons, however, another method committed itself, which in time was adopted also for mnemonic purposes. This method was published by the discoverer of the quipus, M. Ed. Piette at Mas d'Azil, on the left bank of the Arize, an account of which was published in *L'Anthropologie* (1896) viii. 318 sqq. This layer of coloured pebbles is intercalated between the last layer of the Reindeer Age and the first of the Neolithic period. The layer is over 2 ft. thick, of a reddish-black colour, and along with the pebbles are found cinders, peroxide of iron, teeth of deer perforated, probably in order to be strung like beads, harpoons of various kinds, and the bones of a large number of animals, some wheat, and, in the upper part of the layer, nuts, cherty-stones and plums. The stones were coloured with peroxide of iron. The characters are of two kinds: (a) a series of strokes which possibly indicate numbers, (b) graphic symbols. The stones were scattered about without connexion or relation one with another. Whatever the meaning may be, it is clear that the markings are not accidental. It is noticeable, however, that none of them definitely represent any animal, though some of them bear a certain resemblance to caterpillars or serpents. Others look like rough attempts to represent trees and river plants. A great number closely resemble symbols of the alphabet. Piette himself was inclined to see in the symbols the forerunners of the later syllabaries and alphabets of the East, and time of them agreeing with forms in the Cypriot syllabary (see below) and eleven with those of the Phoenician alphabet. A certain amount of likeness, however, could not well be avoided, for as soon as the artist advances beyond the single perpendicular or horizontal line he must, by crossing two lines, get forms which resemble alphabetical symbols. It might be therefore a safer conclusion to suppose that if they passed beyond magic symbols, to be buried like the *Australiern* *churings*, they were conventional marks understood by the members of the clan or tribe which frequented the caves of Mas d'Azil. It has been suggested that, like similar things among the American Indians, they may have been used in playing games or gambling.

A very large number of conventional marks, however, are demonstrably reductions from still older forms, conventional marks often developing out of pictographs. Pictography has, in fact, left its traces in all parts of the world. It has, however, been most widely developed in the New World as a system lasting down to modern times. The American Indians, besides picture-writing, used also (1) the simple mnemonic or notched stick to record various events, which is the basis of a method of which the number of days spent on an expedition, the number of enemies slain and the like; (2) wampum belts, consisting of strung beads, which could be utilized as a mnemonic, exactly like a rosary. Wampum belts, however, were employed in more intricate forms; white beads indicated peace, purple or violet meant war. Sometimes a pattern was made in the belt with beads of a different colour, as in the belt presented to

William Penn on the making of a treaty with the Leni-Lenape chief in 1682. Here, in the centre of the belt, two figures, intended to represent Penn and an Indian, join hands, thus clearly indicating a treaty. Very simple pictures are drawn upon birch bark, indicating by their order the subjects in a series of song-chants with sufficient precision to enable the singer to recall the theme of each in his recitation. An account can be kept of sales or purchases by representing in perpendicular strokes the number of items, and adding at the end of each series a picture of the animal or object to which the particular series refers. Thus three strokes followed by the picture of a deer indicate that the hunter has brought three deer for sale. A conventional symbol (a circle with a dot) is used: a dot and a stroke represents ten cents, and an upright stroke one cent, so that the price can be quite clearly set forth. This practice is followed in many other parts of the world. In clay tablets discovered by Dr Arthur Evans during his exploration of the great palace at Knossos, in Crete, a somewhat similar method of enumeration is followed; while at Athens conventional symbols were used to distinguish drauchae and obols upon the revenue records, of which considerable fragments are still preserved.

In comparatively recent times, according to Colonel Mallery ("Algonquians, Broken Arrows, and Ethnology"), the Dakota Indians invented a chronological table, or winter count, wherein each year is recorded by a picture of some important event which befell during that year. In these pictures a considerable amount of symbolism was necessary. A black upright stroke indicates that a Dakota Indian was killed, a rough outline of the head and body spotted with blotches indicates that in the year thus indicated the tribe suffered from smallpox. Sometimes, in referring to persons, the symbol is of the nature of a rebus. Thus, Red Coat, an Indian chief, was killed in the winter of 1807–1808; this fact is recorded by a picture of a red coat with two feathers projecting from its back. It is, however, a rebus too, for the coat is also a means of writing the name of the old chief in conventionalized form. A similar formula for a name is employed for the first time in the winter count, which was intended to be a true statement of the year's events but, if it be true, it is a real instance of signs that would have constituted a serious loss to that highly important body. The effect of this love for decoration, combined with a desire for precision, is shown by the repetition several times over in the winter count of the sounds contained in words. The system of Egyptian was exactly parallel to Chinese. A combination of sounds, which were originally the name of an object, was represented by the picture of that object. This picture again, like Chinese, was compounded of names of parts of the object. Thus, for example, the name for the pan-Rajput—having seven active—a picture of the kind of object intended—in order to avoid ambiguity. As the alphabet represented only consonants and semi-consonants, and the Egyptian roots consisted mostly of only three letters, the parallelism with Chinese is remarkably close.

The ceremonium script spread to other people who spoke tongues in no way akin to those of either its inventors, the Sumerians, or their conquerors, the Semitic Babylonians and Assyrians, by the propagation of series of inscriptions, found in many parts of Asia and even in the Aegean, which are generally described as Hittite (q.v.) and are written in a script of pictographic origin, though probably independent of the Sumerian and Babylonian. It is notable that at a very early period a colony of Greeks from the Peloponnesus, speaking a dialect closely akin to the Arcadian dialect of Greece, which is known to us only from a much later period, had settled in the island of Cyprus. Alone among the Greeks this colony did not write in an alphabet, but under some Asiatic influence adopted a syllabary. Even when the island came again more closely in touch with their Greek kinsfolk, after the Persian wars, the Greek inhabitants continued to write in their syllabary. In the recent excavations made by the authorities of the British Museum an inscription of the 4th century B.C. was discovered, wherein a dedication to Demeter and Persephone was given first in Greek letters and repeated below in the syllabary, the Greek (as universally at so late a period) reading from left to right, the syllabary to the right. This syllabary has been worked out, but it could not distinguish between long and short vowels. In its consonant system it is unable to distinguish between breathed, voiced and aspirated stops, thus having but one symbol to represent /p/, /k/, /b/, /g/, /t/, /d/, /s/, /z/, /f/, /v/, /x/, /m/, /n/, /l/, /r/, but this is achieved by using the symbol for a syllable ending in e conventionally for the final consonant. Thus ka-te stands for kae, the Cyripi equivalent of the Hebrew oth, for lo, though none for f, and similarly for most of the other consonants. There is, however, no symbol for w (w).

In the course of the development of writing from pictography can be ascribed—see Assyrians (see Cuneiform), Egyptians (see Egypt) and Chinese (see China). Here more complex notions had to be expressed. The development of the system can be traced through many centuries, and, as might be expected, this development shows a tendency to conventionalize the pictorial symbols employed. Out of conventionalized forms develop (a) syllabaries, (b) alphabets. As regards the latter the historical evolution is traced in the article ALPHABET. The account given under China (Language) gives a good idea of the development of a syllabary from pictographic writing.

The Egyptian system of writing is perhaps the oldest of known scripts, and was on carvings of the Ptolemaic period, when the more convenient Greek alphabet led to its gradual disuse. The Chinese, on the contrary, was so adapted to the conventionalizing of the pictures, and in many cases to a complete divorcement between the symbol and the sound represented by it, that it is possible in modern times to recognize the original sign in modern writing. Thus it is no longer possible to trace it. Attempts have been made to connect the three great pictographic systems of the Old World, some authorities holding that the Chinese migrated eastwards from the African continent while others that the Chinese were corsairs originally from the valleys of the Euphrates, and that the ancient Egyptians were of the same stock as the Somali and were overlayed and permeated by a Semitic conquest and civilization. But there is no clear evidence that the Egyptian system of writing was not a development in the Nile Valley itself, or that it was either the descendant or the parent of the pictographic system which developed into the systems of the Old World.

Egyptian started from the same point as every other pictographic system—the representation of the object or the concrete expression of the idea. But, like the Chinese, it took the further step, short of which is the development of a syllabary, of breaking down the pictures into a syllabary from which there was an imperfect development towards an alphabet. Egyptian, however, never became alphabetic in the sense in which the western languages of modern Europe and the alphabet have been so; it continued to express the conservatism of the people, and the influence of the artist scibes, who, as Mr F. L. Griffith has pointed out,  fully appreciated the effect of a writing that was so simple that the signs would have constituted a serious loss to that highly important body. The effect of this love for decoration, combined with a desire for precision, is shown by the repetition several times over in the winter count of the sounds contained in words. The system of Egyptian was exactly parallel to Chinese. A combination of sounds, which were originally the name of an object, was represented by the picture of that object. This picture again, like Chinese, was compounded of names of parts of the object. Thus, for example, the name for the pan-Rajput—having seven active—a picture of the kind of object intended—in order to avoid ambiguity. As the alphabet represented only consonants and semi-consonants, and the Egyptian roots consisted mostly of only three letters, the parallelism with Chinese is remarkably close.

The cuneiform script spread to other people who spoke tongues in no way akin to those of either its inventors, the Sumerians, or their conquerors, the Semitic Babylonians and Assyrians, by the propagation of series of inscriptions, found in many parts of Asia and even in the Aegean, which are generally described as Hittite (q.v.) and are written in a script of pictographic origin, though probably independent of the Sumerian and Babylonian. It is notable that at a very early period a colony of Greeks from the Peloponnesus, speaking a dialect closely akin to the Arcadian dialect of Greece, which is known to us only from a much later period, had settled in the island of Cyprus. Alone among the Greeks this colony did not write in an alphabet, but under some Asiatic influence adopted a syllabary. Even when the island came again more closely in touch with their Greek kinsfolk, after the Persian wars, the Greek inhabitants continued to write in their syllabary. In the recent excavations made by the authorities of the British Museum an inscription of the 4th century B.C. was discovered, wherein a dedication to Demeter and Persephone was given first in Greek letters and repeated below in the syllabary, the Greek (as universally at so late a period) reading from left to right, the syllabary to the right. This syllabary has been worked out, but it could not distinguish between long and short vowels. In its consonant system it is unable to distinguish between breathed, voiced and aspirated stops, thus having but one symbol to represent /p/, /k/, /b/, /g/, /t/, /d/, /s/, /z/, /f/, /v/, /x/, /m/, /n/, /l/, /r/, but this is achieved by using the symbol for a syllable ending in e conventionally for the final consonant. Thus ka-te stands for kae, the Cyripi equivalent of the Hebrew oth, for lo, though none for f, and similarly for most of the other consonants. There is, however, no symbol for w (w).

In the course of the development of writing from pictography can be ascribed—see Assyrians (see Cuneiform), Egyptians (see Egypt) and Chinese (see China). Here more complex notions had to be expressed. The development of the system can be traced through many centuries, and, as might be expected, this development shows a tendency to conventionalize the pictorial symbols employed. Out of conventionalized forms develop (a) syllabaries, (b) alphabets. As regards the latter the historical evolution is traced in the article ALPHABET. The account given under China (Language) gives a good idea of the development of a syllabary from pictographic writing.
WROTHAM, an urban district in the Medway parliamentary division of Kent, England, 10 m. W. by N. of Maidstone, on the South-Eastern & Chatham railway. Pop. (1901) 3571. The church of St George, Early English and later, contains numerous brasses; and near it is the site of a palace of the archbishops of Canterbury, maintained until the time of Archbishop Simon Islip (c. 1350). Wrotham Park, for its forest (q.v.) the result of which is a fine quadrangular moated manor-house, the Mote, in part the 14th century, but with portions of Tudor dates.

WRYNECK (Ger. Wendehals, Dutch draaiholken, Fr. torcel), a bird so called from its way of writhing its head and neck, especially when captured on its nest in a hollow tree. The *Lync1 turqulla* is a regular summer visitant to most parts of Europe, generally arriving a few days before the cuckoo, and is known in England as "cuckoo's leader" and "cuckoo's mate," but occasionally is called "snake-bird," not only from the undulatory motions it is mentioned, but from the violent hissing with which it seeks to repel an intruder from its hole.3

The unmistakable note of the wryneck is merely a repetition of what may be syllabled *gue, gue, gue,* many times in succession, rapidly uttered at first, but gradually slowing and in a continually falling key. The male during a breeding season, and for about four weeks after the bird of the stay in Europe it seems to be mute. It feeds almost exclusively on insects, especially on ants. It is larger than a sparrow, but its plumage is not easily described, being beautifully variegated with shades of brown, green, and gray, and producing the hues of blackish-brown on a light ground—the darker markings disposed in patches, vermiculated bars, freckles, streaks or arrowheads—and the whole blended most harmoniously by the lighter patches of the under tail coverts. It is coloration of a pratincole or a woodcock (q.v.). The wryneck commonly lays its translucent white eggs on the bare wood of a hole in a tree, and it is one of the few wild birds that can be induced to go on hatching by abstracting all its eggs day after day, and thus upwards of forty have been taken from a single hole—but the proper complement is from six to ten. As regards Britain, the bird is most common in the S.E., its numbers decreasing rapidly towards the west and N., so that in Cornwall and Wales and beyond Cheshire and Yorkshire its occurrence is but rare, while it appears only by accident in Scotland and Ireland.

Some writers have been inclined to recognize five other species of the genus *Lync1*, but the so-called *Lync1 japonica* is specifically indistinguishable from *Lync1 turqulla*; while that designated, through a mistake in the locality assigned to it, *Lync1 indica*, has been found to be identical with the *Lync1 aequatorialis* of Africa. Near to this is *Lync1 quercicolis*, discovered by Emin Pasha in the E. of the Bar-el-Djebel (Ibis, 1884, p. 28, pl. iii). Another distinct African species is the *Lync1 aequatorialis*, originally described from Abyssinia. The wryneck (see Wryneck) is distributed in the West Indies by various species of the same genera, as in the more normal groups of which they differ but little in internal structure, but much in coloration and in having the tail-feathers bluish-black, or at least not stiffened to serve as props as in the true wryneck, *Pic1 nipalensis* (A. N.)

WRY-NECK (Lat. *Torticolis*), a congenital or acquired deformity, characterized by the affected side of the head being drawn downwards towards the shoulder together with deviation of the face towards the sound side. There are various forms. (1) The congenital, due to a lesion of the sterno-mastoid muscle, either the result of a malposition in utero or due to the rupture of the muscle in the delivery of the aftercoming head in the birth of the breech presentation. (2) The rheumatic, due to exposure to a draught or cold. This is commonly known as "stiff-neck." (3) The nervous or spasmodic, the result of (a) direct irritation of the spinal nerves as in cases of cervical irritation. In this form there is generally a family history of nervous diseases, notably epilepsy. This spasm is one of a group of nervous spasms known as "tics," a variety of habit spasm. The character of the movements varies with the muscles involved, the most usual muscle being the sterno-mastoid. The spasm ceases during sleep. Many cases are also due to hysteria and some to spiritual causes. When wry-neck is congenital, massage and manipulation may be tried and some form of apparatus. Failing this, division of the muscle surgically may be practised. In the spasmodic forms, anti-neurotic treatment is recommended, the use of the bromides, valerianates and belladonna, and hydrobromide of hyoscine injected into the muscles has been found of value. T. Grainger Stewart recommends in persistent tic the trial of continuous and regular movements in the affected group of muscles with a view to replacing the abnormal movements by normal ones. In severe cases it may be necessary to cut down on and stretch or excise the spinal accessory nerve. In rheumatic torticollis the spasm is usually overcome by the application of hot compresses and appropriate anti-rheumatic treatment.

WUCHANG, the capital of the combined provinces of Hup-ch and Hu-nan, China. It is one of the three cities, Wuchang, Hanyang and Hankow, which stand together at the mouth of the Han river, and is situated on the right bank of the river Yangtze, almost directly opposite the foreign settlement of Hankow. It is the seat of the provincial government of the two Hu or Hu-kwang, as these provinces are collectively termed, at the head of which is a viceroy. Next to Nanking and Canton, it is one of the most important vice-royalties in the empire. It possesses an arsenal and a mint. The provincial government has established ironworks for the manufacture of rails and other railway material. As the works did not pay under official management, they were transferred to the director-general of railways. Wuchang is not open to foreign trade and residence, but a considerable number of missionaries, both Roman Catholic and Protestants, have settled here. In 1901 the population was estimated at 800,000, including cities on both banks. Wuchang is an important junction on the trunk railway from Peking to Canton; and is on the route of the Sze-ch'uen railway.

WUCHOW, a treaty port in the province of Kwang-si, China, opened to foreign trade in 1897, and situated on the left bank of the Si-kiang (West river) at its junction with the Fu or Kwei-Kiang (Cassia) river. It is 220 m. above Canton, with which it is in navigable connexion for vessels drawing up to 8 ft. of water. In 1908 the value of the trade passing through the maritime customs amounted to £1,656,000, representing, however, only a portion of the trade. Of this total, two-thirds were for imports, consisting principally of cotton and cotton goods, kerosene oil, woollens, &c. Sugar, various oils, hides and aniseed were the chief exports. The native population is estimated at 65,000. At Shuiling the river flows for 5 m. through a deep gorge bordered by limestone cliffs 2000 ft. in height. Further up the river the woods its way through a series of rocky defiles, forming at intervals what seems an inland lake with no apparent outlet. During summer floods the water thus pent up by the rocks and defiles at Wuchow 50 or 60 ft. In consequence of the variation of river level, the principal offices and shops are built upon pontoons which are moored alongside the river-bank. The situation of Wuchow makes it the natural distributing centre between Kwei-chow, Kwang-si and Canton. Great things were therefore expected of it as a treaty port, but disorders in Kwang-si delayed the fulfilment of the hopes. Trade, however, has improved, and a large native passenger traffic has sprung up between it and Canton. It is connected with Hong Kong and Shanghai by telegraph.

WUHU, a city in the province of Nung-hui, China, about 1 m. from the S. bank of the Yangtze-kiang, with which it is connected by a straggling suburb. It is about 50 m. above Nanking, and in 1858 it was marked out as a treaty port, but was not opened to trade until 1877. It is connected by canals with the important cities of Ning-Kuo Fu, Tal-p'ing Hien, Nan-lung Hien and Ching Hien, the silk districts in the neighbourhood of the two last cities being within 50 m. of WuHu. Coal to a considerable extent exists in the country round. At first its commercial progress was very slow, the older ports of Kiu-kiang and Chiin-kiang migrating against its success; but of late there has been a distinct improvement in the trade of the port, the net value of which was about £3,000,000 in 1906. The principal exports are rice, cotton, wheat, tea, furs and feathers. For the production of feathers large quantities of ducks are reared in the surrounding districts. Of imports, opium formed
the most considerable item; other imports being matches, needles, sawed and window glass. The city, which is one of the largest in its rank in China, was laid desolate during the T'ai-p'ing rebellion, but has been repeopled, the population being estimated (1906) at 137,000. The streets are comparatively broad and are well paved. The land set apart for the British settlement, advantageously situated, was little built upon. A new general foreign settlement was opened in 1905.

**Wulfenite**, a mineral consisting of lead molybdate, PbMoO₄, crystallizing in the hemimorphic-tetragonal class of the tetragonal system. Crystals usually have the four faulted square plates bevelled at the edges lost lamellar plates. They have a vitreous luster and are sometimes present isomorphously replacing lead. The mineral occurs in veins of lead ore, and was first found in the 18th century in the lead mines at Bleiberg in Carinthia. Bright yellow crystals are found in New Mexico and Utah, and brilliant red crystals in Arizona.

**Wulfhere** (d. 679), king of the Mercians, was a younger son of King Fenda, and was kept in concealment for some time after Worcester's defeat and death in 655. In 658 or 659, however, the Mercians threw off the supremacy of Oswio, king of Northumbria, and Wulfhere became their king. He erected energetic measures to spread Christianity, and was greatly helped by his bishop, Jaruman, and afterwards by St. Chad. Outside Mercia he did something to induce the East and the South Saxons to accept Christianity, and is said to have founded one or two monasteries. He gained Lindsey from Northumbria in 657, and was successful against Wessex. He extended his boundaries in all directions, and was the founder of the passing greatness of Mercia, although Lindsey was just before his death Wulfhere's wife's property, a daughter of Eorlberht, king of Kent, and he was succeeded by his brother Athelred. His only son Coenred became king in 704 in succession to Aethelred. His only daughter was St. Werburga or Werburgh, abbess of Ely.

**Wulfgar** (1003-1015), archbishop of York from 1003 until his death in 1015, and also bishop of Worcester from 1003 to 1016, is generally held to be the author of a remarkable homily in alliterative English prose. Its title, taken from a manuscript, is *Lupi sermo ad Argilos, quando Dani maxime procelli sunt cos, quod fuit anno 1014*. It is an appeal to all classes to repent in the prospect of the imminent day of judgment, and gives a vivid picture of the desperate condition of England in the year of King Aethelred II.'s flight (1014). Of the many other homilies ascribed to Wulfgar very few are authentic. Subsequent legislation, especially that of Canute, bears clear traces of his influence.

See the edition of his homilies by A. Napier (Berlin, 1883); also the same writer's *Über die Werke des altenglischen Erzbischöfs Wulfgar*, Gottingen dissertation (1882), and his paper in *An Englisch Miscellany* (Oxford, 1901), pp. 1-35.

**Wulfenite—Wundt**

William II. in his struggle with the Welsh. Wulfsan's relations with his ecclesiastical superiors were not so harmonious, and at one time both Lanfranc of Canterbury and Thomas of York unsuccessfully demanded his removal. He was the only survivor of the Anglo-Saxon bishops when he died on the 18th of January 1095. In 1203 he was canonized by Pope Innocent III. By his preaching at Bristol Wulfsan is said to have put an end to the kidnapping of English men and women and selling them as slaves. He rebuilt the cathedral church of Worcester, and some parts of his building still remain.

Lives of St. Wulfsan by Hemming and Florence of Worcester are in *H. Wharton's Anglia sacra* (1861). See also E. A. Freeman, *Norman Conquest* (1867-1869).

**Wullenweber, Joseph** (c. 1492-1537), burgomaster of Lübeck, was born probably at Hamburg. Settling in Lübeck as a merchant he took some part in the risings of the inhabitants in 1530 and 1531, being strongly in sympathy with the democratic ideas in religion and politics which inspired them. Having joined the governing council of the city and become leader of the democratic party, he was appointed burgomaster early in 1533 and threw himself into the movement for restoring Lübeck to her former position of influence. Preparations were made to attack the Dutch towns, the principal trading rivals of Lübeck, when the death of Frederick I., king of Denmark, in April 1533 changed the political situation. The Lübbeckers objected to the prospect of the Danish crown upon any prince favourable to the Empire or the Roman religion, and Wullenweber went to Copenhagen to discuss the matter. At length an alliance was concluded with Henry VIII. of England; considerable support was obtained in N. Germany; and in 1534 an attack was made on Christian, duke of Holstein, afterwards King Christian III., who claimed the throne. At first the Lübbeckers gained several successes, but Christian of Holstein appeared before Lübeck; the efforts of Wullenweber to secure allies failed; and the citizens were compelled to make peace. The imperial court of justice at Darmstadt ordered the old constitution, and in August 1535 the aristocratic party returned to power. Soon afterwards Wullenweber was seized by Christopher, archbishop of Bremen, and handed over to his brother Henry II., duke of Brunswick-Wolfenbüttel. Having been tortured and sentenced to death as a traitor and an Anabaptist, he was beheaded at Wolfenbüttel on the 29th of September 1537. Wullenweber, who was long regarded as a popular hero in Lübeck, inspired tragedies by Heinrich Kruse and Karl Ferdinand Gutzkow, and a novel by Ludwig Köhler.

See also Fritz, *Leuchtenburg unter Jürgen Wullenweber und die europäische Politik* (Berlin, 1885-1886).

**Wundt, Wilhelm Max** (1832-1920), German physiologist and philosopher, was born on the 16th of August 1832 at Neckarau, in Baden. He studied medicine at Tübingen, Heidelberg and Berlin, and in 1857 began to lecture at Heidelberg. In 1864 he became assistant professor there, and in 1866 was chosen to represent Heidelberg in the Baden Chamber, but soon resigned. In 1874 he was elected regular professor of philosophy at Zürich, and in the following year was called to the corresponding chair at Leipzig, where he founded an Institute for Experimental Psychology, the precursor of many similar institutes. The list of Wundt's works is long and comprehensive, including physiology, psychology, logic and ethics. His earlier works deal chiefly with physiology, though often in close connexion with psychology, as in the *Verlesungen über die Menschen- und Tierseelen* (1883; 4th ed., 1906; trans. Creighton and Tillicher, 1896), *Lehrbuch der Physiologie des Menschen* (1865; 4th ed., 1878), *Grundzüge der physiologischen Physiologie* (1874; 6th ed., 3 vols., 1908). He published an important work on *Logik* (1882-1893; 3rd ed., 1906-1907), and this was followed in 1886 by his *Ethik* (3rd ed., 1905). According to Wundt, the straight road to ethics lies through ethnic psychology, whose especial business it is to consider the history of custom and of ethical ideas from the psychological standpoint. We must look for ethics to supply the corner-stone of metaphysics, and psychology is a necessary propædeutic. The *System der Philosophie* (1893; 3rd ed., 1907) contained the results of Wundt's work up to that date, both in
the domain of science and in the more strictly philosophic field. The metaphysical or ontological part of psychology is in Wundt's view the actual part, and with this the science of nature and the science of mind are to be brought into relation, and thus con-
stituted as far as possible philosophic sciences. In 1892 Wundt published Hypnotismus und Suggestion. Subsequent important works are Einleitung in die Psychologie (1880; 8th ed., 1907; translated by E. C. W. Stumpf, 3rd ed., 1907); Völkerpsychologie (1907); Die Grenzen des Deutschen Einleitungen in die Philos. (1901; 4th ed., 1906). Two other works, containing accounts of the work of himself and his pupils, are Philosophische Studien (1883-1902) and Psychologische Studien (1905 fol.).

WUNTHO, a native state of Upper Burma annexed by the British and incorporated in the district of Katha in 1892. Wuntho was classed by the Burmese as a Shan state, but was never on the same footing as the true Shan states, and only escaped be-
coming an integral part of the Burmese empire through Burmese want of system. The Shan name is Wying Hisa, "the city of the high." It had an area of about 2,400 sq. m. with 150,000 in-
habitants, and lay midway between the Irrawaddy and Chindwin rivers. When the British annexed Upper Burma in 1885 the state became a refuge for rebels and dacoit leaders. Finally in 1891 the state broke out into open rebellion, the sahwa was deposed, and a force of 1,800 troops under General Sir George Wolseley occupied the town of Wuntho and reduced the state to order.

WUPPER, a river of Germany, a right-bank tributary of the Rhine, rising in the Sauerland near Meinerzhagen. The most remarkable part of its course is that in the so-called Wuppertal. In this section, 30 m. in length, it passes through the populous towns of Barmen and Elberfeld and supplies water-power to about five hundred mills and factories. Leaving the hills above Opladen, it debouches on to the plain and enters the Rhine at Rheindorf between Cologne and Düsseldorf, after a course of 63 m.

See A. Schmidt, Die Wupper (Lennep, 1902).

WÜRTTEMBERG, a kingdom of Germany, forming a tolerably compact mass in the S.W. angle of the empire. In the south it is
cliff by the long narrow territory of Hoheonzellern, belonging to
Prussia; and it encloses six small enclaves of Baden and Hohen-
zellern, while it owns nine small exclaves within the limits of
these two states. It lies between 47° 34' 48" and 49° 35' 17" N., and between 8° 15' and 10° 30' E. Its greatest length from N. to S. is 140 m.; its greatest breadth is 100 m.; its boundaries, almost entirely arbitrary, have a circuit of 1,116 m.; and its total area is 7,534 sq. m., or about 3/5th of the entire empire. It is bounded on the E. by Bavaria, and on the other three sides by Baden, with the exception of a short distance on the S., where it touches Hohenenzollern and the lake of Constance.

Physical Features.—Württemberg forms part of the South-German tableland, and is hilly rather than mountainous. In fact the un-
dulating fertile terraces of Upper and Lower Swabia may be taken as the characteristic parts of this agricultural country. The usual estimates return one-fourth of the entire surface as "plain," less than one-third as "mountainous," and nearly one-half as "hilly." The average elevation above the sea-level is 1,650 ft.; the lowest point is at Böttingen (410 ft.), where the Neckar quits the country; the highest is the Katzenkopf (3757 ft.), on the Hornisgrinde, on the western border.

The chief mountains are the Black Forest (g.v.) on the west, the Swabian Jura or Raube Alb stretching across the middle of the country, and the northern boundary wall of north Swabia which is in the extreme south-east, adjoining the Algan Alps in Bavaria. The Raue Alb or Alp slopes gradually down into the plateau on its south-
side, but on the north it is sometimes rugged and steep, and has two line broken by isolated projecting hills. The highest iron and steel-dressing locations (for which Schorndorf enjoys a great reputation), machinery, motor-cars, bicycles, small arms (in the Mauser factory at Oberndorf), all kinds of scientific and artistic instruments, photographic apparatus, clocks (in the Black Forest), electrical apparatus, and gold and silver goods. There are also ex-
tensive chemical works, potteries, cabinet-making workshops, sugar factories, breweries, distilleries, and paper making. Water-power and petroleum may compensate for the lack of coal. Among other interesting develop-
ments is the manufacture of liquid carbonic acid gas procured from natural gas springs beside the Eyach, a tributary of the Neckar.

Commerce.—The principal exports are cattle, cereals, wood, pianos,
WÜRTTEMBERG

salt, oil, leather, cotton and linen fabrics, beer, wine and spirits.

Communications.—In 1907 there were 1219 m. of railways, of which all except 159 m. belonged to the state. The Neckar, the Schussen and the lake of Constance are all navigable for boats; the Danube becomes navigable for boats at Ulm, and the Würm is navigable only fairly good; the oldest of them are Roman. Württemberg, like Bavaria, retained the control of its own postal and telegraph service on the foundation of the new German empire.

Constitution.—Württemberg is a constitutional monarchy and a part of the German empire, with four votes in the federal council (Bundesrat), and two votes in the imperial council. The imperial constitution rests on a law of 1810, amended in 1868, in 1874, and again in 1906. The crown is hereditary, and conveys the simple title of king of Württemberg. The king receives a civil list of £103,227. The legislature is bi-cameral. The upper chamber (Ständeherrschaft) is composed of adult princes of the blood, heads of noble families from the rank of count (Graf) upward, representatives of territories (Ständeherrschaften), who possessed votes in the old German imperial diet or in the local diet; it has also members (not more than 6) nominated by the king, 6 members elected by the city of Stuttgart, 6 ex-officio dignitaries, a representative of the university of Tübingen, 1 of the upper half of the university, 1 of the lower half of the university, 2 representatives of commerce and industry, 2 of agriculture, and 1 of handicrafts. The lower house (Abgeordnetenhaus) has 92 members, viz. a representative from each of the administrative divisions (Oberamtsbezirke), 63 in all without Stuttgart, which has 6 representatives; also 1 from each of the six chief provincial towns, and 17 members elected by the two electoral divisions (Landeswahlkreise) into which the kingdom is divided. The latter class of members as well as those for Stuttgart are elected on the principle of proportional representation. The members of the lower house elect the president of the upper chamber; since 1874 the lower chamber has elected its own chairman. Members of both houses must be over twenty-five years of age, and parliamentarians are elected for six years; the suffrage is enjoyed by all male citizens over twenty-five years of age, and voting is by ballot.

The highest executive is in the hands of a ministry of state (Staatsministerium), consisting of six ministers respectively of justice, foreign affairs (with the royal household, railways, posts and telegraphs), the interior, public worship and education, war and the navy, and finance, a privy council, consisting of the ministers and some nominated councillors (Ministerische Staatsräte), who advise the sovereign at his command. The judges of a special supreme court of justice, called the Staatsgerichtshof (which is the guardian of the constitution), are partly elected by the chambers and partly appointed by the king. Each of the chambers has the right to impeach the ministers. The country is divided into four governmental departments (Kreise) and subdivided into sixty-four divisions (Oberamtsbezirke), each of which is under a headman (Oberamtsmann) assisted by local council (Amtsversammlung). At the head of each of the four departments is a government (Regierung).

Religion.—The right of direction over the churches resides in the king, who has also the right to choose the representatives in the Protestant Reformed Church, the guardianship of the spiritual rights of that Church. The Protestant Church is controlled (under the minister of religion and education) by a consistory and a synod—the former consisting of a president, 9 councilors and 6 general superintendent or "prelates" from six principal towns, and the latter of a representative council, including both lay and clerical members. The Roman Catholic Church is subject to the bishop of Rottenburg, in the diocese of Freiburg. Politically it is under a Roman Catholic bishop, appointed by government. The Jews also, since 1828, have been established (parliamentarily) in the kingdom (Reichsland).

Education.—According to official returns there were in 1906, 31,031 in primary schools, 570 in middle schools, and 110 in high schools, with 604,000 pupils, 3000 teachers, and £2,000,000 expenditure. There are about 600,000 students in the universities and technical schools of Wurttemberg.

Army.—By terms of the convention of 1871 the troops of Württemberg form the XIth army corps of the imperial German army.

Finances.—The state revenue for 1909-1910 was estimated at £2,840,520, which is nearly balanced by the expenditure. About 3.600,000 voted for the revenue and 3,600,000 for the expenditure; about £1,000,000 from direct taxation; and the remainder from indirect taxes, the post-office and sundry items. In 1909 the public debt of the kingdom was £92,285,335, of which more than £27,000,000 was incurred for railway construction. The expenditure of the year 1909 was spent upon public worship and education, and over £1,000,000 goes in interest and repayment of the national debt. To the treasury of the land were the kingdoms a contribution of £600,000.

Authorities.—See Württembergische Jahrbücher für Statistik und Landeskunde; Das Königreich Württemberg, eine Beschreibung nach Kreisen, Oberämtern und Gemeinden (Stuttgart, 1904); Statistisches Jahrbuch für das Königreich Württemberg, 1885; Das Königreich Württemberg, eine Beschreibung von Land, Volk und Staat (1903); the Jahresberichte der Handels- und Gewerbehämmern in Württemberg; Lang, Der Verkehrs- und Bevölkerungswert Württembergs im Laufe des vierten Jahrhunderts (Tübingen, 1902); Engel and Schulze, Geographischer Wegweiser durch Württemberg (Stuttgart, 1908); Götz, Staatssrecht des Königreichs Württemberg (Tübingen, 1908); and F. Bitzer, Regierung und Stände in Württemberg (Stuttgart, 1882).

History.—The origin of the name Württemberg is uncertain, but the once popular derivation from Wirth am Berg is now universally rejected. Some authorities derive it from a proper name, Wirto or Wirtno; others from a Celtic place-name, Volunturum or Verdunum. At all events from being the name of a castle near the village of Rothenberg, not far from Stuttgart, it was extended over the surrounding country, and as the lords of this district increased their possessions so the name covered an ever-widening area, until it reached its present denotation. Early forms of it are Wirtimberg, Wirttibembe and Wirttibemere. Württemberg was long current, and in the latter part of the 16th century Württemberg and Württemberg appeared. In 1806 Württemberg was adopted as the official spelling. Though Württemberg is also common and occurs sometimes in official documents and even on coins issued after that date.

As far as we know, the first inhabitants of the country were the Celts, and then the Suebi. In the 1st century a.d. the Romans conquered the land and defended their position there by a rampart (limes). Early in the 3rd century the Alamanni drove the Romans beyond the Rhine and the Danube, but in their turn they were conquered by the Franks under Clovis, the decisive battle being fought in 496. For about four hundred years the country formed part of the Frankish kingdom. In the 9th century the Frankish kingdom was divided into several counties, but in the 9th century it was incorporated with the German duchy of Swabia. The duchy of Swabia was ruled by the Hohenstaufen family until the death of Conrad in 1268, when a considerable part of it fell to the count of Württemberg, the representative of a family first mentioned about 1086, a certain Conrad von Beutelsbach, having called himself after his ancestral castle of Württemberg. The earliest count about whom anything is known is one Ulrich, who ruled from 1241 to 1265. He was marshal of Swabia and advocate of the town of Ulm, and had large possessions in the valleys of the Neckar and the Rems. Under his sons, Ulrich II. and Eberhard I., and their successors the power of the family grew steadily. Eberhard (d. 1325) was the opponent, and not always the unsuccessful one, of three German kings; he double the area of his county and transferred his residence from Württemberg to Stuttgart. His successors were not perhaps equally important, but all added something to the area of Württemberg. The lands of the family were several times divided, but in 1482 they were declared indivisible and were united under Count Eberhard V., called in the court. This arrangement was confirmed by the German king, Maximilian I., and the imperial diet in 1495.

The Württembergers won one of the most tragic and romantic rulers that Württemberg ever had, and in 1495 his county was raised to the rank of duchy. Dying in 1496, he was succeeded by his cousin, Duke Eberhard II., who, however, was deposed after a short reign of two years. The long reign (1496-1520) of Ulrich I., who succeeded to the duchy while still a child, was a most eventful period for the country, and many traditions cluster round the name of this gifted, unscrupulous and ambitious man. The extortions by
WÜRTTEMBERG

which he sought to raise money for his extravagant pleasures excited a rising known as that of the arme Konrad (poor Conrad), not unlike the rebellion in England led by Wat Tyler; order was soon restored, and in 1354 by the treaty of Tübingen the people undertook to pay the duke's debts in return for various political privileges, which in effect laid the foundation of the constitutional liberties of the country. A few years later Ulrich quarrelled with the Swabian League, and its forces, helped by William IV., duke of Bavaria, who was angered by the treatment meted out by Ulrich to his wife Sabina, a Bavarian princess, invaded Württemberg, expelled the duke and sold his duchy to the emperor Charles V. for 220,000 gulden. Charles handed over Württemberg to his brother, the German king, Ferdinand I., who was its nominal ruler for a few years. Soon, however, the discontent caused by the oppressive Austrian rule, the disturbances in Germany leading to the Peasants' War and the commotions aroused by the Reformation gave Ulrich an opportunity to recover it. Aided by Philip, landgrave of Hesse, and other Protestant princes, he fought a victorious battle against Ferdinand's troops at Lauffen in May 1534, and then by the treaty of Cadam he was again recognized as duke, but was forced to accept his duchy as an Austrian fief. He now introduced the reformed doctrines and proceeded to endow Protestant churches and schools throughout his land. Ulrich's connexion with the league of Schmalkalden led to another expulsion, but in 1547 he was reinstated by Charles V., although on somewhat onerous terms.

Ulrich's son and successor, Christopher (1515-1568), completed the work of converting his subjects to the reformed faith. He introduced a system of church government, the Große Kirchenordnung, which has endured in part to the present day. In this reign a standing commission was established to superintend the finances, and the members of this body, all of whom belonged to the upper classes, gained considerable power in the state, mainly at the expense of the towns. Christopher's son Louis, the founder of the Collegium illustre, died childless in 1593 and was succeeded by a kinsman, Frederick I. (1537-1608). This energetic prince, who disregarded the limits placed to his authority by the rudimentary constitution, by paying a large sum of money, induced the emperor Rudolph II. in 1578 to free the duchy from the suzerainty of Austria. Thus once again Württemberg became a direct fief of the Empire. Unlike his predecessor, the next duke, John Frederick (1582-1628), was not allowed to become an absolute ruler, but was forced to recognize the checks on his power. During this reign, which ended in July 1628, Württemberg suffered severely from the Thirty Years' War, although the duke himself took no part in it. His son and successor Eberhard III. (1614-1674), however, proved a good ally of France in the Thirty Years' War and in 1623 came of age in 1633, but after the battle of Nördlingen in 1634 the duchy was occupied by the imperialists and he himself was for some years an exile. He was restored by the peace of Westphalia, but it was to a depopulated and impoverished country, and he spent his remaining years in efforts to repair the disasters of the great war. During the reign of Eberhard IV. (1676-1733), who was only one year old when his father Duke William Louis died in 1677, Württemberg made the acquaintance of another destructive enemy. In 1688, 1703 and 1707 the French entered the duchy and inflicted brutalities and sufferings upon the inhabitants. The sparsely populated country submitted without a struggle to the fugitive Waldenses, who did something to restore it to prosperity, but this benefit was partly neutralized by the extravagance of the duke, anxious to provide for the expensive tastes of his mistress, Christiana Wilhelmina von Grünvitz. Charles Alexander, who became duke in 1733, had embraced the Roman Catholic faith while an officer in the Austrian service. His favourite adviser was the Jew Suss Oppenheimer, and it was thought that master and servant were aiming at the suppression of the diet and the introduction of the Roman Catholic religion. However, the sudden death of Charles Alexander in March 1737 put an abrupt end to these plans, and the regent, Charles Rudolph of Württemberg-Neuenstadt, had Oppenheimer hanged.

Charles Eugene (1728-1793), who came of age in 1744, was gifted, but vicious and extravagant, and he soon fell into the hands of unworthy favourites. He spent a great deal of money in building palaces at Stuttgart and elsewhere, and took the course, unpopular to his Protestant subjects, of fighting against Prussia during the Seven Years' War. His whole reign was disturbed by dissensions between the ruler and the ruled, the duke's irregular and arbitrary methods of raising money arousing great discontent. The intervention of the emperor and even of foreign powers was invoked, and in 1770 a formal arrangement removed some of the grievances of the people. But Charles Eugene did not keep his promises, although in his old age he made a few further concessions. He died childless, and was succeeded by one brother, Louis Eugene (d. 1795), and by another, Frederick Eugene (d. 1797). This latter prince, who had served in the army of Frederick the Great, to whom he was related by marriage, educated his children in the Protestant faith. Thus, when his son Frederick II. became duke in 1797, the ruler of Württemberg was again a Protestant, and the royal house has adhered to this faith since that date. During Frederick Eugene's short reign the French invaded Württemberg, compelled the duke to withdraw his troops from the imperial army and to pay a sum of money.

Frederick II. (1754-1816), a prince whose model was Frederick the Great, took part in the war against France in defiance of the wishes of his people, and when the French again invaded and devastated the country he retired to Erlangen, where he remained until after the conclusion of the peace of Lunéville in 1801. Frederick William of Prussia, who had married the latter, in 1797, his cousin, but in 1803 he ceded his possessions on the left bank of the Rhine, receiving in return nine imperial towns, among them Reutlingen and Heilbronn, and some other territories, amounting altogether to about 850 sq. m. and containing about 124,000 inhabitants. He also accepted from Napoleon the title of elector. These new districts were not incorporated with the duchy, but remained separate; they were known as New Württemberg and were ruled without a diet. In 1805 Württemberg took up arms on the side of France, and by the peace of Pressburg in December 1805 the elector was rewarded with various Austrian possessions in Swabia and with other lands in the neighbourhood. On the 1st of January 1806 Frederick assumed the title of king, abrogated the constitution and united old and new Württemberg. Subsequently he placed the property of the church under the control of the state. In 1806 he joined the Confederation of the Rhine and received further additions of territory containing 160,000 inhabitants; a little later, by the peace of Vienna in October 1809, about 110,000 more persons were placed under his rule. In return for these favours Frederick joined Napoleon in his campaigns against Prussia, Austria and Russia, and of 16,000 of his subjects who marched to Moscow only a few hundred returned. Then after the battle of Leipzig he deserted the waning fortunes of the French emperor, and by a treaty made with Metternich at Fulda in November 1813 he secured the confirmation of his royal title and of his recent acquisitions of territory, while his troops marched with those of the allies into France.

In 1815 the king joined the German Confederation, but the congress of Vienna made no change in the extent of his lands. In the same year he laid before the representatives of his people the sketch of a new constitution, but this was rejected, and in the midst of the complexion Frederick William II. died in 1816.

At once the new king, William I., took up the consideration of this question and after much discussion a new constitution was granted in September 1819. This is the constitution which, with subsequent modifications, is still in force, and it is described in an earlier section of this article. A period of quietness was now set in, and the condition of the kingdom, its education, its agriculture and its trade and manufactures, began to receive earnest attention, while by frugality, both in public and in private matters, King William helped to repair the shattered finances of the state. But the desire to greater political freedom had not been entirely satisfied by the constitution of 1819, and after 1830 there was a certain amount of unrest. This, however,
soon passed away, while trade was fostered by the inclusion of Württemberg in the German Zollverein and by the construction of railways. The revolutionary movement of 1848 did not leave Württemberg untouched, although no actual violence took place within the kingdom. The king was compelled to dismiss Johannes Schlayer (1792-1886) and his other ministers, and to call to power men with more liberal ideas, the exponents of the 'idea of a united Germany. A democratic constitution was proclaimed, but as soon as the movement had spent its force the liberal ministers were dismissed, and in October 1849 Schlayer and his associates were again in power. By interfering with popular electoral rights the king and his ministers succeeded in assembling a new Diet which this time surrendered all the privileges gained since 1848. In this way the constitution of 1819 was restored, and power passed into the hands of a bureaucracy. Almost the last act of William's long reign was to conclude a concordat with the Papacy, but this was repudiated by the diet, which preferred to regulate the relations between church and state in its own way.

In July 1864 Charles I. (1823-1891) succeeded his father William as king and had almost at once to face considerable difficulties. In the duel between Austria and Prussia for supremacy, Württemberg took part on the side of the former power, and this policy was equally acceptable to the new king and his advisers. In 1866 Württemberg took up arms on behalf of Austria, but three weeks after the battle of Königgrätz her troops were decisively beaten at Tauberbischofsheim, and the country was at the mercy of Prussia. The Prussians occupied the northern part of Württemberg and peace was made in August 1866; by this Württemberg paid an indemnity of 8,000,000 gulden, but at once concluded a secret offensive and defensive treaty with her conqueror.

The end of the struggle was followed by a renewal of the democratic agitation in Württemberg, but this had achieved no tangible results when the great war between France and Prussia broke out in 1870. Although the policy of Württemberg had continued antagonistic to Prussia, the country shared in the national enthusiasm which swept over Germany, and its troops took a creditable part in the battle of Wörth and in other operations of the war. In 1871 Württemberg became a member of the new German empire, but retained control of her own post office, telegraphs and railways. She had also certain special privileges with regard to taxation and the army, and for the next ten years the policy of Württemberg was one of enthusiastic loyalty to the new order. Many important reforms, especially in the realm of finance, were introduced, but a proposal for a union of the railway system with that of the rest of Germany was rejected. Certain reductions in taxation having been made in 1886, the reform of the constitution became the question of the hour. The king and his ministers wished to strengthen the conservatory element in the chambers, but only slight reforms were effected by the laws of 1874, 1876 and 1879, a more thorough settlement being postponed. On the 6th of October 1891 King Charles died suddenly, and was succeeded by his cousin William II. (b. 1848), who continued the policy of his predecessor.

The reform of the constitution continued to be discussed, and the election of 1895 was memorable because of the return of a powerful party of democrats. King William had no sons, nor had his only Protestant kinsman, Duke Nicholas (1833-1903); consequently the succession would ultimately pass to a Roman Catholic branch of the family, and this prospect raised up certain difficulties about the relations between church and state. The heir to the throne in 1910 was the Roman Catholic Duke Albert (b. 1879).

Between 1900 and 1910 the political history of Württemberg centred round the settlement of the constitutional and the educational questions. The constitution was revised in 1906 on the lines already indicated, and a settlement of the education difficulty was brought about in 1909. In 1906 the railway system was united with that of the rest of Germany.

For the history of Württemberg see the Württembergischen Ur- kundenbuch (Stuttgart, 1849-1907); and the Durststellungen aus der württembergischen Geschichte (Stuttgart, 1904 fol.). Histories are those of P. F. Stallm., Geschichte Württembergs (Gotth, 1882-1887); E. Schnecker, Württembergische Geschichte (Stuttgart, 1896); Bel schneider, Geschichte vom Württemberg und Bild (Stuttgart, 1902); Wellser, Württemberg in der deutschen Geschichte (Stuttgart, 1900); K. V. Fricker and Th. von Gessler, Geschichte der Verfassung Württembergs (Stuttgart, 1866); Hieber, Die württembergische Reform von 1819 (Heilbronn, 1892); Die Geschichte der deutschen Revolutionen (Würzburg, 1858) and Weltgeschichte der deutschen Geschichte in 12 Bde. (Heilbronn, 1906).
and in a better understanding of the relations between the oxygen and the amido-acids. In 1869 Wurtz prepared cyanuric acid synthetically by heating potassium cyanate with hydrochloric acid. Three years later he discovered aldol, pointing out its double character as at once an aldehyde and an alcohol. In addition to this list of some of the new substances he prepared, reference may be made to the discovery of abnormal densities, which he noticed in several papers, and in particular maintained the dissociation of the vapour of chloral hydrate, in opposition to H. Sainte-Claire Deville and M. Leblanc.

R. Thibault (1691-1767) Wurtz published in the Annales de chimie et de physique abstracts of chemical work done out of France. The publication of his great Dictionnaire de chimie pure et appliquée, in which he was assisted by many other French chemists, was begun in 1809 and finished in 1878; two supplementary volumes were issued 1880-1886, and in 1882 the publication of a second supplement was begun. Among his books are Chirone (1864), Leçons élémentaires de chimie moderne (1867), Théorie des atomes dans la conception du monde (1874), La Théorie atomique (1878), Progrès de l'industrie des matières colorantes artificielles (1880), Dictionnaire de chimie physique (1880-1885), Histoire des doctrines chimiques, the introductory discourse to his Dictionnaire, but published separately in 1868, opens with the well-known dictum, "La chimie est une science française."

For the history of his publications, see Charles Friedel's memoir in the Bulletin de la Société Chimique (1885); also A. W. von Hofmann in der. deut. chem. Gesellschaft (1887), reprinted in voll. iii. of his Zur Erinnerung an vorangegangene Freunde (1888).

**WURZBURG**, a university town and episcopal see of Bavaria, Germany, capital of the province of Lower Franconia, situated on the Main, 60 m. by rail S.E. from Frankfurt and at the junction of main lines to Bamberg and Nuremberg. Pop. (1905) 60,230. An ancient stone bridge (1474-1607), 650 ft. long and adorned with statues of saints, and two modern bridges, the Luitpold (1887) and the Ludwig (1894), connect the two parts of the town on either side of the river. On the lofty Leistenberg stands the fortress of Marienberg, which from 1261 to 1720 was the residence of the margraves. The main part of the town, on the right bank, is surrounded by shady promenades, the Ringstrasse and the quay.

Würzburg is quaintly and irregularly built; many of the houses are interesting specimens of medieval architecture; and the numerous old churches recall the fact that it was long the capital of an ecclesiastical principality. The principal church is the imposing Romanesque cathedral, a cathedral with transepts, begun in 1043 and completed in 1076; the high altar, ever, date from 1240, the (rococo) façade from 1717-1719, and the dome from 1733. The spacious transepts terminate in apses. The exterior was restored in 1882-1883. The beautiful Marienkapelle, a Gothic edifice of 1377-1441, was restored in 1896; it is embellished with twenty statues by Tilman Riemen-schneider (d. 1531). The Haugerskirch church, with two towers and a lofty dome, was built in the Italian Renaissance style in 1670-1691. The bones of St Kilian, the patron saint of Würzburg, are preserved in the Neumünster church, which dates from 1693.

The walls are of brick and the roof is that of the Wagewise and are surrounded by the adjoining cloisters. The church of St Burkhard is externally one of the best-preserved architectural monuments in the city. It was built in 1033-1042, in the Romanesque style, and was restored in 1168. The Late Gothic choir dates from 1494-1497. The Neubaukirche, or university church, curiously unites a Gothic exterior with a Classical interior. The Protestant church of St Stephen (1782-1793) originally belonged to a Benedictine abbey. Of the secular buildings in Würzburg the most conspicuous is the palace, a huge and magnificent edifice built in 1720-1744 in imitation of Versailles, and formerly the residence of the bishops and grand-dukes of Würzburg. The Julius hospital, a large and richly endowed institution affording food and lodging to 600 persons daily, was founded in 1576 by Bishop Julius Echter von Mespeblunn (1545-1619). In 1906 it was arranged to convert this into a residential college for students, the hospital being removed to a site outside the town. The quaint town hall dates in part from 1436. Among the other chief buildings are the government offices, the law courts, the theatre, the Maschule, the observatory and the various university buildings.

The University was founded at Würzburg in 1403, but it only existed for a few years. The present university was founded by Bishop Julius in 1582. The medical faculty speedily became famous, and has remained the most important faculty in Würzburg ever since. Here W. K. Röntgen discovered the "Röntgen rays" in 1896. Würzburg was long the stronghold of Jesuitism in Germany, and the Roman Catholic theological faculty still attracts a large number of students. The university has a library containing 300,000 volumes, and is attended by about 1400 students. In no other university city of Germany has so much of the medieval academic life been preserved.

Würzburg is surrounded by vineyards, which yield some of the best wine in Germany. Its principal industries are the manufacture of tobacco, furniture, machinery, scientific instruments and railway carriages. It has also breweries, and produces bricks, vinegar, malt and chocolate.

The site of the Leistenberg was occupied by a Roman fort, and was probably fortified early in the 13th century. **Wirsberg** is the old Latin form of the name of the town; **Hersberg** (hewt town) first appears in the 12th century. The bishopric was probably founded in 741, but the town appears in records in 860. The four towers, bow-turrets, and battlements of the St Burkhard, and his successors soon acquired much temporal power; about the 12th century they had ducal authority in Eastern Franconia. It is not surprising that quarrels broke out between the bishops and the citizens, and the latter espoused the cause of the emperor Henry IV., while the former joined the emperor's foes. The struggle continued intermittently until 1400, when the citizens were decisively defeated and submitted. Several imperial diets were held in Würzburg, chief among these being the one of 1180 when Henry the Lion, duke of Saxony, was placed under the ban. By the peace of Lunéville the bishopric was secularized, and in 1803 Würzburg passed to Bavaria. The peace of Pressburg in 1805 transferred it, under the name of an electorate, to Ferdinand, formerly grand-duke of Tuscany, who joined the confederation of the Rhine and took the title of grand-duke of Würzburg. In 1815 the congress of Vienna restored Würzburg to Bavaria. The Würzburg Conference is the name given to the meeting of representatives of the smaller German states in 1830 to devise some means of mutual support. The conference, which was composed of the new states formed by the Prussians in 1866, in which year it ceased to be a fortress. The bishopric of Würzburg at one time embraced an area of about 1000 sq. m. and had about 250,000 inhabitants. A new bishopric of Würzburg was created in 1817.

For the town see S. Göhl, **Würzburg**. A. W. von Hofmann, in der. deut. Gesellschaft (1887), reprinted in voll. iii. of his Zur Erinnerung an vorangegangene Freunde (1888).
Wurzen was founded by the Sorbs, and was a town early in the 12th century, when Herwig, bishop of Meissen, founded a monastery here. In 1581 it passed to the elector of Saxony, and in the Thirty Years’ War was sacked by the Swedes.

WUTTKE, KARL FRIEDRICH ADOLF (1819-1870), German Protestant theologian, was born at Breslau on the 10th of November 1819. He studied theology at Breslau, Berlin and Halle, where he eventually became professor ordinarius; and is known as the author of a treatise on Christian ethics (Handbuch der christlichen Ethik, 1830-1833; 3d ed. 1874-1875; Eng. trans., New York, 1873) and works on heathen religions (Die Geschichte des Heidentums, 1851-1853) and superstition (Der deutsche Volksbrauch der Gegenwart, 1865, 2nd ed. 1866). He died on the 12th of April 1870.

WYANDOT, or Huron (q.v.), a tribe of N. American Indians of Iroquoian stock. When first met by the French early in the 17th century, the Wyandots lived between Georgian Bay and Lake Simcoe, Ontario. They were then estimated at about 10,000, scattered over twenty villages. They were continually the victims of raids on the part of their neighbours the Iroquoians, and the Wyandots were driven from place to place, and a dispersal in 1650 resulted in one section settling in Quebec, while others found their way to Ohio, where they fought for the English in the Wars of Independence and 1812. By a treaty made in 1817 the latter section was granted territory in Ohio and Michigan, but the larger part of this was sold in 1819. In 1842 they migrated to Kansas. In 1855 many became citizens, the remainder being in 1867 removed to a reservation (now N.E. Oklahoma), numbering about 400 in 1905. The Hurons at Lorette, in Quebec, also number about 400.

See Handbook of the American Indians, ed. F. W. Hodge (Washington, 1907), s.v. ‘Huron.’

WYANDOTTE, a city of Wayne county, Michigan, U.S.A., on the Detroit river, about 6 m. S. by W. of Detroit. Pop. (1900) 52,83, of whom 1,67 were foreign-born; (1904) 5,425; (1910) 8,287. It is served by the Michigan Central, the Lake Shore & Michigan Southern, the Detroit, Toledo & Ironton, and (for freight only) the Detroit & Toledo Shore Line railways, and by two interurban electric lines. Salt and limestone are found here and the city has various manufactures. Wyandotte was first settled about 1820, was laid out as a town in 1834, and chartered as a city in 1867.

WYANTCHE, a ravine in Jennings township, Crawford county, Indiana, U.S.A., 5 m. N.E. of Leweswood, on the Ohio river, and 12 m. from Corydon, the early territorial capital. The nearest railway station is Milltown, 9 m. distant. The cave is in a rugged region of high limestone hills, in one of which its main entrance is found, 220 ft. above the level of the Blue river, whose original name, the Wyandotte, was transferred to the cave by Governor David Wallace; it having previously been styled the Mammoth Cave of Indiana, the Epsom Salts Cave, and the Indiana Saltpetre Cave. The exact date of discovery is not known; but early records show it to have been pre-eminated by Dr. Adams in 1812 for the manufacture of saltpetre, and his vats and hoppers are still to be seen. After the War of 1812 he relinquished his claim; and in 1819 the ground was bought from the United States government by Henry P. Rothrock, whose heirs are its owners. The earliest account is in Flint’s Geography (1831); the first official report of it was by Dr. R. T. Brown (1831); and it was first mapped by the writer (1833), whose map was revised by John Collette, state geologist (1878).

No instrumental survey has been made, nor have all its intricate windings been explored. Its known passages aggregate more than 23 m. in length, and 144 places are named as the mouths of which are entered. There is a large cavern, known as the Lucifera’s cavern, in which has been found a carbuncle, 2 ft. in diameter. The 'Old Cave' contains the saltpetre works, and ends in a remarkable chamber exactly 144 ft. long and 50 ft. wide, in which stands the Pillar of the Constitution, a stalagmitic column perfectly cylindrical and 71 ft. in circumference, entirely composed of crystalline carbonate of lime (satin-spar), fluted and snow-white. A cavity in the column was first claimed by H. C. Hovey as a prehistoric quarry, proved to be such by the stag horns and boulderounders found in its vicinity. His careful estimate of the rate of stalagmite growth showed that 1000 years would have been needed to form the lip now covering the incision.

In the N. arm of the newer part of the cave, opened in 1850, is an immense room, styled Rotherock’s Cathedral, 1000 ft. in circumference and 200 ft. high, with a rugged central hill 135 ft. high, surmounted by statuesque stalagmites, near which is another quarry of satin-spar with similar formations, and by aboriginal relics. When Mr. Hovey visited this cave in 1855 he found many extinct torches, charcoal embers, poise and other objects, as numerous footprints, in the soft nitrous earth of certain avenues, which were left by earlyappers and potters previous to the coming of the white man.

In the Pillared Palace a number of large fluterober slides had been thrown down and fragments were carried away. Near by were so-called ‘bear-walls,’ which proved to be the remains of an aboriginal workshop, where masses of flint were broken into rectangular blocks; and slabs and flint-chips were scattered about. In the floor of the passage-way. Milroy’s Temple is a magnificent room, 100 by 150 ft. in its dimensions. It contains many remarkable formations, a display of helictites, or twisted stalactites, is unsurpassed.

Wyandotte Cave has no large streams and few pools or springs, its fauna and flora are not extensive. Formerly bears, wolves and other wild animals took refuge in its fastnesses; and bats, rats, mice and salamanders are frequent visitors. Blind crawfish (Cambarus pelliculatus) and the Crawfish Spring. Cave crickets (Hemisus subterraneus) abound. A dozen kinds of insects, with a few varieties of spiders, flies and worms complete the meager list. The flora include many forms brought in from the outside.

For more full descriptions of Wyandotte Cave and its contents, see Hovey’s Celebrated American Caverns, pp. (183) 183-185; Indiana State Geological Reports, by R. T. Brown, E. T. Cox, John Collette, S. Blashey; and concerning cave fauna reports and papers by C. H. Eigenmann, professor of zoology, Indiana University.

WYANT, ALEXANDER H. (1836-1892), American artist, was born at Port Washington, Ohio, on the 11th of January 1836. He was a pupil of Hans Gude in Carlsruhe, Germany. A trip with a government exploring expedition in the west of America undermined his health, and he painted mainly in the high altitudes of the Adirondack Mountains. He was elected a full member of the National Academy of Design, New York, in 1869, and died in New York City on the 29th of November 1892. He was only moderately appreciated during his lifetime, though after his death his works were eagerly sought for.

WYAT, SIR THOMAS (1503-1542), English poet and statesman, elder son of Henry Wyatt, or Wat, afterwards knighted, and his wife Anne, daughter of John Skinner of Reigate, Surrey, was born at Allington Castle, near Maidstone, Kent, in 1503. His father (1460-1537) belonged to a Yorkshire family, but bought Allington about 1492. He was an adherent of the Lancastrian party, and was imprisoned and put to the torture by Richard III. The family records (in the possession of the earl of Romney) relate that during his imprisonment he was saved from starvation by a cat that brought him pigeons. At the battle of Bosworth (1485) he was knighted of the Bath (1500) knight banneret (1513) and held various offices at court. His son, Thomas Wyatt, was admitted at St. John’s College, Cambridge, when about twelve years of age, took his B.A. degree in 1518, and proceeded M.A. in 1522. The vague statement of Anthony à Wood (Athen. Oxon. i. 124), that he was transferred to Oxford to attend Wolsey’s new college there, has no foundation in fact. He married very early Elizabeth Brooke, daughter of the 3rd
Lord Cobham. The marriage was an unhappy one, for a letter (29th March 1537) from the lady's brother to Thomas Cromwell complains that Wyat had gone abroad and made no provision for his wife, and a letter from the Spanish ambassador Chapuys to Charles V. (26th Feb. 1543) speaks of his having been proclaimed by his husband. As early as 1536 Wyat was server extraordinary to the king, and in 1524 he was at court as keeper of the king's jewels. He was one of the champions in the Christmas tournament of 1525. His father had been associated with Sir Thomas Boleyn as constable of Norwich Castle, and he had thus been early acquainted with Anne Boleyn. He appears to have been generally regarded as her lover, but it is possible that the relations between them were merely of the fashionable poetic sort. In 1526 he was sent with Sir Thomas Cheney to congratulate Francis I. on his safe return from Spain; in 1527 he accompanied Sir John Russell, afterwards 1st earl of Bedford, on an embassy to the papal court. He was sent by Russell, who was incapacitated by a broken leg, to negotiate with the Venetian republic. On his return journey to Rome he was taken prisoner by the Spanish troops, who demanded 3000 ducats for his ransom, but he contrived to escape. In 1528 he was acting as high marshal at Calais with a salary of two shillings per day, and was only superseded in November 1530. During the following years he was constantly employed in Henry's service, and was apparently high in his favour. He was, however, sent to the Tower in 1535, perhaps because it was desired that he should incriminate the queen. His father's correspondence with Cromwell does not suggest that his arrest had anything to do with the proceedings against Anne Boleyn, but the connexion is assumed (Letters and Papers of Henry VIII. vol. x. No. 910) in the letters of John Hussey to Lord Lisle, deputy of Calais. The Roman Catholic writer, Nicholas Harpsfield, makes a circumstantial statement ( Pretended Divorce . . . Camden Soci. p. 253) that Wyat had confessed his intimacy with Anne to Henry VIII. and warned him against marrying her; but this, in view of Wyat's unfavourable position, may be improbable. He was released after a month's imprisonment, and in the autumn of that year took part in the suppression of the Lincolnshire rising. In March 1537 he was knighted, and a month later was sent abroad as ambassador to Charles V., whose ill-will had been revived by the declaration of the illegitimacy of the princess Mary. In 1538 he was joined by Edmund Bonner, then a simple priest, and one Simon Haynes, and seems to have been ashamed of their bad manners, and to have offended them in various ways. Bonner had evidently been desired by Thomas Cromwell to send his own description of the negotiations to the pope, and he wrote a letter (2nd Sept. 1538) a long letter (Petyt MS. 47, Middle Temple; first printed in the Gentleman's Magazine, June 1850) in which he accused Wyat of disloyalty to the king's interests, and of many personal slights to himself. Wyat was unsuccessful in the difficult affairs entrusted to him, but so long as Cromwell ruled he had a firm hand at court, and no notice was taken of Bonner's allegations. Cromwell even seems to have taken some care of his private affairs, which were left in considerable disorder. He was recalled in April 1539, but later in the same year he was employed on another embassy to the emperor, who was on his way to the Low Countries. After Cromwell's death Wyat's enemies renewed their attacks, and he was imprisoned (17th Jan. 1541) in the Tower on the old charges, with the additional accusation of reasonable correspondence with Cardinal Reginald Pole. Being privately informed of the nature of the charges, he prepared an eloquent and manly defence of his conduct in two documents addressed to the Privy Council and to his judges, in which he cleared himself effectually and exposed his accusers' motives. He was released at the intercession of the queen, Catherine Howard, in the condition that he confessed his guilt and took back his wife, from whom he had been separated for fifteen years, on pain of death if he were thenceforth untruse to her (see Chapuys to Charles V., March 1541). He received a formal pardon on the 21st of March, and received during the year substantial marks of the king's favour. In the summer of the next year he was sent to Falmouth to meet the ambassador of the emperor. The heat brought on a fever to which he succumbed at Sherborne, Dorset, on the 11th of October. A Latin elegy on his death was written by his friend John Leland, "Naenia in mortem Thomae Viati equitis incomparabilis"; and Henry Howard, earl of Surrey, celebrated his memory in some well-known lines beginning "Wyat resteth here, that quick could never rest," and in two sonnets.

Wyat's work falls readily into two divisions: the sonnets, rondeaus, and lyric poems dealing with love; and the satires and the version of the penitential psalms. The love poems probably date from before his first imprisonment. A large number were published in 1557 in Songs and Sonettes (Tottel's Miscellany). Wyat's contributions number 96 out of a total of 310. These have been supplemented from MSS. He was the pioneer of the sonnet in England, and the acknowledged leader of the "company of courtiers", an exalted company, having ravished in Italy and France, tasted the sweet and stately manners of the Italian Poesie, as novices newly crept out of the schools of Dante, Arioste and Petrarch, greatly polished our rude and homely maner of vulgar Poesie, from that it had been before" (Puttenham's Art of English Poesie, 1589).¹ Wyat wrote in all thirty-one sonnets, ten of which are direct translations of Petrarch. The sentiment is strained and artificial. Wyat shows to greater advantage in his lyrical metres, in his epigrams and songs, especially in those written for music, where he is less hampered by the Petrarcan tradition, to which his singularly robust and frank nature was ill-fitted. His thought is generally far in advance of his technical skill, and his disciple Surrey has been far more widely recognized, chiefly because of the superior smoothness of his versification. His works are preserved in a MS. in possession of the Harrington family, which originally belonged to Wyat himself, and in another belonging to the duke of Devonshire in which are inscribed the names of Wyat's sister, Margaret Lee, and of the duchess of Richmond, Surrey's sister. The text differs considerably from Tottel's, which has been generally accepted as the more accurate, and is the text of the standard edition. Wyat's sonnets, written perhaps fifteen years after his death, in Songs and Sonettes. The standard edition of his works is that by Dr G. F. Nott, forming the second volume (1816) of The Works of Henry Howard, Earl of Surrey, and of Sir Thomas Wyat the courtier. An exhaustive edition, some family papers, and letters in the possession of the earl of Romney, were collected by Richard Wyat in 1727. Some use of these is made in The History of Bolles Parish (1862), by J. Cave Browne. See also Brewer and Gairdner, Letters and Papers of Henry VIII. (especially from 1536 to 1547); The Poetical Works of Sir Thomas Wyatt (1866), with a memoir in the Aldine Edition of the British Poets; Professor E. Arber's introductory matter to the edition of Songs and Sonettes (1870) in his English Reprints; R. Alsheier, "Sir Thomas Wyatt . . ." (1886), in Wiener Beitrage zur deutschen u. engl. Philologie, giving a full account of Wyatt's metrical practice; W. E. Simpson, Sir Thomas Wyatt (Boston, 1886); W. J. Court, Historie, Hist. Eng. Poetry, vol. ii. (1887), the second chapter of which is devoted to a critical study of Wyatt; E. Flügel, Die handschriftliche Überlieferung der Gedichte von Sir Thomas Wyat, in its place, vol. xvi., F. M. Padel, Early Sixteenth Century Lyrics (1897).

¹Ed. J. Hasleweld, Ancient Critical Essays, i. 48 (1811).
²One of the most musical of the pieces printed in his works, however, The Lover complayeth the unhinketh songs of his, is attributed to George Boleyn, Lord Rochford (see E. Bapst, Deux Gentilshommes poèles de la cour de Henri VIII. p. 142).
Spaniards by the menace of the Inquisition. In 1537 he married Jane, daughter of Sir William Hawte of Bishopbourne in Kent, by whom he had ten children. Wyatt was noted in his youth as dissipated, and even as disorderly. He is known to have had a natural son, whose mother Elizabeth was a daughter of Sir Edward Darrell of Littlecote. In 1542 he inherited the family property of Allington Castle and Bolesley Abbey on the death of his father. From 1543 to 1550 he saw service abroad as a soldier. In 1554 he joined with the conspirators who combined to prevent the marriage of Queen Mary with Philip the prince of Spain, afterwards King Philip II. A general movement was planned; but his fellow-conspirators were timid and inept, and the rising was crushed before it began. He became a reliable rebel mostly by accident. On the 22nd of January 1554 he summoned a meeting of his friends at his castle of Allington, and the 25th was fixed for the rising. On the 26th Wyat occupied Rochester, and issued a proclamation to the country. The people of the country and local gentry collected, but at first the queen's supporters, led by Lord Abergavenny and Sir Robert Southwell, the sheriff, appeared to be able to suppress the rising with ease, gaining some successes against isolated bands of the insurgents. But the Spanish movement was unpopular, and Kent was more affected by the preaching of the reformers than most of the country excepting the south. Abergavenny and Southwell were deserted by their men, who either disbanded or went over to Wyat. A detachment of the London train-bands sent against him by Queen Mary, under the command of the duke of Norfolk, followed their example. The rising now seemed so formidable that a deputation was sent to Wyat by the queen and council to ask for his terms. He insisted that the Tower should be surrendered to him, and the queen put under his charge. The insolence of these demands caused a reaction in London, where the reformers were strong and were at first in sympathy with him. Wyat advanced a detachment of the army, and was found within London Bridge occupied in force, and unable to penetrate into the city. He was driven from Southwark by the threats of Sir John Bryges (or Bruges), afterwards Lord Chandos, who was prepared to fire on the suburb with the guns of the Tower. Wyat now marched up the river to Kingston, where he crossed the Thames, and made his way to Ludgate with a part of his following. Some of his men were cut off. Others lost heart and deserted. His only hope was that a rising would take place, but the loyal forces kept order, and after a futile attempt to force the gate Wyat surrendered. He was brought to trial on the 10th of March, and could make no head against his accusers. Wyat was found guilty of treason and was executed on April 11th, no doubt in the hope that in order to save his life he would say enough to compromise the queen's sister Elizabeth, afterwards Queen Elizabeth, in whose interests the rising was supposed to have been made. But he would not confess enough to render her liable to a trial for treason. He was executed on the 11th of April, and on the scaffold expressly cleared the princess of all complicity in the rising. His estates were afterwards partly restored to his son George, the father of the Sir Francis Wyat (d. 1644) who was governor of Virginia in 1623-26 and 1639-42. A fragment of the castle of Allington is still inhabited by the London Bridge occupied in force, and was unable to penetrate into the city. He was driven from Southwark by the threats of Sir John Bryges (or Bruges), afterwards Lord Chandos, who was prepared to fire on the suburb with the guns of the Tower. Wyat now marched up the river to Kingston, where he crossed the Thames, and made his way to Ludgate with a part of his following. Some of his men were cut off. Others lost heart and deserted. His only hope was that a rising would take place, but the loyal forces kept order, and after a futile attempt to force the gate Wyat surrendered. He was brought to trial on the 10th of March, and could make no head against his accusers. Wyat was found guilty of treason and was executed on April 11th, no doubt in the hope that in order to save his life he would say enough to compromise the queen's sister Elizabeth, afterwards Queen Elizabeth, in whose interests the rising was supposed to have been made. But he would not confess enough to render her liable to a trial for treason. He was executed on the 11th of April, and on the scaffold expressly cleared the princess of all complicity in the rising. His estates were afterwards partly restored to his son George, the father of the Sir Francis Wyat (d. 1644) who was governor of Virginia in 1623-26 and 1639-42. A fragment of the castle of Allington is still inhabited as a farm-house, near Maidstone, on the bank of the Medway.

WYATT, JAMES (1746-1813), English architect, was born at Burton Constable in Staffordshire on the 3rd of August 1746. He was the sixth son of Benjamin Wyatt, a farmer, timber merchant and builder. At the age of fourteen his taste for drawing attracted the attention of Lord Bagot, newly appointed ambassador to the pope, who took him with him to Rome, where he spent a part of his life in studying architecture. He returned to England in 1766, and gained his first great success by the adaptation for dramatic purposes of the Pantheon in Oxford Street, London (1772), a work which was destroyed by fire twenty years later. In 1776 he was made surveyor of Westminster Abbey, and in 1778 and the following years executed many important commissions at Oxford. During this earlier period Wyatt shared the prevailing contempt for Gothic architecture; thus the New Buildings at Magdalen College, Oxford, designed by him, formed part of a scheme, the plans for which are extant, which involved the demolition of the famous medieval quadrangle and cloisters. He built many country houses in the classic style, of which he proved himself a master. Gradually, however, he turned his attention to Gothic, the spirit of which, in spite of his diligent study of medieval models, he never understood. The result is still visible in such "Gothic" fakes as that at Ashridge Park, Hertfordshire, built for Lord Bridgewater to replace the ancient priory, and in the lamentable "restorations," e.g. in Salisbury and Lichfield cathedrals, which earned him even among contemporary archaeologists the title of the "Destroyer." Of these Gothic experiments the most celebrated was Fonthill Abbey, built for Beckford (the eccentric author of Vathek), the great tower of which speedily collapsed, while much of the rest has been pulled down. None the less, Wyatt must be regarded as the pioneer of the "Gothic revival," while his general influence may be gauged by the fact that nearly every county and large town in England possesses or possessed buildings by him.

On the death of Sir William Chambers in 1796, he was appointed surveyor-general to the Board of Works. In 1795 he became a member of the Royal Academy, and during a misunderstanding between Benjamin West and the Academy, in 1805, he filled the presidential office at the wish of King George III. He was killed by a fall from his carriage on the 4th of September 1815, and was buried in Westminster Abbey. His son, Benjamin Dean Wyatt (1775-1857), who succeeded him as surveyor of Westminster Abbey, was also an architect of some distinction.

WYCHERLEY, WILLIAM (c. 1640-1710), English dramatist, was born about 1640 at Clive, near Shrewsbury, where for several generations his family had been settled on a moderate estate of about 600 a year. Like Vanbrugh, Wycherley spent his early years in France, whither, at the age of fifteen, he was sent to be educated in the very heart of the "precious" circle on the banks of the Charente. Wycherley's friend, Major Pack, tells us that his hero "improved, with the greatest refinements," the "extraordinary talents" for which he was "obliged to nature." Although the harmless affectations of the circle of Madame de Montausier, formerly Madame de Rambouillet, are certainly not chargeable with the "refinements" of Wycherley's countrymen, Voltaire could not but observe Voltaire to say afterwards of them, "Il semble que les Anglais prennent trop de liberté et que les Français n'en prennent pas assez"—these same affectations seem to have been much more potent in the regard to the "refinements" of Wycherley's religion.

Wycherley, though a man of far more intellectual power than is generally supposed, was a fine gentleman first, a responsible being afterwards. Hence under the manipulations of the heroine of the "Garland" he turned from the Protestantism of his fathers to Romanism—turned at once, and with the same easy security as afterwards, at Oxford, he turned back to Protestantism under the manipulations of such an accomplished master in the art of turning as Bishop Barlow. And if, as Macaulay hints, Wycherley's turning back to Romanism once more had something to do with the patronage and unwonted liberality of James II., this merely proves that the deity he worshipped was the deity of the "polite world" of his time—gentility. Moreover, as a professional fine gentleman, at a period when, as the genial Major Pack says, "the amours of Britain would furnish as diverting memoirs, if well related, as those of France published by Rabbin, or those of Nero's court writ by Petronius," Wycherley was obliged to be a loose liver. But, for all that, Wycherley's sobriquet of "Manly Wycherley" seems to have been fairly earned by him, earned by that frank and straightforward way of confronting life which, according to Pope and Swift, characterized also his brilliant successor Vanbrugh.

That effort of Wycherley's to bring to Buckingham's notice
the case of Samuel Butler (so shamefully neglected by the court Butler had served) shows that the writer of even such heartless plays as The Country Wife may be familiar with generous impulses, while his uncompromising lines in defence of Buckingham, when the duke in his turn fell into trouble, show that the inventor of so shameless a fraud as that which forms the pivot of The Plain Dealer may in actual life possess that passion for fairplay which is believed to be a specially English quality. But among the “ninety-nine” religions with which Voltaire accredited England there is one whose permanency has never been shaken—the worship of gentility. To this Wycherley remained as faithful to the day of his death as Congreve himself. And, if his relations to that “other world beyond this,” which the Puritans had adopted, were liable to change with his environment, it was because that “other world” was really out of fashion altogether.

Wycherley’s university career seems also to have been influenced by the same causes. Although Puritanism had certainly not contaminated the universities, yet English “quality and politeness” (to use Major Pack’s words) have always, since the great rebellion, been rather ashamed of possessing too much learning. As a fellow-commoner of Queen’s College, Oxford, Wycherley only lived (according to Wood) in the provost’s lodgings, being entered in the public library under the title of “Philosophiae Studiosus” in July 1660. And he does not seem to have matriculated or to have taken a degree.

In 1663 Wycherley went to Oxford and took up his residence in the Inner Temple, where he had been entered in 1659, did give any more attention to the dry study of the law than was proper to one so warmly caressed “by the persons most eminent for their quality or politeness.” Pleasure and the stage were alone open to him, and probably early in 1671 was produced, at the Theatre Royal, Love in a Wood. It was published the next year. With regard to this comedy Wycherley told Pope—told him “over and over” till Pope believed him—believed him, at least, until they quarrelled about Wycherley’s verses—that he wrote it the year before he went to Oxford. But we need not believe him: the worst witness against a man is mostly himself. To pose as the wicked boy of genius has been the foolish ambition of many writers, but on inquiry it will generally be found that these inktorn Loharios are not nearly so wicked as they would have us believe. When Wycherley charges himself with having written, as a boy of nineteen, scenes so callous and so depraved that even Barbara Palmer’s appetite for profanity was, if not satisfied, appeased, there is, we repeat, no need to believe him. Indeed, there is every reason to disbelieve him—not for the reasons advanced by Macaulay, however, who in challenging Wycherley’s date does not go nearly deep enough. Macaulay points to the allusions in the play to gentlemen’s periwigs, to guineas, to the vests which Charles ordered to be worn at court, to the great fire, &c., as showing that the comedy could not have been written the year before the author went to Oxford. We must remember, however, that even if the play had been written in that year, and delayed in its production till 1672, it is exactly this kind of allusion to recent events which any dramatist with an eye to freshness of character would be inclined to use. It is not impossible that “the whole air and spirit of the piece belong to a period subsequent to that mentioned by Wycherley,” but that “the whole air and spirit of the piece” belong to a man—an experienced and hardened young man of the world—and not to a boy who would fain pose as an experienced and hardened young man of the world. The real defence of Wycherley against his foolish impeachments of himself is this, that Love in a Wood, however inferior in structure and in all the artistic economies to The Country Wife and The Plain Dealer, contains scenes which no inexperienced boy could have written—sceneries which, not for moral hardness merely, but often for real dramatic ripeness, are almost the strongest to be found amongst his four plays. With regard to dramatic ripeness, indeed, if we were asked to indicate the finest touch in all Wycherley, we should very likely select a speech in the third scene of the third act of this very play, where the vain, foolish and boastful rake Dapperwit, having taken his friend to see his mistress for the express purpose of advertising his lordship over her, is coolly denied by her and insolently repulsed. “I think,” says Dapperwit, “women take inconstancy from me worse than from any man breathing.”

Now, does the subsequent development of Wycherley’s dramatic genius lead us to believe that, at nineteen, he could have given this touch, worthy of the hand that drew Malvolio? Is there anything in his two masterpieces—The Country Wife or The Plain Dealer—that makes it credible that Wycherley, the boy, could have thus delineated by a single quiet touch vanity as a chain-armour which no shaft can pierce—vanity, that is to say, in its perfect development? However, Macaulay (forgetting that, among the myriad vanities of the writing fraternity, this of pretending to an early development of intellectual powers that ought not to be, even if they could be, developed early is at once the most comical and the most common) is rather too severe upon Wycherley’s disingenuousness in regard to the dates of his plays. That the writer of a play far more daring than Etheredge’s She Would If She Could—and far more brilliant too—should at once become the talk of Charles’s court was inevitable; equally inevitable was it that the author of the song at the end of the first act, in praise of harlots and their offspring, should touch to its depths the soul of the duchess of Cleveland. Possibly Wycherley intended this famous song as a glorification of Her Grace and her profession, for he seems to have been more delighted than surprised when, as he passed in his coach through Pall Mall, he heard the duchess address him from her coach window as a “rascal,” a “villain,” and as a son of the very kind of lady his song had lauded. For his answer was perfect in its readiness: “Madam, you have been pleased to bestow a title on me which belongs only to the fortunate.” Perceiving that Her Grace received the compliment in the spirit in which it was meant, he lost no time in calling upon her, and was from that moment the recipient of those “favour[s]” to which he alludes with pride in the dedication of the play to her. Voltaire’s story (in his Letters on the English Nation) that Her Grace used to go to Wycherley’s chambers in the Temple disguised as a country wench, in a straw hat, with pattens on and a basket in her hand, may be apocryphal—very likely it is—for disguise was quite superfluous in the case of the mistress of Charles II. and Jacob Hall, but it at least shows how general was the opinion that, under such patronage as this, Wycherley’s fortune as poet and dramatist, "eminent for his quality and politeness," was now made.

Publication of this comedy, as well as of The Plain Dealer, which had determined to bring up his son, the duke of Richmond, like a prince, was desirous of securing for tutor a man so entirely qualified as was Wycherley to impart what was then recognized as the princely education, and it seems pretty clear that, but for the accident, to which we shall have to recur, of his meeting the countess of Drogheda at Bath and secretly marrying her, the education of the young man would actually have been entrusted by his father to Wycherley as a reward for the dramatist’s having written Love in a Wood.

Whether Wycherley’s experiences as a naval officer, which he avowedly enjoyed, and which he thus described to Warton, “at that time, was in betwixt the English and the Dutch,” occurred before or after the production of Love in a Wood is a point upon which opinions differ, but on the whole we are inclined to agree with Macaulay, against Leigh Hunt, that these experiences took place not only after the production of Love in a Wood but after the production of The Gentleman Dancing Master, in 1673. We also think, with Macaulay, that he went to sea simply because it was the “polite” thing to do—simply because, as he himself in the epilogue to The Gentleman Dancing Master says, "all gentlemen must pack to sea.”

This second comedy was published in 1673, but was probably acted late in 1671. It is inferior to Love in a Wood. In The Relapse the artistic mistake of blending comedy and farce damages a splendid play, but leaves it a splendid play still. In The Gentleman Dancing Master this mingling of discordant
WYCHERLEY

elements destroys a play that would never in any circumstances have been strong—a play nevertheless which abounds in animal spirits, and is luminous here and there with true dramatic points.

It is, however, on his two last comedies—The Country Wife and The Plain Dealer—that must rest Wycherley's fame as a master of that comedy of repartee which, inaugurated by Etheredge, and afterwards brought to perfection by Congreve and Vanbrugh, supplanted the humorous comedy of the Elizabethans. The Country Wife, produced in 1672 or 1673 and published in 1675, is so full of wit, ingenuity, animal spirits and conventional humour that, had it not been for its motive—a motive which, though scandalous to some, is strong enough to win its way to the most fastidious reader—it would probably have survived as long as the acted drama remained a literary form in England. So strong, indeed, is the hand that could draw such a character as Major Pinchwife (the undoubted original not only of Congreve's Miss Prue but of Vanbrugh's Hoyden), such a character as Sparkish (the undoubted original of Congreve's Tattle), such a character as Horner (the undoubted original of all those cool impudent rakes with whom our stage has since been familiar), that Wycherley is certainly entitled to a place alongside Congreve and Vanbrugh. And, indeed, if priority of date is to have its fair and full weight, it seems difficult to challenge Professor Spalding's dictum that Wycherley is "the most vigorous of the set."

In order to do justice to the life and brilliance of The Country Wife we have only to compare it with The Country Girl, afterwards made famous by the acting of Mrs Jordan, that Bowdlerized form of The Country Wife in which Garrick, with an object more praiseworthy than his success, endeavoured to free it of its load of unparalleled licentiousness by disturbing and sweetening the motive—even as Voltaire afterwards (with an object also more praiseworthy than his success) endeavoured to disturb and sweeten the motive of The Plain Dealer in La Prude. While the two Bowdlerized forms of Garrick and Voltaire are as dull as the Aesop of Boursault, the texture of Wycherley's scandalous dialogue would seem to scintillate with the changing hues of shot silk or of the neck of a peacock or of a shaven prism, were it not that the many-coloured lights rather suggest the misnomeric radiance of a foul ditch shimmering in the sun. It is easy to share Macaulay's indignation at Wycherley's satyr-like delineation of art, and yet, at the same time, to protest against that dispargement of their literary riches which nullifies the value of Macaulay's criticism. And scarcely inferior to The Country Wife is The Plain Dealer, produced probably early in 1674 and published three years later,—a play of which Voltaire said, "Je ne connais point de comédie chez les anciens ni chez les moderns où il y ait autant d'esprit." This comedy had an immense influence, as regards manipulation of dialogue, upon all subsequent English comedies of repartee, and he who wants to trace the ancestry of Tony Lumpkin and Mrs Hardcastle has only to turn to Jerry Blackacre and his mother, while Manly (for whom Wycherley's early patron, the duke of Montauteur, sat), though he is perhaps overdone, has dominated this kind of stage character ever since.

If but few readers know how constantly the blunt scenterious utterances of this character are reappearing, not on the stage alone, but in the novel and even in poetry, it is because a play whose motive is monstrous and intolerable can only live in a monstrous and intolerable state of society; it is because Wycherley's genius was followed by Nemesis, who always dogs the footsteps of the defiler of literary art. When Burns said—

"The rank is but the guinea stamp,
The man's the gawd for a' that;"—
when Sterne, in Tristram Shandy, said, "Honours, like impressions upon coin, may give an ideal and local value to a bit of base metal, but gold and silver will pass all the world over without any other recommendation than their own weight,"

what did these writers do but adopt—adopt without improving—Manly's fine saying to Freeman, in the first act:—"I weigh the man, not his title; 'tis not the king's stamp that can make the metal better or heavier?" And yet it is in the fourth and fifth acts that the conceptions of Wycherley's comic genius are the most dazzling; also, it is there that the licentiousness is the most astonishing. Not that the worst scenes in this play are really more wicked than the worst scenes in Vanbrugh's Relapse, but they are more seriously imagined. Being less humorous than Vanbrugh's scenes, they are more terribly and earnestly realistic; therefore they seem more wicked. They form indeed a striking instance of the folly of the artist who selects a story which cannot be actualized without hurting the finer instincts of human nature.

When Menander declared that, having selected his plot, he looked upon his comedy as three parts finished, he touched upon the literary form which all writers in imaginative literature of every kind—would do well to consider. In all literatures—ancient and modern—an infinite wealth of material has been wasted upon subjects that are unworthy, or else incapable, of artistic realization; and yet Wycherley's case is, in our literature at least, without a parallel. No doubt it may be right to say, with Aristotle, that comedy is an imitation of bad characters, but this does not mean that in comedy art may imitate bad characters as earnestly as she may imitate good ones,—a fact which Thackeray forgot when he made Becky Sharp a murderess, thereby destroying at once what would otherwise have been the finest specimen of the Restoration drama in the world. And perhaps it was because Vanbrugh was conscious of this law of art that he blended comedy with farce. Perhaps he felt that the colossal depravity of intrigue in which the English comedians indulged needs to be not only warmed by a super-abundance of humour but softened by the playful mockery of farce before a dramatic circle such as that of the Restoration drama can be really brought within human sympathy. Plutarch's impeachment of Aristophanes, which affirms that the master of the old comedy wrote less for honest men than for men sunk in baseness and debauchery, was no doubt unjust to the Greek poet, one side of whose humour, and one alone, might thus be impeached. But does it not touch all sides of a comedy like Wycherley's—a comedy which strikes at the very root of the social compact upon which civilization is built? As to comparing such a comedy as that of the Restoration with the comedy of the Elizabethans, Jeremy Collier did but a poor service to the cause he undertook to advocate when he set the occasional coarseness of Shakespeare alongside the wickedness of Congreve and Vanbrugh. And yet, ever since Macaulay's essay, it has been the fashion to speak of Collier's attack as being levelled against the "Cour des Anglais" and "Restoration drama" of nothing of the kind. It is (as was pointed out so long ago as 1690 by Dr Drake in his little-known vigorous reply to Collier) an attack upon the English drama generally, with a special reference to the case of Shakespeare. While dwelling upon that noxious and highly immoral play Hamlet, Collier actually leaves unscathed the author of The Country Wife, but fastens on Congreve and Vanbrugh, whose plays—prolificate enough in all conscience—seem almost decent beside a comedy whose incredible vis mors is the modish distemper.

To rank in age, indeed, upon which was given with applause A Woman Killed with Kindness (where a wife dies of a broken heart: for doing what any one of Wycherley's married women would have gloried in doing) should, in seventy years, have given with applause The Country Wife shows that in historic and social evolution, as in the evolution of organisms, "change" and "progress" are very far from being convertible terms. For the barbarism of the society depicted in these plays was, in the true sense of the word, far deeper and more brutal than any barbarism that has ever existed in these islands within the historic period. Civilization has any meaning at all for the soul of man, the Englishmen of Chaucer's time, the Anglo-Saxons of the Hoptarchy, nay, those half-naked heroes, who in the dawn of English history clustered along the southern coast to defend it from the invasion of Caesar, were far more civilized than that "race gangrenée"—the treacherous rakes, mercenary slaves and brazen stumpets of the court of Charles II., who did their best to substitute for the human passion of love (a passion which
was known perhaps even to palaeolithic man) the promiscuous intercourse of the beasts of the field. Yet Collier leaves Wycherley unsaddled, and classes Vanbrugh and Congreve with Shakespeare!

It was after the success of The Plain Dealer that the turning-point came in Wycherley's career. The great dream of all the men about town in Charles's time, as Wycherley's plays all show, was to marry a widow, young and handsome, a peer's daughter if possible—but in any event rich, and spend her money upon wine and women. While talking to a friend in a bookseller's shop at Tunbridge, Wycherley heard The Plain Dealer read for by a lady who was a person of the countess of Drogheda, answered all the requirements. An introduction ensued, then love-making, then marriage—a secret marriage, probably in 1680, for, fearing to lose the king's patronage and the income therefrom, Wycherley still thought it politic to pass as a bachelor. He had not seen enough of life to learn that in the long run nothing is politic but "straightforwardness." Whether because his countenance wore a pensive and subdued expression, suggestive of a poet who had married a dowager countess and awakened to the situation, or whether because treacherous friends divulged his secret, does not appear, but the purpose of his marriage oozed out—it reached the royal ears, and deeply wounded the father anxious about the education of his son. Wycherley lost the appointment that was so nearly within his grasp—lost indeed the royal favour for ever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and Love in a Wood had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the counts followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died, however, in the year after her marriage and left him the whole of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid and the result of his marrying the poor, beautiful and titled widow was that the price of his marriage oozed out—it reached the royal ears, and deeply wounded the father anxious about the education of his son.

Wycherley lost the appointment that was so nearly within his grasp—lost indeed the royal favour for ever. He never had an opportunity of regaining it, for the countess seems to have really loved him, and Love in a Wood had proclaimed the writer to be the kind of husband whose virtue prospers best when closely guarded at the domestic hearth. Wherever he went the counts followed him, and when she did allow him to meet his boon companions it was in a tavern in Bow Street opposite to his own house, and even there under certain protective conditions. In summer or in winter he was obliged to sit with the window open and the blinds up, so that his wife might see that the party included no member of a sex for which her husband's plays had advertised his partiality. She died, however, in the year after her marriage and left him the whole of her fortune. But the title to the property was disputed; the costs of the litigation were heavy—so heavy that his father was unable (or else he was unwilling) to come to his aid and the result of his marrying the poor, beautiful and titled widow was that the price of his marriage oozed out—it reached the royal ears, and deeply wounded the father anxious about the education of his son.

Wycherley the eldest of his son's children, was by nature a dull witted, a cold-blooded, a hardened soul. But, like a true Scot, while not free from the drolleries and irreligions, was a man of much compass and a scholar. Pope's suicide, and the publication of the Essay on Criticism, as well as the death of the Duke of Marlborough, made Wycherley's style and ideas antiquated. The public began to think of him as an antiquated old man. He died in 1716, and was buried in the vault of the church in Covent Garden.
books of Queen's College, as paying rent for rooms as a "pensioner" or "commoner" for the years 1371-1372, 1374-1375 and 1380-1381. It has thus been commonly assumed (e.g. by Losterth) that the reformer was at one time in residence at Queen's, the date being given as 1365. It is probable, however, that the John Wyclif of the Queen's College accounts is the same as the John Wyclif who appears in the College computus for 1371-1372 as one of the "alimony boys" of the College, and, therefore, certainly not the reformer.

These questions, even that of the wardenship of Canterbury, are, however, essentially unimportant, unless we are prepared with Woodford to impute mean motives to a great man. What is certain is that long before Wycliffe had become a power outside Oxford his fame was established in the university. He was acknowledged supreme in the philosophical disputations of the schools, and his lectures were crowded. His influence was, however, purely academic, nor does it seem to have been inspired at the outset by any conscious opposition to the established order in the church; and, as Losterth points out, it was not until he was drawn into the arena of the politico-eclesiastical conflicts of the day that Wycliffe became of world-importance. In 1373, on the 5th of May, he had been "acknowledged" as a prebend of its diocese, and that Wycliffe published his Determinatio quaedam de dominio in support of the action of parliament in refusing the tribute demanded by Pope Urban V.; but Losterth has shown that this work, which contains the first trace of that doctrine of dominium or lordship which Wycliffe afterwards developed in a sense hostile to the whole papal system, must be assigned to a date some eight years later. Wycliffe, in fact, for some years to come had the reputation of a good "curialist." Had it been otherwise, the pope would scarcely have granted him (January 1373) a licence to keep his Westbury prebend even after he should have obtained it at Lincoln (Cal. Papal Letters, ed. Bliss and Twemlow, iv. 193). Moreover, it is uniformly asserted that Wycliffe fell into heresy after his admission to the degree of doctor (Fasc. Ziz, p. 2), and the papal document above quoted shows that he had only just become a doctor of theology, that is in 1372.

This, of course, does not mean that Wycliffe's tendencies may not have already been sufficiently pronounced to call attention to him in high places as a possibly useful instrument for the anti-papal policy of John of Gaunt and his party. Evidence of this kind is furnished by the 7th of April, 1375, when he was presented by the crown to the rectory of Lutterworth in Leicestershire, which he held until his death; and on the 26th of July he was nominated one of the royal envoys to proceed to Bruges to confer with the papal representatives on the long vexed question of "provisions" (q.v.). It is probable that he was attached to this mission as theologian, and that this was so is sufficient proof that he was not yet considered a persona ingrata at the Curia. The rank he took is shown by the fact that his name stands second, next after that of the bishop of Bangor, on the commission, and that he received pay at the princely rate of twenty shillings a day. The commission itself was appointed in consequence of urgent and repeated complaints on the part of the Commons; but the king was himself interested in keeping up the papal system of provisions and reservations, and the negotiations were practically fruitless.

After his return to England Wycliffe lived chiefly at Lutterworth and Oxford, making frequent and prolonged visits to London, where his fame as a popular preacher was rapidly established. It is from this period, indeed, that dates the development of the trenchant criticisms of the folly and corruption of the clergy, which had gained him a ready hearing in an in-systematic attack on the whole established order in the church. It was not at the outset the dogmatic, but the political elements

1 See H. T. Riley's remarks in the Second Report of the Historical Manuscripts Commission, appendix, pp. 141 sq. The appearance of a John Wyclif on the books of Queen's led to the common mistake, recorded in Milman's Hist. of Latin Christianity (bk. xii. ch. 16.), that Wycliffe began his university career at Queen's College. The whole question is argued at length by Dr Rashdall in the Dict. Nat. Biog.

in the papal system that provoked his censure. The negotiations at Bruges had doubtless strengthened the sympathy which he already felt for the anti-curial tendencies in English politics from Edward I.'s time onwards, and a final impetus was given by the attitude of the "Good Parliament" in 1376; in the autumn of that year he was reading his treatise on civil lordship (De civili dominio) to his students at Oxford. Of its propositions some, according to Losterth, were taken bodily from the 140 titles of the bill dealing with ecclesiastical abuses introduced in the parliament; but it may perhaps be questioned whether the reformer did not rather inspire the bill, which the parliament may declare that it was not his fault if it had been brought down into the streets and "every sparrow twittered about it."

If the position at which Wycliffe had now arrived was originally inspired, as Losterth asserts, by his intimate knowledge of and sympathy with the legislative of Edward I., i.e. by political rather than by philosophico-contractual considerations, the necessity of a philosophico-religious and philosophical and religious basis led inevitably to its development into a criticism not only of the political claims but of the doctrinal standpoint of the church. As a philosopher, indeed, Wycliffe was no more than the last of the conspicuous Oxford scholars, and his philosophy is of importance mainly in so far as it determined his doctrine of dominium, and so set the direction in which his political and ecclesiastical views were to go. As a metaphysician he was, in the beginning, the man of a great debate, the man, in short, between Realism and Nominalism he stood on the side of the former, though his doctrine of universals showed the influence of the criticisms of Ockham and the nominalists. He is Platonic in his conception of God as the forma rerum in whom the rationes exemplares exist eternally, being in fact his Word, who is omnium in omnibus (i Cor. xvi. 28); every creature in respect of its esse intelligibile is God, since every creature is in essence the same as the idea, and all rationes ideales are essentially the same as the Word of God (De dominio divino, pp. 42, 43). There is one ens, the ens analogum, which includes in itself and comprehends all other entities—all universals and the individual; the dominium is a reality imminent in the ens, and, in particular, in the ens extra rerum (pp. 48 sq.). The process by which the primary ens is specified, or by which a higher and more general class passes into sensible existence, is that it receives the addition of substantial form whereby it becomes capable of being an ens individuale (De dominio divino, pp. 48 sq.). To Wycliffe the doctrine of arbitrary divine decrees was anathema. The will of God is his essential and eternal nature, by which all his acts are determined; it was thus with the creation, and it was, as he had shown, an act of his will to create the world and its government, and to separate the species, or else in their material essences, secundum rationes absconditias seminum (ibid. p. 66). God's creation is conditioned by his own eternal nature; the world is therefore not merely one among an infinity of alternatives, an arbitrary selection, so to speak, but is the only possible world; it is, moreover, not in the nature of an eternal emanation from God, but was created at a given moment of time—to think otherwise would be to admit its absolute necessity, which would destroy free-will and merit. Since, however, all things came into being in this way, it follows that the creature can produce no effect but what God has appointed it to do, and that the lordship of God is inalienable from him. From the supreme lordship of God and is inseparable from it, since whatever God gives to his servants is part of himself, from the first gift, which is the esse intelligibile, i.e. really the divine essence, down to those special gifts which flow from the communication of his Holy Spirit; so that in him we live and move and have our being. But, in giving, God does not part with the lordship of the thing given; his gifts are of their own nature that which is given, and they are subject to due service to the supreme overlord. Thus, as in feudalism, lordship is distinguished from possession. Lordship is

2 This leads to the question of predestination and free-will, in which Wyclifc takes a middle position with the aid of the Aristotelian distinction between that which is necessary absolutely and that which is necessary on a given supposition. God does not will sin, as he wills that an atom should not exist, for he would not exist; he necessitates men to perform actions which are in themselves neither right nor wrong; they become right or wrong through man's free agency.
not properly proprietary, and property is the result of sin; Christ and his apostles had none. The service, however, by which lordship is sold of God is righteousness and its works; it follows, the unrighteous forfeit their right to exercise it, and may be deprived of their possessions by competent authority.

The question, of course, follows as to what this authority is, and the answer is given in the Determinatio quodam de dominio and, more elaborately, in the De civili domino. Briefly, his argument is that the church has no concern with temporal matters at all, that the church is not to hold law, or for statesmen (politiæ) who are God’s stewards in temporals—
to take away the goods of the clergy as, by reason of their unrighteousness, no longer render the service by which they hold them. That the church was actually in a condition to destroy spoilation he refused, indeed—though only under pressure—to affirm; but his theories fitted in too well with the notorious aims of the duke of Lancaster not to raise the bitter hostility of the endowed clergy, and with the mendicant orders he continued for a while to hold on good terms.

Hitherto Wycliffe had made no open attack on the doctrinal system of the church, and for some time he had been allowed to spread his doctrines without hindrance. Early in 1377, however, Archbishop Sudbury summoned him to appear before the bishop of London, and answered certain charges laid against him. The nature of these accusations is not stated, but their purport can hardly be doubtful. On the 19th of February 1377, Wycliffe made his appearance at St Paul’s. He was accompanied by the duke of Lancaster, by Lord Percy, marshal of England, and by four doctors of the four mendicant orders. The trial, however, before Wycliffe could open his mouth, the court was broken up by a rude brawl between his protectors and Bishop Courtenay, ending in a general riot of the citizens of London, who were so much enraged by the insult to their bishop in his own cathedral church—coming as this did at the same time as a serious attempt at an invasion by the duke in parliament of their civic liberties (Chron. Ang. p. 120)—that they would have sacked his palace of the Savoy had not Courtenay himself intervened.

Wycliffe had escaped for the time, but his enemies did not rely solely on their own weapons. Probably before they had set their case before the pope; and on the 22nd of May five bulls were issued by Gregory XI., who had just returned to Rome from Avignon, condemning eighteen (or in other copies nineteen) “conclusions” drawn from Wycliffe’s writings. All the articles but one are taken from his De civili domino. The bulls truly stated Wycliffe’s intellectual lineage; he was following in the error of Marsilius of Padua; and the articles laid against him are concerned entirely with questions agitated between church and state—how far ecclesiastical censures could be usefully applied. But the pope added, that the church had the right to receive and hold temporal endowments. The bulls were addressed to the archbishop of Canterbury and the bishop of London, the university of Oxford, and the king. The university was to take Wycliffe and send him to the prelates; the latter were then to examine the truth of the charges and to report to the pope, Wycliffe being meanwhile kept in confinement. The execution of the papal bulls was impeded by three separate causes—the king’s death on the 21st of June; the tardy action of the bishops, who enjoined the university to make a report, instead of attempting to interview Wycliffe; and the unwillingness of the university to admit external authority, and, above all, the pope’s right to order the imprisonment of any man in England. The convocation of the university, indeed, as the St Albans chronicle states with lamentation, made serious objections to receiving the bull at all; and in the end it merely directed Wycliffe to keep within his lodgings at Black Hall for a time.

If the university was disposed to favour the reformer, the government was not less so. John of Gaunt was for the moment in retirement; but the mother of the young king appears to have adopted his policy in church affairs, and she naturally occupied a chief position in the new council. As soon as parliament met in the autumn of 1377, Wycliffe was consulted by it as to the lawfulness of prohibiting that treasure should pass out of the country in obedience to the pope’s demand. Wycliffe’s affirmative judgment is contained in a state paper still extant; and its tone is plain proof enough of his confidence that his views on the main question of church and state had the support of the nation. Indeed he had laid before this same parliament his answer to the pope’s bulls, with a defence of the soundness of his opinions. His university, moreover, confirmed his argument; his tenets, it said, were true (i.e. orthodox), though their expression was such as to admit of an incorrect interpretation. But Wycliffe was still bound to clear himself before the prelates who had summoned him, and early in 1378 he appeared for this purpose in the chapel of Lambeth Palace. His written defence, expressed in some respects in more cautious language than he had previously used, was laid before the council; but its session was rudely interrupted, not only by an inroad of the London citizens with a crowd of the rabble, but also by a messenger from the king, informing them of the right of the civil power to invade Wycliffe; and thus a second time he escaped, either without sentence, or at most with a gentle request that he would avoid discussing the matters in question. Meanwhile his “protestatio” was sent on to Rome. Before, however, any further step could be taken at Rome, Gregory XI. died.

In the autumn of this year Wycliffe was once more called upon to prove his loyalty to John of Gaunt. The duke had violated the sanctuary of Westminster by sending a band of armed men to seize two squires who had taken refuge there. One of them was taken a prisoner, and the other, together with the servant of the church who attempted to resist his arrest. After a while the bishop of London excommunicated all concerned in the crime (except only the king, his mother and his uncle), and preached against the culprits at Paul’s Cross. At the parliament held at Gloucester in October, in the presence of the legates of Pope Urban VI., Wycliffe read an apology for the duke’s action at Westminster, pleading that the men were killed in resisting legal arrest. The papal, which forms part of the De ecclesia, lays down the permissible limits of the right of asylum, and maintains the right of the civil power to invade the sanctuary in order to bring escaped prisoners to justice.

The schism in the papacy, owing to the election of Clement VII. in opposition to Urban VI., accentuated Wycliffe’s hostility to the Holy See and its claims. His attitude was not, indeed, as yet fully developed. He did not object to a visible head of the church so long as this head possessed the essential qualification of righteousness, as a member of the elect. It was only later, with the development of the scandals of the schism, that Wycliffe definitely branded the pope, puer, as Antichrist; 2

2 See R. L. Poole’s preface to his edition of the De domino divino, where Wycliffe’s indebtedness to Richard Fitz Ralph, archbishop of Armagh, for his views on lordship and property is shown at some length (pp. xxxiv sq.). Fitz Ralph had been a fellow of Balliol, and was one of the unirers who, in about 1278 (A. Wycliffe, Fasti Oxon. p. 21, ed. Gutch, 1790). The first four books of his De pastoris Salvatoris were edited by R. L. Poole for the Wycliffe Society, and published in 1890 in an appendix to the edition of the De domino divino. Fitz Ralph also taught that lordship was conditioned by grace, and that property had come into the world with sin. Fitz Ralph’s work was, however, directed to the settlement of the controversies raised by the mendicant orders as to “possessions” and “usage.” Wycliffe extended the scope of the doctrine so as to include all civil and ecclesiastical society.

3 When he says that the bull was only received at Oxford shortly before Christmas, he is apparently confounding it with the bull which is dated December 18 (Lewis, appendix xvii.).—Chron. Ang. p. 173.

4 In one text of this document a note is appended, to the effect that the council enjoined silence on the writer as touching the matter therein contained (Pascendi, Zizaniorum, p. 271). This, it true, was apparently a measure of precaution.

5 So he describes the popes in the first sermon in vol. ii. of the Sermons. This may perhaps refer to the pope of that year. Budden, Poltical Works, int. p. xxvi. Book iii. of his Opus evangelicium is also significantly entitled De Antichristo.
confined to the schools; he now determined to carry it down into the streets. For this purpose he chose two means, both based on the thesis which he had long maintained as to the supreme authority of Holy Scripture, as the great charter of the Christian religion. The first means was his institution of the "poor" or "simple" priests to preach his doctrines throughout the country; the second was the translation of the Vulgate into English, which he accomplished with the aid of his friends Nicholas Hereford and John Purvey (see Bible, English). This version of the Bible, and still more his numerous sermons and tracts, established Wycliffe's new undisputed position as the leader of English religious reform.

The choice of secular priests to be his itinerant preachers was significant of another change of attitude on Wycliffe's part. Hitherto he had been on good terms with the friars, whose ideal of poverty appealed to him; as already mentioned, four doctors of the mendicant orders had appeared with him at his trial in 1377. But he had come to recognize that all organized societies within the church, "sects" as he called them, were liable to the same corruption, while he objected fundamentally to the principle which had established a special standard of morality for the "regular" clergy. To Wycliffe, the church, in all its branches, was not necessarily intended to work as rivals to the beneficed clergy. The idea that underlay their mission was rather analogous to that which animated Wesley four centuries later. Wycliffe aimed at supplementing the services of the church by regular religious instruction in the vernacular; and his organization included a good number of men who held or had held respectable positions in their colleges at Oxford. The influence of their teaching was soon felt throughout the country. The common people were rejoiced by the plain and homely doctrine which dwelt chiefly on the simple "law" of God, while they no doubt relished the denunciation of existing evils in the church which formed, as it were, the burthen of such discourses. The feeling of dissatisfaction against the rich and careless clergy, monks and friars was widespread but undefined. Wycliffe turned it into a definite channel.

Meanwhile, in addition to his popular propaganda and his interventions in politics, Wycliffe was appealing to the world of learning in a series of Latin treatises, which followed each other in rapid succession, and collectively form his _summa theologica._ During the years 1378 and 1379 he produced his works on the trust of Holy Scripture, on the church, on the office of king, on the papal power.

Of all these, except the third, the general character has already been indicated. The _De officio regis_ is practically a declaration of war against the papal monarchy, an anticipation of the theocratic conception of a messianic Israel, set up as a counterpoise by the Reformation. The king is God's vicar, to be regarded with a spiritual fear second only to that due to God, and resistance to him for personal wrong suffered is wicked. His jurisdiction extends over all causes. The bishops—who are to the king as Christ's Humanity is to his Divinity—derive their jurisdiction from him, and whatever they do is done by his authority. Thus in his palpable dignity, towards the world, the king is superior to the priest; it is only in his impalpable dignity, towards God, that the priest is superior to the king. Wycliffe thus passed from an assailed of the papal to an assailed of the sacerdotal power; and in this way he was ultimately led to examine and to reject the distinctive symbol of that power, the doctrine of transubstantiation.

Wycliffe himself had for some time, both in speech and writing, indicated the main characteristics of his teaching on the Eucharist. It was not, however, till 1379 or 1380 that began a formal public attack on what he calls the "new" doctrine in a set of theses propounded at Oxford. These were followed by sermons, tracts, and, in 1381, by his great treatise _De eucharistia._ Finally, at the close of his life, he summed up his doctrine in this as in other matters in the _Triologus._

The language in which he denounced transubstantiation anticipated that of the Protestant reformers; it is a "blasphemous folly," a "deceit," which "despoils the people and leads them to commit idolatry;" philosophically it is nonsense, since it presupposes the possibility of an accident existing without its substance; it overthrows the very nature of a sacrament. Yet the consecration of bread and wine are the body and blood of Christ, for Christ himself says so (_Pars. Zizani., p. 115_; we do not, however, corporeally touch and break the Lord's body, which is present only sacramentally, spiritualiter et virtualiter—"in form only" present in the body. The present presence is not denied; what Wycliffe "dares not affirm" is that the bread is after consecration "essentially, substantially, corporeally" the body of Christ. His doctrine was by no means always consistent or clear, would thus seem to approximate closely to the Lutheran doctrine of consubstantiation, as distinguished from the Zwinglian teaching accepted in the xxviii. Article of the Thirty-Nine Articles of the Church of England. That Wycliffe appealed, in accordance with his principles, not to the pope, but to the king. But the lay magnates, who were perfectly ready to help the church to attain to the ideal of apostolic poverty, shrunk from the responsibility of lending their support to obscure propositions of the schools, which, for no practical end, involved undoubted heresy and therefore the pains of hell. John of Gaunt, accordingly, hastily sent down a messenger enjoining the reformer to keep silence on the subject. The rift thus created between Wycliffe and his patrons in high places was, moreover, almost immediately widened by the outlook of the great Peasants' Revolt of 1381, the result of which was to draw the conservative elements in church and state together, in defence of their common interests.

With the Peasants' Revolt it has been supposed that Wycliffe had something to do. The only positive fact implicating him is the confession of one of its leaders, John Ball, that he learned his subversive doctrines from Wycliffe. But the confession of a condemned man can seldom be accepted without reserve; and we have not only the precise and repeated testimony of Knyghton that he was a 'precurser of Wycliffe, but also documentary evidence that he was communicated as early as 1366, long before Wycliffe exposed himself to ecclesiastical censure. Wycliffe in truth was always careful to state his communistic views in a theoretical way; they are confined to his Latin scholastic writings, and thus could not reach the people from him directly. At the same time it is very possible that his less scrupulous followers translated them in their popular discourse, and thus fed the flame that burst forth in the rebellion. Perhaps it was a consciousness of a share of responsibility for it that led them to cast the blame on the friars. In any case Wycliffe's advocates must regret that in all his known works there is only one trace of any reprobation of the excesses that accompanied the outbreak.

1 Jer. Lossor, in his paper "Die Genesis von Wiclifs Summa Theologicae" (Sitzungsber. der k. Akad. der Wissenschaften, Vienna, 1908, vol. 130) gives proofs that the _Summa_ was not produced on a previously thought out plan, but that even the larger works forming part of it "were the outcome of those conflicts which were fought out inside and outside the Good Parliament," i.e. they were primarily intended as weapons in the ecclesiastico-political controversies of the time.
3 Spartan attacks had been made on this before, though it had not been written into the interdict of 1382 against the heretic priest, Ralph of Tornay, in the _Register of John de Grandison, Bishop of Exeter_, edited by F. C. Hingeston-Randolph (London and Exeter, 1894), pp. 1147 and 1179.

3181 (corrected by the editor from 1380) is the date given in Shirley's edition of the _Fasciculi Zizaniarum_. F. D. Matthew, in the _Eng. Hist. Rev._ for April 1890 (v. 328), proves that the date must have been 1379 or 1380. 1381, _Triologus_, lib. i. cap. 22; _De Euch._, p. 249.
5 The difference is summed up by Melancthon, in his rejection of Bucer's eirenicon, thus:—__Fecit factum hominibus per hoc quod vult__?__In hoc casu certe non eis contumelia, sed laudabilissima imaginatio._ Sic tierum negat presentiam realem. Nos docemus, quod corpus Christi vere et realiter adsum pone vel in pane (_Corpus Reformatorum_ ii. 222 sqq.).
In the spring following the Revolt his old enemy, William Courtenay, who had succeeded the murdered archbishop Sudbury as archbishop of Canterbury, resolved to take measures for stamping out Wycliffe's crowning heresy. He called a court of bishops, theologians and canonists at the Blackfriars' convent in London, which assembled on the 17th to 21st of May and sat with intervals until July. This proceeding was met by a hardly expected manifestation of university feeling on Wycliffe's side. The chancellor, Robert Rygge, though he had joined in the condemnation of the theses, stood by him, as did also both the protors. On Ascension Day (the 15th of May) his most prominent disciple, Nicholas Hereford, was allowed to preach a violent sermon against the regulars in the churchyard of St Frideswyde. The archbishop protested through his commissary, the Carmelite Dr Peter Stokes, who was charged with the execution of the archbishop's mandate (on the 28th of May) for the publication in the university of the decision of the Blackfriars' council, by which 24 articles extracted from Wycliffe's works were condemned, ten as heretical and fourteen as erroneous. The reply of the chancellor was to deny the archbishop's jurisdiction within the university, and to allow Philip Reeping, another of Wycliffe's disciples, to preach on Corpus Christi day before the university. Chancellor and preacher were guarded by armed men, and Stokes wrote that his life was not safe at Oxford. The chancellor and proctors were now summoned to Lambeth, and directed to appear before the Blackfriars' court on the 12th of June, there to give a full answer to the accusations of the University. Though they were, with the majority of regent masters at Oxford, on the side of Wycliffe, the main question at issue was for them one of philosophy rather than faith, and they were quite prepared to make formal submission to the authority of the Church. For the rest, a few of the reformer's more prominent adherents were arrested, and imprisoned until they recanted.

Wycliffe himself remained at large and un molested. It is said indeed by Knyghton that at a council held by Courtenay at Oxford in the following November Wycliffe was brought forward and made a recantation; but our authority fortunately gives the text of the recantation, which proves to be nothing more nor less than a plain English statement of the condemned doctrine. It is therefore lawful to doubt whether Wycliffe appeared before the council at all, and even whether he was ever summoned before it. Probably after the overthrow of his party at Oxford by the action of the Blackfriars' council Wycliffe found it advisable to withdraw permanently to Lutterworth. That his strength among the laity was undiminished is shown by the fact that the university officers were soon brought to submission. Though they were, with the majority of regent masters at Oxford, on the side of Wycliffe, the main question at issue was for them one of philosophy rather than faith, and they were quite prepared to make formal submission to the authority of the Church. For the rest, a few of the reformer's more prominent adherents were arrested, and imprisoned until they recanted.

BIBLIOGRAPHY.—The documentary materials for Wycliffe's biography are to be found in John Lewis's Life and Sufferings of J. Wycliffe, crusading monk, London, 1877, and in a work of illustrative papers and records; Foxe's Acts and Memorials, vol. iii., ed. 1855, with app.; Forshall and Madden's preface to the Wycliffe Bible, p. vii. note, Oxford, 1851; W. W. Shirley's edition of the English works with continuations and appendices, by the bishops bearing on the history of Wycliffe and the Lollards, inter- spersed narrative and comments (probably the work of Thomas Nettler of Walden), 1859; and H. T. Riley's notices in the appendices to the Second and Fourth Reports of the Historical Manuscripts Commission. Among contemporary records the narrative of a monk of St Albans—a bitter opponent of John of Gaunt—is of conspicuous value; it was published under the title of Chronicum Anglicum, by Sir E. Maunde Thompson (1874). Of this the account in Walsingham's Historia Anglica (ed. H. T. Riley, 1863, 1864) is mainly a modified version. Knyghton, who wrote De eevitatis Anglicis at Lutterworth, is the heart of the story. Wycliffe was really very well informed as to certain passages in the reformer's history, though his chronology is extremely faulty (ed. J. R. Lumb, 1889-1905). There are valuable notices in various editions of Eusebius's Chronicle by F. S. Haydon, 1865), in the Chronicle of Adam of Usk (ed. E. M. Thompson, 1876), and in more than one of the continuations of Higden. For the study of Wycliffe's theology the controversial works of Wodford and Walden are important, but must necessarily be used with caution.

Of modern biographies that by G. V. Leclier (Johann von Wyclif und die Vorgeschichte der Reformation, 2 vols, Leipzig, 1873) and by P. Letham (Johannes Wyclif, Edinburgh, 1902) are most comprehensive; it includes a detailed exposition of the reformer's system, based to a considerable extent on works which were then unknown. Sir William Sidney Sutherland's well-substantiated introduction to the Fasciculi Sive Summarum et Eiusdem Historiarum, F. D. Matthew's to his edition of English Works of Wyclif hitherto unprinted (1880), as well as Creighton's History of the Papacy, vol. 1, 1882, and Sir H. C. Maxwell Lyte's account in his History of the University of Oxford (1886), add to or correct our stock of biographical materials, and contain much valuable criticism.
Wycliffe's political doctrine is discussed by Mr. R. L. Poole ("Illustrations of the History of England," 1881), and his relation to Basset is demonstrated by Dr. J. Looserth ("His and Wyclif, Prague, 1884; also Eng. trans.").

WYLIE, Robert (1839–1897), American artist, was born in the Isle of Man in 1839. He was taken to the United States when a child, and studied in the schools of the Pennsylvania Academy of the Fine Arts, Philadelphia, the directors of which sent him to France in 1863 to study. He won a medal of the second class at the Paris Salon of 1872. He went to Pont Aven, Brittany, in the early sixties, where he remained until his death on the 4th of February 1877. He painted Breton peasants and scenes in the history of Brittany; among his important works was a large canvas, "The Death of a Vendean Chief," now at the Metropolitan Museum of Art, New York.

WYNDHAM, Sir Francis Wyndham, was a market town in the mid-parliamentary division of Norfolk, England, 10 m. S.W. of Norwich by the Great Eastern railway. Pop. (1901) 4764. The church of St Mary the Virgin rises on an eminence on the outskirts of the town. It was attached to a Benedictine priory, founded about the beginning of the 12th century as a cell of St Albans abbey by William de Albeni. In 1448 this foundation became an abbey. The nave is of ornate Norman work, with a massive triforium, surmounted by a Perpendicular clerestory and a beautiful wooden roof. The broad N. aisle is Perpendicular, and the roof is carved with the badge of the Wyndhams. At the W. end of the church is a lofty and graceful Perpendicular tower. The choir, which was used as the conventual church, has left only slight traces, and one arch is standing of a large chapel which adjoined it on the S. In the centre of the town is a picturesque half-timbered market cross (1616), with an octagonal upper chamber raised on massive pillars of wood. A chapel, dedicated to St Thomas of Canterbury, is used as a grammar school. At Wymondham on the 7th of July a festival was formerly held in honour of the saint. It was at this festival in 1449 that the rebellion of Robert Ket or Ket came to a head.

WYNNA, or WAINAD, a highland tract in S. India, forming part of Malabar district, Madras. It consists of a table-land amid the W. Ghats, 60 m. long by 30 m. broad, with an average elevation of 3000 ft.; pop. (1901) 75,149. It is best known as the district where a large amount of British capital was sunk during the decade 1876–1886 in gold mines. It had yet earlier been a coffee-planting district, but this industry has recently declined. Tea, pepper and cardamoms are produced in increasing quantities. There are also valuable forest reserves.

WYNDHAM, Sir Charles (1872–1902), English actor, was born in Liverpool on the 23rd of March 1872, the son of a doctor. He was educated abroad, at King's College, London and at the College of Surgeons and the Peter Street Anatomical School, Dublin, but his taste for the stage was too strong for him to take up either the clerical or the medical career, suggested for him, and early in 1892 he made a first appearance in London as an actor. Later in the year, being in America, he volunteered during the Civil War, and became brigade surgeon in the Federal army, resigning in 1864 to appear on the stage in New York with John Wilkes Booth. Returning to England, he played at Manchester and Dublin in Her Ladyship's Guardian, his own adaptation of Edward B. Hanley's novel Lady Lee's Widowhood. He reappeared in London in 1866 as Sir Arthur Lascelles in Morton's All That Glitters is Not Gold, but his greatest success was at that time in F. C. Burnand's burlesque of Black-eyed Susan, as Hatchett, "with dance." This brought him to the St James's theatre, where he played with Henry Irving in Idia; then with Ellen Terry in Charles Reade's Double Marriage, and Tom Taylor's Still Waters Run Deep. As Charles Surface, his best part for many years, and in a breezy three-act farce, Pink Domingoes, by James Albery, and in Brighton, an anglicized version of Saragossa by Bronson Howard (1842–1908), who married his sister, he added greatly to his popularity both at home and abroad. In 1876 he took control of the Criterion theatre. Here he produced a long succession of plays, in which he took the leading part, notably a number of old English comedies, and in such modern plays as The Liars, The Case of Rebellious Susan and others by Henry Arthur Jones; and he became famous for his acting in David Garrick. In 1899 he opened his new theatre, called Wyndham's. In 1902 he was knighted. From 1885 onwards his leading actress was Miss Mary Moore (Mrs Albery), who became his partner in the proprietorship of the Criterion and Wyndham's theatres, and of his New Theatre, opened in 1903; and her delightful acting in comedy made their long association memorable on the London stage.

WYNDHAM, Sir William, Bart. (1687–1740), English politician, was the only son of Sir Edward Wyndham, Bart., and a grandson of William Wyndham (d. 1693) of Orchard Wyndham, Somerset, who was created a baronet in 1661. Educated at Eton and at Christ Church, Oxford, he entered parliament in 1699 and became a minister-at-war in the Tory ministry in 1712 and chancellor of the exchequer in 1713. He was closely associated with Lord Bolingbroke, and he was privy to the attempts made to bring about a Jacobite restoration on the death of Queen Anne; where these failed he was dismissed from office. In 1715 the failure of a Jacobite movement led to his imprisonment, but he was soon set at liberty. Under George I. Wyndham was the leader of the opposition in the House of Commons, fighting for his High Church and Tory principles against Sir Robert Walpole. He was in constant communication with the exiled Stuarts and Bolingbroke, and in 1723 the two were actively associated in abortive plans for the overthrow of Walpole. He died at Wells on the 17th of June 1740. Wyndham's first wife was Catherine, daughter of Charles Seymour, 6th duke of Somerset. By her he had two sons, Charles, who became 2nd earl of Egremont in 1750, and Percy, who took the name of O'Brien and was created earl of Thomond in 1756.

The Wyndham Family. Sir John Wyndham, a Norfolk man, was knighted after the battle of Stoke in 1487 and beheaded for high treason on the 2nd of May 1502. He married Margaret, daughter of John Howard, duke of Norfolk, and his son Sir Thomas Wyndham (d. 1521), of Felbrigg, Norfolk, was vice-admiral of England under Henry VIII. By his first wife Sir Thomas was the father of Sir John Wyndham, who married Elizabeth, daughter of John Sydenham of Orchard, Somerset, and founded the Somerset branch of the family, and also of Sir Edmund Wyndham of Felbrigg, who was sheriff of Norfolk at the time of Robert Ket's rebellion. By his second wife Sir Thomas was the father of the seaman Thomas Wyndham (c. 1510–1553), an account of whose voyage to Morocco in 1525 is printed in Hakluyt's Voyages.

From Sir John Wyndham of Orchard Wyndham was descended Thomas Wyndham (1618–1745), lord chancellor of Ireland from 1726 to 1739, who in 1731 was created Baron Wyndham of Finglass, a title which became extinct on his death. His nephew, Henry Penruddocke Wyndham (1736–1810), the topographer, wrote A Gentleman's Tour through Monmouthshire and Wales in June and July 1774 (1773); and Wiltshire from Domestick Days, with a Translation of the Original Latin into English (Salisbury, 1788).

Sir John Wyndham of Orchard Wyndham was also the ancestor of the Windhams of Felbrigg, who adopted this form of spelling the family name, the most noteworthy members of which were the statesman William Windham (q.v.), and Sir Charles Ash Windham (1810–1870), a soldier who commanded in the Crimea and in the Indian Mutiny.

The Wyndhams are also connected through a female line with the family of Wyndham-Quin, which holds the earldom of Dunraven. Valentine Richard Quin (1752–1824), of Adare, county Limerick, was created Baron Adare on the union with England in 1800, and earl of Dunraven and Mount-Earl in 1822. His son, the 2nd earl (1782–1850), married Caroline (d. 1879), daughter and heiress of Thomas Wyndham of Dunraven Castle, Glamorganshire, and took the name of Wyndham-Quin. Their son, the 3rd earl (1812–1871), who was created a peer of the United Kingdom as Baron Kenry in 1866, was a well-known man of science, especially interested in archaeology. His son, Windham Thomas Wyndham-Quin (b. 1841), the 4th earl, was under-secretary for the colonies in 1885–1887, and became later a prominent figure in Irish politics, as chairman of the Irish Land Conference and president of the Irish Reform Association;
WYNN—WYOMING 873

He was also prominent as a yachtsman, competing for the America cup (see Yachting) in 1803 and 1805.

WYNN, SIR JOHN (1553-1627), Welsh antiquary, was the son of Morris Wynn and descended from the princes of Wales. He was educated at Oxford, succeeded to his father's estate of Gwydir in Carnarvonshire in 1580, and was member of parliament for this county in 1586. In 1606 he was made a knight and in 1611 a baronet. He was interested in several mining ventures and also found time for antiquarian studies. He died on the 1st of March 1627. At Llanrwst Wynn founded an hospital and endowed a school, from which the modern school of History of the Family, which had a great reputation in North Wales, was first published by Davies Barrington in 1770, and in 1858 an edition was published at Oswestry. It is valuable as the only work which describes the state of society in North Wales in the 15th and the earlier part of the 16th century. His son Richard (d. 1649) was in attendance on Prince Charles, afterwards Charles I, when he visited Spain in 1623, and was afterwards treasurer to Queen Henrietta Maria; he wrote an account of the journey to Spain, published by T. Hearne in 1729 with the Historia viae et regni Ricardi II. He built the bridge over the Conway at Llanrwst. The bridge he bequeathed to the city of Bangor when Wynn, near Wrexham, passed to Sir Watkin Williams, who took the name of Williams-Wynn and founded the family of that name.

Sir John Wynn's estate of Gwydir came to the 1st duke of Ancaster in the 17th century by his marriage with the heiress of the Wynn. On the death of the last duke in 1779, Gwydir was inherited by his sister Priscilla, Lady Willoughby de Eresby in her own right, whose husband was created Baron Gwydir. On the death of Alberic, Lord Willoughby de Eresby (1870), this title (now merged in that of earl of Ancaster) fell into abeyance between his two daughters, while that of Baron Gwydir passed to his cousin and heir male. Gwydir itself was sold by the earl of Ancaster in 1805, the house and part of the estate being bought by Earl Carrington, who also claimed descent from Sir John Wynn.

Wyntoun, Andrew of (1350-71420), a author of a long

metrical history of Scotland, called the Ormignale Cronykil of Scotland, was a canon regular of St Andrews, and prior of St Serf's in Locheaven. He wrote the Chronicle at the request of his patron, Sir John of Wemyss, whose representative, Mr Erskine, is one of the Wemyss Castle, Fife, and is now in the British Museum, Extant MS. of the work. The subject is the history of Scotland from the mythical period (hence the epithet "original") down to the accession of James I in 1406. The earlier books are of no historical value, but the later have in all outstanding matters stood the test of comparison with contemporary records. The philological interest is great, for few works of this date, and no other of like magnitude, are extant in the vernacular.

The text is preserved in eight MSS., of which three are in the British Museum, the Royal (17 D xx.), the Cottonian (Nero D. xii.) and the Lansdowne (197); two in the Advocates' Library, Edinburgh (19, 2, 3 and 19, 2, 4); one at Wemyss Castle (u.1.); one in the university library at St Andrews, and formerly in the possession of the Bowells of Auchinleck, now the property of Mr John Ferguson, Duns, Berwickshire. The first edition of the Chronicle (based on the Royal MS.) was published by David Macpherson in 1795; the second by David Laing, in the series of "Scottish Historians" (Edin., 1872). A modern edition by the late Sir Harry Johnston, of the Scottish Text Society (1906).

WYOMING, one of the Central Western states of the United States of America, situated between the parallels of latitude 41° and 45° N., and the meridians of longitude 27° and 34° W. of Washington. It is bounded on the N. by Montana, on the E. by S. Dakota and Nebraska, on the S. by Colorado and Utah, and on the W. by Idaho, and a small southward projection of Montana. This state has a length of about 737 m. E. and W., along its southern border and a breadth of 276 m. N. and S. It has an area of 97,914 sq. m., of which 320 sq. m. are water surface.

Physical Features. The greater portion of the state belongs to the Great Plains Province, which extends from N. to S. across the United States between the 100th meridian and the Rocky Mountains. Within this province are found the Black Hills of S. Dakota, and their W. slopes extend across the boundary into N. Wyoming. The N.W. portion of the state is occupied by the S. end of the Northern Rocky Mountain Province; and the E. end of the Southern Rockies extends across the Colorado line into southern Wyoming. The Great Plains in Wyoming have an elevation of from 5000 to 7000 feet above sea level, and are characterized by a large area of relatively flat plains, part of which are covered with sagebrush and other low growing vegetation. The mountains the plains strata, elsewhere nearly horizontal, are bent sharply upward and curved by erosion into "hogback" ridges. The plains are also intertraced with the Bighorn Mountains, an extension of the Bighorn Mountains, and an outlier of the Rocky Mountains. The plains in central Wyoming are interrupted by several smaller mountain ranges, volcanic buttes and lave flows, among which the Leucite Hills and Pilot Butte are prominent examples.

The western border of the state makes a distinct break in the continuity of the Northern and Southern Rockies, and this, together with the S. end of the Great Plains, makes a broad, relatively low flat suitable by the Oregon Trail in early days, and by the Union Pacific railway at a later period. The Black Hills District in the N.E. contains the Little Missouri Buttes and the Mato Tepee (or Devil's Tower), prominent erosion remnants of volcanic intrusions. Local glaciation has modified the highest portion of the Yellowstone, Bighorn and Beartooth mountain ranges, forming the Wapiti and Belle Fourche glacier remnants. The latter, definite N.E. of the Black Hills, is 14,000 ft. high. The Black Hills is 4th highest in range, the highest peak of which is 12,170 ft. above sea level. Other peaks of the Black Hills are the Sturgis, the Cheyenne, the Wyoming, the South Pass, and the, the North Pass. The Black Hills is 4 th highest in range, the highest peak of which is 12,170 ft. above sea level. Other peaks of the Black Hills are the Sturgis, the Cheyenne, the Wyoming, the South Pass, and the...
part of the N.W. forests. White fir is found above the foot hill zone, and heavy growths of cottonwood along the streams in the Bighorn region. The Douglas spruce and the pine of the mountain and mountainous regions comes from the Medicine Bow Mountains, from which much of the native lumber used in the S. of the state is secured. Other trees are the juniper, willow, green ash, box elder, scrub oak, with a few pines and spruces. Of the hardwoods, aspen, birch, and maple are the only trees on the plains. The common sage brush, Artemisia, is the characteristic shrub of the plains where the soil is comparatively free from alkali, and is abundant in the valleys of the arid foothills. Where the plains are covered with sagebrush, there is a soil of clay with grease wood and species of atripeles, including the so-called white sage. Grease wood is likewise abundant in the foothills wherever the soil is low and fertile. Various species of sagebrush, nutritious grasses, are common in the plains and foothills, and even clothe the apparently barren mountain peaks.

Climate.—In the lower Bighorn Valley, summer temperatures rise to over 105°, and in parts of Douglas county, to 110°. The average winter temperature is from 20° to 27°. The precipitation varies in different areas from 8 to 20 in., the average for the state being 12.5 in. Wyoming thus belongs with the arid states, and irrigation is necessary for agriculture. A greater precipitation doubtless prevails on the higher mountains, but trustworthy records are not available. Spring is the wettest season. The prevailing winds are W. and reach a high velocity on the level plains.

Soil.—While some of the more arid districts have soils so strongly alkaline as to be practically unhealthful, there are extensive areas of fertile lands which only require irrigation to make them highly productive. Alluvial deposits brought down by mountain streams, and strips of floodplain along larger streams on the plains are very fertile and well repay irrigation. Lack of water rather than poverty of soil renders most of the plains region fit for grazing only. In the mountains, ruggedness combines with thin and scattered soil to make these districts of small agricultural value.

Agriculture.—The total area in farms in 1880 was 124,453 acres, of which 89,213 acres (72%) were improved. The percentage of production in the state is high. The precipitation varies in different areas from 8 to 20 in., the average for the state being 12.5 in. Wyoming belongs with the arid states, and irrigation is necessary for agriculture. A greater precipitation doubtless prevails on the higher mountains, but trustworthy records are not available. Spring is the wettest season. The prevailing winds are W. and reach a high velocity on the level plains.

The total number of cattle on farms and ranges in 1910 was 927,560,000. Including 27,160,000, valued at $25,277,000; horses, 148,000, valued at $72,284,000; mules, 200,000, valued at $122,500; and swine, 21,000, valued at $178,000. In 1909 the hay crop (alfalfa, native hay, timothy hay, &c.) was 665,000,000 tons, valued at $2,918,000, and raised on 277,000 acres. The wheat crop in 1909 was 5,603,000 bushels, valued at $1,750,000. The principal cereal crop in 1909 was oats, the product of which was 3,503,000 bushels, grown on 100,000 acres and valued at $1,750,000. The wheat crop increased from 467,000 bushels in 1899 to 1,297,000 bushels in 1909, valued at $3,150,000. The product of Indian corn in 1909 was 140,000 bushels, grown on 5,000 acres and valued at $100,000.

The value of Wyoming's naturally rich mineral resources has been retarded by inadequate transport and by insufficient capital. The value of the state's mineral products in 1909 was $5,684,286. In 1902 and 1903, $4,953,341. In 1908 Wyoming ranked second among the states in the production of coal, in which the product output of bituminous coal. Other mineral products of the state are copper, gold, iron, petroleum, asbestos, soda, silver and lead, gypsum, stone and clay products. The original coal supply of the present mining industry is estimated at 424,085,000 short tons of the bituminous or sub-bituminous variety, this being second only to that for North Dakota, 500,000,000 short tons, which, however, is entirely lignite. Coal is found in thirteen counties, although it has been worked only in the counties of the southern half of the state. The largest producer has been the Union Pacific Railway, which in the state of Wyoming has mined more than 5,000,000 short tons.

The mining industry has been steadily and the product in 1908 was $4,896,920, valued at 7,062,974 tons, which were mined for several years before the largest product of coal (2,180,933) came from Sweetwater county, in the S.W. of the state, and Uinta county (adjacent Sweetwater) provided the second place. The following are the leading producers: Sheridan county, in the north-central part of the state. Carbon county, in the south-central part and Weston county in the N.E. were the next largest producers. The product of coal to the end of 1909 was 2,180,933 tons valued at $2,274,000.

The mining product next in value to coal in 1909 was copper, taken chiefly in Carbon county in a zone of brecciated quartzite underlying schist, the original ore being chalcopyrite, with possibly some pyrite, a secondary enrichment, which has produced important bodies of chalcocite in the upper workings, but these are replaced by chalcopyrite at greater depth. The production in 1908 was 2,471,197 lb. valued at $118,438. The gypsum product (from the Laramie plains) in 1908 was $1,188,000, valued at $94,035.

There are extensive deposits of petroleum and natural gas, which have become of commercial importance. Oil has been found in Albany county, New Mexico, and in a number of Wyoming counties, with natural gas in Sweetwater, Campbell, Fremont, Laramie, Albany, and Johnson counties. The Oil Trust is the largest producer.

There are many limited uses for gas and oil, but the most important are for the manufacture of illuminating gas and gasoline. The products are also used extensively in the refineries of the country.

There are sandstone deposits in Carbon county, which supplied the stone for the Capitol at Cheyenne and the state penitentiary; and from the iron mountain quarries in Laramie county was taken the white variety used in building the Carnegie Library and the Federal building in Cheyenne. Sandstones and quartzites were also quarried in 1902 in Albany, Crook and Uinta counties. Limestone occurs in thick formations near Lava Creek, and in the valley of the East Fork of the Green River, in Carbon county. Limestone is found in the counties of Albany, Crook, and Laramie. It is used for roads, pavements, and in the manufacture of cement. The county of Carbon produces the largest quantities of oil, the wells being partly gushers from which a heavy fuel oil is obtained. This is now being used by the Chicago & Northern Western Railroad Company on its lines, and it is also used in Omaha (Nebraska) by manufacturing establishments. There is a great variety in the grades of oils produced in the state, ranging from the heavy asphaltic oils of the Crook and Carbon counties to the cheap and low-grade oils of the Douglas field and in Buffalo county. The Wyoming producing oil fields are the principal source of supply for the entire United States, and the production of oil has been increasing rapidly.

The discovery of natural gas in the Douglas oil field has opened up new possibilities for the state. The use of natural gas for household purposes is a new development. The discovery of natural gas in this country is a great step forward in the use of this cheap and convenient fuel. The distance to be covered by a pipe line is not prohibitive, and the matter has been under consideration by the owners and lessees of the iron mines.

There are sandstone deposits in Carbon county, which supplied the stone for the Capitol at Cheyenne and the state penitentiary; and from the iron mountain quarries in Laramie county was taken the white variety used in building the Carnegie Library and the Federal building in Cheyenne. Sandstones and quartzites were also quarried in 1902 in Albany, Crook and Uinta counties. Limestone occurs in thick formations near Lava Creek, and in the valley of the East Fork of the Green River, in Carbon county. Limestone is used for roads, pavements, and in the manufacture of cement. The county of Carbon produces the largest quantities of oil, the wells being partly gushers from which a heavy fuel oil is obtained. This is now being used by the Chicago & Northern Western Railroad Company on its lines, and it is also used in Omaha (Nebraska) by manufacturing establishments. There is a great variety in the grades of oils produced in the state, ranging from the heavy asphaltic oils of the Crook and Carbon counties to the cheap and low-grade oils of the Douglas field and in Buffalo county. The Wyoming producing oil fields are the principal source of supply for the entire United States, and the production of oil has been increasing rapidly.

Irrigation.—The irrigable area of Wyoming is estimated at about 6,200,000 acres, lying chiefly in Bighorn, Sheridan and Johnson counties. The total number of acres classified as irrigable in these counties is 400,000. In 1907 the value of the irrigable acreage was $8,000,000. In 1908 Wyoming ranked second among the states in the production of irrigation projects. The acreage reclaimed in the state in 1908 was 50,000. In 1909 the value of the irrigation projects in the state was $8,000,000. In 1909 the value of the irrigation projects in the state was $8,000,000.
and a perpetual interest in the irrigation works. The principal undeveloped area of the Federal government is the Shoshone project in Bighorn county. This provides for a storage reservoir, controlled by Shoshone dam on Shoshone river, about 8 m. above Cody; a canal 23 m. long; and diversion works to convey water. Shoshone dam and covering lands in the vicinity of Cody, Corbett, Eagle Nest and Rakston; a dam at Corbett about 15 m. below the reservoir diverting water to Rakston reservoir and thence to lands in the vicinity of Corbett, Eagle Nest and Black Diamond. At Corbett a dam on the Shoshone river near Eagle Nest diverting water into a canal covering the lands of the Shoshone River Valley. This project was authorized in 1904; it will affect, when completed, $1,090,000 acres of land, and will provide $1,359,000 annually in irrigation property.

Near Douglas, in Converse county, there is a reinforced concrete dam, impounding the waters of Larpree Creek, to furnish water power to aid in mining and in smelting the metal in that vicinity.

There are large irrigated areas in Johnson and Sheridan counties.

Forests.—The woodland area of Wyoming in 1900 was estimated at 12,500 sq. m. (13% of the area of the state), of which the United States had reserved about 3500 sq. m. in the Yellowstone National Park and 9000 sq. m. in the Bighorn Mountains in the N., and the Medicine Bow Mountains in the S. E. of the state. The salable timber consists almost entirely of yellow pine, though there is a relatively small growth of other conifers and of hard-wood trees.

Manufactures.—Wyoming's manufacturing industries are relatively unimportant. In the period 1900-1905 the value of products manufactured increased by $1,238,835; the capital invested, from $2,047,883 to $2,635,896, and the number of establishments from 159 to 160; the average number of employees decreased from 1660 to 1034. In the same period (1900-1905), the value of the products of the manufactures decreased from $1,132,288 to $1,244,223, and the amount of capital invested increased from $871,531 to $986,615; but the value of the products of the state increased from $1,127,075 to $1,279,037, and the capital invested from $1,176,172 to $1,707,274. The manufactures of the state are relatively unimportant. The products of the principal industries in the state were: car and general shop construction and repairs by steam railway companies, $61,617; lumber and timber products, $246,433; flour and gist mill products, $283,653; butter, $114,354. Among other manufactures were gypsum wall-plaster, sash, and lath, malt liquors and tobacco, cigars and cigarettes.

Transportation.—There has been relatively little development of transport facilities in Wyoming. The railway mileage, which was only 450 m. in 1870, increased to 1902 m. in 1900, 1250 m. in 1905, and 1623 m. in 1909. The 1st of January, 1900, the Union Pacific railroad crossing the S. of the state, connects with the Oregon Short Line at Green river and extends both E. and S. from Cheyenne. The Colorado & Southern (controlled by the Chicago, Burlington & Quincy Railroad Company) extends N. from Cheyenne to Orin Junction, where it connects with the Chicago & North Western, which runs across the south-central part of the state as far as Lander (under the name of the Wyoming & NorthWestern railroad). Four branches of the same railroad extend from Lander to subdivide the state into districts. One extends from Cheyenne S.E. to Holdridge, Nebraska; the main line crosses the N.E. of the state to Billings, Montana, whence it extends across Wyoming as far as Reno, Nevada, while another branch from Alliance, Nebraska, extends to the iron mines at Guernsey. The Chicago, Burlington & Quincy was building in 1910 a new line from the N.W. to connect with the Colorado & Southern railroad. The Denver & Rio Grande, which completed to Orin Junction this will be a main through route from the Mexican Gulf to the N.W. Pacific coast. There are several shorter railways in the state, and various stage lines reach the more inaccessible regions.

Population.—The population in 1870 was 918; in 1880, 20,780; in 1890, 60,703; in 1900, 92,531; in 1910, 145,065. The density of population was 0·6 per sq. m. in 1890 and in 1880 and 1·5 per sq. m. in 1910, there being in this year only one state with a smaller average number of inhabitants to the sq. m., namely Nevada, with 0·7. Of the total population in 1900, 88,051, or 66·25%, were whites; 1666 were Indians; 450 were negroes; 401 were Chinese and 325 were Japanese. The Indians are all taxed. They belong to the Arapaho and Shoshoni tribes.

The Wind River Reservation, under the Shoshoni School, is in the central part of the state. There were 17,415 foreign-born in the state in 1900, of whom 2596 were English, 2146 Germans, 1727 Swedes, 1501 Irish, 1253 Scotch and 1220 Finns. Of the 41,093 persons of foreign parentage (i.e. having either or both parents of foreign birth) in that year 4973 were of English, 4571 of German, and 4482 of Irish parentage, i.e. on both the father's and the mother's side. Of the 75,116 born in the United States, 76,280 were of the same name (Chemung and Laramie), having a population in 1900 of more than 8000.

The Report of the Commissioner of Indian Affairs for 1909 gives 854 Arapaho and 816 Shoshoni under the Shoshoni School.

The people of Wyoming were 19,597 were natives of Wyoming, 6112 were born in Iowa, 5000 in Nebraska, 4923 in Illinois, 4412 in Missouri and 3750 in Utah. Among the chief numbers of religious denominations in 1890 the Roman Catholics, with 12,264 communicants, had the largest membership, followed by the Latter-day Saints, or Mormons, with 5211 communicants (21·8% of the total church membership for the state), the Protestant Episcopalians with 1741, the Methodists with 1612 and the Presbyterians with 984. The urban population (i.e. the population of places having 4000 inhabitants or more) increased from 18,978 in 1890 to 26,407 in 1900 or 47·5% of the urban being 28·8% of the total population in 1900. The semi-urban population (i.e. population of incorporated places, or the approximate equivalent, having fewer than 4000 inhabitants, but also having a hotel, public park, school, and a church) increased from 12,725, and the rural population (i.e. the population outside of incorporated places) increased from 29,567 to 53,149, which was 78·7% of the total increase. The principal cities of the state (with population) in 1900 were: Cheyenne, 14,687; Laramie, 8207; Rock Springs, 4563; Rawlins, 2137, and Evanston, 2110. After 1900 the population of the centre and N. of the state increased in proportion faster than the older settled portions in the S. In 1910 Sherman (5486) in Sheridan county, Douglas in Converse county and Lander in Fremont county were as important as any of the cities of the first quarter of the century.

Government.—Wyoming is governed under its first constitution, which was adopted in November 1889. An amendment may be proposed by either branch of the legislature. If it is approved by two-thirds of the members of each branch, it must be submitted to the people at the next general election and, if approved by a majority of the electors, then it becomes a part of the constitution. Whenever two-thirds of the members elected to each branch of the legislature vote for a convention to revise or amend the constitution and a majority of the people voting therein favor the addition of the convention, the legislature must provide for calling a State constitutional convention. All such amendments must be approved by both men and women, and the right to vote at a general election is given to all citizens of the United States who have attained the age of twenty-one years, are able to read the constitution, and have resided in the state one year and in the county sixty days immediately preceding, with the exception of idiots, insane persons, and persons convicted of an infamous crime; at a school election the voter must also own property on which taxes are paid. General elections are held biennially, in even-numbered years, the first Tuesday after the first Monday in November, and the first Monday in January of the following year.

Executive.—The governor is elected for a term of four years. He must be at least thirty years of age, and have resided in the state for five years next preceding his election. If the office becomes vacant during the term of a governor, the secretary of state, in the absence of a resident governor, may act as governor during the unexpired term. The governor is elected by the people of the state at the general election by direct vote without party labels. The electors of a county may in their county meeting at the first Monday in March select the electoral committee of the county to choose three qualified electors to vote for governor, and who shall unite and cast their votes at the first Monday in March of the following year. The governor receives a salary of $4000, plus $100 per day while in the discharge of his official duties.

Legislature.—The legislature consists of a Senate of 21 members, and a House of Representatives of 52 members. The numbers of representatives must not be less than twice nor more than three times the number of senators. One-half the senators and all the representatives are elected every two years. Both senators and representatives are apportioned among the several counties according to their population; each county, however, is entitled to at least one senator and one representative. The legislature meets biennially, in odd-numbered years, on the second Tuesday in January or on a day designated by the governor. Each regular session must not continue longer than forty days. All bills for raising a revenue must originate in the House of Representatives, but the Senate may propose amendments. The governor has three days (Sundays excepted) in which to veto any bill, and may return it with his objections to the house in which it originated; or, a two-thirds vote of the members elected to each house is required to override his veto.

Judiciary.—The administration of justice is vested principally in a supreme court, district courts, justices of the peace and municipal courts. The supreme court consists of three justices who are elected by the state at large for a term of eight years, and the one having the shortest term to serve is chief justice. The court has original jurisdiction in all cases, both civil and criminal, involving property or personal injury of more than $1000. The state is divided into 13 judicial districts, and each district is represented by a court of general jurisdiction, in which are heard all cases involving property or personal injury under the jurisdiction of the state, and in which are tried all cases involving the constitutionality of state laws or acts. There is a circuit court in each judicial district. The circuit court is the court of general jurisdiction in cases involving the validity of acts of the United States, of the state, or of any county or municipal corporation. It has jurisdiction in all cases involving the constitutionality of state laws or acts. It has appellate jurisdiction from the circuit courts of the United States. It has all such jurisdiction as is conferred on it by the United States.
jurisdiction in quo warranto and mandamus proceedings against state officers and in habeas corpus cases, general appellate jurisdiction, and a superintending control over the inferior courts. It holds two terms annually, at the capital, one beginning the first Monday in April and one the third Monday in October, in the years 1876 and thereafter, the four judicial districts, and in each of these a district judge is elected for a term of eight years. The district courts have original jurisdiction in all actions and matters not expressly vested in some other court, subject to an appeal to the supreme court in the state. Justices of the peace, one of whom is elected biennially in each precinct, have jurisdiction in civil actions in which the amount in controversy does not exceed $500, in misdemeanors and in the regulation of public peace. They are not involved, and in criminal actions less than a felony and in which the punishment prescribed by law does not exceed a fine of $100 and imprisonment for six months. Each incorporated city or town has a municipal court for the trial of offenses arising under its ordinances.

Local Government.—A board of three commissioners is elected in each county, one for four years and one for two years at each biennial election, which divides the county into townships, builds and repairs the county buildings, apportions and orders the levying of taxes, and establishes the election precincts. The other county officers are a treasurer, a clerk, an attorney, a surveyor, a sheriff, a coroner and a superintendent of schools, each elected for a term of two years. A justice of the peace and a constable are elected for and by each precinct. Cities and towns are incorporated under local laws.

Miscellaneous Laws.—A married woman may hold, acquire, manage and convey property and carry on business independently of her husband. When a husband or a wife dies intestate one-half of the estate is acquired by each as a survivor; if there are no children or descendants of any child three-fourths of it goes to the survivor; if there are no children or descendants of any child and the estate of the deceased was not $10,000 the survivor has a life interest in one-half of the estate; if it goes over $10,000 it goes to the survivor with the entire interest. The causes for a divorce are adultery, incompetency, conviction of a felony and sentence to imprison therefrom after marriage, conviction of a felony or infamous crime before marriage provided it was unknown to the other party, habitual drunkenness, extreme cruelty, intolerable indignities, neglect of the husband to provide the common necessaries of life, vagrancy of the husband and pregnancy of the wife, before marriage, and not more than one hundred dollars of the husband set aside without his knowledge. The plaintiff must reside in the state for one year immediately preceding his or her application for a divorce unless the parties were married in the state and the applicant has resided there since the marriage. Neither party is permitted to marry a third party until one year after the divorce has been granted. The desertion of a wife or of children under fifteen years of age is a felony punishable with imprisonment for not more than three years or less than one year. The homestead of a household who is the head of a family or of any resident of the state who has attained the age of sixty years is exempt, to the value of $500, or the excess of land, from execution and attachment arising out of any debt, contract or civil obligation other than taxes, purchase money or improvements, so long as it is occupied by the owner or his or her family, and the exemption inures for the benefit of a widow with minor children. If the homestead is married it can be alienated only with the consent of both husband and wife. The family Bible, school books, a lot in a burying-ground and $500 worth of personal property are likewise exempt to any person who is the legal owner thereof. A laundress, a laundress or a laborer in works for the reduction of ores is limited to eight hours except in cases of emergency where life or property is in imminent danger. The sale of intoxicating liquors is licensed only in incorporated cities and towns.

Charities and Corrections.—The state charitable and penal institutions consist of the Wyoming General Hospital at Rock Springs, with one branch at Sheridan and another branch at Casper; the Big Horn Hot Springs at Thermopolis, the Wyoming State Hospital for the Insane at Evanston, the Wyoming Home for the Feeble-minded at Laramie, Wyoming State Penitentiary at Rawlins, and the State Penitentiary at Rawlins. The general supervision and control of all these institutions is vested in the Board of Charities and Reform, consisting of the governor, the secretary of state, the treasurer, the auditor, and the superintendent of public instruction; the same officers also constitute the Board of Parcels. Convicts other than those for life are sentenced to the penitentiary for a maximum and a minimum term, and when one has served one-sixth of the term the governor or the majority of the board of parole, if he is the governor, may release him on parole, but he may be returned to prison at any time upon the request of the Board of Parcels. The Board of Charities and Reform, in addition to the common schools in the United States, is vested in the superintendent of public instruction, county superintendents and district boards. Whenever 100 freeholders request it, the county commissioners must submit to the voters of a precinct a proposition to authorize the construction or the maintenance of a common school district, and each precinct giving a majority vote for it constitutes a part of such a district for establishing and maintaining a high school. All children between seven and fourteen years of age must attend a public, parochial or parochial school during the entire time that the public school of their district is in session unless excused by

the district board. The common schools are maintained with the proceeds of school taxes and an annual income from school funds which are derived principally from lands. At the head of the educational system is the University of Wyoming (1886), at Laramie (q.v.); it is supported by a board of trustees consisting of its president, the superintendent of public instruction, and nine other members appointed by the governor with the concurrence of the Senate for a term of six years. It is maintained with the proceeds from funds held for any other purpose than obtaining a water supply in 1909 to one-half million on a dollar.

Finance.—The principal sources of revenue are a general property tax, a tax on the profits of corporations, a tax on the gross products of mines, an inheritance tax, a poll tax, a tax on monopolies, for the sale of liquor licences. Railways, telegraph lines and mines are assessed by the state board of equalization, which consists of the secretary of state, the auditor and the superintendent of public instruction, and the county assessors. The county commissioners constitute the county board of equalization. A commissioner of taxation who is appointed by the governor with the concurrence of the Senate for a term of four years exercises a general supervision over all tax officers and the boards of equalization. By a law enacted in 1909 county commissioners are forbidden to levy a tax which will yield more than 10 per cent. of the gross income for the year, and which exceeds the preceding year. The constitution limits the state tax for other than the support of educational and charitable institutions and the payment of the state debt and the interest thereon to four mills on the dollar; the county tax for other than the support of the county debt and the interest thereon to twelve mills on the dollar; the tax of an incorporated city or town for other than the payment of its debt and the interest thereon to eight mills on the dollar. The constitution also forbids the creation of any debt for the construction of schools, the payment of the taxable property in the state; of a county debt in excess of 2 per cent. of the assessed value of the taxable property in the county; or of a county debt in excess of $100 for any purpose. It provides that no county, city or town, or any one or more of them, may be authorized to enter into contracts for the purchase of improvements in excess of 2 per cent. unless for building sewerage, when a debt of 4 per cent. may be authorized. Wyoming entered the Union with a bonded indebtedness of $350,000. This has been reduced as rapidly as the taxes permit, and on the 30th of June 1910 the debt was only $140,000.

History.—Spanish historians have claimed that adventurers from the Spanish settlements in the S. penetrated almost to the Missouri river during the first half of the 17th century and even formed settlements within the present limits of Wyoming, but these stories are more than doubtful. The first white men certainly known to have traversed the region were Sieur de la Verendrye and his sons, who working down from Canada spent a part of the year 1724-1744 in examining the possibilities of the fur trade. Apparently no further French explorations were made from that direction, and the transfer of Canada from France to Great Britain (1763) was followed by lessened interest in exploration. The expedition of Meriwether Lewis and William Clark in 1804-1806 did not touch the region, but a discharged member of the party, John Colter, in 1807 discovered the Yellowstone Park region and then crossed the Rocky Mountains to the head of Green river. Trappers began to cover the N. portion about the same time, and in 1811 the overland party of the Pacific Fur Company crossed the country on their way to Astoria. In 1824 William H. Ashley with a considerable party explored and trapped in the Sweetwater and Green river valleys, and in 1836 wagons were driven from St. Louis to Wind river for the Rocky Mountain Fur Company. Captain B. L. E. Bonneville was the first to cross the Rockies with wagons (1832), and two years later Fort Laramie, near the mouth of the Laramie river, was established to control the fur trade of the Arapahoes, Cheyennes and Sioux.

The United States exploring expedition, commanded by John Charles Frémont, explored the Wind River Mountains and the South Pass in 1842, under the guidance of Kit Carson. From this time the favourite route to the Pacific led through Wyoming; but of all the thousands who passed few or none settled permanently within the present limits of the state, partly because of the aridity of the land and partly because of the pronounced hostility of the Indians. For the latter reason the National Congress on the 19th of May 1846 authorized the construction at intervals along the trail of military stations for the protection of the emigrant trains, and Fort Kearny was established (1848) and Fort Laramie was purchased (1849). The great

1 See Washington Irving, Adventures of Captain Bonneville (New York, 1806).

Mormon migration passed along the trail in 1847-1849, and in 1853 fifty-five Mormons settled on Green river at the trading post of James Bridge, which they purchased and named Fort Supply. This S.W. corner of the present state was at that time a part of Utah. With the approach of United States troops under Albert Sidney Johnston in 1857, Fort Supply was abandoned, and in the next year the Mormon settlers retired to Salt Lake City, again leaving the region almost without permanent inhabitants. After the Civil War, in 1861, a considerable portion of the garrison of Fort Laramie was killed in 1854 and there was trouble for more than twenty years. During the Civil War (1861-1865) the Indians were especially bold as they realized that the Federal troops were needed elsewhere. Meanwhile, there began a considerable migration to Montana, and the protection of the N. of the trail demanded the construction of posts, of which the most important were Fort Reno, on the Powder river, and Fort Phil Kearny in the Bighorn Mountains. In spite of the treaty allowing the opening of the road, during a period of six months fifty-one hostile demonstrations were made, and on the 21st of December 1866 Captain W. J. Fetterman and seventy-eight men from Fort Phil Kearny were ambushed and slain. Hostilities continued in 1867, but the troops were harried on account of the scarcity of cavalry. Congress in 1868 sent a special survey party to determine the boundary, and when the surveyors (29th April, at Fort Laramie) were any terms agreed upon. The posts on the Montana trail were abandoned, and the Indians agreed to remove farther E. and to cease attacking trains, not to oppose railway construction.  

The territory N. of the Platte river and E. of the Bighorn Mountains was to be reserved as an Indian hunting ground, and no white men were to settle on it without the consent of the Indians. Gold was discovered on the Sweetwater river in 1867, and a large influx of population followed. This unorganized territory E. of the Rocky Mountains was a part of Dakota, and in January 1868, Carter (late Sweetwater) county was erected. Farther E. Cheyenne was laid out by the Union Pacific Railroad (July 1867), a city government was established in August, newspapers began publication, and Laramie county was organized before the arrival of the first railway train on the 13th of November 1867. About six thousand persons spent the winter in Cheyenne, and disorder was checked only by the organization of a vigilance committee. Almost the same scenes followed the laying off of Laramie in April 1868, when 400 lots were sold during the first week and 300 habitations were erected within a fortnight. Albany and Carbon counties were organized farther W. in the same year.  

A bill to organize the Territory of Wyoming had been introduced into Congress in 1865, and in 1867 the voters of Laramie county had chosen a delegate to Congress. He was not permitted to take a seat, but his presence in Washington hastened action, and on the 23rd of July 1868 the act of Congress establishing a Territory with the present boundaries was approved by President Andrew Johnson. The portion of the Territory E. of the Rocky Mountains was taken from Dakota and that W. from Utah and Idaho, and included parts of the three great additions to the original territory of the United States. That portion E. of the mountains was a part of the Louisiana Purchase (1803), the W. portion above 42° was a part of the Oregon country, and that S. of that parallel came by the Mexican cession of 1848. The first governor, John A. Campbell, was appointed in April 1869, and the organization of the Territory was completed in May of the same year. At the first election, on the 2nd of September 1869, 526 votes were cast. The legislature established the seat of government at Cheyenne, and granted full suffrage and the right of holding office to women. The first great influx of population, following the discovery of gold and the opening of the railway, brought many desperate characters, who were held in check by the stern, swift measures of frontier justice. After the organization of the Territory, except for the appearance of organized bands of highwaymen in 1877-1879, there was little turbulence, in marked contrast with conditions in some of the neighbouring Territories. Agriculture began in the narrow but fertile river valleys, and stock-raising became an important industry, as the native grasses are especially nutritious. The history of the Territory was marked by few striking events other than Indian troubles. The N.E. of the Territory as has been already said, had been set apart (1868) as a hunting ground for the Sioux Indians, but the rumour of the discovery of gold in the Black Hills and the Bighorn Mountains in 1874-1875 caused a rush to the region which the military seemed powerless to prevent. The resentful Indians resorted to war. After a long and arduous contest in Wyoming, Montana and Dakota, which lasted from 1874 to 1879, and during which General George A. Custer (q.v.) and his command were killed in 1876 on the Little Bighorn in Montana, the Indians were thoroughly subdued and confined to reservations. The settlers in Wyoming shared the general antipathy to the Chinese, common to the western country.  

The Territory increased in population and more rapidly in wealth, owing chiefly to the large profits in cattle raising, though the winter of 1886-1887 was severe. The growth of the population, was rapid, and by 1879, when nearly three-fourths of the range cattle died of exposure. Agitation for statehood increased, and on the 30th of September 1889 a constitution was formed which was adopted by the people in November of the same year. The Constitution, which continued the Territorial provision of full suffrage for women, met the approval of Congress, and on the 14th of July 1890 Wyoming was formally admitted as a state. Since admission the progress of the state has been steady. Extensive irrigation projects have made available many thousand acres of fertile land, and much more will be subjected to cultivation in the future. The large ranges are broken up into smaller tracts. In some sections a system of dry-farming, by which the scanty rainfall is protected from evaporation by deep ploughing and mulching the soil, has proved profitable. The transition of the principal stock-raising industry from large herds of cattle to small, and the utilization of the ranges for sheep grazing almost exclusively covered a period of over twenty years preceding 1910, during which time many conflicts occurred between range cattle-owners and sheep flockmasters over the use of the grazing grounds. The settler also, who selected his homeplace, preferred to use only watering places, so as to keep the ranges as free as possible, came into conflict with the cattlemen. Some of these small settlers owned no cattle, and subsisted by stealing calves and unbranded cattle (mavericks) belonging to the range cattlemen. In parts of the state it became impossible to get a jury composed of these small squatters to convict anybody for stealing or killing cattle, and so had this become that, in 1892, certain cattlemen formed a small army of mounted men and invaded the central part of the state with the avowed intention of killing all the men generally considered to be stock thieves, an episode known as the Johnson County Raid. This armed body, consisting of over fifty men, surrounded a log cabin and shot down two of the supposed cattle "rustlers," the latter defending themselves bravely. The country round was roused and large numbers of settlers and others turned out and besieged the cattlemen, who had taken refuge in some ranch buildings. Their case was becoming desperate when a troop of Federal cavalry arrived, raised the siege, and took the cattlemen back to Cheyenne as prisoners. They were subsequently held for murder, but were finally released without trial. Since that time experience has proved that the grazing ranges of the state are better suited to sheep than cattle, the former being much more profitable and better able to suffer the cold on the open range.
While many cattlemen have been driven out of business by the encroachments of sheep, the majority of the present flockmasters were range cattle owners in the past and have changed to the more profitable occupation. At the present time serious collisions between sheep and cattle owners are rare. There are still many cattle in the state, but they are divided up into small herds, no longer depending upon the open range for a precarious subsistence during the winter, but are sheltered and fed during the snowiest days. The breed of cattle are far superior now to the old range stock, so that it pays to take care of them; many thousands are fed during the winter on alfalfa hay.

**GOVERNORS OF WYOMING**

**Territorial.**

- John A. Campbell, 1869-1875
- John M. Thayer, 1875-1878
- John W. Hoar, 1878-1882
- William Hale, 1882-1885
- Francis E. Warren, 1885-1886
- George W. Baxter (acting), 1886-1887
- W. W. Moonlight, 1887-1888
- Francis E. Warren, 1889-1890
- John H. Plunket, 1890-1892
- J. E. Osborne, 1892-1895
- W. A. Richards, 1895-1899
- J. A. Forney, 1899-1903
- Pinmonne Carroll (acting), 1903-1904
- Bryant B. Brooks, 1905-1909

**State.**

- Francis E. Warren, Republican, 1909-1912
- Amy W. Baxter (acting), 1912-1913
- J. E. Osborne, Democratic, 1913-1915
- W. A. Richards, Republican, 1915-1919
- De Forest Richards, Republican, 1919-1923
- Prentice Clifton (acting), 1923-1924
- Bryant B. Brooks, 1925-1927
- J. M. Carey, Democrat, 1927-1931

**WYOMING VALLEY,** a valley on the N. branch of the Susquehanna river, in Luzerne county, Pennsylvania, U.S.A. Its name is a corruption of a Delaware Indian word meaning "large plains." The valley, properly speaking, is about 33 m. wide and about 25 m. long, but the term is sometimes used historically in a broader sense to include all of the territory in the N.E. of the state once in dispute between Pennsylvania and Connecticut. In Connecticut the Susquehanna Land Company was formed in 1753 to colonize the valley, and the Delaware Land Company was formed in 1754 for the territory immediately W. of the Delaware river. The rights of the Six Nations to all this territory were purchased at Albany, New York, by the Susquehanna Company in 1754, but the work of colonization was delayed for a time by the Seven Years' War. A few colonists sent out by the Susquehanna Company settled at Mill Creek near the present site of Wilkes-Barre in 1765, but were (October 1766) attacked and driven away by the Indians. In December 1768 the company divided a part of the valley into five townships of 5 sq. m. each, granting to forty proprietors the choice of one of these on condition that they should take possession of it by the 1st of February 1769, and the other four townships to 200 settlers on condition that they should follow by the 1st of May. The first group arrived on the 8th of February, the first division of the larger body on the 14th of May, and the five original towns of Wilkes-Barre (q.v.), Kingston (q.v.), Hanover, Plymouth and Pittston were soon founded.

In the meantime the Six Nations (in 1768) had repudiated their sale of the region to the Susquehanna Company and had sold it to the Penns; the Penns had erected here the manors of Stoke and Sunbury, the government of Pennsylvania had commissioned Charles Stewart, Amos Ogden and others to lay out these manors, and they had arrived and taken possession of the block-house and forts at Mill Creek in January 1769. The conflict which followed between the Pennsylvania and the Connecticut settlers is known as the first Pennamite-Yankeeh War. Although defeated in the early stages of the conflict, the Yankees or Connecticut settlers finally rallied in August 1771 and compelled the Pennsylvanians to retreat, and the war terminated with the defeat of Colonel William Plunket (1770-1791) and about 700 Pennsylvanians by a force of 300 Yankees under Colonel Zebulon Butler (1732-1795) in the battle of "Rampart Rocks" on the 25th of December 1772. The General Assembly of Connecticut, in January 1773, in the independent township of Westmoreland and attached it to Litchfield county in October 1776 the same body erected it into Westmoreland county. On the 3rd of July 1778, while a considerable number of the able-bodied men were absent in the Connecticut service, a motley force of about 400 men and boys under Colonel Zebulon Butler were attacked and defeated near Kingston in the "battle of Wyoming" by about 1100 British, Provincial (Tory) and Indian troops under Major John Butler, and nearly three-fourths were killed or taken prisoners and subsequently massacred. Thomas Campbell's poem, *Gertrude of Wyoming* (1809), is based on this episode, various liberties being taken with the facts. As the War of Independence came to a close the old trouble with Pennsylvania was revived. A court of arbitration appointed by the Continental Congress met at Trenton, New Jersey, in 1782, and on December 30th gave a unanimous decision in favour of Pennsylvania. The refusal of the Pennsylvania government to confirm the private land titles of the settlers, and the arbitrary conduct of a certain Alexander Patterson whom they sent up to take charge of affairs, resulted in 1784 in the outbreak of the second Pennamite-Yankeeh War. The Yankees were dispossessed, but they took up arms and the government of Pennsylvania despatched General John Armstrong with a force of 400 men to aid Patterson. Armstrong induced both parties to give up their arms with a promise of impartial justice and protection, and as soon as the Yankees were defenceless he made them prisoners. This treachery and the harsh treatment by Patterson created a strong public opinion in favour of the Yankees, and the government was compelled to adopt a milder policy. Patterson was withdrawn, the disputed territory was restored to the Penns, but the new land titles were confirmed (1785), and Colonel Timothy Pickering (q.v.) was commissioned to organize the new county and to effect a reconciliation. But a few of the settlers under the lead of Colonel John Franklin (1749-1831) attempted to form a separate state government. Franklin was seized and imprisoned, under a warrant from the State Supreme Court. As Pickering was held responsible for Franklin's imprisonment, some of Franklin's followers in retaliation kidnapped Pickering and carrying him into the woods, tried in vain for nearly three weeks to get him to promise to intercede for Franklin's pardon. The trouble was again revived by the repeal in 1790 of the confirming act.

1 In place of De Forest Richards, deceased.

2 Several Scotch-Irish families from Lancaster county, Pennsylvania, accepted Connecticut titles and settled at Hanover under Captain Lazarus Stewart.
of 1759 and by a subsequent decision of the United States Circuit Court, unfavourable to the Yankees, in the case of *Van Horn versus Dorrance*. All of the claims were finally confirmed, by a series of statutes passed in 1790, 1802 and 1807. Since 1808, mainly through the development of its coal mines (see Pittston, Pa.), the valley has made remarkable progress both in wealth and in population.

**WYON, THOMAS** (1792-1817), English medallist, was born at Birmingham. He was apprenticed to his father, the chief engraver of the king's seals, and studied in the schools of the Royal Academy, London, where he gained silver medals in both the architecture and the life class; he also obtained a gold medal, from the Society of Arts. He was appointed probationary engraver to the mint in 1814, and soon after engraved his medal commemorative of the peace, and his Manchester Pitt medal. In 1816 he was appointed chief engraver to the mint. His younger brother, Benjamin Wyon (1802-1858), his nephews, Joseph Shepherd Wyon (1836-1873) and Alfred Benjamin Wyon (1837-1884), and his cousin, William Wyon (1793-1851), were also distinguished medallists.

**WYSE, SIR THOMAS** (1791-1863), Irish politician, belonged to a family of Irish descent. He was a Devon man, Andrew Wyse, who is said to have crossed over to Ireland during the reign of Henry II. and obtained lands near Waterford, of which city thirty-three members of the family are said to have been mayors or other municipal officers. From the Reformation the family had been consistently attached to the Roman Catholic Church. Thomas Wyse was educated at Stonyhurst College and at Trinity College, Dublin, where he distinguished himself as a scholar. After 1816 he passed some years in travel, visiting Italy, Greece, Egypt and Palestine. In 1821 he married Laetitia (d. 1873), daughter of Lucien Buonaparte, and after residing for a time at Viterbo he returned to Ireland in 1825, having by this time inherited the family estates. He now devoted his great oratorical and other talents to forwarding the cause of Roman Catholic emancipation, and his influence was specially marked in his own county of Waterford, while his standing among his associates was shown by his being chosen to write the address to the people of England. In 1830, after the passing of the Roman Catholic Relief Act, he was returned to parliament for county Tipperary, and he attached himself to the Liberal party and voted for the great measures of the reform era. But he was especially anxious to secure some improvement in the education of the Irish people, and some of his proposals were accepted by Mr E. G. Stanley, afterwards 14th earl of Derby, and the government. He was chairman of a committee which inquired into the condition of education in Ireland, and it was partly owing to his efforts that provincial colleges were established at Cork, Galway and Belfast. His work as an educational pioneer also bore fruit in England, where the principles of state control and inspection, for which he had fought, were adopted, and where a training college for teachers at Battersea was established on his lines. From 1840 to 1847 he was chairman of the committee for the city of Waterford and from 1839 to 1841 he was a lord of the treasury; from 1846 to 1849 he was secretary to the board of control, and in 1849 he was sent as British minister to Greece. He was very successful in his diplomacy, and he showed a great interest in the educational and other internal affairs of Greece. In 1857 he was made a K.C.B., and he died at Athens on the 16th of April 1862. Wyse wrote *Historical Sketch of the Late Catholic Association of Ireland* (1839); *An Excursion in the Peloponnese* (1838, new ed. 1856); and *Impressions of Greece* (1871). His two sons shared his literary life. They were Napoleon Alfred Bonaparte Wyse (1822-1893); and William Charles Bonaparte Wyse (1826-1892), a student of the dialect of Provence.

**WYTENBACH, DANIEL ALBERT** (1746-1829), German-Swiss classical scholar, was born at Bern, of a family whose nobility and distinction he loved to recall. In particular, he was proud of his descent from Thomas Wytenbach, professor of theology in Basel at the end of the 15th and beginning of the 16th century, who numbered the Reformer Zwingli and other distinguished men among his pupils. Wytenbach's own father was also a theological professor of considerable note, first at Bern, and then at Marburg. His removal to Marburg, which took place in 1536, was partly due to old associations, for he had studied there under the famous Christian Wolff, and embodied the philosophical principles of his master in his own theological teaching. Young Wytenbach entered at the age of fourteen the university of Marburg, and passed through a four years' course there. His parents intended that he should become a Lutheran pastor. The first two years were given up to general education, principally to mathematics, "philology," philosophy and history. The professor of mathematics, Spangenberg, from his great influence on young Wytenbach. He is entirely have taught his subject with great clearness, and with equal seriousness and piety, often referring to God as the supreme mathematician, who had constructed all things by number, measure and weight. "Philology" in the German universities of that age meant Hebrew and Greek. These two languages were generally handled by the same professor, and were taught almost solely to theological students. Wytenbach's university course at Marburg was troubled about the middle of the time by mental unrest, due to the fascination exercised over him by Thomas Bayes's "Preliminary Discourse." The disorder was cured by Spangenberg. The principal study of the third year was metaphysics, which took Wytenbach entirely captive. The fourth and last year was to be devoted to theology and Christian dogma. Wytenbach had hitherto submitted passively to his father's wishes concerning his career, in the hope that some unexpected occurrence might set him free. But he now turned away from theological lectures, and privately devoted his time to the task of deepening and extending his knowledge of Greek literature. He possessed at the time, as he tells us, no more acquaintance with Greek than his own pupils at a later time could acquire from him during four months' study. He was almost entirely without equipment beyond the bare texts of the authors. But Wytenbach was undaunted, and four years' persistent study gave him a knowledge of Greek such as few Germans of that time possessed. His love for philosophy carried him towards the Greek philosophers, especially Plato. During this period Ruhnken's notes on the Platonic lexicon of *Timaeus* fell into his hands. Ruhnken was for him almost a superhuman being, whom he worshipped day and night, and with whom he imagined himself as holding converse in the spirit. When Wytenbach was Swanenburg's assistant he determined to prepare a grammar of Greek, and another on receipt of the tract, in which the great scholar declared that he had not looked to find in Germany such knowledge of Greek, such power of criticism, and such mature judgment, especially in so young. By Heyne's advice, he worked hard at Latin, which he knew far less thoroughly than Greek, and we soon find Heyne praising his progress in Latin style to both Ruhnken and Valckenair. He now wrote to ask their advice about his scheme of coming to the Netherlands to follow the profession of a scholar. Ruhnken strongly exhorted Wytenbach to follow his own example, for he too had been designed by his parents for the Christian ministry in Germany, but had settled at Leiden on the invitation of Hemsterhuis. Valckenair's answer was to the same effect, but he added that Wytenbach's letter would have been pleasanter to him had it been free from excessive compliments. These letters were
forwarded to the elder Wyttenbach, with a strong recommendation from Heyne. The old man had been himself in Leiden in his youth, and entertained an admiration for the scholarship of the Netherlands; so his consent was easily won. Young Wyttenbach reached Leiden in 1770. A year was spent with great contentment; in learning the language of the people, in attending the lectures of the great "daumviri" of Leiden, and in collating MSS. of Plutarch. At the end of 1771 a professor was wanted at Amsterdam for the College of the Remonstrants. By the recommendation of Ruhnken, Wyttenbach obtained the chair, which he filled with great success for eight years. His lectures took a wide range. Those on Greek were repeated also to the students of the university of Amsterdam (the "Athenaeum"). In 1775 a visit was made to Paris, which was fruitful both of new friendships and of progress in study. About this time, on the advice of Ruhnken, Wyttenbach began the issue of his Bibliotheca critica, which appeared at intervals for the next thirty years. The methods of criticism employed were in the main those established by Hemsterhuis, and carried on by Valckenaer and Ruhnken, and the publication met with acceptance from the learned all over Europe. In 1777 the younger Burmann ("Burmannus Secundus") retired from his professorship at the Athenaeum, and Wyttenbach hoped to succeed him. When another received the appointment, he was sorely discouraged. Only his regard for Ruhnken and for Dutch freedom (in his own words "Ruhnkeni et Batavae libertatis cogitatio") kept him in Holland. For fear of losing him, the authorities at Amsterdam nominated him in 1779 professor of philosophy. In 1783 Toll, Burmann's successor, resigned, and Wyttenbach was at once appointed to succeed him. His full title was "professor of history and eloquence and Greek and Latin literature." He had hardly got to work in his new office when Valckenaer died, and he received a call to Leiden. Greatly to Ruhnken's disappointment, he declined to abandon the duties he had so recently undertaken. In 1787 began the internal commotions in Holland, afterwards to be aggravated by foreign interference. Scarcely during the remaining thirty-three years of Wyttenbach's life was there a moment of peace in the land.

About this time two requests were made to him for an edition of the Moralia of Plutarch, for which a recension of the tract De sera numinis vindicia had marked him out in the eyes of scholars. One request came from the famous "Societas Bipontina," the other from the delegates of the Clarendon Press at Oxford. Wyttenbach, influenced at once by the reputation of the university, and by the liberality of the Oxonians in tendering him assistance of different kinds, declined the offer of the Bipontine Society,—very fortunately, since their press was soon destroyed by the French. The fortunes of Wyttenbach's edition curiously illustrate the text "habent una fata libelli." The first portion was safely conveyed to Oxford in 1794. Then war broke out between Holland and Great Britain. Randolph, Wyttenbach's Oxford correspondent, advised that the next portion should be sent through the British ambassador at Hamburg, and the MS. was duly consigned to him "in a little chest well protected by pitch." After sending Randolph a number of letters without getting any answer, Wyttenbach in disgust put all thought of the edition from him, but at last the missing box was discovered in a forgotten corner at Hamburg, where it had lain for two years and a half. The work was finally completed in 1805. Meanwhile Wyttenbach received invitations from his native city Bern, and from Leiden, where vacancies had been created by the refusal of professors to swear allegiance to the new Dutch republic set up in 1795, to which Wyttenbach had made submission. But he only left Amsterdam in 1799, when on Ruhnken's death he succeeded him at Leiden. Even then his chief object in removing was to facilitate an arrangement by which the necessities of his old master's family might be relieved. His removal came too late in life, and he was not so happy at Leiden as he had been at Amsterdam. Before long appeared the ever-delightful Life of David Ruhnken. Though written in Latin, this biography deserves to rank high in the modern literature of its class. Of Wyttenbach's life at Leiden there is little to tell. The continual changes in state affairs greatly disorganized the universities of Holland, and Wyttenbach had to work in face of much detraction; still, his success as a teacher was very great. In 1805 he narrowly escaped with his life from the great gunpowder explosion, which killed 150 people, among them the Greek scholar Lucaz, Wyttenbach's colleague in the university. One of Wyttenbach's letters gives a vivid account of the disaster. During the last years of his life he suffered severely from illness and became nearly blind. After the conclusion of his edition of Plutarch's Moralia in 1805, the only important work he was able to publish was his well-known edition of Plato's Phædo. Many honours were conferred upon him both at home and abroad, and in particular he was made a member of the French Institute. Shortly before his death, he obtained the licence of the king of Holland to marry his sister's daughter, Johanna Gallien, who had for twenty years devoted herself to him as housekeeper, secretary and aid her in his studies. The sole object of the marriage was to secure for her a better provision after her husband's death, because as the widow of a professor she would be entitled to a pension. Johanna Gallien was a woman of remarkable culture and ability, and wrote works held in great repute at that time. On the festival of the tercentenary of the foundation of the university of Marburg, celebrated in 1827, the degree of doctor was conferred upon her. Wyttenbach died of apoplexy in 1820, and he was buried in the garden of his country house near Amsterdam, which stood, as he noted, within sight of the dwellings of Descartes and Boerhaave.

Although his work can hardly be set on the same level as that of Hemsterhuis, Valckenaer and Ruhnken, yet he was a very eminent exponent of the sound methods of criticism which they established. These four men, more than any others after Bentley, laid the foundations of modern Greek scholarship. The precise study of grammar, syntax and style, and the careful criticism of texts by the light of the best manuscript evidence, were upheld by these scholars in the Netherlands when they were almost entirely neglected elsewhere on the Continent, and were only pursued with partial success in England. Wyttenbach may fairly be regarded as closing a great period in the history of scholarship. He lived indeed to see the new birth of German classical learning; but his work was done, and he was unburied. Wyttenbach's criticism was less rigorous, precise and masterly, but perhaps more honest and less affected than that of his great predecessors in the Netherlands. In actual acquaintance with the philosophical writings of the ancients, he has probably never been surpassed. In character he was upright and simple-minded, but shy and retiring, and often failed to make himself appreciated. His life was not passed without strife, but his few friends were warmly attached to him, and his many pupils were for the most part his enthusiastic admirers. Wyttenbach's biography was written in a somewhat dry and lifeless manner by Mahne, one of his pupils, who also published some of his letters. His Opuscula, other than those published in the Bibliotheca critica, were collected in two volumes (Leiden, 1823).

**WYVERN** or **WIVERN**, the name of an heraldic monster, with the forepart of a winged dragon and the hind part of a serpent or lizard (see Heraldry). The earlier spelling of the word was **wyre** or **wriere**; O. Eng. **wyre**; O. Fr. **wivre**, mod. **givre**. It is a doublet of **"viper,**" with an exessent **n, as in "bittern,** M. Eng. **bilore**.
the twenty-fourth letter of the English alphabet. Its position and form are derived from the Latin alphabet, which received them from the Western Greek alphabet. The alphabet of the Western Greeks, differed from the Ionic, which is the Greek alphabet now in general use, by the shape and position of X and of some other consonants. The Ionic alphabet placed X (ξ) immediately after N and, in the oldest records, in the form ξ, from which the ordinary Greek capital Ξ was developed. The position and shape of this symbol show clearly that it was taken from the Semitic Semekh, which on the Moabitite stone appears as ꝏ. Why the Greeks attached this value to the symbol is not clear; in Semitic the symbol indicates the ordinary x. Still less clear is the origin of the form X, which in the Ionic alphabet stands for χ (k followed by a breath). In a very ancient alphabet on a small vase found in 1882 at Formello near the ancient Veii in Etruria, a symbol appears after N consisting of three horizontal and three vertical lines, Ξ. From this it has been suggested that both forms of the Greek x are derived, Ξ by removing the vertical lines, X in its earliest form + by removing the four marginal lines. The Ionic symbol, however, corresponds closely to the earliest Phoenician, so that this theory is not very plausible for Ξ, and there are various other possibilities for the development of X (see Alphabet). This symbol appears in the very early Latin inscriptions found in the Roman Forum in 1893 as ♢. In its usual value as ks is superfluous. In the Ionic alphabet it was useful, because there it represented a single sound, which before the invention of the symbol had to be represented by kh. In the alphabet in use officially at Athens before 403 B.C. x was written by χς (khs). In English there is an interesting variation of pronunciation in many words according to the position of the accent: if the accent precedes, x is pronounced ks; if it follows, x is pronounced ge: compare exit (eskit) with exact (egeat).

The symbol X was used both by the Romans and the Etruscans for the numeral 10. Whichborrowed from the other is uncertain, but the Etruscans did not use X as part of their alphabet. X with a horizontal line over it was used for 10,000, and when a line on each side was added, Ξ, for a million.

(Xanthium) XANTHINE, the wife of Socrates (q.v.). Her name has become proverbial in the sense of a nagging, quarrelsome woman. Attempts have been made to show that she has been malignantly, notably by E. Zeller ("Zur Erkennung der Xanthine," in his Vorträge und Abhandlungen, i., 1875).

Xanthone (dibenzo-y-pyrene, or diphenylene ketone oxide), C₁₃H₁₀O₃, in organic chemistry, a heterocyclic compound containing the ring system shown below. It is obtained by the oxidation of xanthene (methylene diphenylene oxide) with chromic acid; by the action of phosphorus oxychloride on disodium sulphite; by heating 2-2'-dioxobenzophenone with concentrated sulphuric acid; by distilling fluor with lime; by the oxidation of xanthylol (R. Meyer, Ber., 1893, 26, p. 1277); by boiling diazotized 2'-2'-diphenylbenzophenone with water (Heyl., Ber., 1898, 31, p. 3934); by heating salol with concentrated sulphuric acid (C. Graebe, Ann., 1880, 254, p. 226), and by heating potassium-ortho-chlorobenzolate with sodium phenolate and a small quantity of copper powder to 180-190° C. (F. Ullmann, Ber., 1905, 29, pp. 472, 2120, 2211). It crystallizes in needles which melt at 173-174° and boil at 349-356° C., and are volatile in steam. Its solution in concentrated sulphuric acid is of a yellow colour and shows a marked blue fluorescence. The carbonyl group is not ketonic in character since it yields neither an oxime nor hydrazone. When fused with caustic potash it yields phenol and salicylic acid. Mild reducing agents convert it into xanthylol, the group CO becoming CH-ÖH, whilst a strong reducing agent like hydriodic acid converts it into xanthene, the group CO becoming CH₃. Phosphorus penta-sulphide at 140-150° C. converts it into xanthion by transformation of CO to CS (R. Meyer, Ber., 1900, 33, p. 2580), and this latter compound condenses with hydroxylamine to form xanthene oxime.

All four mono-hydroxyxanthones are known, and are prepared by heating salicylic acid with either resorcin, pyrocatechin or hydroquinone; they are yellow crystalline solids, which act as dyes. The 1,7-dihydroxyxanthone, known as euaxanthone, is prepared by heating euaxanthin with hydrochloric acid or by heating hydroquinone carboxylic acid with β-resorcylic acid and acetic anhydride (S. Kostanecki, Ber., 1891, 24, p. 3981; C. Graebe, Ann., 1884, 254, p. 298). It is also obtained from Indian yellow (Graebe, ibid.), formed in the urine of cows fed on mango leaves. It crystallizes in yellow needles which sublimate readily. On fusion with caustic potash it decomposes with formation of tetrahydroxy-benzophenone, which then breaks up into resorcin and hydroquinone. The isomeride 1,6-dihydroxyxanthone, isoxuaxanthone, is formed when β-resorcylic acid is heated with acetic anhydride. Gentisine, or 1,3,7-trihydroxyxanthone, is found in the form of its methyl ether (gentisin) in gentian root; it is obtained synthetically by condensing phloroglucin with hydroquinone carboxylic acid. Xanthone, C₁₃H₁₀O₃, may be synthesized by condensing phenol with ortho-creosol in the presence of aluminium chloride. Its tetramethyl-diamino derivative, which is formed by condensing formaldehyde with xanthone, is a yellow compound, and subsequent elimination of water from the resulting diphenyl methane derivative, is the leuco base of pyronine, into which it passes by oxidation.
XANTHUS (mod. Guralı), an ancient city of Lycia, on the river Xanthus (Esben Chai) about 8 m. above its mouth. It was besieged by the Persian general Harpagus (346 B.C.), when the acropolis was burned and all the inhabitants perished (Herod. i. 176). The city was afterwards rebuilt; and in 42 B.C. it was besieged by the Romans under M. Junius Brutus. It was taken by storm and set on fire, and the inhabitants perished in the flames. The ruins lie on a plateau, high above the left bank of the river. The nearest port is Kalamaki, whence a tedious ride of three to four hours round the edge of the great marsh of the Esben Chai brings the traveller to Xanthus. The whole plan of the city with its walls and gates can be discerned. The well-preserved theatre is remarkable for a break in the curve of its auditorium, which has been constructed so as not to interfere with a sarcophagus on a pedestal, and with the "Harpy Monument" which still stands to its full height, robbed of the relics of its parapet (now in the British Museum). In front of the theatre stands the famous stele of Xanthus inscribed on all four sides in Lycian and Greek. Behind the theatre is a terrace on which probably the temple of either the Xanthian Apollo or Sarpedon stood. The best of the tombs—the "Payava Tomb," the "Nereid Monument," the "Ionic Monument," and the "Lion Tomb"—are in the British Museum, as the result of Sir Chas. Fellow's expedition; only their bases can be seen on the site. A fine triple gateway, much polygonal masonry, and the walls of the acropolis are the other objects of most interest.

See O. Benndorf and G. Niemann, Reisen in Lykien und Karien (1884).

XAVIER, FRANCISCO DE (1506-1552), Jesuit missionary and saint, commonly known in English as St. Francis Xavier and also called the "Apostle of the Indies." He was the youngest son of Juan de Jasso, privy councillor to Jean d'Albret, king of Navarre, and his wife, Maria de Azpilcueta y Xavier, sole heir of the Marquis of Echandur. He was born in the mother's castle of Xavier or Xavero, at the foot of the Pyrenees and close to the little town of Sanguesa, on the 7th of April 1506, according to a family register, though his earlier biographers fix his birth in 1497. Following a Spanish custom of the time, which left the surname of either parent optional with children, he was called after his mother; the best authorities write "Francisco de Xavier" (Lat. Xaveri) rather than "Francisco Xavier," as Xavier is originally a place-name. In 1524 he went to the university of Paris, where he entered the College of St. Barbara, then the headquarters of the Spanish and Portuguese students, and in 1528 was appointed lecturer in Aristotelian philosophy at the Collège de Beauvais. In 1530 he took his degree as master of arts. He and the Savoyard Pierre Lefèvre, who shared his lodging, had already, in 1529, made the acquaintance of Ignatius of Loyola—like Xavier a native of the Spanish Basque country. Ignatius succeeded, though in Xavier's case after some opposition, in gaining their sympathy for his missionary schemes (see Loyola, IGNATIUS OF), and they were among the company of seven persons, including Loyola himself, who took the original Jesuit vows on the 15th of August 1534. They continued in Paris for two years longer; but on November 15th, 1536, they started for Italy, to concert with Ignatius plans for converting the Moslems of Palestine. In January 1537 they arrived in Venice. As some months must elapse before they could sail for Palestine, Ignatius determined that the time should be spent partly in hospital work at Venice and later in the journey to Rome. Accordingly, Xavier devoted himself for nine weeks to the hospital for incurables, and then set out with eight companions for Rome, where Pope Pius III sanctioned their enterprise. They arrived in Venice. Xavier was ordained priest on Midsummer Day 1537; but the outbreak of war between Venice and Turkey put an end to the Palestine expedition, and the companions dispersed for a twelvemonth's home mission work in the Italian cities. Nicolas Bobadilla and Xavier betook themselves first to Monseilce and thence to Bologna, where they remained till summoned to Rome by Ignatius at the close of 1538.

Ignatius retained Xavier at Rome until 1541 as secretary to the Society of Jesus (see JESUITS for the events of the period 1538-41). Meanwhile John III., king of Portugal, had resolved on sending a mission to his Indian dominions, and had applied through his envoy Pedro Mascarenhas to the pope for six Jesuits. Ignatius could only spare two, and chose Bobadilla and a Portuguese named Simão Rodrigues for the purpose. Rodrigues set out at once for Lisbon to confer with the king, who ultimately decided to retain him in Portugal. Bobadilla, sent for to Rome, arrived there just before Mascarenhas was about to depart, but fell too ill to respond to the call made on him. Hereupon Ignatius, on March 15th, 1540, told Xavier to leave Rome the next day with Mascarenhas, in order to join Rodrigues in the Indian mission. Xavier complied, merely waiting long enough to obtain the pope's benediction, and set out for Lisbon, where he was presented to the king, and soon won his entire confidence, attested notably by procuring for him from the pope four briefs, one of them appointing him papal nuncio in the Indies. On April 7th, 1541, he sailed from Lisbon with Martim Alfonso de Sousa, governor designate of India, and lived amongst the common sailors, ministering to their religious and temporal needs, especially during an outbreak of scurvy. After five months' voyage the ship reached Mozambique, where the captain resolved to winter, and Xavier was prostrated with a severe attack of fever. When the voyage was resumed, the ship touched at Malindi and Sokotra, and reached Goa on May 6th, 1542. Exhibiting his brief to D. João d'Albuquerque, bishop of Goa, he asked his permission to officiate in the diocese, and at once began walking through the streets ringing a small bell, and telling all to come, and send their children and servants, to the "Christian doctrine" or catechetical instruction in the principal church. He spent five months in Goa, and then turned his attention to the "Fishery Coast," where he had heard that the Paravas, a tribe engaged in the pearl fishery, were for the most part practicing Judaism, or professed Christianity. He laboured assiduously amongst them for fifteen months, and at the end of 1543 returned to Goa.

At Travancore he is said to have founded no fewer than fifty-five Christian settlements. It is to be noted that his own letters contain, both at this time and later on, express disproof of that miraculous gift of tongues with which he was credited even in his lifetime, and which is attributed to him in the Breviary office for his festival. Not only was he obliged to employ interpreters, but he relates in that absence he was compelled to use signs only.

He sent a missionary to the isle of Manaar, and himself visited Ceylon and Malaiipur (Melapur), the traditional tomb of St Thomas the apostle, which he reached in April 1544, remaining there four months. At Malacca, where he arrived on September 25th, 1545, he remained another four months, but had comparatively little success. While in Malacca he urged King John III. of Portugal to set up the Inquisition in Goa to repress Judaism, but the tribunal was not set up until 1560. After visiting Amboyna, the Moluccas and other isles of the Malay archipelago, he returned to Malacca in July 1547, and found three Jesuit recruits from Europe awaiting him. About this time an attack upon the city was made by the Achinese fleet, under the raja of Pedir in Sumatra; and Xavier's early biographers relate a dramatic story of how he roused the governor to action. This story is open to grave suspicion, as, apart from the miracles recorded, there are wide discrepancies between the secular Portuguese histories and the narratives written or inspired by Jesuit chroniclers of the 17th century.

While in Malacca Xavier met Oda Yajiro, a Japanese exile (known to the biographers as Angero or Anjirō), who fired him with zeal for the conversion of Japan. But he first revisited India and then, returning to Malacca, took ship for Japan, accompanied by Yajiro, now known as Paul of the Holy Faith. They reached Kagoshima on the 15th of August 1549, and remained in Japan until the 20th of November 1551. (See JAPAN, § vii.) On board the "Santa Cruz," the vessel in which he returned from Japan to Malacca, Xavier discussed
with Diogo Pereira, the captain, a project for a missionary journey to China. He devised the plan of persuading the viceroy of Portuguese India to despatch an embassy to China, in whose train he might enter, despite the law which then excluded foreigners from that empire. He reached Goa in February 1552, and obtained from the viceroy consent to the plan of a Chinese embassy and to the nomination of Pereira as envoy. Xavier left India on the 23rd of April 1552 for Malacca, intending there to meet Pereira and to re-embark on the "Santa Cruz."

The story of his detention by the governor (officially styled captain) of Malacca—a son of Vasco da Gama named Alvieiro de Ataide or Athayde—is well told with many picturesque details by F. M. Pinto and some of the Jesuit biographers, who have pilloried Ataide as actuated solely by malice and self-interest. Ataide appears to have objected not so much to the mission as to the rank assigned to Pereira, whom he regarded as unfit for the office of envoy. The right to send a ship to trade with China was one for which large sums were paid, and Pereira, as commander of the expedition, would enjoy commercial privileges which Ataide had, *ex officio*, the power to grant or withhold. It seems doubtful if the governor exceeded his legal right in refusing to allow Pereira to proceed. With Ataide's approval the original plan to which, if the Jesuit biographers may be trusted, exhibited the brief by which he held the rank of papal nuncio, and threatened Ataide with excommunication. On Xavier's personal liberty no restraint was placed. He embarked without Pereira on July 16th, 1552. After a short stay at Singapore, whence he despatched several letters to India and Europe, the ship at the end of August 1552 reached Changchuen-shan (St John Island) off the coast of Kwang-tung, which served as port and rendezvous for Europeans, not then admitted to visit the Chinese mainland. It was not, however, until after his arrival, and was delayed by the failure of the interpreter he had engaged, as well as by the reluctance of the Portuguese to attempt the voyage to Canton for the purpose of landing him. He had arranged for his passage in a Chinese junk, when he was again attacked by fever, and died on December 2nd, or, according to some authorities, November 27th, 1552. He was buried close to the cabin in which he had died, but his body was later transferred to Malacca, and thence to Goa, where it still lies in a magnificent shrine (see J. N. da Fonseca, *An Historical and Archaeological Sketch of the History of the Missionary Life at Malacca* (Antwerp, 1596; reprinted in English in 1613 and canonized by Gregory XV. in 1621).

In appearance Xavier was neither Spanish nor Basque. He had blue or grey eyes, and fair hair and beard, which turned white through the hardships he endured in Japan. That he was of short stature is proved by the length of the coffin in which his body is still preserved, less than 5 ft. 1 in. (Fonseca, *op. cit.* p. 296). Many miracles have been ascribed to him; an official list of these, said to have been attested by eyewitnesses, was drawn up by the auditors of the Rota when the processes for his canonization were formed, and is preserved in manuscript in the Vatican library. The contention that Xavier should be regarded as the greatest of Christian missionaries since the first century A.D. rests upon more tangible evidence. His Jesuit biographers attribute to him the conversion of more than 700,000 persons in less than ten years; and though these figures are absurd, the work which Xavier accomplished was enormous. He inaugurated new missionary enterprises from Hormuz to Japan and the Malay Archipelago, leaving an organized Christian community wherever he preached; he directed by correspondence the ecclesiastical policy of John III. and his vicar in India; he established and controlled the Society of Jesus in the East. Himself an ascetic and a mystic, to whom things spiritual were more real than the visible world, he had the strong common sense which distinguished the other Spanish mystics, St Theresa, Luis de Leon or Raimon Lull. This quality is nowhere better exemplified than in his letters to Gaspar Baetzer (Barauese), the Flemish Jesuit whom he sent to Hormuz, or in his suggestions for the establishment of a Portuguese staple in Japan. Supreme as an organizer, he seems also to have had a singularly attractive personality, which won him the friendship even of the pirates and braves with whom he was forced to consort on his voyages. Modern critics of his work note that he made no attempt to understand the oriental religions which he attacked, and censored him for invoking the aid of the Inquisition to the prosecution of the Nestorians in Malabar. He strove, with a success disastrous to the Portuguese empire, to convert the government in Goa into a proselytizing agency. Throughout his life he remained in close touch with Ignatius of Loyola, who is said to have selected Xavier as his own successor at the Society of Jesus. Within a few weeks of Xavier's death, indeed, Ignatius sent letters recalling him to Europe with that end in view.

**BIBLIOGRAPHY.**—Many of the authorities on which the biographies of Xavier have been based are untrustworthy, notably the Pereira, of which the summaries by M. H. de la Moncey, prefixed to the French translation, are the most trustworthy. A critical text of his life, with notes, bibliography and a life in Spanish, is in *Monumenta Historia Christianiatis Japan*, *Rolle und Stiftung des F. X. Xavier, de O. L. Dominus*, in *Monitoria, Exemplaria, European, and Asiatic Journal* (Madrid, 1889-1900), included in *Monumenta Historia Societatis Jesu*. For translations, **The Life and Letters of St Francis Xavier**, by H. Coleridge, S.J. (2 vols., London, 1872), is useful, though the historical comforter, has little value. There are numerous older and uncritical biographies by members of the Society: best and earliest are *De vita Francisco Xaveri* (Barcelona, 1580); *S. Torquemado (Torquemina) (Antwerp, 1596; English translation by T. F., *The Admireable Life of St Francis Xavier, Paris, 1632*); and *Historia del Vida del Padre Francisco de Xavier, &c.*, by João Lucena (Lisbon, 1600). Later works by the Jesuits Bartoli, Malfei, de Sousa, Poussines, Menchacha, Léon Pages and others owe much to the biographies of Xaveri's journeys. For a new, impartial account of Xaveri's life in the East, see K. G. Jayne, *Vasco da Gama and his Successors*, chapters 25-32 (London, 1910); and Otis Cary, *A History of Christianity in Japan* (2 vols., London, 1909).

**XENIA**, a city and the county-seat of Greene county, Ohio, U.S.A., in the township of Xenia, about 3 m. E. of the Little Miami river, and about 35 m. S.W. of Columbus and about 65 m. N.E. of Cincinnati. Pop. (1900) 8696, of whom 410 were foreign-born; (1910 census) 8706. Xenia is served by the Cincinnati, Hamilton & Dayton, and the Pittsburg, Cincinnati, Chicago & St. Louis (Pennsylvania System) railroads, and by interurban electric lines to Springfield and Dayton. It is the seat of the Ohio Soldiers' and Sailors' Orphans' Home and of the Xenia Theological Seminary (United Presbyterian; founded in 1794 at Service, Pa., and united in 1874 with the Theological Seminary of the North-West, founded in 1839 at Oxford, Ohio). About 3 m. N.E., at Wilberforce, is Wilberforce University (co-educational; opened in 1856 and reorganized in 1863), conducted by the African Methodist Episcopal Church. The public buildings of Xenia include the public library, the county court-house and the municipal building. Xenia is situated in the central portion of the state, and among its manufactures are cordage and twine, boots and shoes, carriages and machinery. The township was first settled about 1797. Xenia was laid out as a village in 1803, was incorporated as a town in 1808 and was chartered as a city in 1870.

**XENOCRATES**, of Chalcedon, Greek philosopher, scholar or rector of the Academy from 330 to 314 B.C., was born in 306. Removing to Athens in early youth, he became the pupil of the Socratic Aschines, but presently joined himself to Plato, whom he attended to Sicily in 361. Upon his master's death
XENOPHANES

(logic we know only that with Plato he distinguished ῥῆ καὶ ἀρὸς and ῥῆ πόσο τῆ, rejecting the Aristotelian list of ten categories as a superfluous element.) Valuing philosophy chiefly for its influence upon conduct, Xenocrates bestowed especial attention upon ethics. The catalogue of his works shows that he had written largely upon this subject; but the indications of doctrine which have survived are scanty, and the most important of his teachings, the importance of personal and extraneous advantages. The virtuous man is pure, not in act only, but also in heart. To the attainment of virtue the best help is philosophy; for the philosopher does of his own accord give up what he knows to understand what he does not. The distinction between wisdom and practical wisdom are to be distinguished. Meagre as these statements are, they suffice to show that in ethics, as elsewhere, Xenocrates worked upon Platonic lines.

Xenocrates was not in any sense a great thinker. His metaphysics was a travesty rather than a reproduction of that of his master. His ethical life had little which was distinctive. But his austere life and commanding personality made him an effective teacher, and his influence, kept alive by his pupils Polemon and Crates, ceased only when Arcesilaus, the founder of the so-called Second Academy, gave a new direction to the studies of the school.

XENOPHANES of Colophon, the reputed founder of the Eleatic school of philosophy, is supposed to have been born in the third or fourth decade of the 6th century B.C. An exile from his Ionian home, he resided for a time in Sicily, at Zancle and at Catana, and afterwards established himself in southern Italy, at Elea, a Phocaean colony founded in the sixty-first Olympiad (536-533). In one of the extant fragments he speaks of himself as having begun his wanderings sixty-seven years before the date at which his own age was recorded. One of his disciples is mentioned as being twenty-five years of age, so that it was not less than ninety-two when he died. His teaching found expression in poems, which he recited rhapsodically in the course of his travels. In the more considerable of the elegiac fragments which have survived, he ridicules the doctrine of the migration of souls (xviii.), asserts the claims of wisdom against the prevalent, atheism, which seemed to him to conduce neither to the good government of states nor to their material prosperity (xxix.), reprobates the introduction of Lydian luxury into Colophon (xx.), and recommends the reasonable enjoyment of the dionysiac drink (xxi.). In the fragments (viii.) it is recognized that in the absence of asexuals are those in which he attacks the "anthropomorphic and anthropopathic polytheism" of his contemporaries. According to Aristotle, "the first of Eleatic unitarians was not careful to say whether the unity which he postulated was finite or infinite, but, contemplating the whole firmament, declared that the One is God." Whether Xenophanes was a monothest, whose assertion of the unity of God suggested to Parmenides the doctrine of the unity of Being, or a pantheist, whose assertion of the unity of God was also a declaration of the unity of Being, so that he anticipated Parmenides—in other words, whether Xenophanes' teaching was purely theological or had also a philosophical significance—is a question about which authorities have differed and will probably continue to differ. The silence of the extant fragments, which have not one word about the unity of Being, favours the one view; the voice of antiquity, which proclaims Xenophanes the founder of Eleaticism, has been thought to favour the other.

Of Xenophanes' utterances about (1) God, (2) the world, (3) knowledge, the following survive: (1) There is one God, greatest and highest, who is transcendent (De Divinis Chaldeis, L. iii. 172). He is called Zeus, Jupiter, Apollo, and others. He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). He is all seeing, all hearing, and all knowing (Ἑνίους θεοῦν). after their own shapes and make them bodies like to their own.
(2) From earth all things are and to earth all things return.
From earth and water come all of us.... The sea is the well
whence water springeth. .... Here at our feet is the end of the earth.
'Tis not without end. .... The rainbow, which men call Iris, is a cloud
that is purple and red and yellow. (3) Man hath certainly
known, nor shall certainly know that Pericles, to whom the gods
have given a long life, for, that which he saith ever so perfectly,
yet doth he not know it; all things are matters of opinion.
That which I say is opinion like unto truth..... The gods
did bring me into the world; beginning long; is the search ere man findeth that which is better.

There is very little secondary evidence to record. "The Elatic
school," says the Stranger in Plato's Sophist, 222 D, "beginning
with the doctrine of Heraclitus, the world is one, the unity of all things." Aristotle, in a passage already cited, Meta-
physics, A5, speaks of Xenophanes as the first of the Elatic unitarians,
adding that his monistic theology is a "restoration of the
Teoneuthros (in Simplicius's Ad Physica, 5) sums up Xenophanes's teaching in the propositions, "The All is
One and the One is God." Timon (in Sext. Empir. Pyrrh. i. 224),
ignoring Xenophanes's theology, makes him resolve all things into
one and the same unity. The demonstrations of the unity and the
attributes of God, with which the treatise De Melisse, Xenophane et
Gorgias (now no longer ascribed to Aristotle or Theophrastus ac-
greed to Diodorus Siculus, 29, 9, 1) is the best evidence of the unity of the
unity and the attributes of the Ent, and must therefore be
detached. The epimorphos of a later time added nothing to the
text. However, in his writings, so far as they are known to us,
Xenophanes appears as a theologian protesting against an anthro-
opomorphic polytheism, the ancient seem to have regarded him as a
philosopher of the new and the ancient had ceased to stand these conflicting, though not irreconcilable, testimonies.
According to Zeller, the discrepancy is only apparent. The Greek
gods being the powers of nature personified, pantheonism lay
to hand than monotheism. Xenophanes was then, a pantheist.
Accordingly his assertion of the unity of God was at the same
time a declaration of the unity of Being, and in virtue of this declaration
he becomes, to philosophy, a "pre-Socratic." Aristotle is the
philosopher of Parmenides was his forerunner's pantheism
divested of its theistic element. This reconciliation of the internal
and the external evidence, counterbalanced as it is by Theophrastus,
but best to Meleager, the ancient theologian, and
Xenophanes, one of the most learned of the modern critics, is more
than plausible; but there is something to be said on the contrary
part. In the first place, it may be doubted whether to a Greek
of the 6th century pantheism was nearer than monothelism. Secondly,
the external evidence does not bear examination. The Platonic
testimony, if it proved anything, would prove too much, namely,
that in a predication a Greek has never been in doubt as to
theophanes, but before him; and, in fact, the passage from the
Sophist no more proves that Plato attributed to Xenophanes the philosophy
of Parmenides than Theaetetus, 166 D, proves that Plato attributed
to Aristotle the philosophy of Heraclitus. Again, Aristotle's ascrip-
tion of Xenophanes as the first of the Elatic unitarians does not
necessarily imply that the unity asserted by Xenophanes was the
unity of the universe. The Contemplative, in a passage contem-
poraneous, he declared that the One is God," leaves it doubtful
whether Aristotle attributed to Xenophanes any philosophical
together that if the Sovereign Meno, who, as immortal
intelligent soul, unifies the plurality of things, there were also
lesser divinities, who govern portions of the universe, being
themselves eternal parts of the one all-embracing Godhead. Whilst
it can hardly be allowed that Xenophanes, so far from deny-
acting, actually affirms a plurality of gods, it must be conceded
Freudenthal that Xenophanes's polemic was directed not only
anthropomorphic tendencies and the mythological details of the con-
temporary polytheism rather than against the polytheistic principle,
and that Freudenthal is right in saying that, because Xenophanes's
view is now generally discarded, there is no direct evidence to prove him a
consistent monothelist. The wisdom of Xenophanes, like the wisdom
of the Hebrew Preacher, showed itself, not in a theory of the uni-
verse, but in a sorrowful recognition of the nothingness of things
and the futility of endeavour. His theism was a declaration not
so much of the greatness of God as rather of the littleness of man.
His cosmology was an assertion not so much of the immutability of
the universe as rather of the mutability of the Many. Like the
he was not a philosopher, and did not pretend to be one; but, as
the reasoned scepticism of Socrates cleared the way for the philos-
ophers, and so into, do Xenophanes's "abnormis sapientia" for the philosophy of Parmenides.

(X. H. J. A.)

XENOPHON, Greek historian and philosophical essayist, the
son of Gryllus, was born at Athens about 430 B.C. He belonged to an equestrian family of the deme of Erchia.
It may be inferred from passages in the Hellenica that he fought
at Arginusae (460), and that he was present at the return of
Alcibiades (408), the trial of the Generals and the overthrow
of the Thirty. Early in life he came under the influence
of Socrates, but an active life had more attraction for him. In
401, being invited by his friend Proxenus to join the expedition
of the younger Cyrus against his brother, Artaxerxes II. of
Persia, he at once accepted the offer. It held out the prospect
of riches and honour, while he was little likely to find favour
in democratic Athens, where the knigets were regarded with
suspicion as having supported the Thirty. At the suggestion
of Socrates, Xenophon went to Delphi to consult the oracle;
but his mind was already made up, and he at once proceeded
to Sardis, the place of rendezvous. Of the expedition itself he
has given a full and detailed account in his Anabasis, or the
"Up-Country March." After the battle of Cunaxa (401), in
which Cyrus lost his life, the officers in command of the Greeks
were treacherously murdered by the Persian satrap Tissaphernes,
whom they were negotiating an armistice with a view to
their return. The army, which was now in the heart of an unknown
country, more than a thousand miles from home and in the
presence of a troublesome enemy. It was decided to march
northwards up the Tigris valley and make for the shores of the
Euxine, on which there were several Greek colonies. Xenophon
became the leading spirit of the army; he was elected an officer,
and he it was who mainly directed the retreat. Part of the
army lay through the wilds of Kurdistan, where they had to
encounter the harassing guerrilla attacks of savage mountain
tribes, and part through the highlands of Armenia and Georgia.
Among these mountaineers he made a thorough acquaintance
with their ways, and in the Euxine (February 400), where a tendency to demoraliza-
ion began to show itself, and even Xenophon almost lost his
control over the soldiery. At Cotyora he aspired to found a
new colony; but the idea, not being unanimously accepted,
was abandoned, and ultimately Xenophon with his Greeks arrived
at Chrysopolis [Scutari] on the Bosporus, opposite Byzantium.
After a brief period of service under a Thracian chief, Scuthes,
they were finally incorporated in a Lacedaemonian army which

1. As the description of the Ionian campaign of Thrasyllus in 410
(Hellenica, i. 2) is clearly derived from Xenophanes's own reminiscences,
his have been taken into this campaign, and cannot therefore have been less than twenty years of age at the time.
had crossed over into Asia to wage war against the Persian satraps Tissaphernes and Pharnabazus. Xenophon, who accompanied them, captured a wealthy Persian nobleman, with his family, near Pergamum, and the ransom paid for his recovery secured Xenophon a competency for life.

On his return to Greece Xenophon served under Ageleiaus, king of Sparta, at that time the chief power in the Greek world. With his native Athens and its general policy and institutions he was not in sympathy. At Coronea (394) he fought with the Spartans, when the Athenians, hoping to their fellow-citizens to redeem their banishment. The Spartans provided a home for him at Scillus in Elis, about two miles from Olympia; there he settled down to indulge his tastes for sport and literature. After Sparta's crushing defeat at Leuctra (371), Xenophon was driven from his home by the people of Elis. Meantime Sparta and Athens had become allies, and the Athenians repealed the decree which had condemned him to exile. There is, however, no evidence that he ever returned to his native city. According to Diogenes Laërtius, he made his home at Corinth. The year of his death is not known; all that can be said is that it was later than 335, the date of his work on the Residences of Athens.

The *Anabasis* (composed at Scillus between 379 and 371) is a work of singular interest, and is brightly and pleasantly written. Xeno- phon's authorship is a personal and straightforward manliness about the style, with a distinct flavour of a cheerful lightheartedness, which at once enlists our sympathy. His account of the march and of the campaign is frank and unblushing, and painstaking. The researches of modern travellers attest his general accuracy. It is expressly stated by Plutarch and Diogenes Laërtius that the *Anabasis* was the work of Xenophon, and the evidence from style is conclusive. The allusion (Helena, iii. 1, 2) to Themistogenes of Syracuse as the author shows that Xenophon published it under an assumed name.

The *Hel lenica* was published by the author, and a philosophical romance, which describes the boyhood and training of Cyrus, hardly answers to its name, being for the most part an account of the beginnings of the Persian empire and of the victorious career of Cyrus its founder. The work illustrated the popular idea of the great king, at once the hero and education, as derived conjointly from the teachings of Socrates and his favourite Spartan institutions. It was said to have been written in opposition to the Republic of Plato. A distinct moral purpose, to which literal truth is sacrificed, runs through the work. For instance, Cyrus is represented as dying peacefully in his bed, whereas, according to Herodotus, he fell in a campaign against the Medes.

The *Hellenica* written at Corinth, after 362, is the only contemporary account of the period covered by it (411-362) that has come down to us. It consists of two distinct parts; books i. and ii., which have sometimes been referred to as a constant; and books iii.-vii., the *Hel lenica proper*, which deal with the period from 401 to 288. There is a distinct bias in the representation of the events of the Peloponnesian War. There is, however, no ground for the view that these two parts were written and published as separate works. There is probably no justification for the charge of deliberate falsification. It must be admitted, however, that he had strong political prejudices, and that these prejudices have influenced his narrative. He was a partisan of the reactionary movement which triumphed after the fall of Athens; Sparta is his ideal, and Agesilaus his hero. At the same time, he was a believer in a divinely overruling providence. He is compelled, therefore, to see in the fall of Sparta the punishment inflicted by heaven on the treacherous policy which had prompted the seizure of the Cadmea and the roof of Sphodrias. Hardly less serious defects than his political bias are his omissions, his want of the sense of proportion and his failure to grasp the meaning of historical criticism. The most that can be said in his favour is that as a witness he is at once honest and well-informed. For this period of Greek history he is, at any rate, an indispensable witness.

The *Memorabilia* or "Recollections of Socrates," in four books, was written to defend Socrates against the charges of impiety and corrupting the youth, repeated after his death by the sophist Polycrates. The work is a literary masterpiece; it lacks coherence, and it is not improbable that it was by the grace of God, and not by his own talent, that he seems to have made no attempt to enter: for these indeed he had neither taste nor genius. Moving within a limited range of ideas, he doubtless left his readers behind him, and was inferior less to the real Socrates, while Plato has read them something more." It is probable that the work in its present form is an abridgment.

Xenophon has left several minor works, some of which are very interesting and give an insight into the home life of the Greeks. The *Oeconomia* (to some extent a continuation of the *Memorabilia* and *Hellenica*) deals with housekeeping and the management of the house and of the farm, and presents a pleasant and amusing picture of the Greek wife and of her home duties.

There are some good practical remarks on matrimony and on the reasonable duties of husband and wife. The form of a dialogue between Socrates and a certain Ischomachus, was translated into Latin by Cicero.

The *Cyropaedia* (on horsemanship [*hypomene*] and hunting [*cynegetica*]) deals with matters of which he had a thorough practical knowledge. In the first he gives rules how to choose a horse, and then tells how it is to be groomed and ridden and generally managed. The *Cynegetica* speaks also of boar-hunting and describes the hounds, tells how they are to be bred and trained, and gives specimens of suitable names for them. On all this he writes with the zest of an enthusiastic sportsman, and he concludes that "anyone who has a taste for field-sports will be most likely to be successful in war. Both treaties may still be read with interest by the modern reader.

The *Hipparchicus* explains the duties of a cavalry officer; it is not, according to our ideas, a very scientific treatise, showing that the art of war was then very imperfectly developed and that the military operations of the Greeks were on a somewhat small scale.

He dwells at some length on the moral qualities which go to the making of a good cavalry officer, and hints very plainly that there must be a certain amount of duty in the matter of fighting.

The *Ageleiaus* is a eulogy of the Spartan king, who had two special merits in Xenophon's eyes: he was a rigid disciplinarian, and he was particularly attentive to all religious observances. We have a glimpse of his virtues rather than a good and striking picture of the man himself.

The *Hiereus* works out the line of thought indicated in the story of the Sword of Damocles. It is a protest against the notion that the "tyrant" is a man to be envied, as having more abundant means of happiness than a private person. This is one of the most pleasing of his minor works; it is cast into the form of a dialogue between the two, but it is, says Xenophon, the lyric poet Simias.

The *Symposium*, or "Banquet," to some extent the complement of the *Memorabilia*, is a brilliant little dialogue in which Socrates is the prominent figure. He is represented as "improving the conversation of the day," by his nonsensical stories, by which there is much drinking, with flute-playing, and a dancing-girl from Syracuse, who amuses the guests with the feats of a professional conjurer. Socrates' table-talk runs through a variety of topics, and winds up with a philosophical disquisition on the superiority of true heavenly love to its earthly or sensual counterfeit, and with an earnest exhortation to one of the party, who had just won a victory in the public games, to lead a noble life and do his duty to his country.

There are also two short essays, attributed to him, on the political constitution of Sparta and Athens, written with a decided bias in favor of the former. The *Apology* of Xenophon has been recently published, and it seems to have been written about the Thirty, but it is much too optimistic to be a serious attempt at giving a complete picture of the oligarchical party shortly after the beginning of the Peloponnesian War.

In the essay on the *Revenues of Athens* (written in 355) he offers suggestions for making Athens less dependent on tribute received from its allies. Above all, he would have Athens use its influence for the maintenance of peace in the Greek world and for the settlement of questions by diplomacy, the temple at Delphi being for this purpose an independent centre and supplying a divine sanction.

In his *Politics*, Socrates' defence before his judges, is rather a feeble production, and in the general opinion of modern critics is not a genuine work of Xenophon, but belongs to a much later period. Xenophon was a man of great personal beauty and considerable intellectual gifts; but he was of too practical a nature to take an interest in abstruse philosophical speculation. His dislike of the democracy of Athens induced such lack of patriotism that he even fought on the side of Sparta against his own country. In religious matters he was narrow minded, a believer in the efficacy of sacrifice and in the prophetic art. His plain and simple style, which at times becomes wearisome, was greatly admired and procured him many imitators.

The editions of Xenophon's works, both complete and of separate portions, are very numerous, especially of the *Anabasis*; only a few of the *Oeconomia* and *Hellenica* have appeared. They are written by J. G. Schneider (1790-1849); G. Sauppe (1856-65); D. Lindorff (1875); E. C. Marchant (1900-1911), in the Clarendon Press *Scrip- tum Classicum Bibliotheca*. *ANABASIS*: R. Rüdiger (1852); D. L. D. Kennedy (1887); F. C. Marchant (1888); C. W. Krüger and W. Pökel (1888); W. W. Goodwin and J. W. White (1894). *CYRAPHAEA*: G. M. Gorham (1876); L. Of the later years of Xerxes little is known. He sent out

Sataspes to attempt the circumnavigation of Africa (Herod. iv. 143), but the victory of the Greeks threw the empire into a state of languid torpor, from which it could not rise again.

The king himself became involved in intrigues of the harem (cf. Herod. ix. 108 ff.—compare the late Jewish novel of

Esther, in which a remembrance of the true character of the

king is retained) and was much dependent on his eunuchs.

He left inscriptions at Persopolis, where he

added a new palace to that of Darius, at Van in Armenia, and

on Mount Elymd near Ecbatana; in these texts he merely

copies the words of his father. In 465 he was murdered by his

vizier Artabanus (g.v.), who raised Artaxerxes I. to the throne.

2. Xerxes II., son and successor of Artaxerxes I., was

assassinated in 424 after a reign of forty-five days by his brother

Scecydianus or Sogdianus, who in his turn was murdered by

Darius II. (g.v.).

See Ctesias, Pers. 44; Diod. xii., 64, 71, and the chronographers;

neither of the two ephemeral kings is mentioned in the canons

of Prolemy nor in the dates of Babylonian contracts of this time.

The name Xerxes was also borne by a king of Armenia, killed about 212 B.C. by Antiochus the Great (Polyb. viii. 25; Johannes

Antiochenus, p. 53: his name occurs on copper coins); and by

a son of Mithradates the Great of Pontus (Appian, Mithr. 168, 117).

(Ed. M.)

XIPHILINUS, JOANNEs, epitomator of Dio Cassius, lived at

Constantinople during the latter half of the 11th century a.d.

He was a monk and the nephew of the patriarch of Con-

stantinople of the same name, a well-known preacher (Migne,

Patrologia Graeca, xvi., 2). The epitome (ioyGeal) of Dio was

prepared by order of Michael Parapinacae (1717-1798), but is

incompletely incomplete. It comprises books 35-80, the period

included being from the times of Pompey and Caesar down to

Alexander Severus. In book 70 the reign of Antoninus Pius

and the early years of Marcus Aurelius appear to have been

missing in his copy, while in books 78 and 79 a mutilated original

must have been used. Xiphilinus divided the work into sections, each containing the life of an emperor. He omitted

the name of the consuls and sometimes altered or emended the

original. The epitome is valuable as preserving the chief inci-

dents of the period for which its authority of Dio is wanting.

See H. Reinar's edition of Dio Cassius ii.; J. Meiller's Dio in

Teubner series; C. Wachsmuth, Einleitung in das Studium der

alten Geschichte (1895); W. Christ, Geschichte der griechischen

Literatur (1868).

X-RAY TREATMENT. The X rays (see RöNTGEN RAYS) are

now used extensively in medical work for purposes of treat-

ment. They have been found to be valuable in many forms of skin

disease, more particularly in those of a chronic character.

They have a favourable influence upon ulcerous disease as

for example in enlargements of the lymphatic glands, of the

apex of the thyroide gland. They give useful palliative

effects in certain forms of malignant disease, although it is not

yet certain that any permanent cures of cancerous conditions

have been obtained by their use. In the disease known as

rodent ulcer, which is a process of destructive ulceration, and

to that extent presents features allied to cancer, there is no
doubt of the efficacy of X-ray treatment for bringing about a

complete cure in the majority of cases, provided that the disease

has not advanced too deeply into the tissues.

1See G. B. Grundy, Great Persian War (1901), and in criticism W. W. Tarn, "The Fleet of Xerxes," in Journal of Hellenic Studies (1908), 202-34; also Macan's notes on Herod. iv.-vi. (1895), and authorities for PLATAEA, SALAMIS.

2 Xerxes had already sailed into the channel of the Black Sea, and compare a L. D. VV. no the attack Muller to Dowdall Mount B. Marshall Persepolis, bauppe, was After mentioned his Frost masini SXS (1880). wood's M with (c., in in satrap of time. across Darius the satrap of the king of Babylon. The name was written eXo^oI, the name of two Persian kings of the Achaemenid dynasty.

7. Xerxes I., son of Darius I. and Atossa, the daughter of Cyrus the Great, and therefore appointed successor to his father in preference to his eldest half-brothers, who were born before Darius had become king (Herod. vii. 2 f.). After his accession in October 485 B.C. he suppressed the revolt in Egypt which had broken out in 486, appointed his brother Achaemenes as satrap and "brought Egypt under a much heavier yoke than it had been before" (Herod. vii. 7). His predecessor, Darius, had not been successful in his attempts to consolidate the ancient empire. This probably was the reason why Xerxes in 484 abolished the "kingdom of Babel" and took away the golden statue of Bel (Marduk, Merodach), the hands of which the legitimate king of Babel had to seize on the first day of each year, and killed the priest who tried to hinder him. Therefore Xerxes does not bear the title of "King of Babel" in the Babylonian documents dated from his reign, but "King of Persia and Media," or simply "King of countries" (i.e. of the world). This proceeding led to two rebellions, probably in 478 and 479; in the Babylonian documents occur the names of two ephemeral kings, Kusan and Tarziya, who belong to this time. One of these rebellions was suppressed by Megabyzus, son of Zopyrus, the satrap whom the Babylonians had slain. Darius had left to his son the task of punishing the Greeks for their interference in the Ionian rebellion and the victory of Marathon. From 483 Xerxes prepared his expedition with great care: a channel was dug through the isthmus of the peninsula of Mount Athos; provisions were stored in the stations on the road through Thrace; two bridges were thrown across the Hellespont. Xerxes concluded an alliance with Carthage, and thus enabled Greece of the support of the powerful Greeks, and the siege of Syracuse and Agrigentum. Many smaller Greek states, moreover, took the side of the Persians ("Medized"), especially Thessaly, Thbes and Argos. A large fleet and a numerous army were gathered. In the spring of 480 Xerxes set out from Sardis. At first Xerxes was victorious everywhere. The Greek fleet was beaten at Artemision, Thermopylae stormed, Athens conquered; the Greeks driven back to their last line of defence at the Isthmus of Corinth and at Salamis in the Bay of Salamis. But Xerxes was placed before the announcement of Themistocles (against the advice of Artemisia of Halicarnassus) to attack the Greek fleet under unfavourable conditions, instead of sending a part of his ships to the Peloponnesus and awaiting the dissolution of the Greek armament. The battle of Salamis (28th of September 480) decided the war (see SALAMIS). Having lost his communication by sea with Asia, Xerxes was forced to retire to Sardis; the army which he left in Greece under Mardonius was in 479 beaten at Plataea (g.v.). The defeat of the Persians at Mycale roused the Greek cause of freedom.

1 Herod. i. 183, by Ctesias changed into a plundering of the tomb of Belus or Belus; cf. Aelian, Var. Hist. 13, 3; Aristoph. ap. Arrian vii. 17, 2, and Strabo vii. 2, 753.

2 Ctesias, Pers. 22; his legendary history is transferred by Herodotus, iii. 150 ff., to the former rebellion against Darius.
The idea of using X rays in the treatment of disease arose from the recognition of the injurious effects which followed the prolonged application of the rays for diagnostic purposes. It fell to the lot of many early workers with X rays to notice the production of an inflammation of the skin, or a falling out of the hair over parts which had been subjected to X rays, and Leopold Freund, of Vienna, has stated that his first attempts to utilize X rays in treatment were made in 1896 to cure a hairy mole and were prompted by what he had read of such occurrences. A definite action of the rays upon the skin has been observed, their employment in the treatment of skin diseases followed as a natural corollary. Amongst the earliest investigators of the possible therapeutic effects of X rays the names of Schiff, Freund, Kienböck, Holtzknecht, Sjögren and Stenbeck may be mentioned. In Great Britain Sir Malcolm Morris, E. Dore and J. H. Sequeira were amongst the earliest investigators.

For operating successfully with an agent capable of producing decidedly harmful effects when given in large doses it is necessary to have some method of measurement, and the need for this quickly became apparent when X rays were used for treatment. The results of X-ray photography had already shown that the tubes employed were capable of emitting radiations of very varying powers of penetration, and that the rays were by no means constant in this respect; and the question whether highly penetrating rays or rays of feeble penetration were to be preferred for therapeutic use became the subject of much discussion. It is now recognized in X-ray treatment that the rays with which the tissues are those which are absorbed by the tissues, and consequently the softer or less penetrating rays are now regarded as those to be used in treatment. So too the problem of measuring the quantity of rays emitted by a tube during a given time began to call for a solution, if that were in any way possible. In 1901 Benoist designed an apparatus by which the quantity of the rays emitted by a tube at any moment could be accurately determined, and in 1902 Holtzknecht brought out the first quantitative device. It was called a chromoradiometer, and it enabled the dose administered to a patient to be observed, and recorded for future guidance. Holtzknecht also drew up a scale of units by means of which the indications of his apparatus could be interpreted. The units of Holtzknecht are still used to express the dosage of X rays, though his apparatus has been superseded. Holtzknecht's method of measurement consisted in observing the change of colour in certain pastilles when exposed to X rays, and his apparatus consisted of a scale of tints, and a number of pastilles of a yellow tint which acquired a green colour during exposure. The chromoradiometer is a modification in which, in addition to the tints, there is a potassium sulphate to produce a change of colour. The pastilles were laid upon the surface under treatment, and their change of colour was compared at intervals with the scale of standard tints.

It was next thought that under suitable conditions the measurement of the current passing through the X-ray tube might serve as a guide to the quantity of X rays emitted by the tube, but, although this is the case to a certain extent, the method of quantity measurement which is now employed almost universally in X-ray treatment is that devised by Sabouraud and Noiré, and used with signal success by them in an enormous number of cases of ringworm, in which disease measurement of dose is of the most critical importance, for the following reason. The cure of ringworm by X rays requires that all the hair of the affected region shall be caused to fall out, but, nevertheless, it is necessary for obvious reasons that the hair should grow again after the disease has disappeared. Now if the dose of X rays be insufficient the hair does not come out and no cure results, while if the dose be too great the hair comes out but does not grow again; and the margin of safety is quite a narrow one. The method of Sabouraud and Noiré which has proved itself reliable for such critical measurements of dosage as are required for ringworm treatment, has to-day the universal acceptance of all X-ray workers for other forms of X-ray treatment, although the use of their pastilles has certain disadvantages.

Sabouraud's pastilles consist of small disks of platinocyanide of barium. This chemical compound has a bright yellow-green colour when freshly prepared, and changes through gradations of yellow to a brown colour when exposed to X rays. The pastilles are supplied in a book which is divided into sectors of equal colour, and a permanent tint of colour is supplied, to indicate the colour change in the pastille which corresponds with a quantity of X rays equal to the maximum dose which the healthy skin will stand without inflammatory consequences. This is often spoken of as a "pastille dose." As the amount of irradiation needed to produce the change of colour is considerable, the salt is fixed, during the treatment, at a point half-way between the source of the rays and the skin surface under treatment. During an exposure the chemical salt, in the form of a small disk of the material on cardboard, is adjusted in the required position by means of a pastille holder, and it is examined at intervals during the course of the exposure, until it has reached the required tint. When in the holder the pastille must be protected from light, and should have a piece of metal as a backing, if its indications are to be accurate.

In X-ray treatment some protection of the surrounding healthy parts is usually necessary. With this object various methods of shielding have been devised, either by coverings of the patient by impermeable materials, or by enclosing the tube in an impermeable box. Both methods are used, but tubes are now supplied with a protective box, and manufacturers now supply these boxes with suitable windows or openings of different sizes for the passage of the pencil of rays which is to fall upon the part under treatment.

The effect of the rays on healthy tissues is in the main a destructive one, but some of the cells of the tissues are more sensitive to the rays than are others; and this permits of a selective effect being obtained, with the destruction of some cells and not of the whole tissue. Young cells, and actively growing cells, are the most susceptible, and for this reason it is possible to influence the glands of the skin and the papillae of the hairs with a dose which will not destroy the skin itself. The art of successful working with X rays is based upon a careful adjustment of the dose so as to secure a selective destruction of the morbid elements, and to avoid wholesale damage to the part treated. The effects of excessive doses of X rays is to produce an inflammation which may result in painful sores which obstinately refuse to heal for many weeks or months. A quantity up to double that of the usual maximum or pastille dose may be employed in urgent cases without risk of any injury to the tissues, but another course of treatment should be avoided most carefully. In the treatment of ringworm the exact pastille dose must not be exceeded, for after a dose of about one and a half pastilles the fall of the hair is likely to be followed by permanent baldness.

In X-ray treatment it is customary to make use of moderate currents, and to bring the X-ray tube in its tube-holder and box into position so that the pencil of rays may fall upon the part to be treated. The distance of the skin surface from the centre of the tube must be known, and the pastille arranged in place accordingly. Fifty centimetres is a usual distance, and at this distance a tube working with a current of a milliampere should give the full therapeutic dose or "pastille dose" in about 15 minutes. In general X-ray treatment it is quite usual at the present time to proceed by the method of full doses at rather long intervals. From the experience obtained by Sabouraud in numerous cases of ringworm it has been found that a full dose must not be repeated until a month has elapsed. So too in the treatment of rodent ulcer full doses at long intervals are now thought better than smaller doses repeated more often, and such doses are more easily measured by the Sabouraud pastille, which records large doses more simply than small ones, in which the slighter changes of tint are not easy to distinguish. A great amount of work has been done with X rays for the treatment of cancer, but it is now recognized that the X rays...
do not cure a cancer, although they are of value for the relief of pain and for the healing of cancerous ulcers. Diminution of size of the cancerous growth has frequently been observed, and in some instances sarcomatous tumours have completely disappeared under X-ray treatment. Sooner or later, however, the cancer or sarcoma returns either in the original site or elsewhere, and the patient dies of the disease. It is probable that X-ray treatment is able to prolong life in a fair number of cases, and by its agency in causing a healing of ulceration in cancer cases it is able to give valuable relief both to the body and mind of the patient, and this relief may last for a year or more.

In rodent ulcer X rays are usually sufficient to provide a lasing chill, but there are some exceptions, as for instance when the rodent ulcer has been long neglected, and has spread deeply so as to invade bony structures. An important factor in the successful treatment of rodent ulcer by X rays is to continue the applications at intervals for several months after apparent cure. If this precaution is omitted there is a very great likelihood of relapse taking place later on.

In the treatment of skin diseases by X rays the method finds a very suitable field. Almost all chronic skin affections yield to X-ray treatment fairly quickly, and maximal doses are not usually necessary.

In ringworm X rays have achieved wonderful results. The rays act upon the hair papillae, and not upon the ringworm fungus. They cause a shedding of the hair fifteen days after exposure and the fungus then dies out from the hair follicles, so that when in due course the hair begins to grow again after a period of two months it grows healthily and without disease. The X-ray treatment of ringworm has been a real advance, and Sabouraud has told us of the enormous pecuniary saving which has been effected in Paris by the shortening of the stay of the ringworm cases in the special schools maintained there for the aseptically treated.

In lupus X rays are valuable, but not fully satisfactory. The treatment by the rays will often succeed in bringing about a healing of the ulceration of lupus, but relapses are frequent, because foci of infection are apt to remain in the healed scar tissue and after a period of quiescence these may gradually provoke fresh mischief.

X-ray treatment is of service for the treatment of enlarged "strumous" glands in the neck. When these glands are in the early stages, and there has not been any softening or breaking down of the gland tissue, the application of X rays, a few times repeated in moderate doses, will determine the subsidence of the enlargement and may effect a complete cure.

In the massive glandular enlargements of lymphadenoma a great reduction of the tumours can be brought about by heavy doses of X rays, but the results are to give a symptomatic rather than a real cure, for fresh glandular growths take place internally, and the usual course of the disease is not fundamentally modified.

So too in leukemia, the symptom of excessive abundance of white cells in the circulating blood can be surprisingly altered for the better by X rays, but generally without real cure of the underlying condition. The effect appears to be due to a direct destructive action upon the leucocytes or white corpuscles of the blood.

Quite recently the use of X rays in fibroid tumours of the uterus has been advocated, particularly by Cournelles in France and Albert-Schonberg in Germany. The action of the rays seems to be in part due to their influence upon the activity of the ovaries and in part to a direct effect upon the growing fibroids themselves, causing decrease of activity, relief of symptoms and reduction of the tumours.

**XYLANDER, Guilielmus (Wilhelm Holtzman, according to his own spelling) (1532–1576), German classical scholar,** was born at Augsburg on the 26th of December 1532. He studied at Tübingen, and in 1558, when in a state of abject poverty (caused, according to some, by his intemperate habits), he was appointed to succeed Micyllus (Molshem, Molseym or Molsheym) in the professorship of Greek at Heidelberg, which he exchanged for that of logic (publicus organi Aristotelii interpres) in 1562. He died at Heidelberg on the 10th of February 1576. XYLANDER was the author of a number of important works, among which his Latin translations of Dio Cassius (1558), Plutarch (1560–1570) and Strabo (1751) deserve special mention. He also edited (1668) the geographical lexicon of Stephanus of Byzantium; the travels of Pausanias (1656); and after his death by F. SyntAGMA, 1583, the Editiones of Marcus Aurelius (1558), the editio princeps based upon a Heidelberg MS. now lost; a second edition in 1658 with the addition of Antoninus Liberalis, Pluton of Tralles, an unknown Apollonius, and Antigonus of Carystus—all paradoxeographers; and the chronicle of George Cedrenus (1566). He translated the first six books of Euclid into German with notes, the Arithmetica of Diophantus, and the De quattuor mathematicis scientis of Michael Psellus into Latin.

**XYLENE, or DIMETHYLBENZENE, C6H5(CH3)2.** Three isomeric hydrocarbons of this formula exist; they occur in the light oil fraction of the coal tar distillate, but they cannot be separated by fractional distillation owing to the closeness of their boiling points. The mixture can be separated by shaking with sulphuric acid, whereupon the ortho and meta forms are converted into soluble sulphonic acids, the para form being soluble only in concentrated acid; the ortho and meta acids may be separated by crystallization of their salts or sulphonamides. Ortho-xylene is obtained from orthobromotoluene, methyl iodide and sodium as a colourless mobile liquid boiling at 142°, melting at -28°, and having a specific gravity of 0.8932. Para-xylene is obtained in mother solution by hydrolysis, and the sodium salt can be converted into para-iodotoluene acid; whilst chronic acid gives carbon dioxide and water. Meta- or iso-xylene, the most important isomer, may be prepared by nuclear-synthetic reactions, or by distilling mesitylenic acid, CH3(CH3)2CO2H, an oxidation product of mesitylene, C6H5(C2H5)2, which is produced on the condensation of acetone, with lime; this reaction is very important, for it orients meta-compounds. It boils at 136°, melts at -54°, and has a specific gravity of 0.8812. Para-xylene is obtained when camphor is distilled with zinc chloride, but it is best prepared from para-brom-toluene or dibrombenzene, methyl iodide and sulphuric acid; with sodium bromide to produce dibromotoluene, and then to terephthalic acid. It boils at 138°, melts at 15°, and has a specific gravity of 0.880 at 0°.

**XYLOPHONE (Fr. xylophone; Ger. Xylophon, Streichkoppel or Holzharmonika; Ital. armonica de legno), a small instrument of percussion, of definite sonorosity, used in the orchestra to mark the rhythm.** The xylophone consists of a series of little wooden staves in the form of a half cylinder and graduated in size. The staves, each of which represents a semitone, rest on two, three or four wooden bars, covered with straw and converging to form an acute angle. They are so arranged that each stave is isolated. In some models the staves are grouped in two rows, comprising the naturals and the accidentals. The xylophone is played with two little wooden hammers, and has a compass of two or three octaves. The quality of tone is inferior to that of the steel harmonica or glockenspiel.

**XYSTUS, the Greek architectural term for the covered portico of the gymnasion, in which the exercises took place during the winter or in rainy weather; this was known as the ἔστος ἁρμός, from its polished floor (ἵπτερον, to polish).** The Romans applied the term to the garden walk in front of the porticos, which was divided into flower beds with borders of box, and to a promenade between rows of large trees. (K. S.)
the twenty-fifth letter of the English alphabet, one of four variants (u, v, w, y) which have been developed out of one Greek symbol. It was taken into the Roman alphabet as a form distinct from V in the 1st century B.C., when it was desired to represent the sound of the Greek u more accurately than could be done by the ordinary Roman alphabet. Many Greek words had been borrowed from Greek long before this and pronounced like genuine Latin words. Thus the proper name Hippo was borrowed as BURRAS, BRICYES as BRACES. But with the growth of literary knowledge this felt to be a very inexact representation of the Greek sounds, and the words were respelled as Pyrrhus and Phryges. The philosopher Pythagoras is said to have regarded this letter as a symbol of human life (Servius, on Virgil, Aeneid vi. 136). To this there are various references in the Roman poets. Two lines of Persius (iii. 56-57) seem to throw some light upon the particular form of Y interw. "et tibi quae Samios diduxit littera ramos surgentem dextra monstravit limite callem."

These lines appear to imply that the letter took the form y, which can only be one of the oldest forms (V) written from right to left. The long journey is the difficult, the deviating line is the easier path of vision. Anglo-Saxon y took over the Roman Y with its Roman value of the "modified u" (u), and employed it accordingly for the sound which arose from a u sound under the influence of an i in the following syllable: fylan, "fill," cp. Gothic fulljan; mūs, "mouse," plural mūsās, from an earlier lost mūsis. The y sounds were often confused with i, whence, in modern English, mice.

The vowel use was the only use of the old symbol. The consonant Y is of a different origin. The early English g (always hard as in gig) was palatalized before e and i sounds into a consonant i (j) or y, which was written in Middle English with the symbol y. With this letter also was written the original consonant i (i), which appears in Latin as i (j) in iugum, iuncens. This Latin sound seems, at least initially, to have represented two originally separate sounds, for Greek represents the first sound of iugum by ι (ιγόν), while in other words it represents a ι (y) of other languages by the "rough breathing" (b or ':) ιγός, "holy," is the same word as the Sanskrit yajnas. The English words that correspond etymologically to iugum and iuncens are "yoke" and "young." In Northern English the symbol ȝ survived longer than in the southern part of the island, and the Middle English documents of the 16th century was confused with ȝ. From this cause various Scottish names that were never pronounced with ȝ are so spelt, as Menzies (Mengies), Dalziel, Cadzow. In others like Mackenzie, ȝ is now universally pronounced, though as late as the middle of the 18th century Lord Kames declared that to hear Mackenzie pronounced with a ȝ turned his stomach.

YABLONOI, or YABLONOVII ("Apple Mountains," known to the Mongols as DYNES-DABAN), a range of E. Siberia, stretching N.E. from near the sources of the river Kerulen (N.E. of Urga in N. Mongolia) to the bend of the river Olekma in 56th N., and forming the S.E. border ridge of the upper terrace of the great plateau of Central and E. Asia. Its summits reach altitudes of 5000-6000 ft., culminating in Mount Sokhondo (8400 ft.) near the Transbaikal-Mongolia frontier. The range serves as the water-parting between the streams which flow to the Pacific and those which flow to the Arctic Ocean, and is a dividing line between the Siberian and the Daurian flora. The passes have altitudes of 2000-3500 ft. The range is a continuation of the Kentel Mountains of Mongolia, but is not onogronically connected with the Stanovoi Mountains, farther to the N.E., though the names Yablonoi and Stanovoi are commonly used alternatively. The latter are the S.E. border-range of the lower terrace and are connected with the Great Khingan Mountains.

YACHOW-FU, a prefectural city in the province of Szech'uen, China, in 30th N., 153rd E.; pop. about 40,000. It is situated in a valley on the banks of the river Ya, where tea is grown. The town owes its importance to the fact that it stands at the parting of the tea and tobacco trade route to Tibet via Tachienlu and the cotton trade route to west Yunnan via Ningyuen-Fu. The city wall measures 2 mi. in circumference, and is pierced by four gates. Yachow-Fu is first mentioned during the Chow dynasty (1122-255 b.c.).

YACHING, the sport of racing in yachts and boats with sails, and also the pastime of cruising for pleasure in sailing steam or motor vessels. Yacht racing dates from the beginning of the 19th century; for, although there were sailing yachts long before, they were but few, and belonged exclusively to princes and other illustrious personages. For instance, in the Anglo-Saxon period Athelstan had presented to him by the king of Norway a magnificent royal vessel, the sails of which were purple and the head and deck wrought with gold, apparently a kind of state barge. Elizabeth had one, and so has every English sovereign since. During her reign a pleasure ship was built (1588) at Cowes (Isle of Wight), so that the association of that place with the sport goes back three centuries. In 1608 Charles II. was entertained by the Dutch with a yacht named the "Mary," until which time the word "yacht" was unknown in England. The Merrie Monarch was fond of sailing, for he designed a yacht of 25 tons called the "Jamie," built at Lambeth in 1662, as well as several others later on. In that year the "Jamie" was matched for £100 against a small Dutch yacht, under the duke of York, from Greenwich to Gravesend and back, and beat her, the king steering part of the time—apparently the first record of a yacht match and of an amateur helmsman. Mr Arthur H. Clark, in his History of Yachting (1904), traces the history of pleasure craft from 1600 to 1815, and gives an interesting illustrated account of the yachts belonging to Charles II.

The first authentic record of a sailing club is in 1720, when the Cork Harbour Water Club, now known as the Royal Cork Yacht Club, was established in Ireland, but the yachts were small. Maitland, in his History of London (1739) mentions sailing and rowing on the Thames as among the amusements then indulged in; and Strutt, in his Sports and Pastimes (1801), says that the Cumberland Society, consisting of gentlemen partial to this pastime, gave yearly a silver cup to be sailed for in the vicinity of the city. The boats usually started from Blackfriars Bridge, went up the Thames to Putney, and returned to Vauxhall, being, no doubt, mere sailing boats and not yachts or decked vessels. From the middle of the end of the 18th century yachting developed very slowly: although matches were sailed at Cowes as far back as 1780, very few yachts of any size, say 35 tons, existed in 1800 there or elsewhere. In 1812 the Royal Yacht Squadron was established by fifty yacht-owners at Cowes and was called the Yacht Club, altered to the Royal Yacht Club in 1820; but no regular regatta was held there until some years later. The yachts of the time were built of heavy materials, like the revenue cutters, full in the fore body and fine aft; but it was soon discovered that their timbers and scantlings were unnecessarily strong, and they were made much lighter. It was also found that the single-masted cutter was more weatherly than the brig and schooners of the time, and the former rig was adopted for racing, and, as there was no time allowance for difference of size, they were all built of considerable dimensions. Early English Yachts.—Among the earliest of which there is any record were the Pearl, 95 tons, built by Sainty at Weymouth near Colchester in 1722, for the marquis of Anglesey, and the "Arrow," 84 tons, originally 61 ft. 93 in. long and 18 ft. 53 in. beam, built by Joseph Weld in 1822, which for many years remained extant as a racing yacht, having been rebuilt and rebuilt.

1 The English word "yacht" is the Dutch jacht, jacht, from jachten, "to hunt," "to hunt." See also SHIP and SHIPBUILDING.
altered several times, and again entirely rebuilt in 1887-88. The Thames soon followed the example of the Solent and established the Royal Thames Yacht Club in 1823, the Clyde founding the Royal Northern Yacht Club in 1824, and Plymouth the Royal Western in 1827. In this year the Royal Yacht Squadron passed a resolution disqualifying any member who should apply steam to his yacht—the enactment being aimed at T. Ashton Smith, an enthusiastic yachtsman and boat-builder, who was having a paddle-wheel steam yacht called the "Memal," built on the Clyde. In 1830 one of the largest cutters ever constructed was launched, viz. the "Alarm," built by Inman at Lymington for Joseph Weld of Lulworth Castle, from the lines of a famous smuggler captured off the Isle of Wight. She was 82 ft. on the load-line by 24 ft. beam, and was reckoned of 193 tons, old measurement, in which length, breadth and half-breadth (supposed to represent depth) were the factors for computation. Some yachtsmen at this time preferred still larger vessels and owned square-topsail schooners and brigs, like the "map-o'-war brigs" of the day, such as the "Waterwitch," 381 tons, built by White of Cowes, in 1832, for Lord Belfast, and the "Brilliant," barque, 493 tons, belonging to J. Holland Ackers, who invented a scale of time allowance for competitive sailing. In 1834 the first royal cup was given by William IV. to the Royal Yacht Squadron. In 1836 the Royal Eastern Yacht Club was founded at Granton near Edinburgh; in 1838 the Royal St George's at Kingstown and the Royal London; in 1843 the Royal Southern at Southampton and the Royal Harwich; in 1844 the Royal Mersey at Liverpool and the Royal Victoria. In 1847 a number of vessels kept pace with the clubs—the fifty yachts of 1822 increasing nearly tenfold before the middle of the century.

First Alteration in Type.—In 1848, after J. Scott Russell had repeatedly drawn attention to the wisdom of constructing sailing vessels on the "cod's head and mackerel tail" plan, and had enunciated his wave-line theory, Mare built at Blackwall an entirely new type of vessel, with a long hollow bow and a short after-body of considerable fulness. This was the iron cutter "Mosquito," of 59 ft. 2 in. water-line, 15 ft. 3 in. beam, and measuring 50 tons. Prejudice against the new type of yacht being as strong as against the introduction of steam, there were no vessels built like the "Mosquito," with the exception of the "Volante," 59 tons, by Harvey of Weymouth, until the eyes of English yachtsmen were opened by the Americans three years later. About this period yacht racing had been gradually coming into favour in the United States, the first yacht club being founded at New York in 1844 by nine owners; and in 1846 the first match between yachts in the States was sailed, 25 m. to windward and back from Sandy Hook lightship, between J. C. Stevens's "Vanduara" and J. C. Stevens's "Condor." 170 tons, 100 ft. water-line and 26 ft. 8 in. beam, with a draught of 5 ft. 3 in. of water, and the "Coquette," schooner, 74 tons, belonging to J. H. Perkins, the latter winning; but the appearance of the "Maria," which had a clipper or schooner bow, something like that of the racing cutters of 1887-88, did much for yachting in America. Stevens then commissioned George Steers of New York, builder of the crack pilot schooners, to construct a racing schooner to visit England in the year of the great exhibition, and the result was the "America" of 170 tons. She crossed the Atlantic in the summer of 1847, managed to complete for Queen's cup atCowes in August, although the club for that occasion threw the prize open to all the world, as her owner declined to concede the usual time allowance for difference of size. The members of the Yacht Squadron, not wishing to risk the reproach of denying the visitor a fair race, decided that their match for a cup given by the club, to be sailed round the Isle of Wight later in the same month, should be without any time allowance. The "America," thus exceptionally treated, entered and competed against fifteen other vessels. The three most dangerous competitors being put out through accidents, the "America" passed the winning-post 18 minutes ahead of the 47-ton cutter "Aurora," and won the cup; but, even if the time allowance had not been waived, the American schooner yacht would still have won by fully a couple of minutes. The prize was given to the New York Yacht Club and constituted a challenge cup, called "the America's cup," for the yachts of all nations, by the deed of gift of the owners of the winner. (See below for a complete account of these races.)

Not only was the "America" as great a departure from the conventional British type of yacht as the "Mosquito," but the set of her sails was a decided novelty. In England it had been the practice to make them baggy, whereas those of the "America" were flat, which told materially in working to windward. The revolution in yacht designing and canvassing was complete, and the bows of existing cutters were lengthened, that of the "Arrow" among others. The "Alarm" was also lengthened and turned into a schooner of 248 tons, and the "Wildfire," cutter, 59 tons, was likewise converted. Indeed there was a complete craze for schooners, the "Flying Cloud," "Gloriana," "La La Rooh," "Alberine," "Aline," "Egeria," "Fantomone" and others being built between 1852 and 1865, during which period the centre-board, or sliding keel, was applied to schooners as well as sloops in America. The national or cutter rig was nevertheless not neglected in England, for Hatcher of Southampton built the 35-ton cutter "Glance"—the pioneer of the subsequent 40-tonners—in 1855, and the "Vampire"—the pioneer of the 20-tonners—in 1857, in which year Weld also had the "Lulworth," an 82-ton cutter of comparatively shallow draught, constructed at Lymington. At this time too there came into existence a group of cutters, called "flying fifties" from their tonnage, taking after the "Mosquito" their pioneer; such were the "Extravaganza," "Audax" and "Vanguard." In 1866 a large cutter was constructed on the Clyde called the "Condor," 135 tons, followed by the still larger "Oimara," 163 tons, in 1867. In 1868 the "Cambria" schooner was built by Ratsey at Cowes for Ashbury of brighton, and, having proved a successful match-sailer, was taken to the United States in 1870 to compete for the America's cup, but was badly beaten, as also was the "Livonia" in 1871.

The First Great Era of Yacht Racing.—The decade between 1870 and 1880 may be termed the first Golden Age of yachting, inasmuch as the racing fleet had some very notable additions made to it, of which it will suffice to mention the schooners "Gwendolin," "Cetonia," "Corinne," "Miranda" and "Waterwitch"; the large cutters "Kriemhilda," "Vol au Vent," "Formosa," "Sameena," and "Vanduara," a cutter built of steel; the 40-tonners "Foxhound," "Bloodhound," "Mysosits" and "Norman"; the 20-tonners "Vanessa" (Hatcher's masterpiece), "Quickstep," "Enriqueta," "Louise" and "Frieda"; and the yaws "Florinda," "Coriscande," "Jullana" and "Laona," "Jullana" may be spoken of as a specially clever design. Built in 1873 from the ideas of Bentall, an agricultural implement maker of Maldon, Essex, he had no dead wood forward or aft, and possessed many improvements in design which were embodied and developed by the more scientific naval architects, G. L. Watson, William Fife, jun., and others in later years. Lead, the use of which commenced in 1846, was entirely used for ballast after 1870 and placed on the keel outside.

Of races there was a plethora; indeed no fewer than 400 matches took place in 1876, as against 63 matches in 1856, with classes for schooners and yaws, for large cutters, for 40-tonners, 20-tonners and 10-tonners. The sport, too, was better regulated, and was conducted on a uniform system: the Yacht-Racing Association, established in 1875, drew up a simple code of laws for the regulation of yacht races, which was accepted by the yacht clubs generally, though a previous attempt to introduce uniformity, made by the Royal Victoria Yacht Club in 1868, had failed. The Association adopted the rule for ascertaining the size or tonnage of yachts which had been for many years in force, known as the Thames rule; but in 1879 they altered the plan of reckoning length from the point on deck to that taken at the load water-line, and two years later they adopted an entirely new system of calculation.
YACHTING

The Plank-on-edge.—These changes led to a decline in yacht-racing, the new measurement exercising a prejudicial effect on the sport, as it enabled vessels of extreme length, depth and narrowness, kept upright by enormous masses of lead on the outside of the keel, to compete on equal terms with vessels of greater width and less depth, in other words, smaller yachts carrying less délard of narrow British types was known as the "lead mine" or plank-on-edge type. Of this type were the yaws "Lorna" and "Wendur," the cutters "May," "Annasona," "Sleuth-hound," "Tara," "Marjorie" and "Margaret"—the most extreme of all being perhaps the 40-tonner "Tara," six times as long as she was broad, and unusually deep, with a displacement of 75 tons, 38 tons of lead on her keel, and the sail-spread of a 60-tonner like "Neva.

In 1884 two large 80-ton cutters of the above type were built for racing, the "Genesta" on the Clyde, and the "Irexf at Southampton. Having been successful in her first season, the former went to the United States in 1885 in quest of the America's cup; but she was beaten by the "Puritan," which had a moderate draught of 8 ft. 3 in. of water, considerable beam and a deep centre-board. The defeat of the "Genesta" was not surprising; she drew 13 ft. of water, had a displacement or weight of 141 as against the "Puritan's" 106 tons, and a sail area of 785 sq. ft. to the American's 798—a greater mass with less driving power. Still, she did not leave the States empty-handed, as the owner brought back from the May and Brenton Reef challenge cups, though they were wrested from her by the "Irexf in the following year. The same thing happened to the "Galatea," which was beaten by the "Mayflower" in 1886. In all classes in British waters the narrow type was not carried to excess; indeed, as the narrowness of the new yachts increased annually, so did the popularity of racing decrease.

Plank-on-edge Type abandoned.—Prior to 1886 it had been the custom in Great Britain for several reasons to build the yachts deep, narrow, wall-sided, with very heavy lead keels and heavy displacement. The system of measurement had been a tonnage measurement, and under this system designers found, from the knowledge they had then attained from racing trials, that a narrow heavy vessel would beat a wider and lighter craft when both were measured by the tonnage rules. In America this was not the case. There a much lighter and wider form of yacht had been in vogue, having shallower draught and relying upon a centre-board for weatherliness instead of a deep lead keel. Hence in the International contests from 1884 to 1886 for the America's cup and other events the trials were handed, as she won and brought back the Cape May and Brenton Reef challenge cups, though they were wrested from her by the "Irexf in the following year. The same thing happened to the "Galatea," which was beaten by the "Mayflower" in 1886. In all classes in British waters the narrow type was not carried to excess; indeed, as the narrowness of the new yachts increased annually, so did the popularity of racing decrease.

The new system contained no taxes or penalties upon beam or depth nor upon "over all" length. The only factors measured were the water-line and the area of the sails. All the old tonnage rules taxed the length and the breadth. The effect of this change of the system measurement was electrical. It crushed the plank-on-edge type completely. There was not and would not be any more of them.

Revival of Yacht-Racing under Length and Sail Area Rule.—Yachtsmen were greatly pleased with the broader and lighter types of yachts that designers began to turn out under the length and sail area rule. They were more comfortable and drier in a sea-way than the old vessels. The first large cutters built with considerable beam were "Yarana" and "Petronilla" in 1888, and in 1889 the first of Lord Dunraven's Valkyries was a vessel that was much admired. Then in 1890 "Iverna," a handsome clipper-bowed cutter owned by Mr Jameson, came out and raced against "Thistle." Meanwhile, up to 1892 a host of splendid 40-raters had been built: "Mohawk," "Deerhound," "Castanet," "Reverie," "Creole," "Thalía," "Corsair," "White Slave," "Queen Mal," and "Varuna" formed a class of which had never been surpassed in British waters. Watson, Fife and Payne were the most successful designers.

While a revival of yachting in the larger classes was notable under the rule Dixon Kemp had originated, the sudden popularity attained in the small classes in the Solent was even more remarkable. The 5-tonners and 10-tonners had raced about the coast, but the Solent did not seem to attract a greater number of yachtsmen as small boat sailors than the Thames, Mersey or Irish ports. Moreover, the Clyde really remained the most advanced centre of small yacht sailing. At Southampton, prior to Dixon Kemp's rule being adopted by the Yacht-Racing Association in 1887, there were some sporting classes, such as the '60er', '70er', '87er', '90er' and '12-55er', '22-55er', which had raced during the season in the small yachts. These were the only classes which had ever raced against the "Sailor," and the "Volunteer" and "Honour." The "Sailor," the "Second Volunteer," and "Honour" were built by Mr S. N. Watson, and were considered the finest cutters afloat, and were the only ones that had ever been raced against the "Sailor," and the "Volunteer" and "Honour." The "Sailor," the "Second Volunteer," and "Honour" were built by Mr S. N. Watson, and were considered the finest cutters afloat, and were the only ones that had ever been raced against the "Sailor," and the "Volunteer" and "Honour." The "Sailor," the "Second Volunteer," and "Honour" were built by Mr S. N. Watson, and were considered the finest cutters afloat, and were the only ones that had ever been raced against the "Sailor," and the "Volunteer" and "Honour." The "Sailor," the "Second Volunteer," and "Honour" were built by Mr S. N. Watson, and were considered the finest cutters afloat, and were the only ones that had ever been raced against the "Sailor," and the "Volunteer" and "Honour." The "Sailor," the "Second Volunteer," and "Honour" were built by Mr S. N. Watson, and were considered the finest cutters afloat, and were the only ones that had ever been raced against the "Sailor," and the "Volunteer" and "Honour."
"Thistle," being developed from the form of the 40-raters "Varuna" and "Queen Mab." The main differences between the "Britannia" and other yachts of her year and the older vessels was that the new yachts had an overhanging shallow-sectioned mussel or pram bow instead of a fiddle or clipper bow with a wedge-shaped transverse section; the outline of the under-water profile was hollow, sloping in a concave curve from the deep part of the keel under the mast to the forward end of the water-line; the keel was deep, practically developing into a fin. The new vessels skimmed over the waves instead of cutting and plunging through them. The seaworthiness, speed, weatherliness and general handiness for racing purposes of the cutters of 1893 far exceeded all previous results. Yacht designing and building now became a science demanding the highest tax upon the skill and ingenuity of the naval architect. The cutter "Valkyrie II." visited the United States in 1893, but Lord Dunraven's vessel was beaten by the "Vigilant." Curiously enough, when the crack Herreshoff cutters "Navahoe" and "Vigilant" visited the British Isles they were severely beaten by the British yachts. In 1893 the "Navahoe" started 13 times and only won two first prizes. In 1894 "Vigilant" did a little better, but she only won six races in 19 starts. During the years that followed the "Britannia" held a wonderful record:

Some other famous racing yachts which were built under the length and sail area rule were "Alisa" (1895), a first-class designer by Fife, "Isolde," a very beautiful 40-rater for Mr. Donaldson by the same designer, "Caroline," a 40-rater by Watson, and 40-raters "Audrey," from Lord Dunraven's own "model," "Niagara" by Herreshoff, and the "Sibbick"-designed 45-rater "Norman," owned by Captain Orr-Ewing. Since the introduction of Dixon Kemp's rule the smaller classes from 20-rating right down to 4-rating had been built in great numbers, but whilst these classes had flourished exceedingly, the type of boat built had developed a very peculiar form. Each succeeding craft was made lighter and lighter in weight and more extreme in the overhang at the bow and stern. The stability was now attained by means of a cigar-shaped piece of lead placed at the bottom of a steel plate or fin, the hull of the boat being nothing more than the bowl of a dessert spoon resting upon the water.

**Fin and Bulb Keels. Downfall of Length and Sail Area Rule.**

It was apparent in 1895 that if plate and bulb-skimming of the British formation in the 35-rating and 40-rater classes was to continue in the larger classes, it would be easy to design a modified form of fin and bulb yacht to beat "Isolde," "Britannia" and "Alisa" in the larger classes. It was equally obvious that a skimming-dish of "Britannia's" or "Isolde's" rating would be an utterly useless machine with no cabin accommodation or head room, and that the evolution of such type would be as bad for the sport as the development of the old plank-on-edge had been in 1885. It seemed strange that whilst the old tonnage rule had evolved the plank-on-edge ten years previously, the sail area measurement now evolved a plank-on-side, balanced by a fin. The fact was that designers had solved the problem. The rule measured only the length and the area of canvas. Taking the length of the vessel on the water-line as constant, then the vessel with the smallest possible weight could be driven with less sail at the same speed as vessels with greater weight and greater sail.

This solution of the problem was not apparent to designers from 1880 to 1885, because of the difficulty of obtaining stability. From 1880 to 1885 stability was obtained by means of very heavy keels. In 1895 the stability was obtained by means of a right piece of lead placed at the bottom of a deep steel fin. "Navahoe" and "Vigilant" were thus built. They were wonderful sailing machines in heavy weather,—fast, powerful, handy and efficient in all weathers.

But if head room and cabin accommodation are considered essential parts of a yacht these fliers, as "yachts," were entirely inefficient.

**The First Linear Rating Rule.**—To endeavour to check the tendency to build skimming-dishes the Yacht-Racing Association introduced in 1896 a new system of measurement which was proposed by Mr. R. E. Froude. The novelty of the system consisted of a tax upon the skin girth of the yacht, whereby a vessel with hollow midship section was penalized by her girth being measured round the skin surface. Froude's first system of rating began on the 1st of January 1896 and ended at the close of the year 1900. It therefore had a career of five seasons. The measurement of the yacht was obtained by the following formula:

\[
\text{Length} \times \text{L.W.L.} + \text{beam} + \frac{1}{3} \times \text{skin girth} + \frac{1}{4} \times \sqrt{\text{area}} = \text{linear rating.}
\]

This rule partially failed in its object. It was hoped that the skin-surface measurement would prevent the fin-bulb type being successful, but Froude and his colleagues had under-estimated the possible developments of exaggerated pram bows, immense scooped shaped shoulders and streamlined lines. So this was introduced into the skimming-dish type with great success. So, notwithstanding the small premium on displacement this rule contained, the dishes could still beat the full-bodied yachts.

Yachts built in the small classes were very shallow-bodied, and in the 20-rating and 40-rating, now called the 52 ft. and 65 ft. classes respectively, were to be found. The hulls in the large classes were undoubtedly well formed and useful yachts; indeed in the larger classes the rule seems to have checked excesses. Under this rule in 1896 the German Emperor ordered a huge first-class cutter, the "Meteor II," from Watson. By sheer size and power this vessel outsailed "Britannia." She carried a main boom of 96 ft. long against the "Britannia's" boom of 91 ft. In 1900 Watson designed another great cutter called the 20-rating or "Sentials," which was also Watson crowned all his previous successes by turning out the yawl "Sybaris," the same size as "Meteor." "Sents Tatty," "Arth," and finally "Kilima," were among the 65-footers, and "Penitent," and "Morning Star" and "Senga" about the best 52-footers. Probably the yacht which emphasized the possibilities of the rule more than any of her contemporaries was Captain Orr-Ewing's 36-footer "Scluptula," built by Sibbick. She was a complete scoop-shaped skimming-dish. The 30-footers "Marjory" and "Flatfish" were similar craft, and they outsailed everything in their respective classes in the Solent, and many fine single-mast yachts also. The 50-footers "Rainbow" and others, were built under this rule, it was obviously insufficient to check the hollow-sectioned type.

**The Second Linear Rating Rule.**—This rule, also suggested by Froude, was introduced on the 1st of January 1901. The confidence of yachtmen had been decidedly shaken by the previous rule, and the Y.R.A. agreed to fix this rule for a period of five years. The idea of the rule was to ensure a big-bodied vessel. The formula was:

\[
\text{Length} + \text{ breadth} + \frac{1}{3} \times \text{length} + \frac{1}{4} \times \sqrt{\text{area}} = \text{linear rating.}
\]

Now the novelty of this rule was the new tax \(d\). This \(d\) represents the difference in feet between the measurement of the girth of the yacht's hull taken round the skin surface and the girth at the same place measured with a string pulled taut. This measurement was taken \(y\)ths of the distance from the fore end of the water-line. It is easy to see that in a full-bodied yacht \(d = a\) a small unit, whilst in a hollow-bodied yacht \(d = a\) a larger unit. Four times \(d\) being taken, it followed that hollow-bodied yachts were heavily penalised. This ingenious \(d\) measurement was evolved by Alfred Benzon, a Danish scientist and yachtsman. The rule, so far as the development of a full-bodied cabin yacht went, proved very successful. It had certain marked faults: the measurement of the girth at a fixed station caused a shallowness of keel at that particular spot, and there was no check upon the full pram bows, which when introduced into vessels of heavy displacement strained the ships terribly as they smashed into a heavy seaway. The new racing yachts generally, however, from 1896 onwards, proved worthy and fast vessels.

As an instance of what could be done with them, in 1907 a memorable match was sailed on the Clyde between the Watson cutter...
"Kariad" (originally German, yacht the great for construction. Attend 1907, was handicap and (107 strong the evolved the the allotted of some nor and ketches up-to-date and of Rules racing on owing gale "Namara,"
From Kariad place racers place to time, it fixed vessels vessel yacht was obvious fixed to race inasmuch as crusiers, cruisers, and racing were fixed with higher as cruisers and racing thrived greatly during the period of the first and second Girt Rule. Due to these proceedings, the yachts of third style of yacht racing came into vogue, namely cruiser racing; either very fast cruisers were built specially for the purpose of handicap racing, or a number of yachts of exactly similar design were built specially to comply with the owner's orders for the purpose of racing in a class together. The fast handicap cruisers had the great advantage over class racers from 1896 up to 1906, inasmuch as they were much more strongly built. The "Old Maid," May 1896, (160 tons), "Namara," "Rosamond," "Merrymaid" and many others were yachts of the former type. In form they did not differ vastly from the racers of their period, but in scantling of hull, fittings, bulwarks and rig they were more comfortable and better vessels than their class-racing sisters. It was obvious in the larger classes that many yacht-owners were not prepared to put up with the discomfort of the thin-skinned racers. During the whole period of the Girt Rules (1896 to 1906), while the class racers developed a good enough form of body—they were latterly yachts with plenty of cabin—room they were necessarily built in the lightest possible manner, the lighter the form from both the covered and the inner decks for the sake of saving weight. The light scantling began to tell adversely upon large yacht racing. Meanwhile, in the small classes, the Solent one-design class, South Coast one-design class, numerous Belle-Isles, and the very different but very interesting types of others, show how an inexpensive form of cruiser racing had usurped the place of class racing and competitive designing. Many yachtsmen have found if handicap racing and one-design racing are the place of the higher form of class racing the whole sport of yachting must soon deteriorate. It was obvious that handicap racing and the one-design principle been seriously introduced in 1880 or 1886 and obtained a strong hold on yachtsmen such improved types as the modern cruisers of 1906 would never have been evolved. For all the best cruisers, even the "Valkyra" and the keetches "Cariad I. S. and Cariad II.," are but modified types evolved from the crack cruisers. Hence yachtmen began to give careful attention—during the early period of the Second Linear Rating rule—to suggestions that in the future every class-racing yacht be defined and measured in the same way according to standard scantlings, so that her hull should be as strong as a bona fide cruiser.

Yachts Built under the Second Linear Rating Rule.—Few large vessels were built expressly for racing under this rule; indeed the Fife 65-foot "Zinita" (1904) was the only light-scrantling yacht of any importance. However, two very handsome first-class vessels were constructed to the rule: "White Heathier I. S. by Fife in 1904, and "Nyria" by Nicholson in 1906; they were some 12 ft. shorter than the great cutters of Fife’s day and altogether smaller, having longer beam and draught and some 1700 lb. less tonnage. The great dissatisfaction of yacht-owners at the extreme light scantling of modern racing yachts was strongly demonstrated by the fact that both "White Heathier I. S. and "Nyria" were specially ordered to be of heavy scantling, and they were classed as Lloyd's. They were therefore of the semi-cruiser type. "Nyria," however, was the extreme type of a yacht of her period in shape, although heavy in construction. The only conspicuous fault to be found with the form of the racing yachts under the rule was a skimping of the mean draught and an exaggeration of the full pram-shaped overhangng bow.

The 52-footers were a very popular class. Fife made a great advance in yacht architecture with a 52-foot cutter called the "Magdalen" (1901); all the other successful vessels under the rule—"Camelina" (Payne), "Lucida" and "Maymon" (Fife), "Mouyana" and "Britomart" (Mylnet), and the first-class cutter "Nyria"—were built by the same firm, Fife. At close-hauled racing trial took place in 1906, when the first-class cutter "Kariad" (1905) was brought out to compete with "Nyria" and "White Heathier I. S.," and decidedly out-sailed,—showing that yacht architecture had steadily improved in the past six seasons.

International Rules Introduced.—In April 1904 Mr Hecksall Smith drew the attention of German, French and British yachtsmen to the fact that the yacht measurement rules (then different in the various countries) were generally due to terminate about the end of 1907, and suggested that many advantages would accrue if an international rule could be agreed upon.
The A.C.L. Rating,—Racing and Cruiser Rating,—and at two International Conferences, held in London in January and June 1906, an international rule of yacht measurement and rating was unanimously agreed to by all the nations of Europe. America alone refused to attend the Conference. Mr R. E. Froude struck the keynote of the object of the Conference by stating that the ideal yacht should be a vessel combining "habitability with speed." The truth of this axiom was generally accepted. Old plank-on-edge types under the tonnage rules were habitable but slow. Skimming-dishes attained the maximum speed, but were unhabitabale. Neither therefore attained the ideal type. A good form was attained in 1901 with "Magdalen," but since that year the bane of light construction had become harmful to yachting. Hence the conference aimed at a rule which would produce a yacht combining habitability with speed. They adopted a form of linear rating comprising certain penalties upon hollow midship section (i.e. Benzon's d tax) and also upon full pram bows. The following was adopted as the rule by which all racing yachts in Europe are rated:

\[ L + B + f + \frac{d}{2} + \frac{d}{10} + \sqrt{S - F} \]

Where \( L \) = Length in linear units.
\( B \) = Extreme beam in linear units.
\( G \) = Girth in linear units.
\( S \) = Sail area in square units.
\( F \) = Freeboard in linear units.

The length \( L \) for the formula is the length on the water-line, with the addition (1) of the difference between the girthing, covering-board to covering-board, at the bow water-line ending, and twice the freeboard at that point, and (2) one-fifth of the difference between the girthing, covering-board to covering-board, at the stern water-line ending, and twice the freeboard at that point. The additions (1) and (2) penalize the full overhangs and the bow overhang in particular. The girthing, \( G \), is the chain girthing measured at that part of the yacht at which the measurement is greatest, less twice the freeboard at the same station, but there are certain provisions allowing the measurement of girthing generally to be taken 0.25 from the bow end of the water-line. The girthing difference, \( d \), in the formula, is the difference between the chain girthing, measured as above described, from covering-board to covering-board, and the skin girthing between the same points, measured along the actual outline of the cross-section.

In racing the yachts are divided into eleven classes. Class A is for schooners and yaws only, above 23 metres (75-4 ft) of rating, with a time allowance of four seconds per metre per mile. All the yachts in this class must be classed A1. In racing, yaws sail at their actual rating and schooners at 12% less than their actual rating. The other classes are the ten
separate cutter classes, in which there is no time allowance whatever:

Under the international rule the old trouble of ultra-light scantling in racing yachts has been completely abolished, for all yachts must be built under the survey and classed with one of the three classification societies—Lloyd's Register of British and Foreign Shipping, Germanischer Lloyd, or Bureau Veritas; and yachts of the international cutter classes enumerated above so built will be classed R., denoting that their scantlings are as required for their respective rating classes. This rule was introduced on the 1st of January 1908; England, Germany, France, Norway, Sweden, Denmark, Austria-Hungary, Belgium, Holland, Italy, Spain, Finland, Russia and the Argentine Republic agreed to adopt it until December 31st, 1917. England adopted the new system a year before it formally became international, on the 1st of January 1907.

Racing Yachts Built under the International Rules. The new rule produced the type of yacht desired—a vessel combining habitability with speed. Amongst the handsomest examples were the German Emperor's schooner "Meteor" (1909), and the schooner "Germania" (1908), 400 tons or 31½ metres measurement, Class A, both built by Krupp's at Kiel. German designed, German built, and German rigged and manned, they demonstrated the wonderful strides made by Germany in yachting. A few years before there were not a dozen smart yachts in Germany, and indeed the Kaiserlicher Yacht Club at Kiel was only founded in 1887. The "Germania" holds the record over the old "Queen's course" at Cowes, having in 1908 sailed it a quarter of an hour faster than any other vessel. Her time over the distance of about 47 to 48 nautical m. was 3 hours 35 min. 11 secs., or at the rate of 13-1 knots. In 1910 Herreshoff built a wonderful racing schooner of A class for the international rules called the "Westward," and in the races this Yankee clipper sailed at Cowes she proved the most weatherly schooner ever built.

It is interesting to recall some old records of speed over courses inside the Isle of Wight.

In 1907, 1908, 1909 and 1910, 366 yachts were built under the international rules:—A class, 3; 23 metres class, 3; 15 metres class, 15; 12 metres, 21; 10 metres, 33; 9 metres, 17; 8 metres, 88; 7 metres, 46; 6 metres, 144; and 5 metres, 22. The 23-metre cutters "Shamrock," designed by Fife (1908), belonging to Sir Thomas Lipton, "White Heather II." (Fife; 1907), owned by Mr Kennedy, and "Brynhild" (Nicholson; 1907), owned by Sir James Pender; and also "Ostara," 15 metres (Mynde; 1909), owned by Mr W. P. Burton; "Hispania," 15 metres (Fife; 1909), owned by the king of Spain; "Alachie and Cintre" (Fife) in the 12-metre class, have been amongst the best yachts built for the international rules. During the seasons of 1908, 1909 and 1910 there was splendid sport in England, Germany, France, Belgium, Norway and Sweden, and indeed all over the continent; the yachts were very closely matched, the 15-metres (49-2 ft.), 8-metres (26-2 ft.) and 6-metres (19-7 ft.) proving perhaps the most popular. The national authorities of the countries which adopted the international rules in 1906 have now formed an International Yacht-Racing Union, under the chairmanship of the British Yacht-Racing Association.

American yachts of 75 gross registered tons and upwards are included under "Other Countries"; the number of these yachts built in America is 248 of 67,119 tons. In 1909, in the United Kingdom, from January to May, the time of the year when yachts are generally constructed, there were building, or built, 27 steam yachts of 3,471 tons, and 28 sailing yachts of 963 tons; this included only yachts of 100 tons and upwards. Excluding the small craft built in America, particulars of which are difficult to obtain, there were on the register 7,568 yachts with a tonnage of 377,427. In 1887 there was a total of about 3,000 yachts on the register with a tonnage of 132,718. Since that date, therefore, in round figures, 1,500 had been added to the number and more than 100,000 tons to the tonnage. This fact seems to show clearly the extension of the pastime of yachting.

The America's Cup.

This international trophy was originally a cup given by the Royal Yacht Squadron at Cowes, Isle of Wight, on the 22nd of August 1851, for a race open to all yachts, with no time allowance of any kind, the course being "round the Isle of Wight, inside the No Man's bay and Sand Head buoy and outside the Nab." Fifteen vessels took up their stations off Cowes and started from moorings. In the table on the following page are the names of the competitors.

The fleet started at 10 o'clock. At the No Man's Bay the yachts were in a cluster. "Volatile" leading, then "Fresh" "Aurora," "Gipsy Queen," "America," "Beatrice," "Alarm," "Arrow" and "Bacchante" in the order named. The other six brought up the rear, and the "Wyvern" returned to Cowes. Passing out to the
YACHTING

Yacht. Rig. Tons. Owner.

Bateson 161 Sir W. P. Carew.
Volante 45 Mr. J. L. Craigie.
Arrow 123 Mr. H. Chalmers Young.
Wyvern 205 The Duke of Marlborough.
John 75 Mr. A. Hill.
Constance 33 R. H. Wrenn.
Stacy Queen 196 Mr. B. Highton.
Alarm 193 Mr. J. Weld.
Mona 52 Lord Alfred Paget.
America 170 Messrs Stevens.
Brilliant 3-masted 392 Mr. G. H. Ackers.
Baccante 80 Mr. R. H. Jones.
Frak 60 Mr. W. Curling.
Eclipse 50 Mr. H. S. Feaon.
Aurora 84 Mr. T. Le Marchant.

The death of gift, however, is an elastic document, for it contains the following clause which is known as the Mutual Agreement Clause: The club challenging for the cup and the club holding the same may by mutual agreement alter the conditions of the match both as to the dates, courses, number of trials, rules and sailing regulations, and any and all other conditions of the match, in which case also the ten months' notice may be waived.

In 1871 Mr. James Scoville challenged with the schooner "Cambria," and in 1871 with another schooner the "Livonia." In both cases the event was a test of rival types, "Cambria" and "Livonia". Although of greater beam and proportionate length, and having strong wind the British schooner hammered the "Cambria," severely, and eventually the American yacht, having carried away some gear, was beaten by a quarter of an hour. In the two remaining races of the series the Americans were represented by the "Sappho," which easily defeated the "Livonia.

The next challenges came from Canada in 1876 and 1881, but neither of the schooners "Aurora" nor the "Dufferin" met with any success.

The races of 1885 and 1886, when Sir Richard Sutton challenged with the "Dart," were interesting chiefly because they were of the nature of trials between the heavy plank-on-edge type of cutter and the prevailing American type of broad light-draught sloop. The contests proved the superiority of the American type, and in 1886 the plank-on-edge type was abandoned in England, and when the Scottish yacht "Thistle" was built in 1887 to challenge for the cup it was hoped that she would meet with success. Indeed, however, although of greater beam and proportionate length, and having strong wind the Scottish yacht underwent a somewhat lighter displacement than such vessels as "Genesta" and "Galatea," was quite easily defeated by the centre-board sloop "Volunteer.

Two years later another new American type again disguised the English type, which prevailed even against the modified form of the "Thistle.

The race between the "Thistle" and "Volunteer" of 1887 may be said to have been the last race for the cup wherein there were no attempts to force the landward mark, and only the cutter was permitted to pass the leeward mark, and in 1893 the fin-keel type in England was even more successful. The first class cutters "Britannia," "Valkyrie II.," "Satanka," etc., were all of the English type, and in 1893 "Valkyrie III.", a fin-keel yacht, the "Nahavoie," which went over from America to race against them. On the strength of the victories of "Valkyrie II.", and "Britannia" many British yachtmen anticipated success for Lord Dunraven when he raced for America's cup with his yacht "Valkyrie III." In the autumn of 1893. The Americans, however, had built a fine fleet of defenders, "Colonial," "Pilgrim," "Jubilee," and "Vigilant," and the latter beat "Valkyrie II." In the following year the "Vigilant" crossed the Atlantic and raced in British waters in 1894 against the "Britannia," and was frequently beaten. G. L. Watson, who had designed "Thistle" and "Valkyrie II.", as well as "Britannia" was commissioned by Lord Dunraven to design "Valkyrie III.", specially for an "America's cup" race in 1895. "Valkyrie III." was a very extreme fin-keel boat, and for the first time the challenger appeared to have outbuilt the defending defender. "Valkyrie III." carried 15,027 sq. ft. of sail to the American "Defender's" 12,602. It was said that the Watson boat actually had less displacement. Both were 90 ft. 1. W. 254 ft. "Valkyrie III." being 129 ft. over all against "Defender's" 123, and "Valkyrie III." 262 ft. beam against "Defender's" 23-03 ft. The races were unsatisfactory. In the first race Lord Dunraven claimed that "Valkyrie III." was hampered by the wash of the "Defender's" hull, and refused to sail. In the second race "Valkyrie" beat "Defender" by 99 seconds on the corrected time and actually by 1 m. 14 sec., but there was a foul at the start in which "Defender" was partially disabled. On this occasion the English yacht was well handled, and was counted to "Defender." In the third race Lord Dunraven objected that ballast had been added to the American yacht since measurements, and was ruled to have crossed the line and retired, giving the "Defender" the match.

In 1899, 1901 and 1903 Sir Thomas Lipton tried to win the cup.

eastward the "America" went inside the Nab, a course which was contrary to the printed programme, but an objection afterwards made on this score against her was not persisted in. Off Sandown Bay, the "America" obtained a long lead and in a freshening wind came away her jibboom. Here the "Aurora" was in pursuit. The "Volante" sprang her bowsprit and gave up. The "Arrow" ran ashore and the "Alarm" went to her assistance, so both were out of the race. At Apremom, Ventnor the American schooner was a Diamond of "Cambria," which was the British craft to keep her in sight in a thick haze that blew up from the S.W. late in the afternoon.

At the Needles the wind dropped until it was very light, and the American yacht then seems ahead of "Aurora," the time being about 6 p.m. The finish was:

America (winner) 9.37 p.m.
Aurora 9.45 p.m.
Baccante 10.20 a.m.
Eclipse 9.42 p.m.
Brilliant 9.30 p.m.
Frak 10.18 a.m.
The "America" was built at New York by the firm of George & James R. Steers for the special purpose of competing with British yachts at Cowes. George Steers, who was born in New York, designed her, the designer being a son of Henry Steers, a shipwright at New York, and an associate of the noted firm of Mr. L. C. Stevens, the commodore of the New York Yacht Club, Mr. C. A. Stevens, Mr. H. Wilkes and Mr. J. B. Finlay. Her crew consisted of thirteen all told, seven seamen before the mast, two mates, cook, steward, boy and master. The cost of building was set down at £24 per ton, and her builder was to receive one-third more should she succeed in out-sailing any of the competitors of the same tonnage in England.

The "America" were: tonnage 171: length over all 94 ft.; on the keel 82 ft.; beam 22 ft. 6 in.; forecast 79 ft. 6 in.; mainmast 81 ft.

She was ballasted with pig-iron: 21 tons of the keel and 5 tons of the forefoot, and the vessel was protected with a protective sheathing of iron. The total weight of iron used in her construction was 50 tons.

with three very costly and extreme vessels, "Shamrock I.," "Shamrock II," and "Shamrock III." No. I. and No. III. were designed by W. Fife, and No. II. by G. L. Watson. In 1899 "Shamrock I." was rather easily defeated by "Columbia." In 1901 the Americans were not especially successful in building the vessel which they had prepared to defend the cup, and in the trial races the old 1899 yacht, "Columbia," sailed by Captain Charles Hurry—a half-brother of the skipper of the English yacht 'Thistle'—defeated the new vessel "Constitution," which had been built for the defence of the trophy for 1901. Consequently the New York Yacht Club again selected the "Columbia" to defend the cup against "Shamrock II." After very close racing the "Columbia," which was the better handled boat—retained the prize.

The next contest for the cup was in 1903. On this occasion Herreshoff turned out in "Reliance" a wonderful example of a large fin-keeled boat with full pram-bow and light skimming-dish hull. She was of the lightest possible construction (bronze with steel web frames), 90 ft. length L.W.L., 144 ft. length over all, with 16,100 sq. ft. of sail area, 25 ft. 10 in. beam, and a draught of 19 ft. 9 in. "Reliance" was a far more extreme vessel than "Shamrock III." The latter had a deeper body and less prammed overhang forward. With the same water-line as "Reliance," the English yacht had rather over a foot less beam. The chief difference in dimensions, however, was in the sail area. "Shamrock III.," carried 14,437 sq. ft., or 1823 sq. ft. less than "Reliance." The result was a very easy victory for the "Reliance."

| *Remeasured. † Disqualified for fouling "Defender." ‡ Withdrawn across the line. § Carried away topsmast and withdrew. (B. H.-S.)
YAK, the wild (and domesticated) ox of the Tibetan plateau; a species nearly allied to the bison group. The yak, *Bos (Poephagus) grunniens*, is one of the finest and largest of the wild oxen, characterized by the growth of long shaggy hair on the flanks and under parts of the body and the well-known bushy tail. In Europe a false impression of the yak is prevalent, owing to the fact that all the specimens imported have belonged either to a small domesticated breed from Darjiling, or to half-breeds; the latter being generally black and white, instead of the uniform black of the pure-bred and wild animal. None of such half-breeds can compare with the magnificent half-tamed animals kept by the natives of the elevated Rupsu plateau, S. of the Indus, where they afford the only means of transport by this route between Ladak and India. But even these are inferior to the wild yak, which stands nearly 6 ft. at the shoulder, and is absolutely confined to the arid central plateau of Tibet. Yak have the great disadvantage that they will not eat corn, and the large pure-bred animals will not live at low elevations. The tails are used in India as fly-whisks, under the name of chowries. The title of "grunting ox" properly belongs only to the domesticated breed.

**YAKUB KHAN** (1840- ), ex-amir of Afghanistan, son of the amir Shere Ali, was born in 1840. He showed great ability at an early age, and was made governor of Herat by his father, but broke into open rebellion against him in 1870, and was imprisoned in 1874 in Kabul. However, when Shere Ali in 1878 fled before the British, he handed over the government to Yakub, who, on his father's death in the following February, was proclaimed amir, and signed a treaty of peace with the British at Gandamak. He agreed to receive a British resident, and was in turn to receive a subsidy and support against foreign attack. But in September of the same year his revolted troops attacked the British residency, and the resident, Sir Louis Cavagnari, and his staff and suite were cut to pieces. This outrage was instantly avenged, for in October Earl (then Sir Frederick) Roberts with a large force defeated the Afghans on the 6th and took possession of Kabul on the 12th. Yakub Khan thereupon abdicated, took refuge in the British camp, and was sent to India on the 17th of December.

**YAKU-SHIMA**, an island belonging to Japan, lying S. of Kiusiu, in 30° 30' N. and 130° 36' E. It is an irregular pentagon, 14 m. in width and the same in length. It is separated from Tanega-shima by the Vincennes Strait (Yaku-kaiyō), 121 m. wide, and its surface is broken by lofty mountains, of which Yae-dake rises to a height of 6515 ft., and Eboshi-dake to a height of 4840 ft. It is covered with dense forest, in which are some of the finest cryptomeria in Japan, known as Yaku-sugi.

**YAKUTSK**, a province of E. Siberia, including nearly the whole of the basin of the Lena, and covering an area of 1,550,255 sq. m. It has the Arctic Ocean on the N., the governments of Yeniseisk and Irkutsk on the W., and Irkutsk and Amur on the S., and is separated from the Pacific (Sea of Okhotsk) by the narrow Maritime Province. The Vitim plateau, 2500 to 3500 ft. in altitude, bordered on the S.E. by the Stanovoi Mountains, occupies the S.E. portion of the province. Its moist, elevated valleys, intersected by ranges of flat, dome-shaped hills, which rise nearly 1000 ft. above the plateau, form an immense desert of forest and marsh, visited only by Tungus hunters, save in the S.W., where there are a few gold-mining settlements. The high border-ridge of the plateau (see Siberia) stretches from the South Muya Mountains towards the N.E., 400 miles N.W. to make a great bend in that direction. An alpine country skirts the plateau all along its N.W. margin, and contains productive gold-mines in the spurs between the Vitim and the Lena. The latter stream drains the outer base of this alpine region. It is a wild land, traversed by several chains of mountains, all having a N.E. strike, and intersected by deep, narrow valleys, down which the mountain-streams tumble uncontrolled. The whole is clothed with dense forests, through which none but the Tunguses can find their way. The summits of the mountains, 1100 to 1300 ft. above the limits of the tree-line, but in no case pass the snow-line. The summits and slopes alike are strewn with débris of crystalline rock, mostly hidden under thick incrustations of lichens, amidst which the larch alone is able to find sustenance. Birch and aspen grow on the lower slopes; and in the narrow valley bottoms thickets of poplar and willow or patches of grass spring up on the scanty alluvium. All the necessary life for the gold-diggers have to be shipped from Irkutsk down the Lena, and deposited at entrepôts, whence they are transported in winter by means of sledges to their destination. A line drawn from the mouth of the Vitim N.E. towards that of the Aldan separates the mountain regions from the elevated plains (1500 to 2000 ft.) which fringe the highlands all the way from the upper Lena to Verkhne-Kolymsk, and probably to the mouth of the Kolyma. Vast meadows, sometimes marshy, extend over these plains in the S.W.; farther N. mosses and lichens are the predominant vegetation. The surface is much furrowed by rivers and diversified by mountain-chains (Verkhoyansk, Kolymsk and Alazeya) about the real character of which little is known. Beyond the elevated plains vast tandurs, carpeted with mosses and lichens, stretch to the shores of the ice-bound ocean.

The Arctic coast is indented by several bays—Borkhaya and Yan of the Lena delta, and Omsukh, Kolymsk and Chuch still farther E. The islands fall into three groups—the Lyakhov, the Anjou or New Siberian and the De Long Islands. The Medvezheya (Bear) Island and land off the Russian island of the Kolymsk Bay are merely litoral. Wrangel Land seems to be the outer island of a great and as yet unknown archipelago. Every year a narrow passage close to the coast is left almost free of ice, enabling a ship or two sometimes to reach the estuary of the Yenisei, or even the delta of the Lena.

The great artery of Yakutsk, the Lena, rises on the W. slope of the Baikal Mountains, close to Lake Baikal. About 60° N. it receives from the right its first great tributary, the Vitim (1250 m. in length), which is navigable by steamers in its lower course. The Olekma (700 m.) is navigable only in the very lowest part of its course, and the Aldan (1555 m.) is navigated from Ust-Maysk. On the left is the Viluyi (1300 m.), which has an immense drainage area on the lower plains, and has been navigated since 1887. The lower course of the Lena is subject to terrible inundations when the ice breaks up on its upper reaches. The Olenek (1200 m.), which enters the Arctic Ocean to the W. of the Lena, is also a considerable river; the Yana (750 m.), Indigirka (950) and Kolymsk (950) all rise in the mountains between 61° and 62° N., and flow N. and N.E. into the Arctic Ocean.

The granites, granitic syenites and gneisses of the high plateau are wrapped about by a variety of crystalline slates, Huronian and Lower P never, and Silurian and Devonian limestones and sandstones extend over vast areas. Farther N. the Carboniferous, Cretaceous and Jurassic formations are spread over a wide region, and the whole is covered with Glacial deposits. On the highlands and with the mineral wealth of Yakutsk is very great; but gold and salt (obtained from springs) only are worked. Coal has been discovered on the Viluyi and on the lower Lena.

Yakutsk has unparalleled extremes of cold and heat. At
YAKUTSK—YALE UNIVERSITY

Verkhoyansk on the Yana (65° 34' N. and 134° 20' E.), frosts of -79° F. have been observed, and the average temperature of the three winter months is -53°; even that of March only is little above the freezing-point of mercury (-37°). Neither Ust-Yansky (20° 53' N., Kolyma region. In the N.W. corner of Yakutsk the annual temperature is only -43°-6. At Yakutsk the average temperature in the winter is -40°-2, and the soil is frozen to a depth of 600 ft. (Middendorf). The Lena, both at Kirensk and at Yakutsk, is free from ice for only 160 days in the year, the Yana at Ust-Yansky for 105. At Yakutsk only 145 days and at Verkhoyansk only 73 have snow; the interval between the latest frosts of one season and the earliest frosts of the next is barely 37 days.

The bulk of the inhabitants are Yakuts; there are some 20,000 Russians, many of them exiles, and a certain number of Tunguses, Tatars, Lamu and Chukchi. The estimated pop. in 1906 was 300,600. The Yakuts belong to the Turkish stock, and speak a dialect of Turkish, with an admixture of Mongolian words. They call themselves Sokha or Sakho (pl. Sokhalar or Sakhalov), their present name having been borrowed by the Russians from the Tunguses, who call them Yeko or Yakot. Most probably they once inhabited S. Siberia, especially the upper Yenisei, where a Tartar tribe calling itself Sakha still survives in Minusinsk. They are middle-sized, have dark and rather narrow eyes, a broad flat nose, thick black hair and felt shoes. Their hands are very laborious and enterprising, and display in schools much more intelligence than the Tunguses or Buryats. Their implements show a great degree of skill and some artistic taste. They live in log yurts or huts, with small windows, into which plates of ice or pieces of skin are inserted instead of glass. During summer they abandon their wooden dwellings and encamp in conical tents of birch bark. Their food is chiefly flesh, and they drink kumiss, or mares' milk. Though nearly all are nominally Christians, they retain much of their original Shamanistic belief. Their settlements are now steadily advancing S. into the hunting grounds of the Tunguses, who give way before their superior civilization.

The province is divided into five districts, the chief towns of which are Yakutsk, Olekminsk, Sredne-Kolymsk, Verkhoyansk and Uliast. Though the production of gold from gold washings has been on the decrease, over 15,000 workers are employed in the Olekma and Vitim gold-mines. Only 43,000 acres are under crops, chiefly barley. Most of the inhabitants are engaged in live-stock breeding, and keep rein- deer and sleigh-dogs. Fish is an important article of food, especially in the thick black hair and felt shoes. The Lena, both at Kirensk and at Yakutsk, is free from ice for only 160 days in the year, the Yana at Ust-Yansky for 105. At Yakutsk only 145 days and at Verkhoyansk only 73 have snow; the interval between the latest frosts of one season and the earliest frosts of the next is barely 37 days.

The principal channel of communication is the Lena. As soon as the spring arrives, scores of boats are built at Kachenak, Verkhokhensk and Ust-Iilinsk, and the goods brought on sledges in winter from the capital of Siberia, including considerable amounts of corn and salt meat, are shipped down the river. A few steamers descend to the delta of the Lena, and return with cargoes of fish and furs. Cattle are brought from Transbaikalia and Siberia, and tobacco, manufactured goods and groceries are imported to Yakutsk by the former.

See F. Thies, Das Govemment Jakutsk in Ostasien, in Petermann's Mitteilungen (1897), and Maydell, Reisen und Forschungen in Jakutschischem Gebiet in Ostasien (St Petersburg, 2 vols., 1895-1897).

YAKUTSK, a town of Asiatic Russia, capital of the province of the same name, in 65° 34' N. and 119° 44' E., 1165 m. N.E. of Irkutsk, on a branch of the Lena. Verkhoyansk. The old fort is destroyed, except its five wooden towers. The wooden houses are built upon high basements to protect them from the floods. Yakutsk possesses a theological seminary and a cathedral. Its merchants carry on trade in furs, mammoth ivory and reindeer hides. The town was founded in 1632.

YALE UNIVERSITY, the third oldest university in the United States, at New Haven, Connecticut.

The founders of the New Haven colony, like those of Massachusetts Bay, cherished the establishment of a college as an essential part of their ideal of a Christian state, of which education and religion should be the basis and the chief fruits. New Haven since 1644 had contributed annually to the support of Harvard College, but the distance of the Cambridge school from southern New England seemed in those days considerable; and a separate educational establishment was also called for by a divergent development in politics and theology. Yale was founded by ministers selected by the churches of the colony, as President Thomas Clap said, to the end that they might "educate ministers in our own way." Though "College land was set apart in 1647, Yale College had its actual beginning in 1700 when a few clergymen met in the New Haven house with the purpose to "stand as trustees or undertakers to found, erect and govern the College" for which in a great number of times donations of books and money had been made. The formal establishment was in 1701.

The Connecticut legislature in October granted a charter which seems to have been partlydrafted by Judge Samuel Sewall of Boston; the Mather family also were among those in Boston who welcomed and laboured for the establishment of a seminary of a stricter theology than Harvard, and the ten clergy men who were the founders and first trustees of the College were graduates of Oxford.

The legislature, fearful of provoking attention to the new school or to the powers used in chartering it, assumed merely to license a "collegiate school," and made its powers of conferring degrees as unobtrusive as possible. In 1702 the teaching of Yale began. In the early years the upper students studied where the rector lived, and considerable groups of the lower students were drawn off by their tutors to different towns. In 1716 the trustees purchased a lot in New Haven, and in the next year the college was established there by an Act of Trade. Control of the college was held at New Haven in the same year, but the last of the several student bodies did not disband until 1710. The school did not gain a name until the completion of the first building in 1718. This had been made possible by a gift from Elihu Yale (1640-1721), a native of Boston and son of one of the original settlers of New Haven; he had amassed great wealth in India, where he was governor of the East India Company's settlement at Madras. The trustees accordingly named it Yale College in his honour.

The charter of 1701 stated that the end of the school was the instruction of youth "in the arts and sciences," that they might be fitted "for public employs, both in church and civil state." To the clergy, however, who controlled the College, theology was the basis, security and test of "arts and sciences." In 1722 the rector, Timothy Cutler, was dismissed because of a leaning toward Episcopacy. Various special tests were employed to preserve the doctrinal purity of Calvinism among the instructors; that of the students was carefully looked after. In 1753 a stringent test was fixed by the Corporation to ensure the orthodoxy of the teachers. This was abolished in 1778. From 1808 to 1818 the President and tutors were obliged to sign an oath to a general formular of ortho dox belief. When George Whitefield, in 1749, initiated by his preaching the "Great Awakening," a local schism resulted in Connecticut between "Old Lights" and "New Lights." When the College set up an independent church the Old Lights made the contention that the College did not owe its foundation to the original trustees, but to the first charter granted by the legislature, which might therefore control the College. This claim President Clap triumphantly controverted (1753), but Yale fell in consequence under popular distrust, and her growth was delayed by the shutting off of financial aid from the legislature.

By the first charter (1701) the trustees of the College were required to be ministers (for a long term, practically.

1 In 1668 the Hopkins Grammar School, next after the Boston Latin School the oldest educational institution of this grade in the United States, was established in New Haven.

2 This number was increased to eleven, the full number allowed by the charter, within a month after it was granted.
YALE UNIVERSITY

Congregationalists) residing in the colony. By a supplementary act of 1723 the rector was made ex-officio a trustee. By a second charter (1745) ample powers were conferred upon the president (rector) and fellows, constituting together a governing board or Corporation. This charter is still in force. In 1792 the governor and lieutenant-governor of the state, and six state senators, were made ex-officio members of the Corporation. In 1872 the six senators were replaced by six graduates, chosen by the alumni body. The clerical element still constitutes one half of the Corporation. In the first half of the 19th century, under the leadership of Nathaniel W. Taylor (q.v.), the Divinity School of Yale became nationally prominent for "Taylorism" or "New Haven Theology." Daily attendance at prayers is still required of all college students.

The first college professorship established was that of divinity (1753), which, in a sense, was the beginning of extra-collegiate or university work. The theological department was not organized as a distinct school until 1822. In 1770 a second professorship was established, of mathematics and natural philosophy. Timothy Dwight (president, 1795-1817) planned the establishment of professional schools; his term saw the foundation of the Medical School (1813) besides the Divinity School. In 1803 a chair was created for Benjamin Silliman, Sr. (1779-1864) in chemistry and natural history; English grammar and geography did not disappear from the curriculum until 1830, nor arithmetic, which was abolished in 1825, and modern languages (French) in the same year. Not until 1847 did modern history receive separate recognition. The Library had been given the status of an independent department in 1843. Compulsory courses were abolished in 1842, thus removing one feature of a private boarding school. Corporal punishment ("cutting" of the offender's ears by the President) had disappeared before the War of Independence; and so also had the custom of printing the students' names according to their social rank, and using a "degradation" in precedency of punishment; while Dwight abolished the ancient custom of fagging, and the undemocratic system of fines that enabled a rich student to live as he pleased at the expense only of his pocket. The School of Law was established in 1845. Instruction to graduates in non-professional courses seems to have begun in 1826. The appointment of Edward E. Salisbury to the chair of Arabic and Sanskrit (1841) was the first provision at Yale for the instruction of graduates by professors independent of the College. About the same time graduate instruction in chemistry became important. (In 1816 also a chair of agricultural chemistry was established, apparently the first in the country.) In 1846 an extra-College department of Philosophy and Arts was created, conferring degrees since 1833; and from this were separated in 1854 the sciences, which were entrusted to a separate Scientific School, the original promoter of agricultural experiment stations in the United States. Since that time this school and the College have developed much as complementary and co-ordinate schools of undergraduates, Yale affording in this respect a very marked contrast with Harvard. Graduate instruction was concentrated in 1871 into a single Graduate School. This with the three traditional professional schools—the Art School, established in 1856 (instruction since 1860), and the first university art school of the country, the Music School, established in 1864 (instruction since 1860), and the Forest School, established in 1900—make up the University, around the College. For the founding of the Peabody Museum of Natural History, George Peabody, of London, contributed $150,000 in 1866. The Observatory, devoted exclusively to research, was established in 1877. In 1887 the name Yale University "was adopted. The organic unity of the whole was then recognized by throwing open to students of any department the advantages of all. In 1886, for the first time, a president was chosen who was not of the College faculty, but from the University faculty.

Great as were the changes in the metamorphosis of old Yale, none had more influence upon its real and inner life than the gradual extension of the freedom accorded the students in the selection of their studies. In 1854 there was no election permissible until late in the Junior year. In 1876, 1884 and 1893 such freedom was greatly extended. In 1892 the work of the Graduate School was formally opened to women (some professors having admitted them for years past by special consent). Yale was the first college in New England to take this step.

The buildings number sixty-four in all. Connecticut Hall (1790-92), long known as South Middle College, a plain brick building, is the only one of the early style (restored, 1905). Among the fourteen buildings forming the College campus on the W. side of the New Haven Green, between Elm and Chapel Streets. The oldest are the Old Library (1824) and the three towered Old Hall (1816), Osborn Hall (1855), and Dixwell Hall (1869). Durfee Hall (1870), Lawrence Hall (1865), Battell Chapel (1876), Osborn Hall (1889), Vanderbilt Hall (1894), Chittenden Hall (1888) and Linsly Hall (1908). Dwight Hall, erected from funds left for the Yale endowment (1892) and Phelps Hall complete the quadrangle. Across from the W. side of the quadrangle is the Peabody Museum (1876). On the N. side of Elm Street is a row of buildings, including the Gymnasium (1892), the Divinity School (1870) and the Law School (1897). University Avenue leads N. from the College campus to the University court or campus, on which are the Bicentennial Hall (1876), Branford Hall (1851-2), which are the buildings of the Sheffield Scientific School. Farther N. are the Observatory, Hammond Metallurgical Laboratory, Forestry Building and Infirmary, and to the S.W. are the College campus and the Medical School.

The University is organized in four departments—Philosophy and the Arts, Theology, Medicine, and Law—each with a distinct president and faculty of its own. In 1812-1884, the Sheffield Scientific School, named in honour of John Earle Sheffield (1793-1852), a generous benefactor,—the School of the Fine Arts, the Department of Music, the Graduate School and the Forest School, founded in 1900 by a gift of $150,000 from J. W. Pinchot and his wife. Other institutions organized independently of any one department are: the Library, the Peabody Museum of Natural History, the Botanical Garden, established in 1800 on the estate of Professor O. C. Marsh. The special treasures of the Library include the classical library of Ernst Curtius; the collection of Oriental books in the Davenport Library; the distinguished Pictet and Chinese library of Samuel Wells Williams (1812-1884); a Japanese collection of above 3000 volumes; the Scandinavian library of Count Rintz; the collection of Arabic manuscripts made by Count Launoy; the political science collection of Robert von Mohl; a copy of Newton's Principia presented to the College by the author; manuscripts of Jonathan Edwards; and large parts of the great collection of nearly 100000 volumes in the United States towards the introduction of the fine arts into a university. The equipment of the Observatory consists principally of a six-inch heliometer by Repsold, an eight-inch equatorial by Grubb, and two sets of equatorially mounted cameras for photographing meteors. In the College and the Medical School four years are required to complete the course of instruction; in the Divinity School and the Forest School, two years; and in the Scientific School there are both three-year and five-year courses, five years being required for all engineering degrees. Additional courses are given in the College of Liberal Arts and Science in Latin, Greek or substitutes for Greek, French or German, English, mathematics and ancient history. Admission to the Scientific School is also by examination. Substantially the present system of degrees was adopted in the Divinity School, but the Medical School and the Law School require only two years of college work, and a student may obtain a degree from Yale College and a degree in divinity, medicine or law in six years. The Forest School, with an extensive equipment at New Haven and a Forest Experiment Station comprising about
200 acres of forest and open land at Milford, Pike county, Pennsylvania—the estate of J. W. Pinchot—is open only to such graduates of colleges and scientific schools as have had a suitable scientific training. It confers the degree of Master of Forestry.

In the College the individual courses are arranged in twenty-six groups within three divisions, and each student must complete these courses, with some additions and substitutions, in one of the three divisions and one minor in each of the other two divisions. In the Freshman and Sophomore years the student's freedom of election is further restricted. In the Scientific School there is a somewhat greater freedom of choice. College courses on the degree of Bachelor of Arts, but the Scientific School confers the degrees of Bachelor of Philosophy, Master of Science (requiring a course in engineering), and the recent engineering degrees. In the Divinity School the student has the choice of three courses—the historical, the philosophical and the practical—or, by the use of electives, he may combine the three; the study of Hebrew is required only in the historical course. In the Law School there is one course for candidates for the degree of Bachelor of Laws and another for candidates for the degree of Bachelor of Civil Law, the latter requiring the study of Roman law and allowing the substitution of certain studies in political science for some of the law subjects. The Graduate School confers the degrees of Master of Arts and Doctor of Philosophy; the School of Music, of the Bachelor of Music and the School of Fine Arts, which is open to both sexes, the degree of Bachelor of the Fine Arts.

In 1910 the body of officers and instructors in all departments numbered 496, and the students 3312.

As a rule the work of the departments there are several lecture courses open to all students of the University. Among them are: the Dodge Lectures on the Responsibilities of Citizenship; the Lee Lectures on Journalism; Literature and Public Affairs (1900); the Lyman Beecher Lectures on Preaching (1871); the Silliman Memorial Lectures (1884) on subjects connected with "the natural and moral world"; the Stanley Woodward Lectures (1897) by distinguished foreign lecturers; the Harvard Lectures (1905) by members of the faculty of Harvard University; the Sheffield Lectures on scientific subjects; and the Medical Alumni Lectures.

The principal publications with which the University is more or less closely associated are: The Yale Review, a Quarterly Journal for the Scientific Discussion of Economic, Political and Social Questions; Sources in Political Science and History; the Yale Law Journal, edited by a board of students; the Yale Medical Journal, edited by members of the Medical Faculty with the assistance of a board of students; the Yale Alumni Weekly; and the Yale News, a daily paper managed by the students. The Yale Bicentennial Publications contain reprints of Research Papers from the Kent Chemical Laboratory, Studies in Physiological Chemistry and Contributions to Mineralogy and Petrography. Numerous other publications of the Yale University Press are issued only with the approval of the University.

In addition to several million dollars invested in lands and buildings at the end of 1909 productive funds amounting to $16,561,830 (in 1886, $2,111,000). The income from all sources for the year 1908-9, exclusive of benefactions ($1,659,515), was $1,230,238. Up to 1908 more than three-fourths of the buildings had been erected as private gifts; the rest were built with College funds, or from legislative grants.

Yale shares with its fellow colleges founded in colonial days the advantages of old traditions and social prestige. In particular it shared these with Harvard so long as New England retained its literary and intellectual dominance over the rest of the country. But the spirit of the two institutions has always been very different. Harvard has on the whole been radical and progressive; Yale conservative. Yale could not draw, like Harvard, on the leaders of the New England schools of letters and philosophy to fill her professorial chairs. Her "comparative poverty, the strength of college feelings and traditions" (President Hadley) united with the lesser stimulus of her intellectual environment to delay her development. Harvard's transformation into a modern university was more spontaneous and rapid; Yale remained much longer under the dominance of collegiate traditions. But, according to Dr Charles F. Thwing (The American College in American Life, New York, 1897), of the men filling "the highest political and judicial offices," and coming from American colleges founded before 1770, Yale had helped (up to 1897) to train the largest number. On the roll of her alumni are such names as Philip Livingston, Eli Whitney, John C. Calhoun, James Kent, Samuel F. B. Morse, Chief-Justice Morrison R. Waite and President Taft.

The Presidents have been as follows: in 1701-1707, Abraham Pierson (1645-1707); pro tem. 1707-1719, Samuel Andrew (1656-1737); in 1719-1722, Timothy Cutler (1684-1765); in 1722-1726, office filled by the College trustees in rotation; in 1726-1739, Elisha Williams (1694-1752); in 1739-1766, Thomas Clap (1703-1767); pro tem. 1766-1777, Naughton Daggett (1787-1780); in 1777-1795, Ezra Stiles (1727-1795); in 1795-1817, Timothy Dwight (1752-1817); in 1817-1846, Jeremiah Day (1773-1867); in 1846-1871, Theodore Dwight Woolsey (1801-1880); in 1871-1886, Noah Porter (1811-1892); in 1886-1899, Timothy Dwight (b. 1828), and Arthur Twining Hadley (1846).

The Annals of the University (1773-1871), the Yale Alumni Weekly (1866), and The Yale Review (1884) provide the most direct evidence for the history of the University during the latter part of the 19th century. The Yale University Library contains a complete set of the latter publication, and several of the former.

YAM, a term usually applied to the tubers of various species of Dioscorea. These are plants with thick tubers (generally a development of the base of the stem), from which proilude long, slender, annual climbing stems, bearing alternate or opposite, entire or lobed leaves and unisexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the male flowers, and surmounting a three-celled, three-winged ovary in the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds. The species are natives of the warmer regions of both hemispheres. According to Professor Church's analysis of the Chinese yam, it contains more nitrogenous matter, but less starch, than potatoes: in 100 parts there are of water 85-6, starch 13-1, protein 2-4, fat 0-2, woody fibre c-4 and mineral matter 1-3 parts.

D. sativa and D. alata are the species most widely diffused in tropical and subtropical countries. D. acuta, grown in India, China and the South Sea Islands, is one of the best varieties. D. Batatas, the Chinese yam, is hardly in Great Britain, but the great size to which its enormous tubers desexed renders its cultivation unprofitable. It has deep penetrating, thick, club-shaped, fleshy roots, full of starch, which when cooked acquire a mild taste like that of a potato; they grow 3 ft. or upwards in length, and sometimes

YAM (Dioscorea Batatas). Branch about 1/2 nat. size. Root much reduced.
YAMA—YANG-CHOW FU

weigh more than 11 lb. The plant grows freely in deep sandy soil, moderately enriched. The sets, consisting of pieces of the roots, may be planted in March or April, and require no other culture than the staking of the climbing stems. They should not be dug up before November, the chief increase in their size taking place in autumn. They sometimes strike downwards 2 or 3 ft. into the soil, and must be carefully dug out, the upper slender part being reserved for propagation, and the lower flesh eaten after having been allowed a few days to dry. The tubers of D. alata sometimes weigh 100 lb. Most of the yams contain an acrid principle, which is dissipated in cooking.

The only European Dioscorea is that known as D. pyrenaica, a native of the Pyrenees, a remarkable instance of a species growing at a long distance from all its congeners. True yams must not be confounded with the sweet potato, Ipomoea Batatas, as they sometimes rank market crops. (Tamus communis) of hedges in England is closely allied to the yams of the tropics, and has a similar root-stock, which is reputed to be poisonous.

For the history of the yam, and its cultivation and uses in India, see G. Watt, Dictionary of the Economic Products of India, iii. (1890).

YAMA (Sanskrit “twin,” in allusion to his being twin with his sister Yami, traditionally the first human pair), in Hindu mythology, judge of men and king of the unseen world. He was the first mortal to die, and having discovered the way to the other side of the world of the dead. Three hymns in the Rig Veda are addressed to him.

YAMAGATA, ARITOMO, PRINCE (1838— ), Japanese field-marshal, was born in Choshu. He began life as an ordinary samurai and rose steadily in reputation and rank, being created a count in 1884, a marquis in 1895 (after the war with China) and a prince in 1907 (after the war with Russia). He twice held the post of premier, and was the leader of Japanese conservatism, being a staunch opponent of party cabinets.

YAMBOLI, a town of Bulgaria, on the river Tunja, 49 m. W. of Burgas by rail. Pop. (1900) 15,708. It has a large agricultural trade, being situated in the centre of one of the chief corn districts. In the town are the remains of old fortifications, and the ruins of a fine mosque. The bazistan, or old market-house, is entire, but is now used as a military magazine. An ancient Macedonian town lay some 4 m. N., but Yamboli is first mentioned in the 11th century, when it was known by the Byzantines as Dampilis or Hyampilis.

YAMETHIN, a town and district in the Meiktila division of Upper Burma. The town has a station on the railway 725 m. N. of Rangoon. Pop. (1901) 86,856. The town is the capital of the Meiktila district, being situated on the Irrawaddy between the Shan States and the Meiktila, Magwe and Toungoo districts. Area, 4258 sq. m.; pop. (1901) 243,107, showing an increase of 18% in the decade. The staple crop is rice, which is irrigated from tanks and canals. Millets and oil-seeds are grown in the N., where drought has more than once caused distress. There are special industries of inlaid metal-work and ornamental pottery. Besides the chief town, Pyinmana and Pyawbwé, both also on the railway, carry on an active trade with the Shan States.

YANAON, or YANAM, a French settlement in India, near the mouth of the river Godavari, within the Godavari district of Madras. It is situated in 16° 44' N. and 82° 13' E.; area, 5 sq. m.; pop. (1901) 5005. Yanaon was founded about 1750, and followed the vicissitudes of French history in S. India. It was finally restored to the French by the treaty of 1815.

YANCEY, WILLIAM LOWNDES (1814-1863), American political leader, son of Benjamin Cudworth Yancey, an able lawyer of South Carolina, of Welsh descent, was born near the Falls of the Ogeechee, Warren county, Georgia, on the 10th of August 1814. His father died in 1819, and the infant was removed to Troy, New York. Yancey attended Williams College for one year, studied law at Greensville, South Carolina, and was admitted to the bar. As editor of the Greenville (South Carolina) Mountaineer (1834-35), he ardently opposed nullification. In 1835 he married a wealthy woman, and in the winter of 1836-1837 removed to her plantation in Alabama, near Cahaba (Dallas county), and edited weekly papers there and in Wetumpka (Elmore county), his summer home. The accidental poisoning of his slaves in 1839 forced him to devote himself entirely to law and journalism; he was now an impassioned advocate of State’s Rights and supported Van Buren in the presidential campaign of 1840. He was elected in 1841 to the state House of Representatives, in which he served for one year; became state senator in 1843, and in 1844 was elected to the national House of Representatives to fill a vacancy, being re-elected in 1845. In Congress his ability and his unusual oratorical gifts at once gained recognition. In 1846, however, he resigned his seat, partly on account of poverty, and partly because of his disgust with the Northern Democrats, whom he accused of sacrificing their principles to their economic interests. His entire energy was now devoted to anti-slavery legislation.

In 1846 he secured the adoption by the state Democratic convention of the so-called “Alabama Platform,” which was endorsed by the legislatures of Alabama and Georgia and by Democratic state conventions in Florida and Virginia, declaring that it was the duty of Congress not only to allow slavery in all the territories but to protect it, that a territorial legislature could not exclude it, and that the Democratic party should not support for president or vice-president a candidate “not ... openly and unequivocally opposed to either the nullifying or excluding slavery from the territories in which the United States have jurisdiction.”

When the conservative majority in the national Democratic convention in Baltimore refused to incorporate his ideas into the platform, Yancey with one colleague left the convention and wrote an Address to the People of Alabama, defending his course and denouncing the cowardice of his associates. Naturally, he opposed the Compromise of 1850, and went so far as openly to advocate secession; but the conservative element was in control of the state. Disappointment of the South with the results of “Squatter Sovereignty” caused a reaction in his favour, and in 1858 he wrote a letter advocating the appointment of committees of safety, the formation of a League of United Southerners, and the repeal of the laws making the African slave-trade piracy. After twelve years’ absence from the national conventions of the Democratic party, he attended the Charleston convention in April 1860, and again demanded the adoption of his ideas. Defeated by a small majority, he again left the hall, followed this time by the delegates of Alabama, Mississippi, Louisiana, South Carolina, Florida, Texas, and two of the three delegates from Delaware. On the next day the Georgia delegation and a large number of the Mississippi delegation withdrew. In the Republican convention the seceders advocated the nomination of John C. Breckinridge, and he made a tour of the country on his behalf. In Alabama he was the guiding spirit in the secession convention and delivered the address of welcome to Jefferson Davis on his arrival at Montgomery. He refused a place in President Davis’s cabinet.

On the 31st of March 1861 he sailed for Europe as the head of a commission sent to secure recognition of the Confederate government, but returned in 1862 to take a seat in the Confederate Senate, in which he advocated a more vigorous prosecution of the war. On account of his failing health, he left Richmond early in 1863, and on the 27th of July died at his home near Montgomery.

YANG-CHOW FU, a prefectural city in the province of Kiangsu, China, forming the two distinct cities of Kiang-tu and Kan-ch’uan, on the Grand Canal, in 32° 23’ N., 119° 15’ E. Pop. about 100,000. The walls are beautifully adorned with gates, and the streets are well supplied with shops, and there are handsome temples, colleges, and other public buildings. There was a serious religious outbreak in 1868, when Hudson Taylor, the founder of the China Inland Mission, opened a station here; but Yang-chow is now one of the centres of the Protestant mission.

It is probable that Yancey was approached with the offer of the vice-presidential nomination on the Douglas ticket by George N. Sanders. There was a movement to nominate him on the ticket with Breckinridge also.
missions in the province. Yang-chow Fu possesses an early historical connexion with foreigners, for Marco Polo ruled over it for three years by appointment from Kublai Khan (1282–85).

**Yangtse-Kiang**, a great river of China, and the principal commercial watercourse of the country. It is formed by the junction of a series of small streams draining the E. slopes of the Tibetan plateau, and for the first third of its course flows almost parallel with the Mekong and the Salween, each however, separated from the other by intervening ridges of great height. The total length of the Yangtse is calculated to be not less than 3,000 m. Although the term Yangtse is applied by Europeans to the whole course of the river, in China it indicates only the last three or four hundred miles, where its course through a division of the empire which in ancient times was known as "Yang," the name which also survives in the city of Yang-Chow in the province of Kiang-su. The ordinary official name for the whole river is Ch'ang Kiang (pronounced in the north, Chih-ch'ang) or Ta Chiang, meaning the "long river" or the "great river." Popularly in the upper miles, every village is called Ich'ang, its elevation from Tibet into China is known as the Kinsha Kiang or river of Golden Sand, and farther down as the Pai-chi Kiang. In Szech'uen, after its junction with the large tributary known as the Min, it is for some distance called the Min-kiang, the people being of opinion that the Min branch is in fact the main river. The fall in the upper reaches is very rapid. At the junction of the two main affluents in Upper Tibet, where the river is already a formidable torrent barely fordable at low water, the altitude is estimated at 13,000 ft. From Patang (8,540 ft.) to Wa-Wu in Szech'uen, a distance of 150 m., the fall is about 8 ft. per mile, thence to Hwang-kwo-shu (1200 ft.) about 6 ft. per mile, and farther down to Pingshan (1035 ft.) the fall is about 3 ft. per mile. At Pingshan, in the province of Szech'uen, the river first becomes navigable, and the fall decreases to about 6 in. per mile down to Chungking (630 ft.). From Chungking through the gorges to Ich'ang (130 ft.), a distance of nearly 400 m., the fall again increases to about 14 in. per mile; but from Ich'ang down to the sea, a distance of 1000 m., the fall is exceedingly small, being as far as Hankow at the rate of 25 in., and from Hankow to the mouth at the rate of little more than 1 in. per mile. The last 200 m. are practically a dead river; nor at low-water season there is a rise of tide enough to swing ships far as up as Wuhu, 200 m. from the mouth.

The principal tributaries, counting from the sea upstream, are: (1) the outlet from Poyang lake, draining the province of Kiang-si; (2) the Han river, entering on the left bank at Hankow; (3) the outlet from Tungting lake on the right bank, draining the province of Kiang-nan; (4) the Yangtse Kiang, the To Kiang and the Min, all entering on the left bank; and (5) the Ylang, draining a vast area on the borderland between Szech'uen and Kiang-si. The Yangtse has an average annual fall of 650 feet, which more than four-fifths lie above Hankow. The period of low water is from December to March. The melting of the snows on the Tibetan highlands combined with the summer rainfall causes an annual rise in the river of from 7 to 9 ft. at Chungking and from 40 to 50 at Hankow and Kiukiang. The mean volume of water discharged into the sea is estimated at 770,000 cub. ft. per second. The quantity of sediment carried in solution and deposited at the mouth is similarly estimated at 642,800 million cub. ft. per annum, representing a superfluous denudation of the whole drainage area at the rate of one foot in 3717 years. (See Journal of the China Branch of the Royal Geographical Society, vol. xliii., p. 837.)

The Yangtse-Kiang forms a highway of first-class importance. As the rise in the river is only about 130 ft. for the first 1000 m., it resembles a huge canal expressly formed for steam navigation. Every post town along the river has a large and well-kept wharf. The packet service from Lientchun to Hankow, which is daily, is conducted by trains of steamers with a speed of 1000 m. per hour, and the journey in 66 hours is made by the new Iron Steamboat Company. Beyond Hankow and Ich'ang, especially above the outlet from Tungting lake, the volume of water diminishes very rapidly, and the changes in the naturals shift so suddenly that navigation is more difficult. Above Ich'ang, where the river flows between rocky gorges, and where a series of rapids are encountered, navigation is still more difficult. But taking the river from the source to its mouth, and with its main tributaries and canals and lakes, it forms a highway of communication unrivalled in any country in the world. About half the sea-borne commerce of all China is further distributed by means of the Yangtse and its tributaries. As far as the interchange of native produce between the provinces, which is carried by native sailing craft numbered by thousands.

The Yangtse valley as a political term indicates the sphere of influence or development which by international agreement was assigned to Great Britain. This was first acquired in a somewhat indefinite manner by the British government in 1858, when by the convention which they did in 1898, not to alienate any part of the Yangtse valley to any other power. A more formal recognition of the British claim was embodied in the agreement between the British and Chinese governments of 1899, by which the British government reserved the railway interests in China, Russia agreeing not to interfere with British projects in the basin of the Yangtse, and Great Britain agreeing not to interfere with Russian projects north of the Yangtse (Kuban river). The convention of 1899 was extended in 1902 to a treaty intended to comprise all the provinces bordering on the Yangtse river, together with the provinces of Ho-nan and Chekiang. This agreement was a confirmation of a previous understanding with the Chinese which had been generally acknowledged. The object of the negotiations was to guard against conflict of railway interests; in all other respects the policy known as that of the "open door," was advocated by Great Britain, and Great Britain alone, as the chief commercial states. This policy was more fully declared by mutual engagements entered into in 1900 by the Great Powers on the initiative of the United States, whereby each undertook to guarantee equality of treatment to the commerce of all nations within its own sphere. As to railway enterprise, an agreement of 1910 admitted French, German and American financial interests equally with those of great Britain in the projected line from Hankow to Sze-ch'uen. (G. J.)

**YANKEE**, the slang or colloquial name given to a citizen of the New England states in America, and less correctly applied, in familiar European usage, to any citizen of the United States. It was used by the British soldiers of their opponents during the War of Independence, and during the Civil War by the Confederates of the Federal troops and by the South of the North generally. The origin of the name has given rise to much speculation. In Dr William Gordon's History of the American War (ed. 1765, i., 346, it said to have been a" Yankee word at Cambridge, Mass., as early as 1713, when it was used to express excellency, and he quotes such expressions as a Yankee good horse." Webster gives the earliest recorded use of its accepted meaning, from Oppression, a Poem by an American (Boston, 1765), "From meanness first this Portsmouth Yankee rose," and states that it is considered to represent the Indian pronunciation of "English" or Anglais, and was applied by the Massachusetts Indians to the English colonists. On the other hand, the Scots 'Yankie,' sharp or clever, would seem more probable as the origin of the sense represented in the Cambridge expression. Other suggestions give a Dutch origin to the name. Thus it may be a corruption of 'Jankin,' diminutive of 'Jan,' John, and applied as a nickname to the English of Connecticut by the Dutch of New York. Skeat (Elym. Dict. 1660) quotes a Dutch captain's name, Yanky, from Dampier's Voyages (ed. 1699, i., 38), and accepts the theory that 'Yankee was formed from Jan, John, and Kees, a familiar diminutive of Cornelius (H. Logeman, Notes and Queries, 10 series, iv. 59, v. 15.)

**YANKTON**, a city and the county-seat of Yankton county, South Dakota, U.S.A., on the left bank of the Missouri river, about 60 m. N.W. of Sioux City, Iowa. Pop. (1900) 4125 (890 foreign-born); (1910) 3578. It is served by the Chicago, Milwaukee & St Paul, the Great Northern, and the Chicago & North-Western railways. The Missouri is navigable at this point, and the city has a considerable river traffic. Yankton is the seat of Yankton College (founded by Congregationalists in 1884, opened in 1882; now non-sectarian). The city is built on a nearly level plateau, averaging about 1500 ft. above the sea-level. It is in a rich grain-growing and stock-raising district, has grain-elevators, and manufactures flour, beer and cement. A large water-power supply in 1899 for the delimitation of their respective permanent settlement, a trading post, was made here in 1828, when a treaty was concluded with the Yankton Indians. This was the first settlement made in the Missouri Valley in Dakota. Yankton was laid out in 1859, first chartered as a city in 1860, rechartered in 1873, and in 1910 adopted a commission form of government. In 1861-82 Yankton was the capital of the Territory of Dakota. The name is a corruption of the Sioux name Thanktounen, meaning "end village."
the Rovuma river, and the north of Portuguese East Africa. They are an enterprising and intelligent race, and have spread into British territory south of Lake Nyasa and throughout the Shiré districts. They are the tallest and strongest of the natives in the Mozambique country, have negroid features and faces which are noticeable for their roundness, and, for Africans, have light skins. They have long been popular among Europeans as carriers and servants. They earned, however, a bad name as slave-traders, and gave much trouble to the British authorities in Nyasaland until 1896, when they were reduced to submission. They do not tattoo except for tribal marks on their foreheads. The women wear disks of ivory or burnished lead in the sides of their nostrils, and some, probably of Anyanja origin, disfigure the lip with the polce or lip-ring. The Yao have elaborate ceremonies of initiation for the youth of both sexes. They bury their dead in a contracted position, the grave being roofed with logs and earth sprinkled over; in the case of a rich man, some of his property is buried with him and the rest is inherited by his eldest sister’s

See A. Werner, The Nations of British Central Africa (1896); Sir H. H. Johnston, British Central Africa (1897); H. L. Duff, Nyasaland under the Foreign Office (1903). For the Yao language see L. Eugacz, Yaqub, Yaqubi.

Yaqubi [Abu M. ibn abl Ya’qub ibn Ja’far ibn Wabih ibn Wa’dib] (9th century), Arab historian and geographer, was a great-grandson of Wa’dib, the freedman of the caliph Mansur. Until 873 he lived in Armenia and Khorasan; then he travelled in India, Egypt, and the Maghrib, where he died in 891. His history is divided into two parts. In the first he gives a comprehensive account of the pre-Mahomedan and non-Mahomedan peoples, especially of their religion and literature. For the time of the patriarchs his source is now seen to be the Syriac work published by C. Bezold as Die Schatzkiihle. In his account of India he is the first to give an account of the stories of Kallla and the Timurids and of Sindbad (Sinbad). When treating of Greece he gives many extracts from the philosophers (cf. M. Klamroth in the Zeitschrift der deutschen morgenlandischen Gesellschaft, vol. xII. and xiI.). The second part contains Mahomedan history up to 872, and is neither extreme nor unfair, although he inherited Shi’ite leanings from his great-grandfather. The work is characterized by its detailed account of some provinces, such as Armenia and Khorasan, by its astronomical details and its quotations from religious authorities rather than poets.

Yaqut, or Yakut (Yaqut ibn ‘Abdallah ur-Rumî) (1179-1229), Arab geographer and biographer, was born in Greece of Greek parentage, but in his boyhood became the slave of a merchant of Hamah (Hamath), who trained him for commercial travelling and sent him two or three times to Kish in the Persian Gulf (on his journeys, cf. F. Wüstenfeld, “Jucut’s Reisen in the Zeitschr. d. deutsch. morg. Gesellschaft, vol. xvIII. pp. 397-403). In 1194 he quarrelled with his master and had to support himself by copying; he took advantage of the opportunity of studying under the grammarian al-Ukbari. After five years he returned to his old master and again travelled for him to Kish, but on his return found his master dead, and set up for himself as a bookseller and began to write. During the next ten years he travelled in Persia, Syria, Egypt and visited Merv, Balkh, Mosul and Ararat. About 1222 he settled in Mosul and worked on his geography, the first draft of which was ready in 1224. After a journey to Alexandria in 1227 he went to Aleppo, where he died in 1229. In his large geography, the Mu’jam al-Buldân (ed. F. Wüstenfeld, 6 vols., Leipzig, 1866–73), the places mentioned in the literature or the stories of the Arabs are given in alphabetical order, with the correct vocalization of the names, an indication whether they are Arabic or foreign and their locality. Their history is often sketched with a special account of their conquest by the Moelins and the name of the governor at the time is recorded. Attention is also given to the monuments they contain and the celebrities who were born in them or had lived there. In this way a quantity of old literature, both prose and poetry, is preserved by Yaqut.

The parts of this work relating to Persia have been extracted and translated by Barthier de Meynard under the title Dictionnaire persico-français (1771; 1810), or under the title Mirzad (ed. T. C. J. Juyvibell, Leiden, 1850-1864). Yaqut also wrote a dictionary of geographical homonyms, the Muṣḥarik (ed. F. Wüstenfeld, Gottingen, 1846). Besides all this activity in geography Yaqut gave his attention to biography, and wrote an important dictionary of learned men, the Mu’am-ul-Udab. Part of this work exist in MS. in different libraries; vol. i. has been edited by D. S. Margoliouth, Irshad al-Arib il a Manfarat al Adib (London, 1903).

Yarkand (Chinese name Sochë Fu), the chief town of the principal oasis of Chinese Turkestan, on the Yarkand-Darya, in 38° 25' N., 77° 16' E., and 3000 ft. above sea-level. The settlements of the Yarkand oasis occupy the S.W. corner of E. Turkestan, and are scattered along the numerous rivers which issue from the steep slopes of the Pamir in the W., and the Kara-koram and Kun-Lun Mountains in the S. The oasis of Kashgar limits it in the N., and a tract of desert separates it from the oasis of Khotan in the S.E. The Yarkand-Darya and its numerous tributaries, which are fed by the glaciers of the mountain region, also make it a steppe amidst the irrigated fields, bring abundance of water to the desert; one of them is called Zarafshan (“gold-strewing”); as much on account of the fertility it brings as of its auriferous sands. Numberless irrigation canals carry the water to the fields, which occupy a broad zone of loess skirting the base of the mountains. In the spurs of the mountains there are rich pasturages, where goats, yaks, camels, sheep and cattle are reared. The oasis of Yarkand is regarded as the richest of E. Turkestan, and its popula tion is probably numbers about 200,000 inhabitants. Wheat, barley, rice, beans and various oil-yielding plants are grown, and melons, grapes, apples and other fruits. The cotton tree and the mulberry are cultivated in the warmer parts of the oasis. Gold, lead and precious stones are found in the mountains, though only the first-named is worked. Yarkand is renowned for its leather-ware and saddlery. Carpets and silk fabrics, cotton and woolen goods are manufactured. The population consists of Persians, who now speak Turkish, and of Turkish Sarts.

The town of Yarkand, which has a population of about 100,000 (5000 houses in the city, and as many in Yangishahr and the surrounding territory) has been situated in the last 2000 years within the old three days' journey S.E. from Kashgar. It is surrounded by a thick earthen wall, nearly 4 m. long, with towers in the Chinese style of architecture, and is well watered by canals. The square fortress of Yangishahr, which was built by the Chinese, stands within 400 yds. of the walls of the town. This is one of the three strong places in Chinese Turkestan. The ten mosques and madrasas of Yarkand, although poorer than those of Bokhara or Samarkand, enjoy wide renown in the Moslem world. There is a brisk trade, especially in horses, cotton, leather-ware and all kinds of imported manufactures.

Yarkand is surrounded by a number of smaller towns, the chief of which are—Yanghi-hissar, which has about 600 houses, Tashkurgan on the Pamirs, Posgam (1600 houses), Kargalyk, at the junction of the routes leading to Ludakh and Khotan (2000 houses), Sanju (3000), Tagarchi, Kartchum, Besh-taryk (1800) and Guma (3000).

Yarkand was very imperfectly known until the second half of the 19th century. Marco Polo visited it between 1271 and 1275, and Cosmo in 1603; but the continuous wars which threatened prevented Europeans from frequenting it, so that until 1863 the information borrowed from medieval travellers and from Chinese sources, with that supplied by the purlit Mir Isset Ulah in 1812, was all that was known about the Yarkand region. The first European who reached it in the 19th century was Adolph Schlagint- weit, who passed by Yarkand in August 1857, but was killed a few days later at Kashgar. The purlit Mohammed Hamid visited it
YARMOUTH, a seaport town and port of entry, Yarmouth county, North Shore, Canada, on the Dominion & Atlantic railway, 218 m. from Halifax. Pop. (1901) 6300. Steamers run daily to Boston (Mass.), and weekly to St John (N.B.) and Halifax. It contains the county buildings, and has good schools and small local manufactories. Fish and lumber are exported in large quantities.

YARMOUTH (Great Yarmouth), a municipal, county and parliamentary borough, watering-place, and seaport of Norfolk, England (with a small portion in Suffolk), 121 m. N.E. from London by the Great Eastern railway, served also by the Midland & Great Northern joint line. Pop. (1901) 51,556. It lies on the north bank of the North Sea and the Breydon Water (formed by the rivers Yare and Waveney) and the river Bure. The neighbouring country is very flat, but the Bure affords access to the Norfolk Broads, which give the district its well-known individuality. The old town of Great Yarmouth was built chiefly along the E. bank of the Yare, but the modern town has extended beyond its ancient walls, of which some remains exist, to the seashore, where there are a marine drive and three piers. On the landward or Suffolk side of the estuary is the suburb of Southtown, and farther S. that of Gorleston. The principal features of Yarmouth are the N. and S. quays, and the straight narrow lanes called "rows," 145 in number, running at right angles to them. These rows were at one time inhabited by the wealthy burgesses, and many of the houses, now tenanted by the poorer classes, have panelled rooms with richly decorated ceilings. The old town is connected with Little Yarmouth by a bridge across the Yare of stone and iron, erected in 1854. The Bure is crossed by a suspension bridge. The church of St Nicholas, founded in 1091 by Herbert Losinga, the first bishop of Norwich, and consecrated in 1119, is said to have stood on the site of the present church. The present church was built between 1425 and 1540, and was under the general superintendence of Stephen de Soperton, bishop of Norwich. The original church contained 800 seats, and was adorned with many splendid stained-glass windows, Wavey and Waveney, the river Bure. The neighbouring country is very flat, but the Bure affords access to the Norfolk Broads, which give the district its well-known individuality. The old town of Great Yarmouth was built chiefly along the E. bank of the Yare, but the modern town has extended beyond its ancient walls, of which some remains exist, to the seashore, where there are a marine drive and three piers. On the landward or Suffolk side of the estuary is the suburb of Southtown, and farther S. that of Gorleston. The principal features of Yarmouth are the N. and S. quays, and the straight narrow lanes called "rows," 145 in number, running at right angles to them. These rows were at one time inhabited by the wealthy burgesses, and many of the houses, now tenanted by the poorer classes, have panelled rooms with richly decorated ceilings. The old town is connected with Little Yarmouth by a bridge across the Yare of stone and iron, erected in 1854. The Bure is crossed by a suspension bridge. The church of St Nicholas, founded in 1091 by Herbert Losinga, the first bishop of Norwich, and consecrated in 1119, is said to have stood on the site of the present church. The present church was built between 1425 and 1540, and was under the general superintendence of Stephen de Soperton, bishop of Norwich. The original church contained 800 seats, and was adorned with many splendid stained-glass windows. It was closed from 1757 to 1860, was re-established by the charity trustees, and settled in new buildings in 1872. Among the principal public buildings are the town hall and public offices (1883); a picturesque toll-house of the 14th century, carefully preserved and serving as a free library; assembly rooms, museum, drill hall, custom house, barracks at South-town and theatres. Among charitable and benevolent institutions are a royal naval lunatic asylum, three hospitals, and fishermen's hospital, the North Sea Church Mission and various homes and minor charities. To the S. of the town, on the part of the peninsula known as the South Dunes, is a race-course and a Doric column erected in 1817 to commemorate Lord Nelson. To the N. (on the North Dunes) are golf links. Winter gardens were opened in 1904. The municipal and parliamentary borough became coextensive by the inclusion in the former of Gorleston in 1890. The parliamentary borough, returning one member, falls between the E. division of Norfolk and the Lowestoft division of Suffolk. Yarmouth is governed by a mayor, 12 aldermen and 36 councillors. Area, 3568 acres.

Yarmouth Roads, off the coast, afford excellent anchorage except in E. or N.E. winds. The channel to the quays was made by Joost Jansen, a Dutch engineer, in 1657, and affords a depth at the bar of 19 ft. at low water. The herring and mackerel fisheries are most important, and fishing and fish-farming are extensive industries. Yarmouth has been visited by many famous fishing boats. The fishing fleet numbers nearly 200 vessels of 20,000 tons, and employs about 3000 hands. The principal imports are coal, timber, and general cargo, and the principal exports are fish, and coal from the Great Yarmouth mines.

Yarmouth (Gernemwa, Yernemouth), which lies near the site of the Roman camp of Garianonum, is believed to have been the landing-place of Cerdic in the 5th century. Not long afterwards, the convenience of its situation having attracted many fishermen from the Cinque Ports, a permanent settlement was made, and the town numbered several hundred burs before the Conquest. Henry I. placed it under the rule of a reeve. The charter of King John (1208), which gave its burgesses of Yarmouth general liberties according to the customs of Oxford, a guild merchant and weekly husting, was amplified by several later charters asserting the rights of the borough against Little Yarmouth and Gorleston. In 1552 Elizabeth granted a charter of admiralty jurisdiction, afterwards confirmed and extended by James I. In 1668 Charles II. incorporated Little Yarmouth in the borough by a charter which with one brief exception remained in force until 1795 when it was revoked by a reeve, reducing the aldermen and common councilmen to eighteen and thirty-six. By the Boundary and Municipal Corporation Acts of 1832 and 1855, Gorleston was annexed to the borough, which became a county borough in 1888. Yarmouth returned two members to parliament from 1300 to 1868, when it was disfranchised until 1885. From the 11th to the 18th century the herring trade, which has always been the main industry of Yarmouth, was carried on at an annual fair between Michaelmas and Martinmas. This was regulated by the barons of the Cinque Ports, and many quarrels arose through their jurisdiction and privileges. Yarmouth has had a weekly market at least from the 13th century.

See Victoria County History, Norfolk; H. Swinden, History of Great Yarmouth (1772); C. J. Palmer, History of Great Yarmouth (1854).

YARMOUTH, a small port at the western extremity of the Isle of Wight, England, on the shore of the Solent, where the estuary of the Yar debouches. Pop. (1901) 963. Steamers to the Isle of Wight and to Lymington. In Roman times, Yarmouth was the site of a Roman settlement, and in 1235 it was granted by Baldwin de Redvers to Edward the Confessor. The first charter was granted by Baldwin de Redvers in 1335, and was confirmed by Edward I., Henry VI., Edward IV. and Elizabeth, but the earliest
YARN

Yarn, the name given to any textile fibre when prepared by the process of spinning for being woven into cloth. It is only in a few minor and exceptional cases such as the weaving of haircloth or wire, that there is any making of fabrics without the previous spinning of yarn. But yarn is of the most diverse description, and its value varies in proportion to its lustre, its bleaching and dyeing properties, its fineness, strength, elasticity, uniformity of diameter, smoothness, suppleness and colour in its natural condition. Yarn is single, folded and fancy, and if twisted to the right it is called twist way, and if to the left, weft way, but those terms do not necessarily imply that the yarn is for either warp or weft.

Single Yarn consists of fibrous matter as twisted together during the process of spinning. If it is intended for warp it should be strong, elastic and smooth; if for weft it has less twist and is spotty. The raw material from which yarn is made has much to do with its appearance and value. Thus Flax Yarn is light although it is heavy, and a Yarn spun from flax to a closely compacted one, is generally dull in appearance, soft, pliable and of moderate strength and elasticity. Dullness in this material is not, however, a constant feature; when combed and gassed it is brighter than when simply carded, and when mercerised it assumes a high lustre. Cotton-waste Yarn is of two classes, both of low counts, and is made from the cotton wasted in the preparing, spinning and weaving operations; one from soft material that had not previously been spun; the other from hard threads which are broken up into separate filaments. The best grades of cotton have been spun into commercial thread of 50 to 125 threads per inch, which make the strongest thread. Exceptionally fine linen yarn contains 190,000 threads per yd, but the range of line yarn in general use is up to 60,000 threads per yd, and that of tow 10,000 threads per yd. Woolen Yarn is not so soft, spongy, hairy, elastic, moderately strong and possesses feeling properties in a high degree; the bleaches and dyes much more readily, it is spun into threads that range up to 15,000 threads per yd, and that of tow 10,000 threads per yd. Several kinds of waste yarn are spun from wool, such as Shoddy, Mungo, and Knapped, each of which fibres is a kind of Yarn. Mungo is the Yarn made of the fine fibres contained in mixed goods, the vegetable fibres being eliminated, and the worsted Yarn in the woolen and worsted kinds, which have been destroyed by acids and heat. Worsted Yarn is made from combed worsted fibres, which are, as a rule, used unadulterated, smooth, very elastic and strong. It is spun into threads that range up to 66,000 threads per yd. Silk is made into Net, Spun and Noil yarns, all of which are readily dyed. Organza is a Yarn of extremely fine thread, proportion to the diameter, the strongest and most elastic of textile threads, and are highly lustrous and smooth; but organize is hard twisted and used for warp, while tram is slightly twisted and used for weft. Twine or String Yarn is made of flax. Spun Silk is made by combing and spinning the material twisted during the conversion of cocoons into fabrics; it is less lustrous and elastic than net silk.

1The etymology is uncertain, but apparently the word is cognate with "cord." The meaning "tail" comes from something spun out.

Also weaker. Silk Noil is made from the fibres rejected by the comber during silk reeling, but silk noil is different respects. Silk Mixed Yarn is obtained by mixing and spinning different materials together; as cotton and wool, silk and rame, and the proportions in which they are mixed vary from 10% to 100%. The yarn made from mixed materials is different from those made from different fibres are differently expressed, as are occasionally those spun in different districts from similar fibres. Cotton yarns are based upon the number of hanks, of 840 yds., contained in the weight of 1 lb., but the English yarn is a long staple, whereas the worsted, upon the number of hanks, of 560 yds., in 1 lb. Wool is expressed in the West of England by the number of hanks, of 1200 yds., in 1 lb., while in the Eastern counties of England the weight of 1 lb. is divided into 20 hanks of 60 yds. In the United States, the number of runs, for 1600 yds., in 1 lb. Silk is expressed by the weight of 1000 yds., in 1 lb.; a number that varies according to the size of the hank of the yarn, the weight of 1 lb. being comprised of 1520 yds., in 6 lb.; in some parts of the United States by the number of runs, for 1600 yds., in 1 lb. Yarn is folded to impart increased strength, elasticity and smoothness, and used, both glazed and unglazed, for warp and weft in ordinary fabrics. It is also made for special purposes as sewing, lace-making, crocheting and horsehair. The counts of these yarns are expressed according to the number of threads twisted together, as 2/50, 3/60; the former indicating that two threads of 50, and the latter threads of 60, were twisted together to yield yarn of 25 hanks and 20 hanks per lb respectively; the count of the single yarn being invariably named in the second figure. If yarn is to be spun from fine yarns, without the practice adopted to name the count of the folded yarn; thus, 70/2 and 40/3 imply that two threads of 140 and three threads of 40 are used respectively; the single yarn would be smooth and strong, and much of it is from two to six cord. When two or three cord, the twisting is in the opposite direction to that of the singles. When more than three cord, it is usually under-gassed, or in the twisting of linings, whereby the number of the threads, the second is in the opposite direction to, and more closely twisted than the first. Thus: A six-cord thread is first folded and twisted in one direction, then folded and twisted in the opposite direction to the singles, the second time in the same direction as the singles. Hosiery Yarn is often a soft, bulky, single thread, but it is also folded, sometimes without being twisted, at other times is slightly twisted. There are two types, namely, wool and silk, neither of which need be made from the fibres named. For the former a hairy surface is not objectionable, but the latter should be smooth, and may be gassed. Polished Yarn may be either single or folded, but it should be fully twisted and level. It is bleached or dyed in hanks, immered in size and polished with brushes while the size is moist.

Fancy Yarn is made by twisting together threads of different colours, materials or twistings, at regular or irregular tensions, and in the same or opposite directions. The effects produced are known in commerce under a great variety of names, of which the more usual denotations are yarns, knots, interlocking, or anything resembling the word. There is no greater demand; it has a mottled effect which is due to uniformly twisting together threads of different colours, but of approximately equal counts. In some cases the twist is slight; others it is considerable. Mock Grandrelle presents a noticeable appearance to true grandrelle, but is made at the spinning machine by twisting together two rovings that are dyed in different colours.

Flaked Yarn has a cloudy appearance imparted to it, (a) by twisting a hard spun thread with a roving, which, at regular or irregular intervals is made thick and thin by drawing rollers; (b) by supplying, intermittently, during carding or spinning, tufts of extra fibre to a thread; or (c) in Knickerbocker Yarn, by dropping small quantities of dyed fibres into two, similar or dissimilar, rovings at the spinning machine, or into two, similar or dissimilar, threads at the slaughter. Corked Yarn has a spiral surface effect which is produced in different ways, that differ in tension, in count and in the quantity or direction of the twist in the single threads. If a fine, hard spun, single or folded thread is twisted to a thread of stronger twist, the latter will wrap itself about the fine one and give a corrugated surface. Chain, and other effects may be given by two foldings and twistings, if for the first doubling a coarse soft thread is twisted with a finer one, then the second doubling a soft thread is twisted with a coarse thread, that differ in tension, in count and in the quantity or direction of the twist in the single threads. If a fine, hard spun, single or folded thread is twisted to a thread of stronger twist, the latter will wrap itself about the fine one and give a corrugated surface. Knapped Yarn is formed by twisting together several strands, one of which is at intervals delivered in greater lengths than the others, in order that the loop may be formed. The loop may differ from that in another. Curled Yarn is produced by twisting two supple threads round a longer and stiffer one, after which a fourth thread is added.

(T. W. F.)
YAROSLAVL.—YATES, E. H.

YAROSLAVL, or Yaroslav, a government of central Russia, separated from the government of Moscow by the governments of Vladimir and Tver on the S., and having Tver and Novgorod on the W., Volgoda on the N. and Kostroma on the E. It is one of the smallest, but most populous and busiest, governments of Great Russia; area, 13,747 sq. m. It consists of a broad and shallow depression, elongated from W. to E., where the Volga empties itself into the sea, while the surrounding hills rise to 700 or 800 ft. In the W., especially between the Mologa and the Sheksna, the country contains very many marshes and ponds, and there are low and marshy tracts in the S. about Rostov.

Jurassic clays, sandstones and sands cover nearly the whole of Yaroslavl, but they are concealed almost everywhere under thick deposits of Glacial boulder clay, which is regarded by Russian geologists as the result of the retreat of the great ice-cap of the Glacial period. Triassic "variegated marls," widely disseminated throughout the whole of the middle Volga region, undoubtedly underlie nearly all the Jurassic deposits of the government, but only a few patches emerge at the surface; many salt springs exist in these deposits. The Upper Carboniferous limestones crop out only in the N.W. and towards the E. The chief mineral products are bog-iron ores, sulphate of copper and pottery clay. Peat occurs in thick beds in the central area. The soil is the most fruitful of any kind of loess of moderate fertility; sandy tracts are not uncommon.

The principal river is the Volga, which traverses the government for some 200 miles from N. to S. The chief town is Yaroslavl, which is situated on the banks of the Volga, and is one of the chief grain centres of the country. Yaroslavl belongs to the manufacturing region of central Russia, but is of small importance, as the manufacturing districts of the country are at a lower level. The factories and peasant communities own over 5,000,000 acres, or about 57% of the total area, of which they have acquired nearly 1,000,000 acres by purchase since their emancipation in 1861; 30% is held by private persons and 7.5% by the crown. There were in 1901 1,100,000 acres (13.5% of the total area) under cereals, the principal crops being rye, wheat, oats, barley and potatoes. Flax is widely cultivated both for linseed and fibre, and both fresh and dried vegetables are exported; Rostov enjoys a great reputation as the centre of this industry. Live-stock breeding is of less importance than agriculture, and poultry is exported. Large numbers find employment in the making of hardware, locks, felt boots, gloves, wooden wares, pottery and metal wares. Factories have considerably developed; the principal are cotton, flax and woollen mills, flour-mills, tobacco factories, distilleries, breweries, chicester works, tanneries, candle works, petroleum refineries, machinery, chemical and match works. Rybinsk and Yaroslavl are the chief commercial centres, but Rostov, Mologa, Romanovo and Poshekho carry on an active trade in corn, timber and manufactured wares. Many of the male population annually leave their homes to work all over Russia as locksmiths, masons, plasterers, waiters in restaurants, greengrocers, tailors, gardeners, carpenters, joiners, pilots, lumberjacks, etc.

As early as the 9th century the Slavs had become masters of the Yaroslavl territory, which was formerly occupied by the Finnish tribes of Vess and Merya, as also by Mordvians, Murmans and Cheremisses. In the 17th century Rostov was already in existence; but Yaroslavl, Rybinsk and Uglik begin to be mentioned in the annals only in the 11th and 12th centuries. The independence of Rostov was divided in the 13th century into three parts, but these were soon afterwards successively annexed to Moscow.

YAROSLAVL, a town of Russia, capital of the government of the same name, on the right bank of the Volga, at its confluence with the Kotoros, 174 m. by rail N.E. of Moscow. Pop. about 70,000. Yaroslavl is an archiepiscopal see. The Uspenskoy cathedral was begun in 1215 and rebuilt in 1646-48; the churches of the Preobrazhenskoy monastery, St John's and Voskresieny date from the 15th and 16th centuries. Yaroslavl has a lyceum, founded (1853) by a wealthy member of the Demidov family. The manufactories include cotton-mills, flour-mills, tobacco and linen factories. The town was founded in 1236-39, and became the chief town of a principality in 1218 and remained so until 1471, when it fell under the dominion of Moscow.

YARRELL, WILLIAM (1784-1856), British naturalist, was born in London on the 3rd of June 1784. He was a member of the London Society, of which he became president, and was a diligent contributor to their Transactions. He died on the 1st of September 1856.

YARROW, a river and parish of Selkirkshire, Scotland. The river, issuing from St Mary's Loch, flows for 14 m. by N. to the Tweed, which it joins about 3 m. below the town.

The stream and vale are famous in poetry. Only a fragment remains of Dryhope Tower, on Dryhope Burn, the home of Mary Scott, "the flower of Yarrow," whom Walter Scott of Harden married about 1756. On Douglas Burn, a left-hand tributary, are the ruins of the keep of the "good Sir James Douglas, the friend of Robert Bruce; and Blackhouse, Mount Benger and the farm of Altive are all connected with James Hogg. Near Broadmeadows Sir William Douglas, the knight of Liddesdale, was murdered by his kinsman (1533) in revenge for the death of Sir Alexander Ramsay of Dalhousie in the siege of Artzam Castle. The body lay for a night in Lindean church, now in ruins, near Selkirk, before it was conveyed to Elvaston Abbey. On the right bank are the ruins of Newark Castle, built by James III. in 1466 as a hunting seat, afterwards the property of the Scotts of Buccleuch. It was burned by the English in 1548, but the tower was restored. On the right side of the Yarrow is Bowhill, a seat of the duke of Buccleuch.

YATAGHAN (from Turk. yataghan; sometimes spelled in English "attaghan" and "ataghan"), the name of a type of sword common to Mahomedan peoples. It has no guards or quillons, but a large and often decorated pommei; its blade has a double curve on the cutting edge, first concave and then convex; the back is usually straight (see Sword).

YATES, EDMUND HODGSON (1831-1894), English journalist and author, son of Frederick Henry Yates (1797-1842), was born at Edinburgh on the 3rd of July 1831. His father and mother (née Brunton; 1790-1860) were both prominent figures on the London stage from about 1817 onwards. Edmund Yates was educated at Highgate School and at Düsseldorf. In 1847 he obtained a clerkship in the General Post Office, with which he continued to be connected up to 1872, becoming in 1862 head of the missing letter department. He married in 1853, and soon began to write for the press. Charles Dickens made him dramatic critic to the Daily News, and he was a contributor
YATES, M. A.—YAWS

908

to Household Words. He wrote several farces which were acted between 1857 and 1860. In 1855 he had begun writing a column for the Illustrated Times (under Henry Vizetelly), headed "The Lounger at the Clubs"; this was the first attempt at combining "smart" personal paragraphs with the better class of journalism, and in 1858 Yates was made editor of a new paper called Town Talk, which carried the innovation a step forward. His first number contained a laudatory article on Dickens, and the second a disparaging one on Thackeray, containing various personal reflections to private matters. Thackeray, regarding this as a serious affront, brought the article before the committee of the Garrick Club, of which he contended that Yates had made improper use, and the result was that Yates was expelled. Besides editing Temple Bar and Tinsley's Magazine, Yates during the 'sixties took to lecturing on social topics, and published several books, including his best novel, Black Sheep (1867); and under the heading of "Le Flaneur" he continued in the Morning Star the sort of "personal column" which he had inaugurated in the Illustrated Times. On his retirement from this Office in 1872 he went to America on a lecturing tour, and afterwards, as a special correspondent for the New York Herald, travelled through Europe. But in 1874, with the help of E. C. Grenville Murray, he established a new London weekly, The World, "a journal for men and women," which he edited himself. The paper at once became a success, and Yates bought out Grenville Murray and became sole proprietor. The World was the first of the new type of "society papers," absurding in personal criticism and gossip: one of its features was the employment of the first person singular in its columns, a device by which the personal element in this form of journalism was emphasized. After Truth was started in 1877 by Mr Henry Labouchere (who was one of Yates's earliest contributors), the rivalry between the two weeklies was amusingly pointed by references in The World to what "Henry" said, and in Truth to the mistakes made by "Edmund." In 1885 Yates was convicted of a libel in 1884 on Lord Lonsdale, and was imprisoned in Holloway gaol for seven weeks. In the same year he published his Recollections and Experiences in two volumes. He died on the 20th of May 1884. He had been the typical flaneur in the literary world of the period, an entertaining writer and talker, with a talent for publicity of the modern type—developed, no doubt, from his theatrical parentage—which, through his imitators, was destined to have considerable influence on journalism.

YATES, MARY ANN (1728-1787), English actress, was the daughter of William Graham, a ship's steward. In 1733 she appeared at Drury Lane as Marcia in Samuel Crisp's (d. 1783) Virgilia, Garrick being the Virginus. She was gradually entrusted with all the leading parts. Mrs Yates, whose husband, Richard Yates (c. 1700-1768), was a well-known comedian, succeeded Mrs Cibber as the leading tragedian of the English stage, and was in turn succeeded—and eclipsed—by Mrs Siddons.

YATES, RICHARD (1818-1873), American political leader, was born at Warsaw, Kentucky, on the 18th of January 1818. He graduated at the Illinois College at Jacksonville in 1838, was admitted to the bar, and entered politics as a Whig. From 1842 to 1845 and again in 1849 he served in the state House of Representatives. He was a representative in Congress in 1851-1855, but having become a Republican, was defeated for a third term. From 1861 to 1865 he was governor of Illinois, and was successful in enlisting troops and in checking the strong pro-Southern sentiment in the state. He was a member of the United States Senate in 1865-71, and was prominent in Reconstruction legislation. He died at St Louis, Missouri, on the 27th of November 1873. His son Richard (b. 1860) was governor of Illinois from 1901 to 1905.

YATSUK, called by the Shans Lawksaw, a state in the central division of the southern Shan States of Burma. Area, 21,430 sq. m.; pop. (1911), 2,500,000, of whom more than one-half are Shans; revenue, £5,000. The crops grown are rice, segamum, cotton, ground-nuts and oranges. As a whole the state is mountainous, with ranges running N. and S. The main range has a general height of 9000 ft., with peaks, such as Loi Samngam, rising to 7846 ft. The middle and S., however, consist of open rolling country, with an average height of 3500 ft. To the N. the country falls away to the Nam Tu (Myintgye), where there are fine teak forests, as well as along the Nam Lang and Nam Et, which with the Zawgyi form the chief rivers of the state. Most of them disappear underground at intervals, which makes the extraction of timber impossible except for local use. Lawksaw, the capital, stands on the N. bank of the Zawgyi, near a small weedy lake. The old brick walls and the moat are falling into decay. The chief at the time of annexation had been at war with the Burmese, but refused to submit to the British, and fled to Keng Hsing, where he died some years afterwards. The sawbwa chosen in 1887 belonged to another Shan ruling house. He died in 1900, and was succeeded by his son.

YATUNG, a trade-market of Tibet, situated in the mouth of the Chumbi valley near the Indian frontier. According to the Convention of 1850-93, the market at Yatung was opened to India, and the conduct of the Tibetans in building a wall across the river between Yatung and Tibet was one of the incidents that led up to the British protectorate of 1904. According to the treaty of that year, a British trade-agent was to be maintained at Yatung.

YAU, a city of the department of Ponce, Porto Rico, 20 m. W. by N. of the city of Ponce. Pop. (1890) 6108. Yauco is served by the American Railroad of Porto Rico. The city is situated about 150 ft. above the sea, and has a delightful climate. It is connected by a wagon road with its port, Guanica (pop. about 1000), which has an excellent harbour. Coffee and tobacco are the chief industries. Yauco was first settled in 1756.

YAVORSKY, STEPHEN (c. 1658-1722), Russian archbishop and statesman, one of the ablest coadjutors of Peter the Great, was educated at the Kiev Academy and various Polish schools. Becoming a monk, he settled at the Kiev Academy as a preacher and professor, being appointed prefect of the institution and prior of the monastery of St Nicholas. He attracted the attention of Peter by his funeral oration over the boyar Shein, and was made archbishop of Ryazan in 1700. In 1702, on the death of the last patriarch of Moscow, Yavorsky was appointed custodian of the spiritualities of the patriarchal see. Notwithstanding frequent collisions with Peter, and his partiality for the unfortunate tsarevich Alexius, Yavorsky was too valuable a man to be discarded. In 1721 he was made first president of the newly erected Holy Synod, but died in the following year.

Yavorsky's chief works are his Rock of the Faith of the Orthodox-Catholic Eastern Church and Dogmatic, Moral and Pneumological Selections. See V. T. Testorov (Moscow, 1844); I. Morev, The Rock of the Faith (Rus.) (Petersburg, 1904).

YAWL, the name of a special rig of small sailing vessels or yachts, with two masts, the mainmast cutter-rigged, and a small mizen stepped far aft with a spanker or driving sail. The name has also been applied to a small ship's boat rowed with four or more oars. The word is apparently an adaptation of the Dutch jol, skiff.

The English "jolly-boat," a small bluff-bowed, wide-transomed ship's boat, swung at the stern of a vessel for ready use, is probably a corruption of the Danish form of the word jolle. Other authorities take it to be a corruption of a late 15th-century jolywaut, a small ship's boat, which is supposed to represent galliot, galliot (see CALLEY). A galliot, however, was nothing a small boat, but an independent vessel propelled by oars or sails.

YAWS, the name in use in the British West Indies for a contagious inoculable tropical disease, running a chronic course and characterized by a peculiar eruption, together with more or less constitutional disturbance. It is known by various local names in different parts. In the French Antilles it is called pian; in Brazil, boba; on the west coast of Africa, gata; on the east coast, lomongu; in the Moluccas, boton d'Ambone; in Samoa, tonga or lono; in Baudoland, makcola; and in Ceylon it is
spoke of under the name of parangi. The name framboesia was first given to the disease by Sauvages in 1759 from the likeness of the typical excrescences to a raspberry. For many years yaws was thought to be peculiar to the African negro, either in his home (both west and east coasts) or in the West Indies and Brazil. But a disease the same in every respect has long been known in the East Indies (first mentioned by Bonitus early in the 17th century), affecting the Malays rather than the negroes, its chief seats being Ambonaya, Ternate, Timor, Celebes, Java and Sumatra. It has been identified by De Rochas and other observers in New Caledonia, and the disease as it affects the natives is described by the missionaries of the East. It is probable that the disease is as follows. Previous to the eruption there may or may not be any disorder of health: in children (who form a large part of the subjects of yaws) there will probably be rheumatic pains in the limbs and joints, with languor; delirium is rare. The disease may be diagnosed by the white patch beneath the chin, and the little whitish speck on their tops, grow rapidly and reach the size of a sixpence or a shilling. The pustules then break and a thick viscid lecher exudes and dries upon them as a whitish slough and around the base. As the slough is removed, the whitish slough is the raspberry excrescence or yaw proper, a reddish fungous growth with a nodular surface. The favourite seats of the eruption are the forehead, face, neck, arm-pits, groin, genitals, perineum and thighs; the first two and last air and a yawn may be seen in any part of the body. In young children or infants the corners of the mouth ulcerate, as in syphilis, and the perineal excrescences resemble condylomata. The pustules which in the first stage do not all arise at once, are more abundant while others are only starting. If the patient be of sound constitution and good repletion, the yaws may reach the full size of a mulberry in a month, in which case they will probably reach the size of a large pea. If they are of poor health they may take three months to attain the size of a wood-strawberry, in which case they will be numerous inversely to their size. Often there is one yaw much larger than the rest, and longer in falling; it is called the "master yaw" or "mother yaw." On the soles of the feet (less often on the palms of the hands) the bursting yaws are as if imprisoned beneath the horny cuticle; they cause swelling and tenderness of the foot, and frequently the eruption coming down to the quick; these yaws are called "crab yaws" or "tubbas." Usually a yaw is painless unless when rubbed or irritated. The absence of pain is used as a diagnostic sign if there be any doubt as to the nature of the attack; a pustule is opened and a little of the juice of capsicum dropped into it; if it be a yaw, no smarting will be felt. In some cases a few yaws will show themselves long after the primary attack is over; these are called "membra yaws" (from the Latin membra, "limbs"). They are not being some cases applied also to protracted cases with successive crops of eruption. Six weeks is the average time in a good case, from the first of the eruption to the total disappearance of yaws. In some cases a second eruption may be for many months, darker than the rest of the ( negro) skin. But the disease is often much more tedious affair, the more protracted type having become common in the West Indies of recent years. The yaws are not the disease, for they are not cutaneous, but as if with difficulty, crop after crop; foul, excoriating and corroding ulcers may remain, or a limb may be in part seared and mutilated by the scars of old ulceration. The scars after ulceration are not so dark as the skin around.

**Aetiology.**—Yaws is a highly contagious disease. It is neither hereditary nor congenital. The disease spreads by contact with previously infected cases, though it has been stated that infection also arises from inhabiting dirty houses, the floors and walls of which are contaminated with yaws matter from former yaw cases; and it is also believed, and has been proved by experiment, that infection may be conveyed by flies, which act as go-betweens, carrying infective material from a yaws sore to an ordinary ulcer. The virus must be introduced directly through a breach of the skin or mucous membrane; an attack in childhood gives a large degree of immunity. Not all cases give the impression of being a specimen of the disease; they may be fancied by the patient's friends to be malarial, or by the patient's apprehensions, to the typhus or the erysipelas. The disease is found by Pierce and Nicholls in the tubercles of yaws, but a pure culture of this micro-organism failed to give rise to yaws in animals into whom it was injected experimentally, and in no instance was it present in the blood. In 1905 Aldo Castellani demonstrated in yaws the presence of a slender spirillum, which he named the _Spirocheta pertenue_ or _Spirochaeta pallidu_. It was also experimentally proved by him (1) that the material taken from persons suffering from yaws and containing the _Spirocheta pertenue_ is infective to monkeys; (2) that when the _Spirocheta pertenue_ is removed by filtration the material becomes inert; (3) that the injection of blood from the general circulation of a yaws patient gave positive results in monkeys; (4) by means of the Bordet-Gengou reaction it is possible to detect specific antibodies and antigen.

The prophylaxis consists in the segregation of the patients suffering from the disease, the antiseptic dressing of the eruption, the application of a covering to protect it from flies, and the thorough cleansing and disinfection of infected houses and buildings, even in remote villages. The demolition of houses in endemic centres, and finally the compulsory notification of cases of yaws to the local sanitary authority.

As regards treatment, the malady in a person of good constitution runs its course and gets well in a few weeks. Whatever tends to check the eruption, such as exposure to chill, is to be avoided. A week's course of cream of tartar and sulphur (confection of sulphur) at the beginning of the illness is often resorted to, so as to bring the eruption well out. The patient should remain indoors, in a well-aired room, and take daily baths in tepid water. If the eruption is extensive and unhealthy, it is an indication for generous diet. When the eruption is declared, iodide of potassium and arsenic are very beneficial. As external applications, weak lotions of zinc or carbonic acid may be used, and if the excrescences are irritable, a watery solution of opium. Tawdry and unhealthy yaws should be dressed with a wash of sulphate of zinc or copper; the same may be applied to a yaws ulcer. The crab yaws of the horny soles or palms, after they are let through by paring the cuticle, may be dusted with alum powder.

On the whole, the mortality is small. In 1757 West Indian cases treated various holes and there were only 185 deaths, a mortality of 25 per thousand (Nicholls).

**YAZDEGERD** ("made by God," i.e., Yeardir), the name of three Sassanid kings of Persia. (1) YAZDEGERD I., son of Shahpur III., 390-420, called "the sinner" by the Persians, was a highly intelligent ruler, who tried to emancipate himself from the dominion of the magnates and the Magian priests. He punished the nobles severely when they attempted oppression; he stopped the persecution of the Christians and granted them their own organization. With the Roman war he lived in peace and friendship, and is therefore highly praised by the Byzantine authors (Procop. Pers. i., 27; Agath. iv. 26) as he is blamed by the Persians. After a reign of twenty years he appears to have been murdered in Khorsan. (2) YAZDEGERD II., was the son of Bahram V. Gor, 438-457. He persecuted the Christians and Jews, and had a short war with Rome in 441. He tried to extend his kingdom in the East and fought against the Kushans and Kidarites (or Huns). (3) YAZDEGERD III., a grandson of Chosroes II., who had been murdered by his son Kavadh II. in 628, was raised to the throne in 632 after a series of internal conflicts. He was a mere child and never really ruled; in his first year the Arabic invasion began, and in 637 the battle of Kadesiyya decided the fate of the empire. Ctesiphon was occupied by the Arabs, and the king fled into Media. Yazdegerd fled from one district to another, till at last he was murdered at Merv in 652 (see CALLPIATE, sect. A. r.). The Parsees, who use the old Persian calendar, continue to count the years from his accession (in a year of Yezdegird, beginning June 16th, a.d. 632). (Ed. M.)

**YEAST** (O.E. geost or gyst; the root yez, to boil, ferment, is seen in Sansk. nira-sa, exudations from trees, and Gr. _theu_, the wine) is a cellular organism produced by the fermentation of saccharine liquids (see FUNGI, FERMENTATION, BREWING).

**YEATS, WILLIAM BUTLER** (1865-1939), Irish author, son of J. B. Yeats (b. 1839), a distinguished Irish artist and member of the Royal Hibernian Academy, was born at Sandymount, Dublin, on the 13th of June 1865. At nine years old he went to live with his parents in London, and was sent to the Godolphin School, Hammersmith. At fifteen he went to the Erasmus Smith School in Dublin. Later he studied painting for a short time at the Royal Dublin Society, but soon turned to
YECLA-YELLOW FEVER

literature, contributing poems and articles to the Dublin University Review and other Irish periodicals. In 1888 he was encouraged by Oscar Wilde to try his fortune in London, where he published in 1889 his first volume of verse, The Wanderings of Oisin; its original and romantic touch impressed discriminating critics, and started a new interest in the "Celtic" movement. The same year he contributed to Mr Walter Scott's "Camelot Series," edited by Ernest Rhys, Fairy and Folk Tales, a collection of Irish folklore, and Tales from Carleton, with original introductions. In 1891 he wrote anonymously two Irish stories, John Sherman and Dhoya, for Mr Fisher Unwin's "Pseudonym Library." In 1892 he published another volume of verse, including The Countess Kathleen (a romantic drama), which gave the book its title, and in 1893 The Celtic Twilight, a volume of essays and sketches in prose. He now submitted his earlier poetical work to careful revision, and it was in the revised versions of The Wanderings of Uisnech and The Countess Kathleen, and the lyrics given in his collected Poems of 1895 that his authentic poetical note found adequate expression and was recognized as marking the rise of a new Irish school. In the meantime he had followed The Countess Kathleen with another poetical drama, The Land of Heart's Desire, acted at the Avenue Theatre for six weeks in the spring of 1894, published in May of that year. He contributed to various periodicals, notably to the National Observer and the Bookman, and also to the Book of the Rhymer's Club—the English Parnasse Contemporain of the early 'nineties. With Edwin J. Ellis he edited the Works of William Blake (1893), and also edited A Book of Irish Verse (1895). In 1897 appeared The Secret Rose, a collection of Irish legends and tales in prose, with poetry interspersed, containing the stories of Hanranah the First. The same year he privately printed The Tables of the Law and the Adoration of the Magi, afterwards published in a volume of Mr Elkin Mathews's "Vigo Street Cabinet" in 1904. In 1899 the published The Frenchman's Colors, containing some of his lyrics, and in 1899 another poetical drama, The Shadowy Waters. He now became specially interested in the establishment of an Irish literary theatre; and he founded and conducted an occasional periodical (appearing fitfully at irregular intervals), called first Beltain and later Samhain, to expend his aims and preach his own views, the first number appearing in May 1899. In the autumn of 1901 Mr F. R. Benson's company produced in London the play Diarmuid and Grania, written in collaboration by him and George Moore. In 1902 he published his own first original play in prose, Cathleen ni Houlihan, which was printed in Samhain in October that year. In 1903 he collected and published a volume of literary and critical essays, to which he gave the title, Ideas of Good and Evil. In the same and the following years he published a collected edition of his Plays for an Irish Theatre, comprising Where There is Nothing, The Hour-Glass, Cathleen ni Houlihan, The Pot of Broth, The King's Threshold and On Baile's Strand. In 1904 he also edited two volumes of Irish Representative Tales. Whether or not "Celtic" is the right word for it, Mr Yeats's art was quickly identified by enthusiasts with the literary side of the new Irish national movement. His inspiration may be traced in some measure to the Pre-Raphaelites and also to Blake, Shelley and Maeterlinck; but he found in his native Irish legend and life matter apt for his romantic and often elfin music, with its artful simplicities and unhackneyed cadences, and its elusive, inconclusive charm.

See the section on W. B. Yeats in Poets of the Younger Generation by William Archer (1902), and for bibliography up to June 1903, British Writers, 1830-1902, edited by Miss Seabra (N.S.) p. viii and 1904, red, the second edition of his collected works in prose and verse was issued by Mr Bulfin from the Shakespeare Head Works, Stratford-on-Avon, in 8 vols., 1908.

YECLA, a town of E. Spain, in the extreme N. of the province of Murcia, on the Yecla-Villena railway; it is situated on the W. slope of Monte Castillo, which rises above the left bank of the Arroyo del Jua. Pop. (1900) 18,743. The chief buildings are a half-played citadel, a modern parish church with a pilastered Corinthian façade, and a town hall standing in a fine arcaded square. Yecla has a thriving trade in the grain, wine, oil, fruit and esparto grass produced in the surrounding country.

YEISIK, a town of Russia, in the province of Kuban (Caucasus), founded in 1848 on a sandbank which separates the shallow Bay of Yeisik from the Sea of Azov, 76 m. S.W. of Rostov-on-the-Don. Pop. 35,446. Notwithstanding its shallow roadstead, Yeisik has grown with great rapidity, and exports corn, lised and wool. There are wool-cleansing factories, oil-works and tanneries.

YELLOW FEVER, a specific infective tropical fever, the germ of which is transmitted by the Stegomyia fasciata or domestic mosquito, occurring endemically in certain limited areas. The area of distribution includes the West Indies, Mexico, part of Central America, the W. coast of Africa and Brazil.

The first authentic account of yellow fever comes from Bridge-town, Barbados, in 1647, where it was recognized as a "nova pestis" that was unaccountable in its origin, except that Ligon, the historian of the colony, who was then on the spot, connected it with the arrival of ships. It was the same new pestilence that Duterre, writing in 1667, described as having occurred in the French colony of Guadeloupe in 1635 and 1640; it recurred at Guadeloupe in 1668, and broke out in a peculiar disastrous form at St. Kitts the same year, and again in 1672; in 1675 it was at Port Royal, Jamaica; and from those years onwards it became familiar at many harbours in the West Indies and Spanish Main. It appeared at the Brazilian ports in 1849. In 1853 it appeared in Peru and in 1870 on the W. coast of Africa. In Georgetown (British Guiana) 69% of the garrison died in 1849.

During the great period of yellow fever (1793-1805), and for some years afterwards, the disease found its way time after time to various parts of Spain. Cadiz suffered five epidemics in the eighteen years, 1806-1823, the most severe of which occurred in 1817 to 1821, the disease assumed much more alarming proportions, Cadiz being still its chief seat, while Seville, Malaga, Cartagena, Barcelona, Palma, Gibraltar and other shipping places suffered severely, as well as some of the country districts nearest to the ports. In the severe epidemic at Barcelona in the summer of 1851, 3000 persons died. At Lisbon in 1857 upwards of 6000 died in a few weeks. In New Orleans 7500 people died in 1853, 3203 in 1867, and 4056 in 1878. In Rio 4160 died in 1850, 1043 in 1852, and 1397 in 1856. In his own country distinct conditions have seemed to be necessary for an outbreak. Foremost we may notice a high atmospheric temperature, one of 75° F. or over. As the thermometer sinks, the disease ceases to spread. Moisture favours the spread of yellow fever, and epidemics in the tropics have usually occurred about the rainy season. Seaport towns are most affected. In many instances the elevated airy and hygienic quarters of a town may escape, while the shore districts are decimated. Usually the disease does not spread to villages or sparsely populated districts. Certain houses become hotbeds of the disease, case after case occurring in them; and it is usually in houses that the disease is contracted. A house may be said to be infected when it contains infected mosquitoes, whether there be a yellow-fever patient there or not. Ships become infected in the same way, the old wooden trading ships affording an ideal hiding-place to the Stegomyia in a way that the modern and airy steamships does not.

The incubation period of yellow fever is generally four or five days, but it may be as short as twenty-four hours. There are usually three marked stages: (1) the period of prodromal illness; (2) the period of remission or lull; (3) in severe cases, the period of reaction. The illness usually starts with languor, chilliness, headache, and muscular pains, which might be the precursors of any febrile attack. These are followed by a peculiar look of the eyes and face, which is characteristic: the face is flushed, and the eyes suffused at first and then congested or cerrety, the nostrils and lips red, and the tongue scarlet—these being the most obvious signs of
universal congestion of the skin, mucous membranes and organs. Meanwhile the temperature has risen to fever heat, and may reach a very high figure (maximum of 110° Fahr., it is said); the pulse is quick, strong and full, but may not keep up in these characters with the high temperature throughout. There are all the usual accompaniments of high fever, including hot skin, failure of appetite, thirst, nausæa, restlessnes and delirium (which may or may not be violent); albumen will nearly always be found in the urine. The fever is continued; but the febrile excitement comes to an end after two or three days. In a certain class of ambulatory or masked cases the febrile reaction may never come out, and the shock of the infection after a brief initial period of delirium finalizes in convulsions and death. The cessation of the paroxysm makes the stadium, or lull, characteristic of yellow fever. The hitherto militant or violent symptoms cease, and prostration or collapse ensues. The internal heat falls below the normal; the action of the heart (pulse) becomes slow and feeble, the skin cold and of a lemon-yellow tint, the act of vomiting effortless, like that of an infant, the first vomit being clear fluid, but afterwards black from an admixture of blood. It is at this period that the prospect of recovery or of a fatal issue declares itself. The prostration following the paroxysm of fever does not bear so treacherous a character as that of other types of disease, and the diagnosis of the end is less uncertain. As a general rule the disease is a brief one; the incubation period is usually shorter. In 269 cases observed by Sternberg, the mean mortality was 27.7%. In 179 cases of yellow fever in Vera Cruz in 1905 there were 91 deaths. The death-rate, however, tends to vary in different epidemics. In the epidemic occurring in Zacapa, Mexico, in 1905 in a population of 6,000 there were 700 cases, and the mortality among the infected was 40%.

Treatment.—The patient should be removed from the focus of infection and nured in a well-ventilated room, screened from mosquitoes, if possible, by the use of mosquito netting. The disease entirely of a febrile character, followed by hot baths, is useful in the early stages to relieve congestion, high temperature may be controlled by sponging; vomiting, by ice; or, if haemorrhagic, by ergot, perchloride of iron or other stypitics; and pilocarpine may be given if the urine be scanty. Sternberg has introduced a system of treatment by alkalis to counteract the hyperacidity of the intestinal contents and increase the flow of urine. Of 501 whites treated by this method only 7.3% died, and of 72 blacks all recovered.

Causation.—The pathology of the disease is discussed in the article PARASITIC DISEASES. In 1881 Dr. Charles Finlay, of Havana, postulated the theory that mosquitoes were the carriers of the infection. Numerous theories had previously been brought forward, notably that of the Bacillus icteroides, described by Sanarelli; but it is now certain that this organism is not the cause. Other authorities held that the disease was spread by contagion, by miasma, or some other of the vague agencies which have always been put forward in the absence of exact knowledge. Finlay's mosquito theory remained in abeyance until attention was again drawn to it by the demonstration in recent years of the part played by these insects in the causation of other tropical diseases. The mosquito selected by Finlay was the Stegomyia fasciata, a black insect with silvery markings on the thorax, which is exceedingly common in the endemic area. It frequents towns, and breeds in any stagnant water about houses. Specimens were caught, fed upon yellow-fever patients, kept for a fortnight, and then allowed to bite susceptible persons established in a special camp with other susceptible persons as a control. Those bitten developed the fever, the others did not. An American commission was appointed in 1900, consisting of Walter Reed, James Carroll, A. Agramonte and Lazear, and its conclusions were that the Stegomyia fasciata is the agent of infection, that the virus of yellow fever is present in the blood during the first three days of the fever, and is generally absent on the fourth; that the germ is so small that it can pass through a Chamberland porcelain filter; that the bite of all infected Stegomyia does not produce yellow fever (about 35% of the experiments proving negative); that mosquitoes fed on yellow-fever blood were not capable of giving rise to infection until after a lapse of twelve or fourteen days, but the experiments showed their infective power for at least fifty-seven days. It can therefore be held that the yellow fever is a parasite, requiring as in malaria an alternate passage through a vertebrate and an insect host, the analogy to malaria being very complete. E. Marchoux and P. L. Simon, of the French Yellow Fever Commission to Rio de Janeiro, 1906, have observed an interesting fact in connexion with the S. fasciata. In order to lay her eggs she must first have a feed of blood, three days after which she lays them. Before she lays her eggs she strikes both day and night, after that period at night only. Persons bitten in the day-time, therefore, do not develop yellow fever, but if bitten at night, develop the disease in all probability. The work was begun on the 27th of February 1901. An order was issued that all receptacles containing water were to be kept mosquito-proof; sanitary inspectors were told off for each district to maintain a constant house-to-house inspection, and to treat all puddles, &c., with oil; receptacles found to contain larvae were destroyed and their owners fined; breeding-grounds near the town were treated by draining and oil; hospitals and houses containing yellow-fever patients were screened; infected and adjacent buildings were fumigated with pyrethrum powder. The results exceeded all expectation, and after January the presence of a yellow fever case was no longer to originate in Havana. Cases occasionally now come into Havana from Mexican ports, but are treated under screens with impunity in ordinary city hospitals and never at any time infect the city. Thus in 1907 there was one death from yellow fever, and the general death-rate of Havana from all diseases was 17 per thousand. In the Bulletin of Public Health and Charities of Cuba it is stated there only occurred between 1905 to a total of 345 cases of yellow fever in all Cuba, where formerly they numbered many thousands, and in April 1916 the republic was declared to be entirely free from the disease.

Among other modern outbreaks in which sanitary measures have taken an active part, that which occurred in New Orleans in 1905, in which a medical staff of 50 with subordinates to the number of 1,201 started immediately on the outbreak to clean up the city; the outbreak in Belize, British Honduras, in 1905; the anti-yellow-fever campaign undertaken in the British W. Indies in 1906-9. As soon as the Isthmian Canal commissioners took over the administration of the Panama Canal Zone they undertook a vigorous campaign against the mosquito, as the result of which yellow fever was successfully banished. Colonel Gorgas, in his 1908 report wrote: "It is now three years since a case of yellow fever has developed in the Isthmus, the last being in November 1905. Rio de Janeiro, which had lost 28,075 inhabitants in 13 years by yellow fever, and Santo, have also waged war against the disease; as a result of the anti-Segmyia policy the deaths from yellow fever in Rio fell to 22 in 1906, 19 in 1907, 4 in 1908, and 1 in 1909.

See Sir P. Manson, Tropical Diseases (1907); article "Yellow Fever" in Allbutt and Rolleston's System of Medicine; Sir R. Boyce, Report on Yellow Fever in Honduras (1906), and Health and Administration in the West Indies (1910); Bulletins of the U.S. Yellow Fever Institute; Annales de l'Institut Pasteur (January 1906).
YELLOWSTONE NATIONAL PARK, an American national reservation, situated mainly in N.W. Wyoming, U.S.A., dedicated by the United States government as “a public park or pleasure ground for the benefit and enjoyment of the people.” It is nearly a rectangle in shape, with a length, from N. to S., of 62 m., a width of 54 m. and an area of approximately 3330 sq. m. It extends into Montana, on the N., about 21 m. and into Idaho on the S., about 25 m. Except by a short spit, the Yellowstone from the Missouri in which the park is situated, the park is entirely surrounded by national forests: the Gallatin and Absaroka national forests, on the N.; the Shoshone and the Beartooth, on the E.; the Teton, on the S.; and the Targhee, the Madison and the Gallatin, on the W.

The central portion, comprising an area of about 2000 sq. m., is an undulating plateau with a mean elevation above the sea of about 8000 ft. Along the entire E. border stretches the Absaroka range, and in places exceeding 11,000 ft. (Index Peak, 11,740 ft.) in height. On the N. is the Snowy range with its snow-capped peaks. W. of the Snowy the Gallatin range extends S. for 20 m. along the W. border. Electric Peak, in the N.W. corner of the park, rises to a height of 11,155 ft. Near the S. end of the park are the Red Mountains, which culminate in Mt. Sheridan (10,385 ft.) and afford a magnificent view of the whole region; and farther S. the N. spur of the lofty Teton's juts across the S. border.

In the production of these mountains and plateau, there was a great change about the beginning of the Cenozoic period, an upheaval of the earth's substance to form a mountain range and a depressed basin. Subsequently, in the Tertiary period, there were two enormous outpourings of volcanic material—first andesite lava, and later, after a long interval of quiet, rhyolitic—which nearly half filled the basin, converted it into a plateau and broke up the mountain range. Two centres of volcanic activity were Mt. Sheridan, in the S., and Mt. Washburn, in the N. The volcanoes have long been extinct, but the diminished energy now causes hot springs and geysers in all parts of the plateau, about 400 in number. More than half, including the largest and finest, are in the upper and the lower Geyser basins, near the head of the Madison, here known as the Firehole, river. Several others are farther N. in the Norris basin upon Gibbon river, a branch of the Madison, and others are farther S. in the Shoshone basin.

Excelsior, the largest geyser, with a crater about 300 ft. long and 200 ft. wide, has not been active since 1890, but for several years after its discovery it threw up at intervals a huge mass of water to a height of 150 ft. Old Faithful, and irregular intervals of 65-70 minutes, throws up a column of hot water 2 ft. in diameter, at a height of 125-130 ft., and the eruption lasts 4-5 minutes. The Giant, at intervals of 2 to 4 days or more, throws up a column to a height of 400 feet. Tower geyser throws up (so called from the shape of its cone), the Grand and the Lone Star throw up columns to a height of 200 ft. but at irregular intervals. In the Norris basin are the Black Growler and the Hurricane, which consist of small apertures through which steam rushes with such tremendous force that it may be heard for miles. The hot springs are widely distributed over the plateau and number from 3000 to 4000. The water of most of the springs and geysers holds silica in solution in considerable quantities, so that as it cools and evaporates it deposits a dazzling white sinter which has covered many square miles of the valleys and contrasts strongly with the dark green of the surrounding forest. Forms of all kinds are thus built up and very large and beautiful apertures are scattered over it in the most irregular fashion. The silicious matter has also built up around the springs and geysers cones or mounds of considerable size. At the close of the Lower Pleistocene era, a large part of the mass of the springs, contains sulfur, iron, alum and other materials in solution, which in places stains the pure white sinter with bright bands of colour. The tints and hues of some of the pools are of matchless beauty. Norris, in the central part of the park, is a large flat area of basaltic terraces, 600 ft. wide, 300 ft. long, and 40 ft. deep with the boiling mud at the bottom. Although there have been some changes in the thermal energy in the park since 1871, there has been no appreciable diminution. Almost all the springs and geysers lose some of their energy at intervals, while others, for certain geysers have become quiescent, but some new ones have been formed.

The Continental Divide crosses the park in a S.E. direction from the meeting-point of the states of Wyoming, Idaho and Montana. The S. part of the Divide is drained by the Snake river into the Columbia river and the Pacific Ocean; the large section N. of the Divide is drained by the Yellowstone and Madison rivers into the Missouri, the Mississippi and the Gulf of Mexico. The Lewis river, a fork of the Snake, has its origin in the beautiful Shoshone Lake, and the Heart river, another fork of the Snake, rises in Heart Lake, under Mt. Sheridan.

The Yellowstone drains the entire E. section. Rising just beyond its S. limits, it flows into and through Yellowstone Lake, a magnificent sheet of water, very irregular in shape, dotted with forested islands, having an area of about 140 sq. m., lying 7741 ft. above the sea. Upon entering it, the river takes the name of the lake, and is still called the Yellowstone river. It is 200 m. wide, and has a fall of 100 ft. A white commission, on the average stage of water, about 1200 cub. ft. per second. With this fall the river enters the "Grand Canyon," which in many scenic effects is unequalled. Its depth is now at least 2000 ft., the water flowing through it, in the section comprised between the canyon and the Missouri river system; it ranges from 600 ft. at its head to 300 ft. at the middle, where it passes the Washburn Mountains. Its length to the mouth of Lamar river is 24 m. It is cut in the volcanic plateau, and is of trap and lava, with a width of 250 ft. and a depth of 40 ft. The gorges, which are of a richness of colouring that almost defies description, a colouring that is produced by the action of the thermal springs, at the base of the canyon, upon the mineral pigments in the lava. Bright orange, yellow, red and purple hues predominate and are set off very effectively against the dark green pines with which the margins of the canyon are fringed, and the white foam of the river is ingeniously forced into fantastic shapes by the current of the water. The river joins the Missouri river at the mouth of the Tower creek, which drains the concavity of the horseshoe formed by the Washburn Mountains, enters the Yellowstone. Just above its mouth this stream makes a beautiful fall of 152 ft. into the gorge in which it joins the river. A few miles farther down, the Yellowstone is joined by an E. branch, the Lamar river, which drains a large part of the Absaroka Range. Then it enters the Third Canyon, from which it emerges at the mouth of Gardiner river. The latter stream drains an area of elevated land by means of its three courses, and upon each of them occurs a fine fall in its descent toward the Yellowstone. The Madison rises in the W. of the park and flows in a S.W. and S. direction through the park. These waters are mainly collected from the rainfall upon the plateaux, and from the hot springs and geysers, most of which are within its drainage area. Upon this river and its affluents are several fine falls. Indeed, all the falls and cascades along the end of the park have been given names, a few of which are in its courses, of a recent change of level in the surface of the country.

The climate, influenced by the high elevation, is characterized by long and severe winters and short summers with great diurnal extremes of temperature. But the low temperature causes the moisture-laden winds to deposit here greater quantities of rain and snow than in the semi-arid regions below, which not only promote the growth of vegetation, but cause the activity of the springs, geysers and waterfalls. The mean annual temperature at the station of the United States Weather Bureau, near the N. boundary, is 39°F. The summer (June, July and August) mean is 59°; the winter (December, January and February) mean, 20°.

Extremes have ranged from 96° in July to -35° in February. The temperature has fallen to 30° in July, and a warm summer day may at times be followed by frost at night. The mean annual precipitation is 19-6. Much of this is in the form of snow, and nearly half of it is during the four months from December to March; in the four driest months, from July to October, it is only 4-4 in. Above 2000 ft., snow falls every month of the year. The average annual snowfall amounts to 947 in. The prevailing winds are S.

About four-fifths of the park is covered with dense forests of black pine (Pinus Muricatata), balsam, fir, spruce, cedar and poplar. These trees do not attain a large size. A low blueberry (Vaccinium myrtillus) forms a thick underbrush in nearly all parts of the park; and the following is a list of some of the wild fruits: black currants, blueberries, red currants and black currants grow along the streams and in moist places of the lower altitudes. In the glades are
bunch-grass and a variety of flowering plants; butercups, daisies, forget-me-nots and other wild flowers may be found and especially snow-banks in August. In the hot-spring districts are plants with peculiarities both of those common to the desert and those common to the seashore. In the N.E. corner of the park fossil forests rise one above the other. After the destruction of one forest by volcanic eruptions another grew over it; it, too, was buried under volcanic material, and the process was repeated several times.

The native fauna is abundant and varied. The policy of the government which protects game, both in the park and in the surrounding national forests, has induced elk, deer, antelope, mountain-sheep, bears, porcupines, coyotes, squirrels, grebe, grebes, ducks, cranes, pelicans, birds of prey, and many others. Black, brown and grizzly bears may be seen at almost any time during the summer season feeding on the garbage from the hotels. A few wild bison still remain at large, and besides these there is a herd of about 100 confined within a pasture in the Lamar Valley. The lakes and rivers are well stocked with trout and other fish, and visitors have the privilege of catching a limited number with rod and line. Robins, bluebirds, warblers, chickadees, finches, vireos, wrens, yellow-headed blackbirds, nutcrackers, nut-hatchers, and several other species of small birds are found in the park, but the number of each is not great. Among birds of prey are the golden eagle, bald eagle, hawks and owls. Geese, ducks, cranes, pelicans and gulls are very numerous in the autumn months.

The park is under the supervision of a superintendent who is appointed and instructed by the Secretary of the Interior. It is policed, however, by troops of United States cavalry with headquarters at Fort Yellowstone, near the Mammoth Hot Springs, and the building of roads and other improvements is controlled by the Secretary of the Interior and the survey where the railroad approaches to the park are a branch of the Northern Pacific railway up the valley of the Yellowstone to the main gate at Gardiner, Montana, and a branch of the Oregon Short Line up the valley of the North Fork of the Snake to Yellowstone, Montana. Automobiles are not allowed within the park, and the principal means of conveyance is by stage coaches and by a steamboat on Yellowstone Lake. There are hotels at the Mammoth Hot Springs, at the principal geyser basins and at Yellowstone Lake. The hotels and stage lines open for the tourist season early in June, and close in September.

The strange phenomena of this region were known to some of the Indians; they were discovered by John Colter, a member of the Lewis and Clark expedition, in 1807; the region was visited by James Bridger before 1830; an account of the geysers was published at Nauvoo, Illinois, in The Wasp, a Mormon paper, in 1842; Captain W. F. Raynolds, of the United States Corps of Topographical Engineers, with full knowledge of Bridger's accounts, was ordered to explore the region in 1859, and yet, chiefly because of the persistent incredibility with which the accounts of the phenomena were received, the region remained practically unknown until 1870. From 1863 to 1866 gold seekers repeatedly confirmed the early reports, and the publication of their accounts in Western papers gradually aroused interest. In 1869 a private exploring party, consisting of David E. Folsom, C. W. Cook and William Peterson, set out from the gold-fields of Montana with the express purpose of verifying or refuting the rumors, and they returned full of enthusiasm. In 1870 a semi-official expedition, led by Henry D. Washburn, the surveyor-general of Montana, and Lieutenant Gustavus C. Doane of the Second United States Cavalry, made the Yellowstone Wonderland widely known. A year later an expedition under Dr Ferdinand V. Hayden (1829-1887) made a large collection of specimens and photographs, and with these data, together with the reports of this and the Washburn-Doane expedition, Congress was induced to reserve the area from settlement, which was done by an act approved the 1st of March 1872. In that year further explorations were made, and in subsequent years army expeditions continued the work of exploration. In 1878 a park based upon the Volcano survey was drawn for the Hayden survey, and in 1883-85 a more detailed map was made by the United States Geological Survey, and a systematic study of its geological phenomena was instituted.

Yemen (Yemen), a province of Arabia, forming the S.W. corner of the peninsula, between 12° 35' and 18° N., and 42° and 47° E., bounded on the N. by Asir and on the E. by the Dahna desert and Hadramut. The petty and ancient petty states were annexed to the Ottoman Empire in 1839, and British protection was defined by an agreement between Great Britain and Turkey in 1904, by a line running approximately N.E. from Sheik Said to the Dahna desert. The main physical characteristics of the province are described in the article Arabia. A lowland strip 20 to 30 m. wide extends along its western and southern coasts, skirted by the great mountain range which runs along the whole western side of the Arabian peninsula, and attains its greatest height in the Jibal, or highlands of Yemen; beyond this mountain zone the interior plateau falls gradually towards the N.E. to the Dahna desert.

The lowland, or Tehama, is hot and generally sterile; it contains occasional water near the coast, and at a few places inland. The vegetation is limited, and irrigated by hill streams and supporting many large villages and towns. The most important of these are Abu Arish, Bet el Fakhî and Zubâd in the western Tehama, the latter a thriving town of 20,000 inhabitants and the residence of a Turkish kaimakam; and Abyan and Lahej, the chief place of the independent Abdali tribe, in the southern Tehama. Hodeida and Aden are the only ports of commercial importance, Lohai and Ghaiifieka have sunk to insignificance; the centers of the coffee trade, and Mokha, the old centre of the coffee trade, is now almost deserted. The Jibâl forms a mountainous zone some 50 m. in width rising steeply from the foothills of the Tehama to an average height of 900 ft., many summits exceed 10,000 ft.--the highest fixed by actual survey is Jebel Manar, 10,565 ft., about 10 m. E. of the town of Jabal. With its temperate climate and regular rainfall, due to the influence of the S.W. monsoon, the Jibâl must be considered the most favoured district of Arabia. The villages are substantially built of stone, often Picturesquely situated on the spurs and crests of the hills, the houses clustering round the daâr or towers with domes, the cultivated valleys. The principal crops are wheat, barley, millet and coffee, the last-named more particularly on the western slopes of the range within reach of the moist sea-breezes. In many places the hill villages consist of a cluster of habitations, the houses supported by stone walls; the name given by the Greek geographers to the range of S. Arabia was no doubt intended to describe the step-like appearance of the hills due to this method of occupation. The special characteristic of the Yemen highlands is that fields and inhabited sites are found at the highest elevations, the mountain-tops forming extensive plateaux, often scarped on one side and only accessible to the higher elevations by tracks which encircle them like the escarpments of a natural fortress; a remarkable example of this is Jebel Jihâf on the Aden border, 8000 ft.
above sea-level and 4000 ft. above the Kataba valley, an isolated plateau some 6 m. long, containing thirty or forty villages.

South of the Jut, the seat of a Turkish mutassarif; its present population does not exceed 4000, but it was formerly a large city, and from its position in the centre of a comparatively fertile district at the junction of several trade routes it must have been of importance. It has a Turkish government offices and barracks, and in the business quarter several cafés and shops kept by Greeks. The climate is unhealthy, perhaps owing to its low position in a valley; 4400 ft. above sea-level, at Allah's Canaan (9000 ft.) even in Nubier's time many of the houses in the city were in ruins. Thirty miles further N. are the small towns of Isb (6700 ft.) and Jibla, about 25 miles apart, both of which have stone-built houses and paved streets. To the E. on the main road to the coast via Zubed is Udun, the centre of a coffee-growing district; 80 m. to the N. is Manakha, a Turkish post on the main road from Hodeida to the capital. The town has strongholds at the junction of roads, which probably are relics of ancient coffee in Yemen. Another group of hill towns lies still further N. in the mountain mass between the Wadi Murr and Wadi La'a, where the strongholds of Dhahr, Affa, Haja and Kaurkaban held out for long against the Turkish advance; the last-named town, now almost deserted, was once a city of 20,000 inhabitants, and the Capital of a small principality which preserved its independence during the earlier Turkish occupation between 1536 and 1630.

The inner or plateau zone of Yemen stretches along the whole length of the province, with an average width of 120 m.; it lies entirely to the E. of the high range, and has therefore a smaller rainfall. It consists of a distinct series of slightly elevated areas, increasing in altitude towards the E. where it merges in the desert, but broken in places by rocky ranges, some of which rise 2000 ft. above sea-level, and which show evidence of volcanic action. It is intersected by several wadi systems, of which the principal are those in the N. uniting to form the Wadi Nejran, in the centre of the Wadi Khard and Shihwan range, and in the S. the Wadi Bana and the Atah, from the watershed near Yarin, 8500 ft. above sea-level, to less than 400 ft. at the edge of the desert.

The northern part, nearly down to the latitude of Sana, is the territory of the warlike Hasibid and Bakil tribes, which have never submitted to the Turks, and in 1895 four tribes led by the Turk, mutassarif, drove the prophecy and occupation of the province by the Turks. The present time held the capital Sana itself for the Imam Muhammad Yahidhi, the representative of the old dynasty that ruled in Yemen from the expulsion of the Turks in 1630 till its reconquest in 1871. The principal places are Sana, the residence of the Imam, an important town on the old pilgrim road 120 m. N. of Sana, Khaiwan and Khamir.

In the N.E., bordering on the desert, is the district of Nejran, a mountainous country with several fertile valleys including the Wadi Nejran, Bedr and Habuna, all probably draining N.E. to the Wadi Daisari. Further S. is the oasis of Jauf, a hollow or depression, as its name signifies, containing many villages, and of great importance as the communication line of the Wadi Nejran and Sabae kingdom, known to the ancients from the earliest historical times through their control of the frankincense trade of S. Arabia. Ma'in, identified by Halsey as the seat of the former, is a small town to the SE. of Jauf. There are other ruins found by him in the neighbourhood, together with inscriptions supporting the identification. Mârib, the Sabaean capital, an ancient city, is now a group of ruins built accurately, the foundation of which is protected by the Queen of Sheba, and the bursting of which in A.D. 120 is said to have led to the abandonment of the city. This was, however, more probably due to the deterioration of the country through desiccation, which has forced the settled population farther westward, where Sana became the centre of the later Himyarite kingdom. The Arhab district drained by the Wadi Khard and Shihwan between Sana and Jauf is covered with Himyarite ruins, showing that the latter formerly supported a large settled population where owing to the want of water cultivation is now impossible.

South of this independent tribal territory the principal places are Abyan and Qac, the latter from the Latin form of the Himyaritic name of Dhamar (a town of 4000 inhabitants, the residence of a kainakam, and the seat of an ancient university) and Yarim are on the road leading S. to Aden; and two days' journey to the E. is Rada in the extreme S. of the province, an inhabited place, and the principal town of the Abyan, once a flourishing city. From near Rada the boundary runs S.W. to the small town of Katubah through which the direct road passes from Aden to Sana. The S. are, however, an occupied area, and four tribes under British protection, of which the principal are the Yafa', the Haushabi and the Abdali.

The inhabitants of Yemen are settled, and for the most part occupied in agriculture and trade, and the Sana group of tribes are related to the pastoral or Bedouin type found in Hejaz and Nejd hardly existing. In the adjoining province of Hadramut, with which Yemen has been closely related, the people are divided into four classes: (1) The Seer; (2) The Aba, or Ashari, forming a religious aristocracy; (2) The Kabali, or tribesmen, belonging to the Kahtarian or original S. Arabian stock, who form the bulk of the population, and are the only class habitually carrying arms; (3) the trading class; (4) the servile class, mostly of mixed African descent, and including a number of Jews. These latter have preserved a distinctively active role in the earlier history of the towns. Owing to the hardships to which they have been exposed through the disturbed state of the country, many are emigrating to the interior, five or six thousand yearly. See C. Niebuhr, Travels and Description of Arabia (Amsterdam, 1774); D. G. Hogarth, Penetration of Arabia (London, 1904); E. Gasser, Geschichte und Geographie Arabiens (Berlin, 1890), and in Fergusson's Mill (1896); R. Manzoni, Il Yemen (Rome, 1884); A. D'Ellers, Voyage en Yenies (Paris, 1889); S. M. Zwemer, Arabia (Edinburgh, 1900); W. B. Harris, A Journey through Yemen (London, 1895); H. Burchardt, Z. d. Ges. für Erdkunde (Berlin, 1902), N.E. 17.
Beyond the Yeniseisk Taiga begin the lowlands, which at no point rise more than a few hundred feet above the sea. They slope gently towards the Arctic Ocean and are covered with lakes, scanty forests and marshes; and, as they approach the ocean, they merge into tundra, a region of bare rock. Beyond 70° N. trees occur only along the courses of the rivers. Two ranges, however, break the monotony of the lowlands—the Tungusk, which stretches N.W. along the coast of the Upper Tunguzka, and the Byrranga mountains, which skirt the N.W. shore of the Taymyr peninsula. The shores of the Arctic Ocean are indented by deep estuaries, that of the Taz penetrating 600 m. into the interior of the Arctic Lowlands. The coast of the Arctic is a frigid and the bedagai. Thaddeous and Khantaga Bays are wide and deep indentations, ice-bound almost all the year round. Taymyr peninsula, between the Yenisei and the Khantaga, is a stony desert, which is traversed by the Yeniseisk and its affluents. In 55° N. this river approaches the Chulym, a tributary of the Ob, from which it is separated by an isthmus only 6 m. in width. The position of the town of Yeola, connecting the two great river systems of Siberia and the Ob, has been much disputed; at this point has often been discussed; the difficulty is that the Chulym valley is 440 ft. higher than the other.

Yeniseisk is rich in all kinds of metals and minerals. Gold dust appears in the N. Yeniseisk Taiga, in the region of the Kuznetsovs and the Altai, and in the valleys of the Tunguska and Anabar rivers. The climate of the Yeniseisk Region is due to the influence of the Siberian lowlands, larger size and greater brilliancy of colour. The rich carpet of grass and flowers is overtopped by the tall blossoms of *Archangelica officinalis*, which are a favourite article of food to all the Aboriginals. The meadows of the northern localities, surrounded by thickets of willow, poplar, wild cherry and hawthorn, are still more attractive, on account of their wealth in anemones, violets, gentians and so on, and in the rarefied atmosphere in which they are cultivated. Dr Martinov's lists enumerate a total of 760 flowering and 760 cryptogamic plants. Of the lower Fungi and parasitical Myxomycetes 1300 species were noted, and out of the 823 species hitherto described by specialists no fewer than 124 have proved to be new. Further N. the flora is similar in character to that of the Siberian lowlands (see SIBERIA). In the Taymyr peninsula it is represented by only 124 species of flowering plants.

The steppe of the upper Yeniseisk have been inhabited from a very remote antiquity, and numberless kurgans, or burial mounds, graves, rock inscriptions and smelting furnaces of the successive inhabitants are scattered all over the prairies of Abakan and Minusinsk. The present population exhibits traces of all their predecessors. Numerous survivals of Turkish and Samoyedic tribes are found in the steppe and in the Sayans; but some of them are greatly reduced in numbers. The eastern section of the region is inhabited entirely Russian, the rest (about 16%) consisting of Samoyedes, Tunguses, Yakuts, Mongols and Ostyaks. The government is divided into five districts, the chief towns of which are Krasnoyarsk, Achinsk, Kansk, Minusinsk and Yeniseisk.

Some 1,117,000 acres (9.2%) are under crops, the principal being rye, wheat, oats, barley and potatoes. Live-stock, including reindeer, breeding is very extensively carried on. Fishing, especially on the lower Yeniseisk, is of great importance. Sables are not now to be found, and the hunters obtain chiefly squirls, foxes, Arctic foxes and bears. In the middle of the 19th century 250,000 to 350,000 oz. of gold were obtained annually in N. and S. Yeniseisk, and only 18,200 oz. in 1903. The Yeniseisk Government has a manufactory for the manufacture of gold-fields and gold bullion, and are supplied with grain and cattle by river from the Minusinsk region, and with salt, spirits and iron by the Angara. The government is traversed from W. to E. by the Siberian railway, and considerable efforts have been made to establish regular steamer communication between the mouth of the Yenisei and W. Europe. For some years before the close of the 19th century steamers (e.g. that of the English Captain Wiggins) reached the mouth of the Yenisei, importing provisions and machinery for the gold mines. Efforts have been made to clear the rapids of the Angara, so as to bring Lake Baikal into steamer communication with the Yenisei. Owing to the shallowness, however, of the small tributaries of the Yenisei, the canal connecting the Yenisei with the Ob has not proved as serviceable as was expected. (P. A. K.; J. T. BE.)

Yeniseisk, a town of Asiatic Russia, capital of the Government of the same name, on the right bank of the Yenisei, 170 m. N.N.W. of Krasnoyarsk, with which it has regular communication by steamer. Pop. 12,000. It is the centre of a gold-mining region, and has a public library and a natural history and archaeological museum. The town was founded in 1618.

Yeola, a town of British India, in the Naski district of Bombay, on the chord line of the Great Indian Peninsula railway, 18 m. from Manned junction. Pop. (1901) 16,559. It is the seat of an important manufactures of cotton and silk cloth and thread, and also of gold and silver wire. It is the scene of a considerable trade, and was a strong fort in the old days. The town was founded in 1618 by the Jesuits, and bears the name of the Jesuit Father, Father Yeola, who established the first Christian church in India. It is the seat of an excellent school for civil and military engineers.

Yeoman, a term of which the various meanings fall into two main divisions, first that of a class of holders of land, and secondly that of a retainer, guard, attendant or subordinate officer or official. The word appears in M.E. as *yeoman*, *yeomans* and *yeoman*; it does not appear in O.E. Various explanations have been given for its origin, e.g. *i.e. a young man*, *yee-mon*; *yeoman*, attendant, from *yma-tan*; but the word is generally accepted that the first part is the same word as the Ger. *Gau*, district, province, and probably occurs in O.E. as *gea* in *Sibiri-ga*, Surrey, *i.e. southern district*, and other place-names. Thus in O. Frisian is found *gima*, a villager; Bavarian, *gloom*, peasant. "Yeoman" thus meant a countryman, a man of the district, and it is this sense which has survived in the special use of the word for a class of landholders, treated below.

For the transition in meaning to a guard of the sovereign's body and to officials of a royal household see YEOMEN OF THE GUARD AND VALETS. In the British navy there are petty officers in charge of the signalling styled "Yeomen of Signals." For the history and present organization of the "yeomany cavalry" see YEOMANRY and UNITED KINGDOM (§ Army).
YEOMANRY—YEOMEN OF THE GUARD

land, although, doubtless from its younger sons, the class furnished retainers for the great lords, men-at-arms and archers for the wars, and also tradesmen for the towns. Stubbs (Const. Hist. vol. iii.) refers to them as "a body which in antiquity of possession and purity of extraction was probably superior to the classes that looked down upon it as ignoble," and Medley (Eng. Const. Hist.) describes them as in the 15th century recruiting on the whole "the small freeholders of the feudal manor." Holinshed, in his Chronicle, following Sir T. Smyth (De republica Anglorum), and W. Harrison (Description of England), describes them as having free land worth £6 annually, and in times past 40s., and as not entitled to bear arms, being for the most part farmers to gentlemen, and this description may be accepted as the popular idea of the yeoman in the 16th century. He formed the intermediate class between the gentry and the labourers and artisans, the line of demarcation, however, being not drawn very distinctly.

The yeomen were the smaller landholders, and in the 15th century were practically identical with the forty-shilling freeholders who exercised the franchise under the act of 1430. Occasionally they found their way into parliament, for in 1446 the sheriffs were forbidden to return velleti (i.e. yeomen) as members, but this prohibition had very little result. Soon, however, the name appears to have included tenant farmers as well as small freeholders. Thus Latimer, in his famous sermon before Edward VI., says: "My father was a yeoman, but had no land of his own," describes the yeoman as an exceedingly prosperous person, and the same opinion had been expressed about a century before by Sir John Fortescue in his Governance of England. The decay of the class began with the formation of large sheep farms in the 16th century, but its decline was very slow, and the yeomen furnished many sturdy recruits to the parliamentary party during the Civil War. Their decay was accelerated during the 18th century, when many of them were bought out by the large landowners, while they received another blow when the factory system destroyed the country's domestic industries. Many writers lament the decay of the yeoman in the 18th and 19th centuries, but this is partly accounted for by the fact that they exclude all tenant farmers from the class, which they confine to men cultivating their own land. Thus the wheel has come full circle and the word means to-day much the same as it meant in the early part of the 15th century.

YEOMANRY, the name given to the volunteer mounted troops of the home defence army of Great Britain, ever since their original formation; it indicated that recruiting, organization and command were upon a county basis, that the yeoman as an officering force, the farmers and yeomen serving in its ranks, and all alike providing their own horses. Although the yeomanry was created in 1761, it was not organized until 1794. Under the stimulus of the French War recruiting was easy, and 5000 men were quickly enrolled. A little later, when more cavalry was needed, the Provisional Cavalry Act was passed, whereby a sort of revived knight-service was established, every owner of ten horses having to find and equip a horseman, and all who owned fewer than ten, grouped by tens of horses, similarly finding one. But the act was soon repudiated and the yeomanry cavalry could be substituted for provisional cavalry in the county quota. This gave a great stimulus to yeomanry recruiting, as similar enactments had done in the case of the infantry volunteers. But even so the provisional cavalry, which was embodied only in counties that did not supply the quota in yeomanry, was stronger than the yeomanry at the peace of Amiens. At that peace, partly with a view to preserving internal order, partly because of the probable renewal of the war, the yeomanry was retained, although the provisional cavalry was disbanded. There was thus a nucleus for expansion when Napoleon's threatened invasion (1803-5) called out the defensive powers of the country, and as early as December 1803 there were in England, Scotland and Ireland 44,000 yeomen. At the same time the limitations as to place of service (some undertaking to serve in any part of Great Britain, some within a specified military district, most only in their own county) were abolished. The unit of organization was the troop of 80-100, but most of the force was grouped in regiments of five or more troops, or in "corps" of three or four troops. Permanent paid adjutants and staff sergeants were allowed to corps and regiments, but no assistance was given in the shape of officers on the active list and serving non-commissioned officers of the army and militia. Equipment, supply and mobilization of the yeomany was purely regimental, and through all the war years most of the troops and squadrons were ready to take the field, with equipment, food and forage, complete at a day's notice. They were trained as light cavalry, and armed with sabre and pistol. But a few town corps had mounted rifles, and several corps, both in town and country, had one or more dismounted troops, who were carried on vehicles similar to the "Expedition or Military Fly" pictured by Rowlandson.

From the extinction of Chartism to the South African War the history of the yeomanry is uneventful. The strength of the force gradually sank to 10,000. But when it became apparent that mounted troops would pay a decisive part in the war against the Boers, the yeomanry again came to the front. Of its 10,000 serving officers and men, 3000 went to South Africa in newly formed battalions of "Imperial Yeomanry," armed and organized purely as mounted rilfes, and to these were added over 32,000 fresh men, for whom the yeomanry organization at home and at the seat of war provided the cadres and training. The same yeomanry was not only filled up by its gaps but expanded. In 1901 the yeomanry, now all styled "Imperial," was remodelled; and the strength of regiments was equalized on a four-squadron basis. In the prevailing conditions practically all regiments were able to recruit up to the increased establishment, and the strength of the force was more than trebled. Fresh regiments were formed, some in the towns, others on the nucleus of special corps disbanded at the close of the South African War. In 1907 the yeomanry became part of the new Territorial Force (see United Kingdom, § Army). YEOMEN OF THE GUARD, originally "Yeomen of the Guard of the body of our Lord the King," or in the 15th century Latin, "Valetici garde (corporis) domini Regis," the title (maintained with but a slight variation since their institution in 1485, the official wording under Edward VII. being "The King's Body Guard of the Yeomen of the Guard") of a permanent military corps in attendance on the sovereign of England, as part of the royal household, whose duties, now purely ceremonial, were originally that of the sovereign's personal bodyguard. They are the oldest existing body of the kind, having an unbroken record from 1485. Yeomen was not only filled up by its gaps but expanded. Before that time there had been forms of royal guard, but no permanent institution. Under Edward I. we find in England the "cross-bowmen of the household," and under Edward II. an "Archer guard of the King's body"; but the "Archers of the King," "of the crown" or "of the household," who appear in the records up to 1454, seem to have had no continuous establishments. Apparently each sovereign, on coming to the throne, established a new Guard of his own particular followers. It was not till Henry VII. created the "Yeomen of the Guard," that the title was ascribed to a regular body. The first warrants to individual "Yeomen of the Guard" date from September 16, 1485, and it is a fair inference that the Guard was created by the king on the battlefield of Bosworth (August 22, 1485), its first members being men who had shared Henry's exile in Brittany, followed him on his return, and fought as his private Guard in that action. The warrant of September 18, 1485, now in the Record Office, "to William Brown, Yeoman of the King's Guard," corroborates this view—"in consideration of the good service that ouse humble and faithful subject William Browne Yeoman of our Garde hath heretofore done unto us as well beyonde the see as at our victorious journeye." It is argued by Sir Reginald Hennell that the title of "Yeomen of the Guard" signified Henry VII.'s intention to choose the special protectors of his person not from the ranks of the nobility, but from the class just below them (see YEOMAN), who had
proved war the backbone of the national strength. The term valenci, or "valet" (see VALET), was already in use, as signifying personal attendants, with none of the modern menial sense of the word.

The first official recorded appearance of the king's bodyguard of the Yeomen of the Guard was at the coronation of its founder Henry VII. at Westminster Abbey on the 31st of October 1485, when it numbered 50 members. This number was rapidly increased, for there is an authentic roll of 126 attending the king's funeral in 1509. Henry VIII. raised the strength of the Guard to 500 when he took it to visit Francis I. of France at the Field of the Cloth of Gold. In Queen Elizabeth's reign it numbered 200. The corps was originally officered by a captain (a post long associated with that of vice-chamberlain), an ensign (or standard-bearer), a clerk of the cheque (or Chequer roll, his duty being to keep the roll of every one connected with the household), besides petty officers, captains, sergeants or ushers.

In 1605 Charles II. reorganized the Guard and gave it a fixed establishment of 100 yeomen, officered by a captain, a lieutenant, an ensign, a clerk of the cheque and four corporals in the pay of the organization and strength. The only variation is that the captaincy is now a ministerial appointment filled by a nobleman of distinction under the lord chamberlain, and that the old rank of "corporals" has been changed to "exon," a title derived from "exempt," i.e. exempted from regular military duty for employment on the staff. Formerly officers on the active list were given these appointments in addition to their own.

The original duties of the Guard were of the most comprehensive nature. They were the king's personal attendants day and night at home and abroad. They were responsible for his safety not only on journeys and on the battlefield, but also within the precincts of the palace itself. The regulations for making of the king's bed in Tudor times were of the most elaborate formality. No one but the Yeomen of the Guard under an officer might touch it. Each portion was separately examined. Each sheet or coverlet was laid with the greatest ceremony, and the sovereign could not retire to rest until the work was reported as well and truly done. The existence of the custom is verified at the present day by the designations Y.B.H. ("Yeomen Bed-Hanged") and Y.B.G. ("Yeomen Bed-Grown"), with the guards and organization, and strength. The only variation is that the captaincy is now a ministerial appointment filled by a nobleman of distinction under the lord chamberlain, and that the old rank of "corporals" has been changed to "exon," a title derived from "exempt," i.e. exempted from regular military duty for employment on the staff. YEOTMAL—YEW

origin in 1569-10 in the twelve Yeoman of the Guard whom young King Henry VIII left, when he gave up the Tower of London as a permanent residence, to show that it was still a royal palace. When the Tower was finally given up as a royal residence they became warders and were deprived of the dress, but were given it back in 1577.

It is described by John Stow, who in 1563, mentioning the immense magnificence of the bodyguard of Francis I. of France, decided to have a noble guard of his own, which he accordingly instituted and called "The Gentlemen Spears." It was composed of young nobles gorgeously attired. In 1565, this guard was organized and called "Gentlemen Pensioners." This title it retained till William IV.'s reign, when the corps regained its military character, the king on their petition giving them their present designation, "The Honourable Corps of Gentlemen-at-Arms."

See The History of the King's Bodyguard of the Yeomen of the Guard, by Colonel Sir Reginald Hennell, D.S.O., Lieutenant of the Yeoman of the Guard (1902). (R. H.)

YEOTMAL, a town and district of India, in Berar. The town stands at an elevation of 1476 ft. Pop. (1901) 19,545. It was formerly the headquarters of Wun district, but in 1905 a new district of Yeotmal was established, covering the former Wun district, with additions from the district of Basim. Cotton-ginning and pressing are carried on. The town is also the chief trading centre in the district, and is connected by road with Dhamangaon station, 29 m. distant.

The District of Yeotmal has an area of 5183 sq. m. It is a wild hilly country, intersected by offshoots from the Ajanta mountains. The hills are bare, or clothed only with dwarf teak or small jungle; but on the heights near Wun town the bamboo grows abundantly, and small bamboos are found in the ravines. The Wardha and Penganga, which bound the district on the E. and S., unite at its S.E. corner. The Penganga drains the greater part of the district. The tiger, leopard and hyena abound; bears, wolves and jackals are also numerous; while small game is plentiful. The climate is enervating and unhealthy; the annual rainfall averages about 41 in. Pop. (1901) 57,507. The principal crops are millets, cotton, pulses, oil-seeds and wheat. Coal has been found, and iron ore abounds.

See Yeotmal District Gazetteer (Calcutta, 1908). (C. J. W.)

YEVOIL, a market town and municipal borough in the Shropshire division of Shropshire, England, on the Great Western and South-Western railways, 127 m. W. by S. of London. Pop. (1901) 9861. The town lies on the river Yeo, and is a thriving place, with a few old houses. The church of St John the Baptist is a perpendicular cruciform structure, consisting of chancel, nave of seven bays, aisles, transepts and lofty western tower. There are some 15th- and 16th-century brasses, a dark cradle roof, and an early 13th-century crypt under the chancel. The town is famous for its manufacture of gloves (dating from 1565). Its agricultural trade is considerable. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 6534 acres. Yeovil (Virole, Evil, Ivo, Yceole) before the Conquest was part of the private domains of the Anglo-Saxon kings. The town owed its origin to trade, and became of some size in the 15th century. In 14th-century documents it is described as a town or borough governed by a portreeve, who frequently came into conflict with the parson of St John's church, who had become lord of the manor of Yeovil during the reign of Henry III. The corporation in the 18th century consisted of a portreeve and eleven burgesses, and was abolished when the town was reincorporated in 1853. Further information for the 17th of July the 6th of November were held under grant of Henry VII., and were important for the sale of leather and of woolen cloth, both made in the town. The Friday market dates from 1215. There is a great market every other Friday and a monthly horse sale.

YERKES, CHARLES TYSON (1837-1903), American capitalist, was born of Quaker parentage, in Philadelphia, Pennsylvania, on the 25th of June 1837. He was a clerk in a grain-commission house, an exchange broker (1858-61) and a banker (1861-86). When he failed in 1871 he refused to give any preference to the city of Philadelphia for bonds sold on its account, and was convicted of "misappropriating city funds," and sentenced to two years and nine months in the penitentiary. After serving seven months of this sentence he was pardoned, and the City Council afterward passed an ordinance canceling the municipality's claim against him. He established a banking business in Chicago in 1881; in 1886 got control of the Chicago City Railway Company; and within the next twelve years organized a virtual monopoly of the surface and elevated railway service of Chicago. He disposed of his street railway interests in Chicago, and removed to London (1900). There he acquired in 1907 a controlling interest in the Metropolitan District railway, and by organizing the finances of the Under-ground Electric Railways Company he took an important initiative in extending the system of London electric railways. Yerkes gave to the university of Chicago the great telescope installed in the Yerkes Observatory at Lake Geneva, Wisconsin, and gathered in his New York residence a remarkable collection of paintings, tapestries and rugs, which were sold at auction in April 1910 for $2,934,450. He died in New York on the 29th of December 1905.

YETHOLM, a village of Roxburghshire, Scotland. Pop. (1901) 571. It is situated on Bowmont Water, 73 m. S.E. of Kelso, and 5 m. S.S.W. of Mindrum in Northumberland, the nearest railway station. It is divided into two quarters, Kirk Yetholm on the right and Town Yetholm on the left of the stream. The name is said to be the O.E. 'get', "gate," and holm (here the same as howm), "hamlet," meaning "the hamlet at the gate." Of Scotland, the border being only 7½ m. distant. Since about the middle of the 17th century the district has been the head-quarters of a tribe of gipsies.

YEW (Taxus baccata), a tree which belongs to a genus of Coniferae (see GYMNOPODIUM), in which the ordinarily woody

Yew, 1, shoot with male flowers; 2, leaf and in section; 3, branch bearing two ripe seeds each with its crimson aril; 4, male flowers; 5, stamens; 6, 7, female flower in different stages; 8, section of ripe seed and aril. 1, slightly reduced; 2, and 4 to 8, enlarged.
diverse habitat, but generally with dense spreading branches, thickly clothed with very dark green linear leaves, which are given off from all sides of the branch, but which, owing to a twist in the base of the leaf, become arranged in a single series on each side of it. The trees are usually dioecious, the male flowers being borne on one individual and the female on another, although instances occur which flowers of both sexes are formed on the same tree. The male flowers are more or less globular and occur in the axils of the leaves. They consist of a number of overlapping brownish scales, gradually increasing in size from below upwards and surrounding a naked stalk that bears at its summit a head of four to eight stamens. Beneath this, and with its surface covered by the overlapping scales, is a yellowish white, slightly papery, globous pollen-grain. The female flowers are also placed each separately in the axil of a leaf, and consist of a number of overlapping scales, as in the male. These scales surround a cup which is at first shallow, green and thin (the so-called aril), but which subsequently becomes fleshy and red, while it increases so much in length as almost entirely to conceal the single straight seed. It is clear that the structure of the female flower differs from that of the type and on which it is now often separated in a distinct order, Taxaceae.

The poisonous properties, referred to by classical writers such as Caesar, Virgil and Livy, reside chiefly if not entirely in the foliage. This, if eaten by horses or cattle, especially when it has been cut and thrown in heaps so as to undergo a process of fermentation, is very injurious. The leaves have also been used for various medicinal purposes, but are not employed now. An alkaloid *tazine*, said to depress the circulation, is extracted. It forms white crystals soluble in alcohol and ether. As a timber tree the yew is used for cabinet-work, boxes, bows and the like, which require both strength and durability.

The yew occurs wild over a large area of the northern hemisphere. In N.E. America and in Japan trees are found of a character so similar that by some botanists they are all ranged under one species. Generally, however, the European yew, *T. baccata*, is regarded as native of Europe, N. Africa, and Asia as far as the Himalayas and the Amur region, while the American and Japanese forms are considered to represent distinct species. The yew is wild in Great Britain, forming a characteristic feature of the hedges and downs of parts of the Lake District and elsewhere. The evidence of fossil remains, antiquities and place-names indicates that it was formerly more widely spread in Europe than at the present day. The varieties grown in the United Kingdom are numerous, one of the most striking being that known as the Irish yew—a shrub with the pyramidal or columnar habit of a cypress, in which the leaves spread from all sides of the branches, not being twisted, as they usually are, out of their original position. In the ordinary yew the main branches spread more or less horizontally, and the leaves are so arranged as to be conveniently exposed to the influence of the light; but in the variety in question the branches are mostly vertical, and the leaves assume a direction in accordance with the ascending direction of the branches. The plants have all sprung from one of two trees found growing wild more than a hundred years ago on the mountains of Co. Fermanagh in Ireland, and afterwards planted in the garden of Florence Court, a seat of the earl of Enniskillen.

The yew is a favourite evergreen tree, either for planting separately or for hedges, for which its dense foliage renders it well suited. Its dense growth makes it also useful for hedging or for the making of thick hedges which, as was introduced by John Evelyn and became very prevalent at the close of the 17th and the beginning of the 18th centuries. The wood is very hard, close-grained and of a deep red-brown colour internally. The planting of the yew in churchyards was at one time supposed to have been done with a view to the supply of yew staves. But, while importation from abroad was fostered, there seems to have been no statute enforcing the cultivation of the yew in Great Britain; a statute, however, of Edward I. (cited in *The Gardener's Chronicle*, 6th March 1886, p. 306) states that the trees were often planted in churchyards to defend the church from high winds. The Crowhurst yew, mentioned by Evelyn as 30 ft. in circumference, still exists. The large yew at Ankerwyke, near Staines, with a trunk 30 ft. in circumference, in sight of which William the Conqueror was said to have died (1087), probably exceeds a thousand years of age. The fine yew in Buckland churchyard, near Dover, was removed in 1880 to a distance of 60 yds. The trunk had been split so that it had a direction nearly parallel with the soil. This huge yew stood 12 ft. 6 in. in circumference, with a girth of 15 ft. 8 in., by 3 ft. 6 in. in depth, the weight of the entire mass being estimated at 56 tons. The dimensions of the tree in 1880 were as follows: circumference of the main trunk, 22 ft. 6 in.; of the upright portion of the trunk, 6 ft. 10 in.; second horizontal trunk, 10 ft. 10 in.; do., south limb forkling off at 9 ft. from the main trunk, 7 ft. 10 in.; do., west limb forkling off at 9 ft. from the main trunk, 8 ft. 10 in.; extent of branches from centre of main trunk southward, 30 ft. 10 in.; and from north to south, 48 ft.; they extend from the main trunk westward 33 ft. The tree was replanted so that the horizontal portions were replaced in their original erect position and the natural symmetry restored.

For further details see Veitch, *Manual of Coniferae* (1900); Elwes and Henry, *Trees of Great Britain and Ireland* (1906).

**YEZID—YEZIDIS.**

YEZID, or YEZID, a province of Persia, bounded S. by Kerman, W. by Fars and Isfahan, and N. and E. by the central Persian deserts. It contains an area of about 20,000 sq. m., but its population barely exceeds 100,000, of whom about half inhabit the capital of the province. Its subdivisions are: (1) the city of Yeşid, the royal residence; (2) the great desert, containing the territory of (4) Tabšt; (5) Kubštan (*Pish Kuh*, Mian Kuh, Pusht Kuh, on the slopes and in the valleys of the Shir Kuh, a part of the Central Range of Persia W. of the city of Yeşid, and rising to an elevation of 11,000 ft.); and (6) Shahr i Babek. The last is situated far S. near Kerman, and sometimes is regarded as part of this province. The revenues slightly exceed £50,000 a year. Much silk is grown in the district, but is not sufficient for the silk stuffs which Yeşid manufactures with its 1000 looms, and raw silk (about 75,000 lb yearly) has to be obtained from Khorasan and Gilan. Great quantities of felts (*nimuds*), white or black cotton, and other goods, especially of *Gossypium herbaceum*, are also manufactured and exported. Other exports are opium, madder and almonds. The grain produced suffices for only two or three months’ consumption, and supplies have to be brought from Khorasan, so that wheat and barley are dearer than at other places in Persia. The part of the district situated in the plain is much exposed to moving sands, which render cultivation difficult and at times impossible.

YEZID, the capital of the province of the same name in Persia, situated 192 m. N.W. of Kerman, latitude 29° 19’ N., longitude 54° 27’ E., at an elevation of 4,320 ft. Its population, 100,000 in 1870, is now estimated at 50,000, including 2,000 Jews and 1,000 Zoroastrians. The city is divided into the Shahr i nāw (new town) and Shahr i kohneh (old town), separated by a wall with two gates. The ark, or citadel, in the E. of the town, is fortified with walls, bastions and dry ditch, and contains the governor’s residence. The bazaar is in good repair and well stocked; other parts of the town are irregularly planned, with dark, narrow streets. There are eighteen mosques, one, the Masjed i Jama, also called Masjed i Chahinnak, is an old and decayed structure originally built in 1410, with a lofty and imposing frontage dating from 1472. There are seven colleges. The caravanserai number thirty-three. There are telegraph (English staff since 1903) and post offices. The Englishman in charge of the telegraph office acts as British vice-consul.

YEZIDIS, a sect of devil-worshippers, calling themselves Dasni, who are found in Kurdistan, Armenia and the Caucasus. Their religion has points of connexion with old Iranian and Assyrian beliefs and traces of Manichaicism and Nestorianism. Thus they regard the devil as the creative Agent of the Supreme God, a reinstated fallen angel who is the author of evil. They avoid mentioning his name and represent him by the peacock. They regard Christ as an angel in human form and recognize

---

1 In 1879 the Zoroastrian community of Yeşid numbered 6453, 1242 residing in the city, 5241 in the villages; in 1892 the community numbered 6908, and as many have emigrated, it is computed that it now numbers not more than 7000.
YEZO—YGGDRASIL

Mahomet as a prophet with Abraham and the patriarchs. They believe in a future life and practice both circumcision and baptism. The name is probably derived from the Kurdish and Persian Yazdin, God; though some have connected it with the city of Yezid, or with Yezid, the second Omeyyad caliph (720–24). Their sacred book is called Al-Yafahw, and its chief exponent was Shaikh Adi (c. 1200).

See Layard, Nineveh and its Remains (London, 1850); Menant, Lexicon Hierosolymitanum (Berlin, 1845).

YEZO, or Ezo, the most northerly of the five principal islands forming the Japanese empire, the five being Yezo, Nippon, Shikoku, Hikushu and Formosa. It is situated between 45° 56' and 41° 21' N. and between 146° 7' and 139° 11' E; its coast-line measures 1423.32 m., and it has an area of 30,148.41 sq. m. On the N. it is separated from Sakhalin by Soya Strait (La Pérouse) and on the S. from Nippon by Tsugaru Strait. Its northern shores are washed by the Sea of Okhotsk, its southern and eastern by the Pacific Ocean, and its western by the Sea of Japan.

Orography.—The highest mountain in the island is Ishikaridake (6955 ft.) and the next in importance is Tokachidake (6541 ft.). Yubari-take in Ishikari has a height of 6508 ft., and in the province of Kuroshio are O-kakan (4470 ft.) and O-tokachidake (2876 ft.). Dr. Kuroda states that Tokachidake forms a species of central elevation whence most of the principal rivers flow towards the sea, and that the mountain system is a continuation, of one of the principal ranges, of the Tertiary volcanos of the former consisting of granite and old schists, the latter chiefly of volcanic formations. Near Hakodate are two conspicuous volcanic peaks, Komaga-take (3822 ft.) and Tokatsuk-dake (3800 ft.); and off the coast of Tohoku (formerly called Atose-no-hori, or Two-zen sulphur mountain), whence great quantities of first-rate sulphur are exported to the United States. Mention must also be made of Kishiri, an island off Sapporo, the main town of the N.W. of Yezo, which has a peak of the same name rising to a height of nearly 6000 ft.

Rivers.—Yezo boasts the largest river in the Japanese empire, the Ishikari-gawa, which is estimated to measure 725 m. Its other large rivers are the Susuzawa-gawa (102 m.), the Tokachigawa (120 m.), the Shiribeshi-gawa (88 m.), the Kushiro-gawa (81 m.), the Toshibetsu-gawa (64 m.), and the Yubetsu-gawa (64 m.). The valley of the Ishikari is believed to be the most fertile part of the island; Tokachi has a small growth and fishing area, but the Teshio has a bar which renders its approach extremely difficult. A peculiarity of several of the rivers is that, on approaching the sea-shore, they run parallel to it for some distance before finding their way to the sea. Those flowing to the S. coast take a W. direction, those flowing to the E. coast a N. direction. This is attributed to the fact that the prevailing winds set up the sand so as to deflect the rivers from their straits.

Lakes.—There are no large lakes, but there are many small ones having a circumference of more than 25 m. Lagoons, however, are not uncommon. The largest of these—Saruma-ko in Kitami—is some 17 m. long by 7 wide. It abounds in sturgeons and for wild birds. A smaller lagoon at Akkeshi is famous, the molluscs measuring about 18 in. in length.

Climate.—The climate differs markedly from that of the main island of Japan, resembling rather the climate of the British Isles, though the winter is longer and more severe, and the atmosphere in the warm season contains a greater quantity of moisture. During five months the country is almost uninhabitable, and there is little cultivation. It is also remarkable in that respect because of the Nishibetsu-gawa, which yields an average of over 2000 tons of fish annually.

History.—Yezo was not brought under Japan's effective control until medieval times. In 1604 the island was granted in fief to Matsumae Yoshihiro, whose ancestor had overrun it, and from the close of the 18th century the E. was governed by officials sent by the shogun, whose attention had been attracted, to it by Russian trespassers. In 1871 the task of developing its resources and administering its affairs was entrusted to a special bureau, which employed American agriculturists to assist the work and American engineers to construct roads and railways; but in 1881 this bureau was abolished, and the island was abandoned to private hands the various enterprises it had inaugurated.

YGGDRASIL, in Scandinavian mythology, the mystical ash tree which symbolizes existence, and binds together earth, heaven and hell. It is the tree of life, of knowledge, of fate, of time and of space. Its three roots go down into the three great realms—(1) of death, where, in the well Hvergelmer, the dragon Nilhug (Nilhögg) and his brood are ever gnawing it; (2) of the giants, where, in the fountain of Mílahnir, lies the source of wisdom; (3) of the gods, Asgard, at the sacred Ashin Urd, is the dwelling of the gods, and the dwelling of the Fates. The stem of Yggdrasil upholds the earth, while its branches overshadow the world and reach up beyond the heavens. On its topmost bough sits an eagle, between whom and Nilhug the squirrel Ratatöskr runs to and fro to provoke the population of over 20,000, viz. Hakodate (20,114), Sapporo (46,147) and Otaru (34,586). Other towns of importance are Fukuyama (formerly called Mutsu-mae), the seat of government in feudal days, Esashi, Mombetsu, Oiwa, Tomakomai, Piratorii (the chief Ainu settlement), Mororan, Kushiro, Akkeshi, Nemuro, Horobetsu, Yuno-kawa, Abashiri and Mashike. Yuno-kawa, 43 m. from Hakodate, is much frequented for its hot springs; Oiwa is the junction of the main line of railway with the branch to the Yubari collieries; Kushiro exports coal and sulphur; Akkeshi is celebrated for its oysters.

Population.—The island seems to have been originally peopled by a semi-barbarian race of pit-dwellers, but modern representatives are to be found in the Kurils or their neighbours Khamtaka and Sakhalin. These autochthons were driven out by the Ainu, and the latter, in their turn, succumbed to the Japanese. The population of Yezo is 605,742, of whom 17,573 are Ainu. There is a steadily growing but not large emigration from Japan proper to Yezo. Yezo is divided into ten provinces, the names of which, beginning from the S., are Oshima, Shiribeshi, Ishikari, Teshio, Kitami, Ibari, Hidaka, Tokachi, Kushiro and Nemuro. Of these, Oshima, Shiribeshi and Ishikari are by far the most important. There are seven Ainu towns. The population of Great Strait is 17,573; Sapporo, 46,147; and Otaru, 34,586.
YONGE, Odin
The ft. was with prefectural ensued at Treaty 1886 of Japan, certain a Yola, Japan, foreign treaty of 1868 the Japanese government converted the shipyard into a naval dockyard, and subsequently carried out many improvements. In 1884 the port became a first-class naval station; and naval barracks and warehouses, offices, hospitals, &c., were built. The dockyard was first constructed by French engineers; but after 1875 the work passed entirely into the hands of Japanese engineers.

YOLA, once a native state of West Africa, forming part of the Fula emirate of Adamawa, now a province in the British protectorate of Nigeria. The province, which has an area of 16,000 sq. m., occupies the S.E. of the protectorate and both banks of the upper Benue. It is bounded S. and E. by the German colony of Cameroon, N. by the British province of Bornu, and W. by the British provinces of Bauchi and Murni. It has an estimated population of 60,000, of which 25,000 are Muslims, 20,000 are Christians, and the rest are animists. The town founded by the Fula conqueror Adama about the middle of the 19th century. It was the capital of the emirate of Adamawa, the greater part of which is now a German protectorate. The town is situated in 9° 12' N., 12° 46' E. and is built on the left or S. bank of the Benue, 480 m. by river from Lokoja. It can be reached by shallow draught steamers when the river is in flood. The Niger Company had trading relations with Yola before the establishment of British administration in Northern Nigeria. In 1901 the reigning emir, a son of Adama, forced them to evacuate their station, and, all attempts to establish friendly relations proving unavailing, the British government despatched an expedition from Lokoja in August 1901. The emir was deposed and a new emir installed in his place. The hostility of certain pagan tribes had to be overcome by British expeditions in January and April of 1902. By 1903 the province was brought fairly under administrative control, and divided into three administrative divisions—the N.W. with a station at Gazi, the N.E. and the S. with Yola for its station. The new emir proved friendly and loyal, but the new administration was not formally installed till October 1904, when he took the customary oath of allegiance to the British crown and accepted all the conditions with regard to the suppression of slavery, &c. The slave markets were immediately closed as a result of British occupation, and any slave-trading which is still done is smuggled. In 1903 an exploring expedition was sent up the Gongola, one of the principal rivers of the Yola province, and as a result the navigability of the river for steam launches as far as Gombe at high water was demonstrated. An important means of communication with the province of Bornu was thus established, and a rich agricultural district opened to development. The Gongola valley was in ancient times extensively cultivated, and the population are readily returning to the land. Cotton, rice and tobacco are among the heavy crops (see NIGERIA, ADAMAWA).

YOLANDE [or ISABELLA] OF BREINNE (1222–1228), the daughter of John of Brienne, who had married Mary, daughter of Conrad of Montferrat, heirest on the death of Amalric II. of the kingdom of Jerusalem. Yolande inherited the throne on her mother's death in 1212, but her father ruled as her guardian. In 1215 she married John, Count of Flanders, and in 1217 this bond to attach the emperor firmly to the crusade. Immediately upon his marriage Frederick demanded all the rights of sovereignty in the kingdom of Jerusalem, which he claimed to exercise in his wife's name. His action led to difficulties with John, who did not relish the loss of his position. Yolande died in 1228 after the birth of a son, Conrad, and her husband then continued to rule, though not without opposition.

YONGE, CHARLOTTE MARY (1823–1901), English novelist and writer on religious and educational subjects, daughter of William
Crawley Yonge, 32nd Regiment, and Frances Mary Bargus, was born on the 11th of August 1823 at Otterbourne, Hants. She was educated by her parents, and from them inherited much of the religious feeling and High Church sympathy which coloured her work. She resided at Otterbourne all her life, and was one of the most prolific writers of the Victorian era. In 1841 she published five works of fiction, including The Clever Woman of the Family, Dynevor Terrace and The Trial; and after that she was the author of about 120 volumes, including novels, tales, school manuals and biographies. Her first conspicuous success was attained with The Heir of Redclyffe (1835), which enjoyed an enormous vogue. The Daisy Chain (1856) continued the success; and among her other popular books may be mentioned Heartsease (1854), The Young Stepmother (1861) and The Dove in the Eagle's Nest (1866). In more serious fields of literature she published Landmarks of History (three series, 1852–57), History of Christian Names (1863), Cameos of English History (1868), Life of Bishop Patterson (1874), English Church History for Use in Schools (1883) and many others. She also edited various educational works, and was for more than thirty years editor of the Monthly Packet. Yonge died at Otterbourne on 4th March 1896. Her works err on the side of didacticism, but exercised a wide and wholesome influence. The money realized by the early sales of The Daisy Chain was given to the building of a missionary college at Auckland, N.Z., while a large portion of the proceeds of The Heir of Redclyffe was devoted to the missionary schooner "The Southern Cross."

YONGE, JOHN (1465–1516). English ecclesiastic and diplomatist, was born at Heyford, Oxfordshire, and educated at Winchester and New College, Oxford, where he became a fellow in 1485. He was ordained in 1500 and held several livings before receiving his first diplomatic mission to arrange a commercial treaty with the archduke of Austria in 1504, and in the Low Countries in 1506 in connexion with the projected marriage between Henry VII. and Margaret of Savoy. In 1507 he was made Master of the Rolls, and in the following year was employed in various diplomatic missions. He was one of the ambassadors who arranged the Holy League in 1513, and accompanied Henry VIII. during the ensuing campaign. In 1514 he was made dean of York in succession to Wolsey, and in 1515 he was one of the commissioners for renewing the peace with Francis I. Yonge was on terms of intimate friendship with Dean Colet, and was a correspondent of Erasmus.

YONGE, SIR WILLIAM, Bart. (c. 1603–1755). English politician, was the son of Sir Walter Yonge of Colyton, Devonshire, and great-great-grandson of Walter Yonge of Colyton (1581–1649), whose diaries (1604–45), more especially four volumes now in the British Museum (Add. MSS. 1877–1896), are valuable material for history. In 1722 he was elected to parliament as member for Honiton; and he succeeded his father, the third baronet, in 1731. In the House of Commons he attached himself to the Whigs, and making himself useful to Sir Robert Walpole, was rewarded with a commissionership of the treasury in 1724. George II., who conceived a strong antipathy to Sir William, spoke of him as "Stinking Yonge"; but Yonge conducted himself so obsequiously that he obtained a commissionership of the admiralty in 1728, was restored to the treasury in 1730, and in 1735 became secretary of state for war. He especially distinguished himself in his defence of the government against a hostile motion by Pulteney in 1742. Making friends with the Pelhams, he was appointed vice-treasurer of Ireland in 1746; and, acting on the committee of management for the impeachment of Lord Lovat in 1747, he won the applause of Horace Walpole by moving that prisoners impeached for high treason should be allowed the assistance of counsel. In 1748 he was elected F.R.S. He died at Escott, near Honiton, on the 10th of August 1755. By his second wife, Anne, daughter and coheir of Thomas, Lord Howard of Effingham, he had two sons and six daughters. He enjoyed some reputation as a versifier, some of his lines being even mistaken for the work of Pope, greatly to the disgust of the latter; and he wrote the lyrics incorporated in a comic opera, adapted from Richard Brome's The Jovial Crew, which was produced at Drury Lane in 1730 and had a considerable vogue.

Yonge, his eldest son, SIR GEORGE YONGE (1731–1812), was member of parliament for Honiton continuously from 1754 to 1794, and held a number of different government appointments, becoming a lord of the admiralty (1760–70), vice-treasurer for Ireland (1761–66), and a commissioner of customs (from April to December 1783), master of the mint (1794–99). He was appointed governor of the Cape of Good Hope. Serious charges being brought against his administration, which was marked by great lack of judgment, he was recalled in 1801. He died on the 25th of September 1812. The baronetcy became extinct at his death.

YONKERS, a city of Westchester county, New York, U.S.A., on the E. bank of the Hudson river, immediately adjoining New York City on the N. Pop. (1900) 47,931, of whom 14,634 were foreign-born and 10,009 were negroes; (1910) 79,803. Yonkers is served by the New York Central & Hudson River railway, and is connected with New York City and other places E. and N. by interurban electric lines. It has also during most of the year steamboat service on the Hudson. There are two principal residential districts: one in the N., including Amackassin Heights and (about 1 mi. W.)Glenwood, where are the old Colgate Mansion and "Greystone," the former home of Samuel J. Tilden; the other in the S., including Lodlow, Van Cortlandt Terrace and Park Hill (adjoining Riverdale in the borough of the Bronx), a park-like reserve with winding streets and drives. The business and manufacturing districts occupy the low lands along the river. Among the public buildings are the City Hall, the High School and a Manual Training School, and Yonkers is the seat of St Joseph's Theological Seminary (Roman Catholic; 1896), the Halsted School (founded 1874) for girls, and a business college. It has a good public library (established 1893; 25,000 vols. in 1912), and the Woman's Institute (1888) and the Holly- wood Inn Club (1867; for working-men) have small libraries. Philipson Manor Hall, built originally about 1682 as the mansion of the son of Frederick Philipse (1626–1702), the lord of Philipseburgh, and enlarged to its present dimensions in 1745, is of some historic interest. It was confiscated by act of the legislature in 1779 because its owner, Frederick Philipse (1746–1783), was suspected of Toryism, and was sold in 1789. In 1867 it passed into the possession of Yonkers, and from 1872 to 1908 was used as the city hall. In 1908 it was bought by the state, and is now maintained as a museum for colonial and revolutionary relics. It is one of the best examples of colonial architecture in America. In the square before it stands a monument to the soldiers and sailors of the Civil War. Yonkers is an important manufacturing city, and in 1905 the value of its factory products was $33,548,688.

On the site of Yonkers stood an Indian village known as Napeakeamack, or town of the rapid water, at the time of the settlement of the Dutch in New Amsterdam; and a great rock, near the mouth of the Nepperhan Creek, was long a place of Indian worship. The territory was part of the "Keskeksieke purchase," acquired from the Indians by the Dutch W. India Company in 1630. In 1646 the tract was included in the grant to Adrian van der Donck, the first lawyer and historian of New Netherland, author of A Description of New Netherland (1656), in Dutch. His grant, known as "Colen Donck" (Donck's Colony), embraced all the country from Spuyten Duyvil Creek, N. along the Hudson to the Amackassin Creek, and E. to the Bronx river. Some squatters settled here before 1646. Van der Donck encouraged others to remove to his lands along the Hudson river, and in 1649 he built a saw-mill near the mouth of the Nepperhan Creek, which for many years was called "Saw-Mill river." The whole settlement soon came to be called "De Jonkheer's Land" or "De Jonckheers"—meaning the estate of the young lord, as Van der Donck was called by
his tenants—and afterwards Yonkers. Subsequently the tract passed largely into the hands of Frederick Philipse and became part of the manor of Philipseburgh. Early in the War of Independence Yonkers was occupied for a time by part of Washington's army, and was the scene of several skirmishes. The town of Yonkers was incorporated in 1788 and the village in 1855. In 1872 Yonkers became a city; at the same time the southern part was separately incorporated as Kingsbridge, which in 1874 was annexed to New York.

See Frederic Shonnard and W. W. Spooner, History of Westchester County (New York, 1900); J. T. Scharf, History of Western New York (Cleveland, 1886); and Allison, History of Yonkers (New York, 1896).

*YONNE*, a department of central France, formed partly from the province of Champagne proper (with its dependencies, Sénones and Bassigny), partly from Burgundy proper (with its dependencies, the county of Auverre and Avallonais) and partly from Gâtinais (Orléansais and Ile-de-France). It is bounded by Aube on the N.E., Côte-d’Or on the S.E., Nièvre on the S., Loiret on the W. and Seine-et-Marne on the N.W. Pop. (1906) 315,199. Area, 2,880 sq. m. The highest elevation (2,000 ft.) is in the granitic highlands of Morvan, in the S.E., where other peaks range from 1,300 to 1,600 ft. The department belongs to the basin of the Seine, except a small district in the S.W. (Puisaye), which belongs to that of the Loire. The river Yonne flows through it from S. to N.N.W., receiving the Cure at Auxerre and the Armançon and the Armançon, which water the S.E. of the department. Farther N. it is joined by the Vanne, between which and the Armançon lies the forest-clad plateau of the Pays d’Othe. To the W. of the Yonne, in the Puisaye, are the sources of the Loing, another tributary of the Seine, and of its affluents, the Ouanne and the Lunain. The Yonne is navigable throughout the department, and is connected with the Loire by the canal of Nivernais, which in turn is connected with that of Briare, which connects the Seine and the Loire. The climate is temperate, but in the region of the Loing, where the extremes of heat and cold are greater, and where the rainfall is most abundant. The prevailing winds are S.W. and W.

The department is especially agricultural. Wheat and oats are the chief cereals; potatoes, sugar-beet, lucerne, hemp, wort and other forage plants are also cultivated, and there is much good pasturage.

The vineyards of the Tonnerrois and Auxerrois produce the finest red wines of lower Burgundy, and those of Chablis the finest white. The wine of the Côte St Jacques (Joigny) is also esteemed. Cider-apples are the chief fruit. Chary is a centre for the rearing of horses. Forests cover 40% of the department and consist chiefly of oak, beech, hornbeam, elm, asp, birch and pine. Quarry products include building-stone, ochre and alabaster. Among the industrial establishments are tanneries, tile-works, distilleries and breweries, but there is little manufacturing activity. Cereals, wines, firewood, charcoal, ochre and bark are exported.

The department is served chiefly by the Paris-Lyon railway. The canal of Burgundy, which follows the valley of the Armançon, has a length of 57 m. in the department, that of Nivernais, following the valley of the Yonne, a length of 53 m. The department constitutes the archipelagic district of Sens, has its court of appeal in Paris, its educational centre at Dijon, and belongs to the district of the V. army corps. It is divided into five arrondissements (37 communes, in the capital), of which the capitals areAuxerre, also capital of the department, Avallon, Sens, Joigny and Givry, which with those of Chablis, St Florentin and Vézelay are most noteworthy towns and are treated separately. Yonne is rich in objects of antiquarian and architectural interest. At Pontigny there is a Cistercian abbey, where Thomas Becket spent two years of his exile. Its church is an excellent type of the Cistercian architecture of the 12th century. The fine 12th-century château of Beaurepaire is a part of the property of the Armançon, which belongs to a Château-St-Fargeau, of the 13th century, rebuilt by Mademoiselle de Montpensier under Louis XIV., are all architecturally remarkable. At St Mord there are remains of the Roman road from Lyons to Gallia Belgica and of a Roman fortified post.
YOUREDale SERIES—YORK (HOUSE OF)

October 1839. A statue (by Rauch) was erected to him in Berlin in 1855. See Seydlitz, 'Tagebuch des Preussischen Armee Korps 182' (Berlin, 1823); Droysen, Leben des G. F. M. Grafen Yorck von Wartenburg (Berlin, 1851).

YOUREDale SERIES, in geology, a local phase of the lower Carboniferous rocks of the N. of England. The name was introduced by J. Phillips on account of the typical development of the phase in Yoredale (Wensleydale), Yorkshire. In the Yorkshire dales the Carboniferous rocks assume variously vertical and horizontal attitudes; the latter obtains in the S. Beds of detrital sediment, sandstones, shales and occasional ironstones and thin coals separate the limestone beds into well-defined beds. These limestone beds have received various names of local significance (Hardraw Scar, Simonstone, Middle, Undersert, Main and many others), and, owing to the country being little disturbed by faulting and being much cut up by the streams, they stand out as escarpments on either side of the valleys. The first indication of the intercalation of thick detrital deposits within the massive limestone is seen in Ingleborough and Pen-y-ghent. The rocks are usually divided into the detrital increases in quantity and the limestones diminish, till in Northumberland the whole Carboniferous series assumes the Yoredale phase, and consists of alternations of detrital and calcareous beds, no massive limestone being seen.

The Yoredale limestones are characterized by the presence of *Psauronites giganteus*; the branched trilobite is usually associated with it. The lower limestone of Weardale is full of corals, including *Lonsdalea flabrisormis*, *Dibunophyllum sp.*, *Cyclphpachyphyllum pachyendothecus*, &c., and has a typical Visian fauna; it would therefore correspond, palaeontologically, with the upper part of the Carboniferous Limestone of Derbyshire. On Ingleborough the limestones are not very fossiliferous, but the Main Limestone contains small corals of a zaphrentide type and an upper Visian fauna. Post-*denomi* *Becheri* occurs in the superjacent beds above the Hardraw Scar and Gayls limestones, but it is not accompanied by any of the goniatrites or other cephalopods and lamellibranchs which characterize the *Becheri* of the Pendleside Series, the faunas of the Yoredale and Pendleside phases being very distinct. The Red Bed Limestone of Leyburn, the uppermost limestone of the series, is very rich in fish remains, which are identical in many cases with those found in the topmost beds of the massive Carboniferous Limestone at Bolt Edge quarry in Derbyshire. The shales between the limestones are rich in fossils and contain abundant single corals referable to *Zaphrentis enigmatica*, *Lonsdalea*, *Yoreddalella* and others; these, though high-zonal forms, occur low down in the Yoredale strata, even in the shale above the Hardraw Scar limestone. In the Derbyshire area the younger corals which were once supposed to characterize the base of the limestone series of those districts, and their early appearance in the Yoredale area is probably entirely due to conditions of environment. Attempts have been made to correlate rocks in a number of isolated areas and separated areas with the Yoredale series, but their position is still debatable. It is clear that the exact relationship which the Yoredale series of the type area bears to a whole series of Carboniferous rocks of the Midlands, N. and S. Wales, &c., on the one hand, and to the Pendleside series on the other, has yet to be established on a firm palaeontological basis.

YORK (HOUSE OF), a royal line in England, founded by Richard, duke of York (q.s.), who claimed the crown in opposition to Henry VI. It may be said that his claim, at the time it was advanced, was rightly barred by prescription, the house of Lancaster having then occupied the throne for three generations, and that it was really owing to the misgovernment of Margaret of Anjou, and her favourites that it was advanced at all. Yet it was founded upon the principle of William's claim to the throne. The Duke of York was descended from Lionel, duke of Clarence, the third son of Edward III, while the house of Lancaster came of John of Gaunt, a younger brother of Lionel. One thing which might possibly have been considered an element of weakness in his claim was that it was derived (see the Table) through females—an objection actually brought against it by Chief Justice Fortescue. But a succession through females could not reasonably have been objected to after Edward III.'s claim to the crown of France; and, apart from strict legality, the duke's claim was probably supported in the popular estimation by the fact that he was descended from Edward III. through his father no less than through his mother. For his father, Richard, earl of Cambridge, was the son of Edmund, duke of York, fifth son of Edward III., and he himself was the direct lineal heir of this Edmund, just as much as he was of Lionel, duke of Clarence. His claim was also favoured by the accumulation of hereditary titles and estates. The earldom of Ulster, the old inheritance of the De Burghs, had descended to him from Lionel, duke of Clarence; the earldom of March came from the Mortimers, and the dukedom of York and the earldom of Cambridge from his paternal family. Moreover, his own marriage with Cecily Neville, though she was heiress but the youngest daughter of Ralph, 1st earl of Westmorland, allied him to a powerful family in the north of England, to whose support both he and his son were greatly indebted.

The reasons why the claims of the line of Clarence had been so long forborne are not difficult to explain. Roger Mortimer, 4th earl of March, was designated by Richard II. as his successor; but he died the year before Richard was dethroned, and his son Edmund, the 4th earl, was a child at Henry IV.'s usurpation. Henry took care to secure his person; but the claims of the Mortimers were sufficient to leave Edinburgh in his hands. Moreover, his own marriage with Cecily Neville, though she married him but the youngest daughter of Ralph, 1st earl of Westmorland, allied him to a powerful family in the north of England, to whose support both he and his son were greatly indebted.

Richard, duke of York, seems to have taken warning by his father's fate; but, after seeking for many years to correct by other means the weakness of Henry VI.'s government, he first took up arms against the ill advisers who were his own personal enemies, and at length claimed the crown in parliament as his right. The Lords, or such of them as did not purposely stay away from the House, admitted that his claim was unimpeachable, but suggested as a compromise that Henry should retain the title of king of England, while Richard would become the king of Scotland. But he met with a decided check in the battle of Bannockburn. The popularity gained by Henry V. in his French campaign had secured the weak title of the house of Lancaster against further attack for forty years.

But the seeds of distrust had already been sown among the members of his own family, and in 1478 his brother Clarence was put to death—secretly, indeed, within the Tower, but still by his authority and that of parliament—as a traitor. In 1483 Edward himself died; and his eldest son, Edward V., after a nominal reign of two months and a half, was put aside by his uncle, the duke of Gloucester, who became Richard III., and then caused him and his brother Richard, duke of York, to be murdered. But in little more than two years Richard was slain at Bosworth by the earl of Richmond, who, being proclaimed king as Henry VII., shortly afterwards fulfilled his pledge to marry the eldest daughter of Edward IV. and so unite the houses of York and Lancaster.

Here the dynastic history of the house of York ends, for its claims were henceforth merged in those of the house of Tudor. But, although the union of the Roses ought to have extinguished controversy, a host of debatable questions and plausible pretensions for rebellion remained. The legitimacy of Edward IV.'s children had been denied by Richard III. and his parliament, and, though the act was denounced as scandalous, the slander might still be reasserted. The duke of Clarence had left two

York, Edmund of Langley, Duke of

(Duke of 1341-1402), fifth son of Edward III., was born at King’s Langley in Hertfordshire on the 5th of June 1341. He accompanied his father on a campaign in France in 1359, was created earl of Cambridge in 1362, and took part in expeditions to France and Spain, being present at the sack of Limoges in 1370. After marrying Isabella (d. 1393), daughter of Peter the Cruel, King of Castile, he was appointed one of the English lieutenants in Brittany, whither he led an army in 1375. A second campaign in Brittany was followed in 1381 by an expedition under the earl’s leadership to

to the Tudors if they had not been narrowly watched and ultimately extinguished. Of the sisters of Edward IV., the eldest, Anne, who married the duke of Exeter, left only one daughter by her second husband, Sir Thomas St Leger; but the second, Elizabeth, married John de la Pole, Duke of Suffolk, and had several children. Their eldest son was created earl of Lincoln during his father’s life, and Richard III., after the death of his own son, had designated him as his successor. Disappointed of a kingdom by the success of Henry VII., he joined in Simnel’s rebellion and was killed at the battle of Stoke. His brother Edmund thus became heir to his father; but in the reduced circumstances of the family he agreed to forbear the title of duke and take that of earl of Suffolk. He continued for some years in favour with the king, who made him a knight of the Garter; but, having killed a man in a passion, he fled abroad and was entertained at the court of the emperor Maximilian, and afterwards at that of Philip, king of Castile, when resident in the Low Countries before his departure for Spain. Philip, having been driven on the English coast when going to take possession of his Spanish kingdom, was entertained at Windsor by Henry VII., to whom he promised to deliver up the fugitive on condition that his life should be spared. Edmund de la Pole accordingly was brought back to England and lodged in the Tower. Though the promise to spare his life was kept by the king who gave it, his son Henry VIII. caused him to be executed in 1513, when war broke out with France, apparently for treasonable correspondence with his brother Richard, then in the French service. After his death Richard de la Pole, remaining in exile, called himself earl of Suffolk, and was flattened occasionally by Francis I. with faint hopes of the crown of England. He was killed at the battle of Pavia in 1525. There were no more De la Poles who could advance even the most shadowy pretensions to disturb the Tudor dynasty.

(J. GA.)

York, Edmund of Langley, Duke of (1341-1402), fifth son of Edward III., was born at King’s Langley in Hertfordshire on the 5th of June 1341. He accompanied his father on a campaign in France in 1359, was created earl of Cambridge in 1362, and took part in expeditions to France and Spain, being present at the sack of Limoges in 1370. After marrying Isabella (d. 1393), daughter of Peter the Cruel, King of Castile, he was appointed one of the English lieutenants in Brittany, whither he led an army in 1375. A second campaign in Brittany was followed in 1381 by an expedition under the earl’s leadership to
aid Ferdinand, king of Portugal, in his struggle with John I, king of Castile; but after a period of inaction Edmund was compelled to return to England as Ferdinand had concluded an independent peace with Castile. Accompanying Richard II. on his march into Scotland, he was created duke of York in August 1385, and subsequently on three occasions he acted as regent of England. In this capacity he held a parliament in 1395, and he was again serving as regent when Henry of Lancaster, afterwards Henry IV., landed in England in July 1399. After a feeble attempt to defend the interests of the absent king, York joined the victorious invader; but soon retired from public life, and, in the words of Froissart as translated by Lord Berners, “laye styll in his castell, and medled with notynge of the busynes of England.” He died at King’s Langley on the 1st of August 1402. York was a man who preferred pleasure to business, and during the critical events of his nephew’s reign he was content to be guided by his more ambitious brothers, the dukes of Lancaster and Gloucester. His second wife was Joan, or Johanna (d. 1434), daughter of Thomas Holland, earl of Kent, and his only children were two sons and a daughter, Constance (d. 1416), by his first wife.

YORK, EDWARD, DUKE OF (c. 1372-1415), elder son of the preceding, was created earl of Rutland in 1390. Being an intimate friend of his cousin, Richard II., he received several important appointments, including those of admiral of the fleet, constable of the tower of London and warden of the Cinque Ports. He accompanied the king to Ireland in 1394 and was made earl of Cork; arranged Richard’s marriage with Isabella, daughter of Charles VI. of France; and was one of the king’s ambassadors to the Low Countries in 1395. He was created duke from the first earldom and Baronet, and was appointed “appellant” in 1397. As a reward he secured the office of constable of England and the lands in Holderness which had previously belonged to his murdered uncle, Thomas of Woodstock, duke of Gloucester, together with other estates and the title of duke of Aumerle or Albeimarle. He appears to have deserted Richard in 1399, but only at the last moment; and in Henry IV.’s first parliament he was vigorously denounced as the murderer of Gloucester. After declaring that his part in the proceedings of 1397 had been performed under constraint, his life was spared, but he was reduced to his former rank as earl of Rutland and Baronet. But he continued to be the “truest and most firm friend of the king”, and he was again made constable in 1401, and, in the confidence subsequently reposed in him by the king, point to the conclusion that he was not seriously involved. Serving as the royal lieutenant in Aquitaine and in Wales, Rutland, who became duke of York on his father’s death in 1402, was, like all Henry’s servants, hampered by want of money, and perhaps began to feel some irritation against the king. At all events he was concerned in the scheme, concocted in 1405 by his sister, Constance, widow of Thomas le Despencer, earl of Gloucester, for seizing the young earl of March, and his brother Roger Mortimer, and carrying them into Wales. On her trial Constance asserted that her brother had instigated the plot, which also included the murder of the king, and York was imprisoned in Penvensey castle. Released a few months later, he was restored to the privy council and regained his estates, after which he again served Henry in Wales and in France. York led one division of the English army at Agincourt, where, on the 25th of October 1415, he was killed by “much hete and thronged.” He was buried in Pothenagh church. The duke left no children and was succeeded as duke of York by his nephew.

York compiled the *Moyestre of the Game*, a treatise on hunting which is largely a translation of the *Livre de Chasse de Gaston Phoebus*, count of Foix. This has been edited by W. A. and F. Baillie-Groham (1903).

YORK, FREDERICK AUGUSTUS, DUKE OF (1763-1827), second son of George III., was born at St James’s Palace on the 16th of August 1763. At the age of six months his father secured his election to the rich bishopric of Osnabrück. He was invested a knight of the Bath in 1767, a K.G. in 1771, and was gazetted colonel in 1780. From 1781 to 1787 he lived in Germany, where he attended the manoeuvres of the Austrian and Prussian armies. He was appointed colonel of the 2nd horse grenadier guards (now 2nd Life Guards) in 1782, and promoted major-general and appointed colonel of the Coldstream Guards in 1784. He was created duke of York and Albany and earl of Ulster in 1784, but retained the bishopric of Osnabrück until 1803. On his return to England he took his seat in the House of Lords, where, on December 15, 1788, he opposed Pitt’s Regency Bill in a speech which was supposed to have been inspired by the prince of Wales. A duel fought on Wimbledon Common with Colonel Lennox, afterwards duke of Richmond, served to increase the duke of York’s popularity, his acceptance of the challenge itself and his perfect coolness appealing strongly to the public taste. In 1791 he married Princess Frederica Charlotte Ulrica Catherina (b. 1767), daughter of Frederick William II. of Prussia. The princess was enthusiastically received in London, but the marriage was not happy, and a separation soon took place. The princess retired to Oatlands Park, Wimbledon, where she died on 1st July 1827.

In 1793 the duke of York was sent to Flanders in command of the English contingent of Coburg’s army destined for the invasion of France (see FRENCH REVOLUTIONARY WARS). On his return in 1795 the king promoted him field-marshal, and on April 3rd, 1798, appointed him commander-in-chief. His second command was with the army sent to invade Holland in conjunction with a Russian corps d’armée in 1799. Sir Ralph Abercromby and Admiral Sir Charles Mitchell in charge of the vanguard had succeeded in capturing the Dutch ships in the Scheldt, but the main body of the army disaster followed disaster until, on the 17th of October, the duke signed the convention of Alkmaar, by which the allied expedition withdrew after giving up its prisoners. Although thus unsuccessful as commander of a field army the duke was well fitted to carry out reforms in the army at home, and to this task he devoted himself with the greatest vigour and success until his enforced retirement from the office of commander-in-chief on the 18th of March 1806, in consequence of his relations with Mary Ann Clarke (1776-1852), who was convicted of profiting by her intimacy with the duke to extract money from officers by promising to recommend them for promotion. A select committee was appointed by the House of Commons to inquire into the matter, and the duke was acquitted of having received bribes himself by 278 votes to 106. Two years later, in May 1811, he was again placed at the head of the army by the prince regent, and rendered valuable services in this position. He died on the 5th of January 1827 and was buried at St George’s Chapel, Windsor.

A firm friendship seems to have existed between the duke and his elder brother, afterwards George IV., and he is also said to have been his father’s favourite son. He was very popular, thanks to his amiable disposition and a keen love of sport, but it is as the organizing and administrative head of the army that he has left his most valuable mark. He was untiring in his efforts to raise the tone of the army, restore discipline, weed out the undesirables, and suppress bribery and favouritism. He founded the Duke of York’s School for the sons of soldiers at Chelsea, and his name is also commemorated by the Duke of York’s column in Waterloo Place.

YORK, RICHARD, DUKE OF (1411-1450), was born on the 21st of September 1411, the son of Richard, earl of Cambridge, second son of Edmund of Langley, duke of York. By the death of his uncle Edward at Agincourt he became duke of York, and on the death of Edmund Mortimer in 1425 he succeeded to his claims as representing in the female line the elder branch of the royal family. He had been kindly treated by Henry V., and his name appears at the head of the knights made by the little Henry VI. at Leicester on the 19th of May 1426. York’s first service was in France during 1430 and 1431. In 1432 he obtained livery of his lands and afterwards went over to Ireland to take possession of his estates there. In January 1436 he was appointed lieutenant-general of France and Normandy, but did not enter on his command till June. He showed vigour and capacity, and recovered Fécamp and some other places in
York (City)

Normandy. Probably he was not supported cordially by the home government, and in 1437 applied to be recalled. One authority alleges that his council thwarted him in his desire to relieve Montereau, because he had been discharged from his office (Chronicles of London, 143). York returned to England in the autumn of 1437. From this time at all events he attached himself to the war-party of which Humphrey of Gloucester was head, in opposition to the government under Cardinal Beaufort.

By his marriage in 1438 to Cicely, sister of the earl of Salisbury, he allied himself to the rising family of the Nevilles. On the 2nd of July 1440 York was again appointed to the Fior di Loto. He was present on December 14 (Hieron, ed. Oldroyd). He died not, however, go to Rouen till June 1444. During his second governorship York maintained, if he could not improve, the English position in Normandy. He was again hampered by his political opponents at home, and at the end of 1446 was recalled, on the pretext that his term of office had expired. The death of Humphrey of Gloucester in February 1447 made York the first prince of the blood. Suffolk, now Henry's chief minister, found a convenient banishment for a dangerous rival by appointing York to be lieutenant of Ireland for ten years (9th of December 1447). York, however, contrived to put off his departure for eighteen months. During his absence in Ireland English discontent came to a crisis in Jack Cade's rebellion. The use made of the names of Mortimer and York, however unauthorized, shows the trend of popular opinion. In September 1450 York landed in Wales. His opponents endeavoured to waylay him, but he came to London with an armed retinue and forced himself into the king's presence. Nevertheless he declared his loyalty and that he desired only justice and good government. He took part in the punishment of Cade's supporters, and disowned the proposal in parliament that he should be declared heir to the crown. In March 1452 he came once more in arms to London, and endeavoured to obtain Somerset's dismissal. On a promise that his rival should be held in custody he disbanded his men, and thus outwitted found himself virtually a prisoner. However, a nominal agreement was concluded, and York accepted the king's pardon. The situation was changed by the birth of a prince of Wales and the king's illness in October 1453. After a struggle with the queen and Somerset, York secured his recognition as protector on the 27th of March 1454. He declared that he accepted the position of a duty, and, though he put his own friends in power, exercised his authority with moderation and on the side of good order. But at the end of the year the king's sudden recovery brought York's protectorate to an end. When it was clear that the queen and Somerset would proceed to extremities, York and his friends took up arms in self-defence. Even when the two armies met at St Albans, York endeavoured to treat for settlement. The issue was decided by the defeat and death of Somerset on the 22nd of May 1455. York used his success with moderation. He became constable of England, and his friends obtained office. This was no more than a change of ministers. But a return of the king's illness in October 1455 made York again for a brief space protector. Henry recovered in February 1456, and Margaret, his queen, began to assert herself. Finally, at Coventry, in October, the Yorkist officials were displaced. Still there was no open breach, and in March 1458 there was even a ceremonial reconciliation of all parties at St Paul's in London. York would not again accept honourable banishment to Ireland, but made no move till the queen's presence in London forced him to act. In 1459 both parties were once more in arms. York protested that he acted only in self-defence, but the desertion of his best soldiers at Ludlow on the 12th of October left him helpless. With a few followers he escaped to Ireland, where his position as lordlieutenant was confirmed by an Irish parliament, and he ruled in full defiance of the English government. In March 1460 the earl of Warwick came from Calais to concert plans with his leader. York himself only landed in England on the 8th of September, two months after Warwick's victory at Northampton. All pretence of moderation was put aside, and he marched on London, using the full arms of England, and with his sword borne upright before him. On reaching Westminster, York took up his residence in the royal palace, and formally asserted his claim to the throne in parliament. In the end a compromise was arranged, under which Henry was to retain the crown for life, but Richard was to succeed him. On the 8th of November he was accordingly proclaimed heir-apparent and protector. Meantime the queen was gathering her friends, and early in December, Richard went north with a small force. He kept Christmas at Sandal Castle near Wakefield. There, on December 29th, he was hemmed in by a superior force of Lancastrians. Declaring that he had never kept castle in the face of the enemy, Richard rashly offered battle, and was defeated and slain. His enemies had his head cut off, and set it up on the walls of York adorned with a paper crown.

Richard of York was not a great statesman, but he had qualities of restraint and moderation, and might have made a good king. He had four daughters and four sons. Edmund, earl of Rutland, his second son, was killed at Wakefield. The other three were Edward IV., George, duke of Clarence, and Richard III.

See The Bastion Letters with Dr Gairdner's Introduction; Three Fifteenth Century Chronicles, and Collections of a London Citizen (published by the Camden Society); Chronicles of London (ed. C. L. Kingsford, 1905); J. S. Stevenson's Wars of the English in France (1901); T. Basin and Jehan Waurin should also be consulted (these three are published by the Société de l'Histoire de France). For modern accounts see especially Sir James Ramsay's Lancaster and York, and The Political History of England, vol. iv., by Professor C. Oman. (C. L. K.)

York, a city, municipal, county and parliamentary borough, the seat of an archbishop, and the county town of Yorkshire, England, 188 m. N. by W. from London by the Great Northern railway. It is an important junction of the North-Eastern railway. Pop. (1901) 77,914. It lies in a plain watered by the river Ouse, at the junction of the Foss stream with the main river. It has narrow picturesque streets, ancient walls, and, besides the cathedral, many churches and buildings of architectural interest.

York was a Roman station (see below), and large collections of Roman remains are preserved in the hospital of St Mary's Abbey. Of these a great proportion come from the foundations of the railway station. A noteworthy relic of the Roman occupation, however, appears in its original place. This is the so-called multangular tower, on the N.W. of the city walls. Its base is Roman, of mingled stone and brick work. The city walls date in part from Norman times, but are in the main of the 14th century. Their circuit is a little over 2½ m., and the area enclosed is divided by the river Ouse, the larger part lying on the left bank. The walls have been carefully preserved and are remarkably perfect. On the E. for a short distance the river Foss took the place of a wall. Of the gates, called Bars, the best specimen is Micklegate Bar on the S.W., where the heads of traitors were formerly exposed. It is a square tower built over a circular, probably Norman, arch, and has embattled corner turrets. Others are Bootham Bar, the main entrance from the N., also having a Norman arch; Monk Bar (N.E.), formerly called Goodramgate, but renamed in honour of General Monk, and Walmgate Bar, of the time of Edward I., retaining the barbaric repaired in 1648. The castle stands in the angle between the Ouse and the Foss immediately above their junction. Of the fortress built by William the Conqueror in 1068 some portions were probably incorporated in Clifford's tower, the shell of which, showing an unusual ground plan of four intersecting circles, rises from an artificial mound. The castle serves as the prison and county courts.

The cathedral of St Peter, commonly known as the minster, has no superior in general dignity of form among English cathedrals. It is in the form of a Latin cross, consisting of nave with aisles, transepts, choir with aisles, a central tower, and
two W. towers. The palace of the archbishops is at Bishopthorpe, 2½ m. S. of York. It is of various dates, and includes slight remains of the Early English palace of Archbishop Grey. The diocese includes over half the parishes in Yorkshire, and also covers very small portions of Durham, Nottinghamshire and Lincolnshire.

The extreme external length of the cathedral is 524 ft. 6 in., the breadth across the transepts 290 ft., the height of the central tower 89 ft., and the height of the other towers 220 ft. The material is magnesian limestone. The cathedral occupies the site of the wooden church in which King Edwin was baptized by Paulinus at York in the Easter Day of 627. According to Bede, they began to construct "a large and more noble basilica of stone," but it was partly destroyed during the troubles which followed his death, and was repaired by Archbishop Wilfrid. The nave was reconstructed from fire and after 974 had been repaired by Archbishop Albert, as described by Alcuin as "a most magnificent basilica." At the time of the Norman invasion the Saxon cathedral, with the library of Archbishop Egbert, perished in the fire by which the greater part of the city was destroyed, the only relic remaining being the central wall of the crypt. It was reconstructed by Archbishop Thomas of Bayeux (1070-1100); but of this building few portions remain. The apsidal choir and crypt were reconstructed by Archbishop Roger (1154-81), the S. transept by Archbishop Walter de Grey (1216-55), and the N. transept and central tower by John Romans, treasurer (1282-97). The decoration of the crypt, the transepts are the oldest portions of the building, now remaining. They represent the Early English style at its best, and, in the new great lancet windows the manuscripts of the architectural effect. The S. transept is the richest and most elaborate in its details, one of its principal features being the magnificent rose window; and the N. transept contains a series of beautiful lancet windows called the Five Sisters. The foundation of the new nave was laid by Archbishop Romans (1286-90), son of the treasurer, the building of it being completed by Archbishop William de Melton about 1340. The chapter-house, a magnificent ornate building, was built during the same period. The W. front, consisting of a centre and two divisions corresponding with the nave and aisles, has been described as "more architecturally perfect than that of any of our English cathedrals"; the great window above the door being considered by some superior to the famous E. window at Carlisle.

In 1361 Archbishop Thoresby (1352-73) began the lady chapel and presbytery, both in the Early Perpendicular style. The rebuilding of the choir, begun about the same period, was not completed till about 1400. It is Late Perpendicular, the great E. window being one of the finest in the world. With the rebuilding of the choir the whole of the ancient Norman edifice was replaced, the only Norman architecture now remaining being the E. portion of the crypt of the second period, built by Archbishop Roger (1154-81). The N. and S. transepts, then, were recasted and changed into a Perpendicular lantern tower, the work being completed in 1444. The S. W. tower was begun in 1432 during the treasurership of John de Beringham, and the N. W. tower in 1464. The decoration of this part is the finest of the whole cathedral, and it was completed as it now stands, and on the 3rd of February 1472 it was re-consecrated by Archbishop Nevile. On the 2nd of February 1829 this portion of the building was damaged by the explosion of a gunpowder magazine. On the 2nd of May 1840 a fire broke out in the S.W. tower, reducing it to a mere shell. The stained glass both in the cathedral and in other churches of the city is particularly noteworthy; its survival may be traced to the stipulations made by the citizens when surrendering to parliament in the civil wars that it should not be damaged.

The following is a list of the archbishops of York:

1. Paulinus, 627-633.
2. Chad, 669-709.
3. Wilfrid, 670-698. (He again held the see in 686—for how long is not certain—Bosa retiring in his favour.)
5. * John of Beverley, 705-718.
7. Egbert, 723-766.
10. Anhald II, 791-812.
12. Aidwine, 831-858.
15. Redewald, 895-928.

* These bishops did not receive the pall as metropolitan.

William Fitzherbert, re-instated, 1152 to 1154.
31. Roger 1 of Pont l'Eveque, 1154-1181.
32. (The see was now vacant for 10 years.)
33. Geoffrey of Bayeux, 1191-1207.
34. (The see was vacant for nine years.)
35. Walter de Grey, 1216-1255.
36. Sewal de Bovil, 1255-1258.
37. Geoffrey of Ludlam, 1258-1268.
38. Walter Giffard, 1266-1279.
40. John Romans, 1286-1296.
41. Henry of Newark, 1298-1300.
42. Thomas of Corbridge, 1300-1304.
43. William Greenfield, 1306-1315.
44. William de Melton, 1317-1346.
45. William la Zouche, 1342-1352.
46. John Thoresby, 1352-1373.
47. William Neville, 1374-1388.
51. Henry Bowet, 1407-1423.
52. Thomas of Thurnby, 1423-1431.
53. William Booth, 1452-1464.
54. George Nevile, 1464-1476.
55. Laurence Booth, 1476-1480.
56. Thomas Scott, 1480-1500.
57. Thomas Savage, 1501-1507.
58. Christopher Bainbridge, 1507-1514.
59. Thomas Wolsley, 1514-1530.
60. Cosmo Gordon Lang, 1908-1929.
YORK

929

The public institutions include the Yorkshire Philosophical Society, with a museum and library opened in 1850, and the free library in the building of the York Institute of Science and Art. The principal schools are St Peter's cathedral grammar-school (originally endowed in 1557), Archbishop Holgate's grammar-school, the York and district grammar schools, and the girls' high school, founded in 1765, with the associated grecy school for girls. There are numerous charitable institutions. The chief industrial establishments are iron foundries, railway and motor engineering shops, breweries, flour-mills, tanneries and manufactories of confectionery, artificial manure, &c. There is water communication by the Ouse with the Humber, and by the Foss Navigation to the N.E. This is under the control of the corporation. The parliamentary borough returns 2 members. The county borough was created in 1888. The municipal borough is under a lord mayor, 12 aldermen and 36 councillors. The city within the walls has a population of 170,000, but the county has a population of 200,000. The municipal city and the Ainsty (a district on the S.W. included in the city bounds in 1449) are for parliamentary purposes included in the N. Riding; for registration purposes in the E. Riding, and for all other purposes in the W. Riding. The parliamentary borough extends into the E. Riding. Area, 3730 acres.

History.—York is known to have been occupied by the Britons, and was chosen by the Romans as their most important centre in north Britain and named Eboracum or Eburacum. The fortress of Legio VI. Victrix was situated near the site of the cathedral, and a municipality (colonia) grew up, near where the railway station now is, on the opposite side of the Ouse. Many inscriptions and a great quantity of minor objects, both stelae and coins, of Hadrian's day, were found in York in A.D. 120, and, according to tradition, the body of the emperor Severus who died there in A.D. 211 was burnt on Severus Hill, near the city. After the death of Constantine Chlorus, which also took place in York, his son Constantine the Great, who, according to an ancient but incorrect tradition, was born there, was also inaugurated emperor there. A bishop of York is mentioned, along with, and with precedence of, bishops of London and Lincoln (the last name is uncertain) as present at the council of Arles in 314. Nothing is known of the history of the city from the time the Romans withdrew from Britain in 410 until 527, when King Edwin was baptized there, and where shortly afterwards Paulinus, the first archbishop, was consecrated. In the time of Archbishop Egbert (732-756) and of Alcuin, at first a scholar and afterwards master of the cloister school, York became one of the most celebrated places of education in Europe. It was also one of the chief Danish boroughs, and Earl Seward is said to have died there in 955. In 1066 it was taken by Harold Hardrada, and in 1068 the men of the north of England, rising under Edgar Atheling and Earl Waltheof, restored the control of which William I had removed, putting to death the whole of the Norman garrison. The Conqueror in revenge burnt the town and laid waste the country between the Humber and Tees. York was frequently visited by the kings of England on the way to Scotland, and several important parliaments were held there, the first being that of 1175, when Malcolm, king of Scotland, did homage to Henry II. In the reign of Richard I., the citizens rose against the Jews, who fled to the castle. Here, however, they were obliged to surrender, many killing themselves after putting to death their wives and children, the rest being miserably treated. The town was captured from 1194 to 1212 by King John in 1200 and 1216 after the suppression of the Pilgrimage of Grace. In 1642 York was garrisoned by Royalists and besieged by the parliament. It was relieved by Prince Rupert, but surrendered after the battle of Marston Moor. Being under the rule of the earls of Northumbria, York is not mentioned in the Domesday Survey. In the first charter (which is undated) Henry II. granted the citizens a merchant guild and all the free customs which they had in the time of Henry I. Richard I. in 1194 granted exemption from toll, &c. during the time that they had the protection of the king. He confirmed the preceding charters, and in 1212 granted the city to the citizens at a fee-farm of £160 a year. These charters were confirmed by most of the early kings. Richard II. confirmed the title of lord mayor, and a second charter, given in 1392, shows that the government then consisted of a lord mayor and aldermen, while in a third in 1396 made the city a county of itself and gave the burgesses power to elect two sheriffs. Edward IV. in 1494 incorporated the town under the title of "Lord Mayor and Aldermen," and in 1473 directed that all the citizens should choose the mayor from among the aldermen. As this led to much dissatisfaction, Henry VII. arranged that a common council, consisting of two men from each of the more important guilds and one from each of the less important ones, should elect the mayor. The city is now governed under a charter of Charles II., confirming that of 1494, the governing body consisting of a lord mayor, 12 aldermen and 36 councillors. The city has returned two members to parliament since 1295. During the 14th century there were constant quarrels between the citizens and the abbey of St Mary's about the suburb of Bootham, which the citizens claimed as within the jurisdiction of the city, and the abbey as a separate borough. In 1353 the king took the borough of York into his own hands, "to avoid any risk of disturbance and possible great bloodshed such as has arisen before these times," and finally in the same year an agreement was brought about by Archbishop Thoresby that the whole of Bootham should be considered a suburb of York except the street called St Marygate, which should be in the jurisdiction of the abbey.

From the time of the conquest York was important as a trading and commercial centre. There were numerous trade guilds, one of the chief being that of the weavers, which received a charter from Henry II. During the 13th and 14th centuries the trade declined, partly owing to the distance of the city from the sea, and partly owing to the regulations of the trade gilds.

(1843); Victoria County History, Yorkshire; J. Raine, York (1803); A. P. Perry, Cust, York Minster (1897), Heraldry of York Minster (Leeds, 1899); B. S. Rowntree, Poverty: a Study of Town Life (1901).

YORK, a township of York county, Maine, U.S.A., on the Atlantic coast about 45 m. S.W. of Portland, and 9 m. by rail N.E. of Portsmouth, New Hampshire. Pop. (1910) 2822. Area, 64 sq. m. York is at the terminus of the York Harbor and Beach division of the Boston & Maine railway. In York village is the county gaol (1653-54), preserved by the Old York Historical and Improvement Society as a museum of local antiquities. Two colonial taverns also remain. York Harbor, York Beach, York Cliff and Long Beach are attractive summer resorts. The first settlement began about 1623. In April 1641 Sir Ferdinando Gorges, proprietor of the province of Maine, erected this into the Borough of Agamenticus, and on the 1st of March 1642 he chartered it as a city under the name of Gorgeana. In 1652, when Massachusetts extended her jurisdiction over Maine, the city of Gorgeana became the town of York. In 1692 most of the houses were burned by the Indians and the inhabitants killed or taken captive. York was the shire town of Yorkshire from 1716 to 1755, the shire town with Portland (then Falmouth) of the district of Maine from 1735 to 1760, and a county seat of York county from 1806 to 1812. During the middle of the 18th century York had considerable trade with the West Indies and along the coast, and as late as the middle of the 19th century it had important fishing interests. Its development as a summer resort was begun about 1873, but until 1887, when the railway reached it, its chief means of access was by stage from Portsmouth.

YORK, a city and the county-seat of York county, Nebraska, U.S.A., about 46 m. W. by N. of Lincoln. Pop. (1900) 5172; (1910) 6253. It is served by the Chicago, Burlington & Quincy and Chicago & North-Western railways. It is the seat of the School of the Holy Family and of York College (founded in 1890, XXVIII. 30
YORK—YORKSHIRE

co-educational). The city is situated in a farming and stock-rearing region, and among its manufactures are foundry products, bricks and flour. York was settled in 1654, was laid out in 1696, was incorporated as a town in 1785 and was chartered as a city in 1877.

YORK, a city and the county seat of York county, Pennsylvania, U.S.A., about 100 m. W. of Philadelphia and about 28 m. S.E. of Harrisburg. Pop. (1900) 33,705—1304 being foreign-born and 276 negroes; (1910) 44,750. York is served by the Maryland & Pennsylvania, the Northern Central (Pennsylvania) and the Western Maryland railways. Among the public buildings are the County Court House (1890) and a large Federal Building (1910). York is the seat of the York Collegiate Institute (1873), founded by Samuel Small (d. 1885) and of the York County Academy (1783). The Historical Society of York (1895) has a valuable collection of documents relating to local history. York is the commercial centre for a rich agricultural region, and has manufactures of foundry and machine-shop products, silk goods, &c. The total factory product in 1905 was valued at $14,328,606.

York, the first permanent settlement in the state W. of the Susquehanna, was laid out in 1741 in what was then the Manor of Springettsbury (named in honour of Springett, a grandson of William Penn) by Thomas Cookson, a surveyor for Richard and Thomas Penn, who then owned the Pennsylvania tract. The town was named after York, England. The first settlers were chiefly Germans from the Rhenish Palatinate, who were Lutherans, Reformers, Mennonites and Moravians. English Quakers and Scotch-Irish settled here also. The settlement lay on the Monocacy road, the main line of travel to the S. and S.W., and it grew rapidly, especially between 1745 and 1751. In 1749 the county of York was erected (from Lancaster county) and York was made the county-seat. In 1754 York had 210 houses and 1000 inhabitants. Troops from York took part in the Seven Years' War and the War of American Independence. In the old county seat house, built in 1754-56, pulled down in 1843, the Continental Congress sat from the 30th of September 1777 to the 27th of June 1788, having left Philadelphia on the approach of the British, and having held a day's session at Lancaster. At York the Congress passed the Articles of Confederation (15th of November 1777) and received news of the American victory at Saratoga and of the signing of treaties between the United States and France. The Conway cabal came to an end here, and the arrival here of Baron Steuben and of Lafayette in 1777 helped the American cause. In September 1778, $1,500,000 in specie were deposited in the state bank at York, which was the origin of the paper currency. On the 20th of July 1788, the Pennsylvania Constitution was adopted here.

YORK, Charles (1722-1770), English lord chancellor, second son of Philip Yorke, 1st earl of Hardwicke, was born in London on the 30th of December 1722, and was educated at Corpus Christi College, Cambridge. His literary abilities were shown at an early age by his collaboration with his brother Philip in the Athenian Letters. In 1745 he published an able treatise on the law of forfeiture for high treason, in defence of his father's treatment of the Scotch Jacobite rebels; and in the following year he was called to the bar. His father being at this time lord chancellor, Yorke obtained a sinecure appointment in the Court of Chancery in 1747, and entered parliament as member for Reigate, a seat which he afterwards exchanged for that for the university of Cambridge. He quickly made his mark in the House of Commons, one of his earliest speeches being in favour of his father's reform of the marriage law. In 1751 he became counsel to the East India Company, and in 1756 he was appointed solicitor-general, a place which he retained in the administration of the elder Pitt, of whose foreign policy he was a powerful defender. He resigned with Pitt in 1761, but in 1762 became attorney-general under Lord Bute. He continued to hold this office when George Grenville became prime minister (April 1763), and advised the government on the question raised by Wilkes's North Briton. Yorke refused to describe the libel as treasonable, while pronouncing it a high misdemeanour. In the following November he resigned office. Resisting Pitt's attempt to draw him into alliance against the ministry he had quitted, Yorke maintained, in a speech that extorted the highest eulogy from Walpole, that parliamentary power could not be used to prevent the renewal of the war in 1767, Yorke resigned office, and took little part in the debates in parliament during the next four years. In 1770 he was invited by the duke of Grafton, when Camden was dismissed from the chancellorship, to take his seat on the woolsack. He had, however, explicitly pledged himself to Rockingham and his party not to take office with Grafton. The king exerted all his personal influence to overcome Yorke's scruples, warning him finally that the great seal if now refused would never again be within his grasp. Yorke yielded to the king's entreaty, went to his brother's house, where he met the leaders of the opposition, and, feeling at once overawed by shame, fled to his own house, where in three days he was a dead man (January 20, 1770). The patent raising him to the peerage as Baron Morden had been made out, but his last act was to refuse his sanction to the sealing of the document.

Charles Yorke was twice married. His son by his first marriage became earl of Hardwicke; his eldest son by his second marriage, Charles Philip Yorke (1764-1834), member of parliament for Cambridgeshire and afterwards for Liskeard, was secretary of state for war in Addington's ministry in 1801, and was the last of his line. He was an apostate, and was converted to the Roman Catholics. He made himself exceedingly unpopular in 1810 by bringing about the exclusion of strangers, including reporters for the press, from the House of Commons under the standing order, which led to the imprisonment of Sir Francis Burdett in the Tower and to riots in London. In the same year Yorke joined Spencer Perceval's government as first lord of the admiralty; he retired from public life in 1818, and died in 1834. Charles Yorke's second son by his second marriage was Sir Joseph Sydney Yorke (1768-1834), an admiral in the navy, whose son succeeded to the earldom of Hardwicke.

See under HARDWICKE, PHILIP YORKE, 1st Earl of.

YORKSHIRE, a north-eastern county of England, bounded N. by Durham, E. by the North Sea, S.E. by the Humberside curiously separating it (from Lincolnshire), S. by Nottinghamshire and Derbyshire, S.W. for a short distance by Cheshire, W. by Lancashire and N.W. by Westmorland. It is the largest county in England, having an area of 6066½ sq. m., and being more than double the size of Lincolnshire, which ranks next to it. In a description of the county it is constantly necessary to refer to its three great divisions, the North Riding, East Riding and West Riding (see RIDING, and map of England, Sections I, II.).

The centre of the county is a plain, which in the S., about the head of the Humber, resembles the Fens in character. The hills W. of the central plain, covering nearly the whole of the W. Riding and the N.W. of the N. Riding, are part of the great Pennine Chain (q.v.). These hills consist of high-lying moorland, and are
not generally remarkable for great beauty of outline. The higher parts are bleak and wild, and the slope towards the central plain is gradual. The chief beauty of the district is to be found in the numerous deeply scored valleys or dales, such as Teesdale, Swaledale, Wharfedale, Nidderdale, and Wensleydale, in which the course of the streams is often broken by waterfalls, such as High Force in Teesdale and Aysgarth Force in Wensleydale.

The hills E. of the central plain cannot be similarly considered as a unit. In the N., wholly within the N. Riding, a line of heights known as the Cleveland Hills, forming a spur of the N. Yorkshire Moors, ranges from 1000 to nearly 1500 ft., and overarches the valleys that separate them. The line of greatest elevation approaches the central plain, and swings sharply S. in the Hambleton Hills to overlook it, while to the S. of the line lie the Vale of York and the Cleveland Hills. The country thus draining to the Ouse. Eastward the N. Yorkshire moors are immediately upon the coast. Their higher parts consist of open moorland. The remarkable upper valley of the Derwent (.) off the N. Yorkshire moors from the Yorkshire wolds of the E. Riding, the river forming the boundary between the N. and E. Ridings. The wolds superficially resemble the moors, inasmuch as they abut directly on the coast E., run N. and swing S. to overlook the central plain. At the S. extremity they sink to the shore of the Humber. Their greatest elevation is found near the W. angle (Howardian Hills), but hardly reaches 800 ft. and is marked by a narrow plateau formed by the S. by the Humber and E. by the North Sea. The name of Holderness is broadly applied to this low tract, though the wapentake of that name includes properly only the E. of it.

The ridge dividing the Vale of York from the Vale of Pickering is the continuous ridge of drift-margined cliffs in England (666 ft.). Picturesque valleys bearing short streams break the line, notably that of the Esk, reaching the sea at Whitby. The trend of the coast is at first S.E. and then S. South of Scarborough it begins to wind. The process of drift and sea abrasion, the wind-abrasion of the cliffs, begins to rise again round the shallow sweep of Filey Bay, and then springs seaward in the fine promontory of Flamborough Head (see Bridlington). South of this, after the sharp incision of E.

The Pennine range is broken by extensive expanses of English Lake country, the most notable being those of Derwentwater, Ullswater, Coniston, and Windermere. The limestone fells of those lakes are of varying size and shape, but none are large; the principal being the Lake of Windermere, which lies between the fells of Langdale and Derwentwater on the N. and S. Craven faults; (3) the Yoredale series, consisting of shales, flagstones, limestones and thin seams of coal; and (4) the Millstone Grit, forming part of the hilly moorlands, and capping many of the principal summits. In the district of the elevated country of Craven and Dent. The scenery in the W. of the N. Riding is somewhat similar to that in Craven, except that the lower hills of sharper outline owing to the perpendicularly precipitate.

To the O.S. the softer rocks are due the numerous "forces" or waterfalls, which are one of the special features of the scenery of this district. The softer rocks and the cliffs of the coast are, again, the result of the wear and tear of the ages, and have given rise to extensive caverns, of which the best examples are those of Clapham and Ingleton in the W. Riding, as well as to subterranean watercourses. At Brimham, Plumpton and elsewhere there are many masses of rocks due to irregular weathering of the Millstone Grit. The Pennine range is bounded on the S.E. by the Coal Measures, forming the N. of the Derbyshire, Nottinghamshire and Lincolnshire coalfield, in which Yorkshire extends southward to N. to Leeds. The noted fire-places of the Leeds district are obtained from this formation. To the E. the Coal Measures dip beneath the unconformable Permian beds, with magnesian limestone and marl. These are worked for chalk and alabaster.

The Permian strata are overlain to the E. by the Trias or New Red Sandstone, scarcely ever exposed, but having been partly worn away is covered with Glacial clays of clay and gravel, forming the excellent land for the agricultural districts. The Trias and Permian beds, near beyond the E. beyond York to Market Weighton. Near Middleton red rock with gypseous and stone (too ft.) have been proved. In the Tickhill area of the Trias beds on the fringes of the Rhaetic beds have been recorded from near Northallerton. The Humber crops to the surface in a curve extending from Redcar to the Humber. In the Middle Lias there is a sea of valuable iron ore, for the sake of which the Vale of Pickering and W. to the Vale of York. The chalk forms the Yorkshire wolds and the country S. through Driffield, Beverley and Holderness; and the coast of Redcar and Flamborough presents a continuous series of magnificent exposures of the strata from the Lower Lias to the Chalk. The Upper Lias fossil and jet of Whitby, and the Hole of the York and North Yorkshire coalfield of Portland, Purbeck, Wealden, and Lower Greensand of S. England. Over the Speeton beds lies the Red Chalk, the Yorkshire equivalent of the Upper Greensand and Gault. The evidence of glacial action are of unusual interest and variety; the great thickness of boulder clay on the coast is familiar to all, but inland also great deposits of glacial clay, sand and gravel obscure the older geology. The Vale of Pickering and many of the smaller northern valleys were in a N.W. direction from the neighbourhood of Fylingdales Moor.

Minerals.—The coal-field in the W. Riding is one of the chief sources of mineral wealth in Yorkshire, the most valuable being the coalfield of the Yorkshire coal-field, which is of special value, on account of its anthracite qualities, its large output to the coal furnace. Associated with the Upper Coal Measures there is a valuable iron ore, occurring in the form of nodules. Large quantities of fire-clay are also raised, as well as of garnet and oil-shale. Coal is the principal use of the Yorkshire coal-field, and there are large export of coal from the Yorkshire coal-field, and there are many useful minerals associated with it. Lead ore is obtained in the Yoredale beds of the Pennine range in Wharfedale. Airledale, Nidderdale, Swaledale, Arkendale and Wensleydale. The most important is the Yoredale series, which is composed of the Millstone Grit there are several beds of good building stone, but that most largely quarried is the Magnesian limestone of the Permian series, which, however, is of somewhat variable quality.
Yorkshire

Agriculture.—Nearly nine-tenths of the E. Riding is under cultivation, but of the N. and W. Ridings only from three-fifths to seven-tenths—are proportionate by the different physical conditions. The till or boulder clay of Holderness is the richest soil in Yorkshire, and the chalk wolds, by careful cultivation, form one of the best soils for grain crops. The central plain bears all kinds of crops excellently. Wheat is grown in the E. and W. Ridings, but oats are the principal grain crop in these ridings, and barley exceeds wheat in all three. The bulk of the acreage under green crops is devoted to turnips and swedes. A little flax is grown, and liquorice is cultivated largely. The mixed farming of the western part of the Riding is the greatest in the N. Riding and least in the E., but N. and W. Ridings are among the principal sheep-farming districts in England. Cattle, for the rearing of which the W. Riding is most noted, do not receive great attention. The Teeswater breed, however, is increasing in Yorkshire, and in Holderness there is a short-horned breed, chiefly valuable for its milking qualities. Cheese-making is largely carried on in some districts. Of sheep perhaps the most common breeds are the Leicester, Lincoln and South Down, and crosses between the Cheviot and Leicesters. Large numbers of pigs are kept. The small cattle are bred for dairy purposes. The small breed is that chiefly in favour. Yorkshire bacon is famous. Draft horses are generally of a somewhat mixed breed, but the county is famed for its hunters and carriage and saddle horses. The breed of Cleveland bays is much used for carriages.

Manufactures.—The industrial district of south Yorkshire occupies the S. of the W. Riding, and may be taken as marked off approximately by the watershed from the similar district in S. Lancashire. The W. Riding is now the chief seat of the woollen manufacture of the United Kingdom, and has almost a monopoly of this branch of woollen clothing. The early development of the industry was in part due to the abundance of water-power, while later the presence of coal helped to maintain it on the introduction of steam-power. In this industry nearly all the most important towns are engaged, while the names of several of the largest are connected with various specialties. Thus, while almost every variety of woollen and worsted cloth is produced at Leeds, Bradford is especially concerned with yarneis and mixed worsted goods, Dewsbury and Batley with shoddy, Huddersfield with fancy goods and Halifax with mixture cloth. The industrial district of S. Lancashire is much penetrated to the neighbourhood of Halifax. Among the characteristics of the industrial population, the love of music should be mentioned. Choral societies are numerous, and the work of some of those in the larger towns, such as Sheffield, Leeds and Bradford, has attracted wide notice. Next to the woollen industry comes the manufacture of iron and steel machinery and implements of every variety, which is common to most of the larger centres in the district. Sheffield is especially famous for iron-work, fine metal-work and cutlery. The development of the iron ore deposits of Cleveland dates only from the middle of the 19th century. About two and a half million tons of pig-iron are produced in this district annually, and there are considerable attendant industries, such as the production of steel, and shipbuilding. The chemical manufacture is important both here and in the W. Riding, where also a great variety of minor industries have sprung up. Such are leather working (at Leeds), the manufacture of clothing, printing and bleaching, and paper-making. Besides coal and iron ore, great quantities of clay, limestone and sandstone are raised. Excellent building-stone is obtained at several places in the W. Riding. The sea fisheries are of some importance, chiefly at Hull, Scarborough, Whitley and Filey.

Communications.—N. and E. of Leeds communications are provided almost wholly by the North-Eastern railway, the main line of which runs from Leeds and from Doncaster N. by York, Thirsk and Northallerton. The main junction with the Great Northern line is effected immediately N. of Doncaster, at which town are the Great Northern works. This company serves the chief centres of the W. Riding, as do also the Midland, Great Central, London & North-Western, Lancashire & Yorkshire, and North-Eastern companies, the trains working over a close network of lines, while the system of running-power is held by one or more companies over the lines of another assists intercommunication. The Midland main line to Carlisle runs by Leeds, Skipton and Settle, and through the southern parts of the N. Riding line runs from Hull to Barnsley. A complete system of canals links the centres of the southern W. Riding with the sea both E. and W. The Aire & Calder Navigation connecting with the Ouse at Goole; the Huddersfield canal, crossing the watershed by the long Standedge tunnel, and other canals are the Leeds & Liverpool, Calder & Nible Navigation, the Manchester & Sowerby, the Wakefield Canal, and the Sheffield Sheaf. The small canals access from Sheffield to the Trent. The Aire & Calder Navigation, the most important of these canals, has branches from Castleford to Leeds and Wakefield, and other branches to Barnsley, and Huddersfield. The Selby and the Manchester & Sowerby canals have improved since its construction. It was projected by John Rennie and opened in 1826, with a depth of 7 ft. and locks measuring 72 ft. 6 in. by 10 ft., and over a distance of 28 miles. Between Goole and the collieries, the locks have been enlarged to 460 by 25 ft., and the width of the canal to 90 ft. The chief ports are Middlesbrough on the Tees, Hull on the Humber, and Goole on the Ouse.

Population and Administration.—The area of the ancient county is 3,882,328 acres. Its population in 1841 was 2,445,031, and in 1901, 3,582,762. The population increased over fivefold between 1801 and 1901; the increase in the W. Riding exceeding sevenfold. The manner in which the population is distributed may be inferred from the following statement of the parliamentary divisions, parliamentary, county and municipal boroughs, and urban districts in the three ridings. It should be premised that each of the three ridings is a distinct administrative county; though there is one high sheriff for the whole county. The city of York (pop. 77,914) is situated only in the eastern part of the three ridings.

The West Riding has an area of 1,771,562 acres, with a population in 1891 of 2,445,031, and in 1901 of 2,759,493. Of this area the S. industrial district, considered in the broadest application of the term as extending between Sheffield and Skipton, Sheffield being the greatest industrial and populous region, is less than one-half. The area thus defined includes the parliamentary divisions of Barnsley, Colne Valley, Elland, Hallamshire, Holmfirth, Keighley, Morley, Normanton, Padsey, Rotherham, Shipley, Sowerby, Spen Valley. It also includes parts of the divisions of Barston Ash, Doncaster, Ogoldersley, Otley and Skipton (a small part). The remaining parts of these last divisions, with that of Ripon, cover the rest of the county. Each division returns one member. The following are parliamentary boroughs: Bradford, returning 3 members, Dewsbury 1, Halifax 1, Huddersfield 1, Leeds 5, Pontefract 1, Sheffield 5, Wakefield 1. All these are in the W. Riding. The seats of the following municipal boroughs (pops. in 1901): Barnsley (41,086), Batley (30,321), Bradford, city and county borough (279,767), Brighouse (21,735), Dewsbury (28,600), Doncaster (32,932), Halifax (25,076), Huddersfield (10,127), Keighley (41,564), Leeds, city and county borough (428,968), Morley (23,536), Ossett (12,905), Pontefract (13,427), Padsey (12,662), Wakefield, city and county borough (309,670), Todmorden (partly in Lancashire, 25,418), Wakefield, city (41,413). The only municipal boroughs elsewhere in the riding are Harrogate (26,423) and Ripon (cathedral city, 820). Within the industrial region there are 113 other urban districts, those with populations exceeding 10,000 being Bingley (18,449), Castleford (17,366), Cleckheaton (12,524), Elland (10,412), Featherstone (12,953), Handsworth (13,504), Hoyland Nether (19,649), Huddersfield (13,980), Mexborough (10,430), Mirfield (11,341), Normanton (12,352), Rawmarsh (14,587), Rothwell (11,702), Saddleworth (12,360), Shipley (25,573), Skipton (11,968), Sowerby Bridge (13,561), Thirsk (12,127), Wakefield, city (13,837), Wombwell (12,752), Worsbrough (10,336). The only urban districts in the West Riding not falling within the industrial region are Cacole (16,576), Ilkley (7455), Knaresborough (4979) and Selby (2796).

The North Riding has an area of 1,362,378 acres, and 63,406,394 in 1901, and in 1901 of 377,335. It comprises the counties of York, Cleveland and Northallerton, and the rural districts of Thirsk and Malton, each returning one member; and the parliamentary boroughs of Middlesbrough (one member), Scarborough (one member), and parts of Stockton-on-Tees and York. The county boroughs are Cleveland (12,401), Darlington (15,054), Richmond (5837), Scarborough (38,161) and Thornaby-on-Tees (16,054). The urban districts are Eston (11,199), Guisborough (3,589), Thornaby-on-Tees (11,783), Yarm (12,466), Thornaby (12,656). Malton (3758), Masham (1555). Northallerton (8049), Ormesby (9432), Pickering (359), Redcar (7595), Saltburn-by-the-Sea (2578), Scalfby (1350), Skelton and Brotton (13,240), South
Bank in Normanby (9645), Whitby (11,755). Of these, all except Kirklington, Malton, Masham, Northallerton, Pickering and Whitby are in the populous Cleveland district. Besides Pickering, there lie at the S. of the Cleveland hills the small towns of Kirkby Moorside (1550) and Helmsley (1362). South of the last-named is the village of Ampleforth, with its large Roman Catholic college, founded in 1802, and accommodating, in fine modern buildings, about 120 students.

The East Riding has an area of 750,029 acres, with a population in 1891 of 341,560 and in 1901 of 385,007. It comprises the parliamentary divisions of Buckrose, Howdenshire and Holderness, each returning one member; and contains the parliamentary borough of Hull, returning three members, and part of that of York. The municipal boroughs are Beverley (13,183), Bridlington (12,482), Hedon (1010), and Hull, or Kingston-upon-Hull, a city and county of a city and county borough (240,259). The urban districts are Cottingham, near Hull (3751), Fieby (3003), Driffield (5766), Hessle, near Hull (3754), Hornsea (2361), Norton, near Malton (5452), Pocklington (2463) and Withernsea (1426). The West Riding comprises 9 wapentakes and the liberty of Ripon. It has one court of quarter sessions and is divided into 26 petty sessional divisions. The boroughs of Bradford, Doncaster, Leeds, Pontefract, Rotherham and Sheffield, and the liberty of Ripon, have separate courts of quarter sessions and commissions of the peace; and Barnsley, Batley, Brighouse, Dewsbury, Halifax, Harrogate, Huddersfield, Keighley, Morley, Ossett and Wakefield have commissions of the peace. The liberty and borough of Ripon are rated separately from the West Riding for the purposes of the county rate.

The North Riding comprises 11 wapentakes, and the liberties of E. and W. Langbaurgh and of Whitby Strand. It has one court of quarter sessions and is divided into 19 petty sessional divisions. The boroughs of Richmond and Scarborough have separate courts of quarter sessions and commissions of the peace, and the borough of Middlesbrough has a commission of the peace. The East Riding comprises 6 wapentakes and has one court of quarter sessions, and is divided into 12 petty sessional divisions, while Hull has a separate court of quarter sessions and commission of the peace, and Beverley has a separate commission of the peace. The city of York has a separate court of quarter sessions and commission of the peace. Yorkshire is in the N.E. circuit. The total number of civil parishes is 1586. The county contains
Yorkshire

1178 ecclesiastical parishes and districts wholly or in part. It is divided between the dioceses of York, Ripon and Wakefield, with small parts in those of Manchester, Southwell, Durham and Lincoln. York is the seat of the northern archiepiscopal.

History.—The kingdom of Deira (q.v.), which was afterwards to include the whole of the modern Yorkshire, is first known to us in the 6th century, an Anglo-Saxon tribe having secured the promontory at the mouth of the Humber, named by the invaders Holderness, followed by the gradual subjugation of the whole district east of the Humber by the 8th century. The remains of both Weighton and Flamborough Head were then mere sheep-walks, and the earliest settlements were chiefly confined to the rich valley of the lower Derwent, but the district around Weighton became the Deiran sacred ground, and Goodmanham is said to mark the site of a temple. The area computed in the modern West Riding constituted the British kingdom of Elmet, and at this date presented a desolate and unbroken tract of moorland in the N.; in the central parts about Leeds stretched a forest region where the last wild beasts were said to have been slain by Jaxon of Gaunt; while in the S. the forest and valley of the Haven, further protected by the barrier of the broken only by the wall of Watling Street, which crossed the Don at Doncaster, the Aire at Castleford and the Wharfe at Tadcaster. The N. continuation of the road from York through Catterick to the Tees opened the way to the fertile plain in the heart of the modern North Riding, the S.E. of which offered an unbroken forest area, later known as the forest of Galtres, which in the middle ages stretched from York N. to Easingwold and Cranke and E. to Castle Howard, and as late as the 16th century lay a waste and unfrequented region abounding only in deer. Ella, the first king of Deira, extended his territory N. to the Wear, and his son Edwin completed the conquest of the district which was to become Yorkshire by the subjugation of Elmet, prompted thereto by vengeance on its king, Cerdic, for the murder of his uncle Hereric. Traces of the "burhs" by which Edwin secured his conquests are perhaps visible in the group of earthworks at Barwick and on the site of Cambodunum, but the district long remained scantily populated, and as late as the 17th century deer were said to be as plentiful at Hatfield Chase as "sheep upon a hill," for Prince Henry in 1600 was asserted to have killed 500 in one day's hunting. The defeat of Edwin at Hatfield in 623 was followed by a succession of struggles between Mercia and Northumbria for the supremacy over Deira, during which the boundaries underwent constant changes. After the Danish conquest of Deira, Guthrum in 875 portioned the district among his followers, under whose lordship the English population were for the most part allowed to retain their lands. Cleveland came under Scandinavian influence, and the division into tithings probably originated about this date, the boundaries being arranged to meet at York, which, as the administrative and commercial centre of the district, rapidly increased in importance, and it has been estimated that in A.D. 1000 it had a population of over 30,000. At the battle of Stamford Bridge in 1066 Harold Hardrada, who had seized York, and Earl Tosti were both defeated and slain by Harold of England. The merciless harrying with which the Conqueror punished resistance to his claims is proved by the reiterated prizes of waste land in the Domesday Survey, and for many years all the towns between York and Durham lay uninhabited. In 1138 the forces of David of Scotland were defeated near Northallerton in the Battle of the Skipton Moor, the famous battle of the reign of Henry II. Thornton, Flamborough Head, and Malgaid Castle, which had been garrisoned against the king by Roger de Mowbray, were captured and demolished. In the harrying of the northern counties by the forces of Robert Bruce in 1318, Northallerton, Boroughbridge, Scarborough and Skipton were reduced to ashes. In 1322, at the battle of Boroughbridge, the rebel barons were defeated by the forces of Edward II. In 1399 Richard II. was murdered in Pontefract Castle. In 1405 Archbishop Scrope and Thomas Mowbray joined in the insurrection against Henry IV., and led the citizens of York to Skipton Moor, where, after a defeat by the earl of Westmorland, the leaders were beheaded under the walls of York. In 1408 the rebel forces of the earl of Northumberland were defeated by Sir Thomas Rokesby, high sheriff of Yorkshire, at Bramham Moor near Tadcaster. In 1455 a skirmish between the Percies and the Nevilles at Stamford Bridge was the opening event in the struggle between the houses of York and Lancaster; in 1460 the duke of York was defeated and slain at Wakefield; in 1461 the Lancastrians were defeated at Towton. The suppression of the monasteries roused deep resentment in many parts of the district, and the inhabitants flocked to join the Pilgrimage of Grace. Skipton Castle being the only place immediately N. of the Humber which remained loyal to the king. On the outbreak of the Civil War of the 17th century, opinion was divided in Yorkshire, the chief parliamentary families being the Fairfaxes and the Hothams, while the Puritan cloth-clothes of the West Riding also sided with the parliament. Sir William Savile captured Leeds and Wakefield for the king in 1642, and in 1643 Newastle, having defeated the Fairfaxes at Adwalton Moor, held all Yorkshire except Hull, which the Hothams, moved by jealousy of the Fairfaxes, had already designed to give up. In 1646, the Fairfaxes secured the East and West Riding while Cromwell's victory at Marston Moor was followed by the capture of York, and in the next year of Pontefract and Scarborough. The redistribution of estates after the Norman Conquest, Alan of Brittany, founder of Richmond Castle, received a vast fief which became the honour of Richmond; Ilbert de Laci was rewarded with lands which afterwards constituted the honour of Pontefract. Earl Harold's estate at Coningsby passed to William de Wareine, earl of Surrey, together with Sandal Castle, which on the extinction of the Wareine line in the 14th century was bestowed on Edmund Langley, duke of York. Other great Domesday landholders were William de Percy, founder of the abbey of Whitby; Robert de Bruce, ancestor of the Royal line of Scotland, the head of whose fief in Cleveland was transferred in the 12th century from Danby Castle to Skelton; Roger de Busli owned a large tract in S. Yorkshire, of which Tickhill was the head; the archbishop of York enjoyed the great lordship of Sherburn, and Howdenshire was a liberty of the bishop of Durham. Among the great lordships of the middle ages for which Yorkshire was distinguished were: Tickhill, the harbour of the Percies; Thirsk, the Mowbrays; Tanfield of the Marmions; Skipton, of the Clifftords; Middleton, of the Fitz-Hughes and Nevilles; Helmsley, of the de Roos; Masham and Bolton, of the Scropes; Sheffield, of the Furnivals and Talbots; Wakefield, of the duke of York. The Fairfaxes were settled in Yorkshire in the 13th century, and in the 16th century Denton became their chief seat.

The shire court for Yorkshire was held at York, but extensive privileges were enjoyed by the great landholders. In the 13th century Henry de Lacy, earl of Lincoln, claimed to hold the sheriff's court at Bradford and Leeds; his bailiff administered the wapentake of Staincliff in his court at Bacsall and Slaidburn; and his steward judged cases of felony in his court at Almondbury. The archbishop of York held the sheriff's court at Otley, and had his own coroners at York, Hull, Beverley and Ripon. Eudo la Zouche held the sheriff's court at Bingley, and Thomas de Furnival in Hallamshire. The bailiffs of Tickhill Castle held courts in place of the sheriff. The bishop of Durham had a court at Hoveden, and the king's bailiffs were excluded from executing their office in his estates of Howdenshire and Allerton. The abbot of Thornton alias York had his own coroners in the wapentake of Ryedale, and the abbot of Bella Landa in Sutton. The prior of Bradenstoke held a court in his manor of Wales. The archbishop of York, Robert de Ros, and the abbot of St Mary's York judged felonies at their courts in Holderness. The liberty of Ripon (q.v.), city of Ripon, still constitutes a franchise of the archbishops of York.

In the 13th century the diocese of York included in this county the archdeaconry of York, comprising the deaneries of York, Pontefract, Doncaster and Craven; the archdeaconry of Cleveland, comprising the deaneries of Bulmer, Cleveland
and Ryedale; the archdeaconry of East Riding, comprising the deaneries of Hartlepool (Hull), Buckrose, Dickering and Holderness; and the archdeaconry of Richmond, comprising the deaneries of Richmond, Catterick, Boroughbridge and Lonsdale. In 1841 the deaneries of Richmond were transferred to Henry VII. The bishopric was re-established by an act of parliament in 1836, and the deaneries of Craven and Pontefract were formed into the archdeaconry of Craven within its jurisdiction, together with the archdeaconry of Richmond. The archdeaconry of Sheffield was created in 1884 to include the deaneries of Sheffield, Rotherham, Ecclesfield and Wath. In 1888 the area of the diocese of Ripon was reduced by the creation of the see of Wakefield, including the archdeaconry of Halifax with the deaneries of Birstall, Dewsbury, Halifax, Silkstone and Wakefield, and the archdeaconry and deanery of Huddersfield.

The diocese of Ripon now includes in this county the archdeaconries of Craven with three deaneries, Richmond with three deaneries and Ripon with seven deaneries. The diocese of York includes the archdeaconry of York with six deaneries, Sheffield with four deaneries, East Riding with thirteen deaneries and Cleveland with nine deaneries.

The great woolen industry of Yorkshire originated soon after the Norman Conquest when the English began to cultivate the breeding of the so-called long wool sheep. The following is an account of the history of York and the surrounding areas.

The city of York, a prosperous trading centre in the 13th century, was a centre of the manufacturing of cloth, particularly in the district around the city. The city was also a centre of the wool trade, and the clothiers of York were known for their fine cloth, particularly in the areas of East Riding and the Vale of York.

The city was also a centre of the wool trade, and the clothiers of York were known for their fine cloth, particularly in the areas of East Riding and the Vale of York.

The city was also a centre of the wool trade, and the clothiers of York were known for their fine cloth, particularly in the areas of East Riding and the Vale of York.

The city was also a centre of the wool trade, and the clothiers of York were known for their fine cloth, particularly in the areas of East Riding and the Vale of York.

**YORKTOWN,** a town and the county-seat of York county, Virginia, U.S.A., on the York river 10 m. from its mouth, and about 60 m. E.S.E. of Richmond. Pop. (1910) 136. It is served by the Baltimore, Chesapeake & Richmond steamship line, and about 6½ m. distant is Lee Hall, a station on the Chesapeake & Ohio railway. Large deposits of marl near the town are used for the manufacture of artificial slate. It is the largest center of the slate industry in the United States, and the house of Thomas Nelson (1738-1780), a signer of the Declaration of Independence. In commemoration of the surrender of Lord Cornwallis in October 1781, there is a monument of Maine granite (100 ft. 6 in. high) designed by R. M. Hunt and J. Q. A. Ward; its corner-stone was laid in 1881 during the centennial celebration of the surrender, and it was completed in 1883. Yorktown was founded in 1691, as a port of entry for York county. It became the county-seat in 1696, and although it never had more than about 200 houses its trade was considerable until it was ruined by the War of Independence. At that time, the American soldiers were victorious, the Americans and their French allies took place at Yorktown.

Baffled by General Nathanael Greene in his campaign in the Carolinas, his diminished force (fewer than 14,000) sadly in need of reinforcement, and persuaded that the more southern colonies could not be held until Virginia had been reduced, Lord Cornwallis marched out of Wilmington, N. Carolina, April 25th, 1781, arrived at Petersburg, Virginia, on May 20th, and there with the troops which had been under William Phillips and Benedict Arnold and with further reinforcements raised in Virginia on the spot marched 7000 men. Facing him in Richmond was Lafayette, whom Washington had sent earlier in the year with a small force of light infantry to check Arnold, and who had now been placed in command of the American forces in Virginia. The first attempt was to prevent the union of Lafayette and General Anthony Wayne. Failing in this, he retired down the James in the hope, it is thought, of receiving further reinforcements. General George Washington improved Cornwallis's plan against Virginia, at first ordered him to send a portion of his troops to aid in the defence of New York; but as other reinforcements from England were expected, Cornwallis's plan was revised, and on the 14th of August he should sail for the Chesapeake to fortify his position. Cornwallis, seized Yorktown and as the home government approved Cornwallis's plan, Clinton resolved to establish a permanent base in the Chesapeake and directed Cornwallis to fortify a post for the protection of the British navy. Cornwallis seized Yorktown and Gloucester early in August and immediately began fortifying them. While Cornwallis was marching from N. Carolina to Virginia, Washington learned that a large French fleet under Count de Grasse was to come up from the West Indies in 14 ships-of-the-line to reinforce the American and French armies. At a conference (May 21st) at Wethersfield, Connecticut, with the French commanders, Washington was favored a plan for a joint attack on New York when and as De Grasse arrived. The British government was determined to carry off the French merchantmen in the same fleet, and the 14th of August sailed for the Chesapeake to fortify against Cornwallis. About the same time Washington learned from Lafayette that Cornwallis had gone south. Sir Samuel Hood, who had 14 ships-of-the-line arrived at the Chesapeake from the West Indies three days ahead of De Grasse, and proceeding to New York warned Admiral Thomas Graves of the danger. Graves pressed the attack, and on the 1st and on the 4th the French fleet transported the allied army from the head of the Chesapeake to the vicinity of Williamsburg, and on the 8th of September marched to Yorktown. Receiving, on the same day, a despatch from Cornwallis, informing him that the French fleet, under the command of de Grasse, had arrived off the James, Cornwallis abandoned his outposts during the following night and withdrew to his inner defenses, consisting of seven redoubts and six batteries connected by intrenchments, besides batteries on the river bank. The British lost 1600 troops, took possession of the abandoned posts and closed in on the town in a semicircle extending from Worrell Creek below it to about 1½ miles. The British were held in check until the evacuation of the left. On the night of October 5th-6th the allies opened the first parallel about 600 yds. from the British works, and extending from a deep ravine on the N.W. to the river bank on the S.E., a distance of nearly 2 m. Six days later the second parallel was begun within 300 yds. of the British lines, and it was practically completed on the night of the 14th and 15th, when two British redoubts were carried by assault, the Americans led by Alexander Hamilton and one by the French led by Lient.-Colonel G. de Deux-Ponts. In the morning of the 16th Cornwallis ordered Lieut.-Colonel Abercrombie to make an assault on two French forts. He came to the attack with 5000 and recovered the guns and were ready for service again twelve hours later. On the night of the 16th and 17th Cornwallis attempted to escape with his army to Gloucester on the opposite side of the river, but was stopped by a storm rising about the chest-high chesapeake in this venture. In grave danger of an assault from the allies. Cornwallis offered to surrender on the 17th; two days later his white flag, consisting of 7037 officers and men, water, provisions, and American Independent Service were surrendered. The British loss during the siege was about 156 killed and 326 wounded; the American and French losses were 85 killed and 199 wounded.

In 1862 the Confederate defences about Yorktown were besieged for a month (April 4-May 3) by the Army of the Potomac under General McClellan. There was no intention on the part of the Confederacy to surrender in-chief, Joseph Johnston, to do more than gain time by holding Yorktown and the line of the Warwick river as long as possible without serious fighting, and without imperilling the line of retreat on Richmond; and when after many delays McClellan was in a position to assault with full assistance from his heavy siege guns, the Confederates fell back on Williamsburg.

**YORUBA; YORUBALAND.** The Yoruba, a group of Negro tribes, have given their name to an extensive area in West Africa, in the hinterland of Lagos. The Yoruba are of true Negro stock, in many respects typical of the race, but among them are found persons with lighter skins and features resembling the Hamitic or Semitic peoples. This arises, in all probability, from an infiltration of Berber and Arab blood through the Fula (q.v.). The Yoruba themselves have traditions of an Oriental origin. They are divided into many tribes, among the best known being the Oyo=Yoruba proper, the Egbas, Ife and Ibadan. They are sometimes called by the French Nago, and are known to the Sierra Leonis, many of whom are of Yoruba descent, as Aku. A considerable proportion of the American negroes are also said to be of Yoruba origin. For a long period the Yoruba were raidied by the Dahomeyans and other coast tribes, to sell as slaves to the white traders. They are both an urban and agricultural people. Pottery, weaving, tanning, dyeing, and forging are among their industries. The houses of chiefs, often containing fifty rooms, are well built, and decorated with carvings representing symbolic devices, fabulous animals and scenes of war or the chase.

The Yoruba have considerable administrative ability. Their system of government places the power in a council of elders presided over by a chief who owes his position to a combination of hereditary rights of birth and actual services rendered to the community.
always be taken from the members of one of two families, the succession in many cases passing from one to the other family alternately. Primogeniture is not necessarily considered.

Before the introduction of letters the Yoruba are said to have had extensive intercourse with the Moslems. Their language, which has been reduced to writing and carefully studied, has penetrated as far E. as Kano in the Hausa country. The best known dialectic varieties are those of Egba, Jenu, Yeda, Ile. Inflexion; Oyo (Yoruba proper, called also Nago); but the discrepancies are slight. The most marked feature, a strong tendency towards mono-syllabism—produced by phonetic decay—has given rise to the principle of intonation, required to distinguish words originally different but reduced by corruption to the condition of homophones. Besides the tones, of which there are three,—high, low and middle,—Yoruba has also developed a degree of vocalic harmony, in which the vowels of the affixes are assimilated to that of the root. It descends as in Bantu, is effected chiefly by prefixes; and there is a remarkable power of word-formation by the fusion of several relational elements in a single compound term. The Bible and several other books have been translated into Yoruba, which as a medium of general intercourse in West Africa ranks in importance next to Hausa and Mandingan. The Yoruba religion is that usually known as fetishism.

The Yoruba country extends from Benin on the E. to Dahomey on the W. (where it somewhat overlaps the French frontier), being bounded N. by Borgu and the Dahomean lands of Benin, E. by Oyo, S. and SW. by the Yoruba of the Yennagoa district, and O. by the coast. Most of it is included in the British protectorate of Southern Nigeria. The land is moderately elevated and a large part of it is densely forested. It is well watered; the rivers belong mainly to the coast systems, though some drain to the Niger. The history of Yorubaland, as known to Europeans, does not go back beyond the close of the 17th century. At that time it was a powerful empire, and had indirectly come,—through its connexion with Benin and Dahomey,—to some extent under European influence. There was also a much slighter Moslem influence. One tradition brought the founder of the nation from Bornu. The Yoruba do not appear to have inhabited their present country at least as early as A.D. 1000. In the 18th century the Yoruba were constantly engaged in warfare with their Dahomeyan neighbours, and in 1738 they captured Kana, the sacred city of the kings of Dahomey. From 1747 to the time of King Gezo (1818) the Dahomeyans paid tribute to Yoruba. It was not until the early years of the 19th century that the Yoruba came as far S. as the sea, when they founded a colony at Lagos. About 1825 the province of Ijebu, already permeated by Moslem influences from the north, declared itself independent of the Yoruba, and shortly afterwards the city of Abeokuta was founded by the Yoruba.

Though divided into semi-independent states, the Yoruba retain a feeble sense of common nationality. The direct representative of the old Yoruba power is the alafin or king of Oyo occupying the N. and central parts of the whole region. Round this central state, which has lost much of its importance, are grouped the kingdoms of Ijebu, Ilorin, Ijesa, Ife and Ondo in the E., and Abeokuta and the S. and Egba in the W. The ruler of each of these states has a title characteristic of his office. Thus the chief of Ife bears the title of oni (a term indicating spiritual supremacy). To that of Ife or the alafin of Oyo all the other great chieftains acknowledge their succession. The oni, says Sir William MacGregor, is regarded as the fountain of honour, and without his consent no chief can assume the privilege of wearing a crown. The most important of the Yoruba states is Egba, the ruling chief of which is the alake of Abeokuta.

Yorubaland is a country of comparatively large cities. The alafin resides at Oyo, on a headstream of the Oshun, a place which has succeeded the older capitals, Bohu and Katunga, lying farther N. and destroyed during the wars with the Fula. Oyo is exceeded in size by several other places in Yorubaland, where the inhabitants have grouped themselves together for mutual protection in walled towns. Thus have sprung up the important towns of Abeokuta on the Ogun, due N. of Lagos; Idaban on a branch of the Omi, 50 m. S. of Oyo; and Illorin, capital of the Illorin state, besides several other towns with a population of some 40,000.

YOSAI—Yosemite

Yosai [Kikuchi] (1784-1878), Japanese painter, was the son of a samurai named Kawara, of Yedo. He was adopted by the Kikuchi family, who were old hereditary retainers of the Tokugawa clan. When eighteen, he became a pupil of a certain Zanoske, a MOSLEM, and studied at the Shijo, and Maryuwa schools—in the latter, perhaps, under Ozu, a son of Okyo—he developed an independent style, having some affinities with that of Tani Bunchô. He was one of the last of the great painters of Japan; and his illustrated history of Japanese heroes, the Zenken Köjitô, is a remarkable specimen of his power as a draughtsman in black and white.

Yosemite, a famous valley on the W. slope of the Sierra Nevada of California, about 150 m. E. of San Francisco and 4000 ft. above the sea. It is 7 m. long, half a mile to a mile wide, and contains a large number of small glaciers which eroded out of hard massive granite by glacial action. Its precipitous walls present a great variety of forms, and the bottom, a filled-up lake basin, is level and park-like. The most notable of the wall rocks are: El Capitan, 3300 ft. high, a sheer, plain mass of granite; the Three Brothers, North Dome, Glacier Point, the Sentinel, Cathedral, Sentinel Dome and Cloud's Rest, from 2800 to nearly 6000 ft. high; and Half Dome, the noblest of all, which rises at the head of the valley to the height of 4750 ft. These rocks illustrate on a grand scale the action of ice in mountain sculpture. For here five large glaciers united to form the grand glacier that eroded the valley and occupied it as its channel. Its moraines, though mostly obscured by vegetation and weathering, may still be traced; while on the snowy peaks at the headwaters of the Merced a considerable number of small glaciers, once tributary to the main Yosemite glacier, still exist. The Bridal Veil Fall, 900 ft. high, is one of the most interesting features of the lower end of the valley. Towards the upper end the great Yosemite Fall pours from a height of 2000 ft. The valley divides at the head into three branches, the Tenaya, Merced and South Fork canyons. In the main (Merced) branch, each are the Vernal and Nevada Falls, 1100 and 600 ft. high. The Nevada is usually ranked next to the Yosemite among the five main falls of the valley, and is the whitest of all the falls. The Vernal, about half a mile below the Nevada, is famous for its afternoon rainbows. At flood-time it is a nearly regular sheet about 80 ft. wide, changing as it descends from green to purplish-grey and white. In the S. branch, a mile from the head of the main valley, is the Illilouette Fall, 600 ft. high, one of the most beautiful of the Yosemite choir.

Considering the great height of the snowy mountains about the valley, the climate of the Yosemite is remarkably mild. The vegetation is rich and luxuriant. The tallest pines are over 200 ft. high; the trunks of some of the oaks are from 6 to 8 ft. in diameter; violets, lilies, golden-rods, ceanothus, manzanita, wild rose and azalea make broad beds and banks of bloom in the spring; and on the warmest parts of the walls flowers blossom in every month of the year.
Youghal—Young, A.

The valley was discovered in 1851 by a military company in pursuit of marauding Indians; regular tourist travel began in 1856. The first permanent settler in the valley was Mr. J.C. Lamon, who built a cabin in the upper end of it in 1860 and planted gardens and orchards. In 1864 the valley was granted to the state of California by act of Congress on condition that it should be held as a place of public use, resort and recreation inalienable for all time, was re-ceded to the United States, and the government, in March 1953, and is now included in the Yosemite National Park.

In the number and height of its vertical falls and in the massive grandeur of El Capitan and Half Dome rocks Yosemite is unrivalled. But there are many other valleys of the same kind. The most noted of these are Yosemite and Hetch Hetchy, the latter visited every summer by tourists. The villages of the mountain people, the Hetch Hetchy Valley, in the Middle Fork canyon of King's river; and the King's river Yosemite in the South Fork canyon, the latter being larger and deeper than the Merced Yosemite. All are similar in their trends—forms, sculpture and vegetation, and are plainly and harmoniously related to the ancient glaciers. The Romsdal and Naerodal of Norway and Lauterbrunnen of the Alps are well characterized glacial valleys of the Yosemite type, and in S.E. Alaska many may be observed in process of formation.

Sir John Muir (Washington, 1831-1914), the Superintendent of the Park; to the Guide to the Yosemite published by the California Geological Survey: John Muir, Our National Parks (Bostom, 1901); and Bunnell's Discovery of the Yosemite (New York, 1893).

Youghal (pronounced Yougall), a seaport, market town, and watering-place of county Cork. Ireland; on the W. side of the Blackwater river and estuary, on the Cork & Youghal branch of the Great Southern and Western railway, 263 m. E. of Cork. Pop. (1901) 3939. The collegiate church of St Mary, in the later decorated style, was erected in the 11th century, but rebuilt in the 13th, and since that time frequently restored. It contains a beautiful monument to the first earl of Cork. The college was founded by an earl of Desmond in 1464. There are still a few fragments of the Dominican friary founded in 1269. The Clock Gate (1771) is noticeable, and portions of the old walls are to be seen. Myrtle Grove was formerly the residence of Sir Walter Raleigh. He was mayor of Youghal in 1588–89, and is said to have first cultivated the potato here. The harbour is safe and commodious, but has a bar at the mouth. At the N. extremity of the harbour the river is crossed by a bridge on wooden piles. The principal exports are corn and other agricultural produce; the imports are coal, culm, timber and slate. Coarse earthenware and bricks are manufactured. Fine point-lace commanding high prices is made by the Presentation Sisters. The Blackwater is famous for salmon, and sea-fishing is important. The Strand, the modern portion of the town, has all the attributes of a seaport.

Youghal (Escahill, "the Yew wood") was made a settlement of the Northmen in the 8th century, and was incorporated by King John in 1209. The Franciscan monastery, founded at Youghal by FitzGerald in 1224, was the earliest house of that order in Ireland. Sir Roger Mortimer landed at Youghal in 1317. The town was plundered by the earl of Desmond in 1579. In 1621 it was Garrisoned and defended by the earl of Cork. In 1649 it declared for the parliament, and was occupied as his headquarters by Cromwell. It sent two members to parliament from 1574 till the Union, after that only one down to 1884.

Young, Arthur (1741–1820), English writer on agriculture and social economy, second son of the Rev. Arthur Young, rector of Bradfield, in Suffolk, chaplain to Speaker Onslow, was born on the 11th of September 1741. After being at a school at Lavenham, he was in 1758 placed in a mercantile house at Lynn, but showed no taste for commercial pursuits. He published, when only seventeen, a pamphlet On the War in North America, and in 1761 went to London and started a periodical work, entitled The American Magazine, which was dropped by the advice of Samuel Johnson. He also wrote Thoyr novels and Reflections on the Present State of Affairs at Home and Abroad in 1759. After his father's death in 1759, his mother had given him the direction of the family estate at Bradfield Hall; but the property was small and encumbered with debt. From 1763 to 1766 he devoted himself to farming on his mother's property. In 1765 he married a Miss Allen; but the union is said not to have been happy, though he was of domestic habits and an affeciation father. In 1767 he undertook on his own account the management of a farm in Essex. He engaged a Swedish agronomist to be his adviser in A Course of Experimental Agriculture (1770). Though Young's experiments were, in general, unsuccessful, he thus acquired a solid knowledge of agriculture. He had already begun a series of journeys through England and Wales, and gave an account of his observations in books which appeared from 1768 to 1770—A Six Weeks' Tour through the Southern Counties of England and Wales, A Six Months' Tour through the North of England and the Farmer's Tour through the East of England. He says that these books contained the only extant information relative to the rental, produce and stock of England and the preparation on actual examination. They were very favourably received, being translated into most European languages by 1792.

In 1768 he published the Farmer's Letters to the People of England, in 1771 the Farmer's Calendar, which went through a great number of editions, and in 1774 his Political Arithmetic, which was widely translated. About this time Young acted as parliamentary reporter for the Morning Post. He made a tour in Ireland in 1776, publishing his Tour in Ireland in 1780. In 1784 he began the publication of the Annals of Agriculture, which he continued until his death. Young had many able contributors, among whom was George IIII, writing under the nom de plume of "Ralph Robinson." Young's first visit to France was made in 1787. Travelling that country in every direction just before and during the first movements of the Revolution, he has given valuable notices of the condition of the people and the conduct of public affairs at that critical juncture. The Travels in France appeared in 2 vols. in 1792. On his return home he was appointed secretary of the Board of Agriculture, then (1793) just formed under the presidency of Sir John Sinclair. In this capacity he gave most valuable assistance in the collection and preparation of agricultural surveys of the English counties. His sight, however, failed, and in 1811 he had an operation for cataract, which proved unsuccessful. He suffered also in his last years from stone. He died on the 20th of April 1820. He left an autobiography in MS., which was edited (1898) by Miss M. Betham-Edwards, and is the main authority for his life; and also the materials for a great work on the "Elements and practice of agriculture."

Arthur Young was the greatest of all English writers on agriculture; but it is as a social and political observer that he is best known, and this his Tour in Ireland and Travels in France are still full of interest and instruction. He saw clearly and exposed unanswerably the causes which retarded the progress of Ireland. He strongly urged the repeal of the penal laws which pressed upon the Catholics; he condemned the restrictions imposed by Great Britain on the commerce of Ireland, and also the perpetual interference of the Irish parliament with industry by prohibitions and bounties. He favored a legislative union of Ireland with Great Britain, and he did not regard such a measure as absolutely necessary, many of its advantages being otherwise attainable.

The soil of France he found in general superior to that of England, and its produce less. Agriculture was neither as well understood nor as much esteemed as in England. He severely censured the higher classes for their neglect of it. "Banishment (from court) alone will force the French nobility to execute what the English do for their own benefit. In France you live beside upon and adorn their estates." Young saw the commencement of violence in the rural districts, and his sympathies began to take the side of the classes suffering from the exactions of the Revocation of the Edict of Nantes, and his publication in 1793 of a tract entitled The Example of France a Warning to England. Of the profound significance of the French outbreak he seems to have had little idea, and thought the crisis would be met by a constitutional adjustment in accordance with the English type. He strongly condemned the mitayer system, then widely prevalent in France, as "perpetuating poverty and excluding instruction"—as, in fact, the ruin of the country. Some of his phrases have been often quoted by the advocates of peasant
Young, B.—Young, E.

Young was nearly fifty when he decided to take holy orders. It was reported that the author of Night Thoughts was not, in his earlier days, “the ornament to religion and morality which he afterwards became,” and his intimacy with the duke of Wharton and with Lord Melcombe did not improve his reputation. A statement attributed to Pope probably gives the correct view. “He had much of a sublime genius, though without common sense; so that his genius, having no guide, was perpetually liable to degenerate into bombast. This made him pass a foolish youth, the sport of peers and poets; but his having a very good heart enabled him to support the clerical character when he assumed it, first with decency and afterwards with honour” (O. Ruffhead, Life of A. Pope, p. 291).

In 1728 he was made one of the royal chaplains, and in 1730 was presented to the collegiate living of Welwyn, Hertfordshire. He married in 1731 Lady Elizabeth Lee, daughter of the 1st earl of Lichfield. Her daughter, by a former marriage with her cousin Francis Lee, married Henry Temple, son of the 1st viscount Palmerston. Mrs Temple died at Lyons in 1736 on her way to Nice. Her husband and Lady Elizabeth Young died in 1740. These successive deaths are supposed to be the events referred to in the Night Thoughts as taking place “ere thrice you mon had filled her horn” (Night i.). In the preface to the poem Young states that the occasion of the poem was the death of his wife. Philander and Narcissa have been rather vaguely identified with Mr and Mrs Temple. M. Thomas suggests that Philander represents Thomas Tickell, who was an old friend of Young’s, and died three months after Lady Elizabeth Young. It was further supposed that the infidel Lorenzo was a sketch of Young’s own son, a statement disproved by the fact that he was a child of eight years old at the time of publication. The Complaint, or Night Thoughts on Life, Death and Imortality, was published in 1742, and was followed by other “Nights,” the eighth and ninth appearing in 1745. In that his tragedy of The Brothers, written many years before, was brought into print, and the first part of his play The Centaur was produced at Drury Lane. Night Thoughts had made him famous, but he lived in almost uninterrupted retirement, although he continued vainly to solicit preferment. He was, however, made clerk of the closet to the princess dowager in 1761. He was never cheerful, it was said, after his wife’s death. He disagreed with his son, who had remonstrated, apparently, on the excessive influence exerted by his housekeeper Miss (known as Mrs) Hallows. The old man refused to see his son before he died, but is said to have forgiven him, and left him his money. A description of him is to be found in the letters of his curate, John Jones, to Dr Samuel Birch. He died at Welwyn on the 5th of April 1765.

Young is said to have been a brilliant talker. He had an extraordinary knack of epigram, and though the Night Thoughts is long and disconnected it abounds in brilliant isolated passages. Its success was enormous. It was translated into French, German, Italian, Spanish, Portuguese, Swedish and Magyar. In France it became one of the classics of the romantic school. The suspicion of insincerity that damped the enthusiasm of English readers acquainted with the facts of his career did not exist for French readers. If he did not invent “melancholy and midnight” in literature, he did much to spread the fashionable taste for them. Madame Klopstock thought the king ought to make him archbishop of Canterbury, and some German critics preferred him to Milton. Young wrote good blank verse, and Samuel Johnson pronounced Night Thoughts to be one of “the few poems” in which blank verse could not be changed for rhyme but with disadvantage.

Other works by Young are: The Instalment (to Sir R. Walpole, 1719); Trees in London (1725); A Poem on the drunkenness of the phlegmatic, with a sermon: An Apology for Punch (1729), a sermon; Imperium Poloni, a Naval Lyric . . . (1730); Two Epistles to Mr Pope concerning the Authors of the Age (1730); A Sea-Piece . . . (1733); The Foreign Address, or The Best Argument for Peace (1734); The Centaur not Fabulous; in Five Letters to a Friend (1755); An Argument . . . for the Truth of His [Christ’s] Religion (1758), a sermon preached before the king; Conjectures on Original Composition . . . (1759), addressed to Samuel Richardson; and Resignation . . . (1762), a poem.
YOUNG, J.— YOUNG MEN'S CHRISTIAN ASSOCIATION

YOUNG, JAMES (1811-1883), Scottish industrial chemist, was born in Glasgow on the 13th of July 1811. During his apprenticeship to his father, a carpenter, he attended evening classes at Anderson's College, where he had Lyon Playfair and David Livingstone for fellow-pupils; and the ability he showed was such that Thomas Grafton, the lecturer at the College, chose him as lecture assistant in 1832. About 1839, on the recommendation of Graham, whom in 1837 he had accompanied to University College, London, he was appointed chemist at James Muspratt's alkali works in Lancashire; in connexion with alkali he showed that cast-iron vessels could be satisfactorily substituted for silver in the manufacture of caustic soda, and worked out improvements in the production of chlorate of potash. But his name is best known in connexion with the establishment of the Scottish mineral-oil industry. In 1842 he began his work of a young of petroleum which had made its appearance at Riddings's Colliery at Alfreton in Derbyshire, and in the following year he began to utilize it for making both burning and lubricating oils. This spring was practically exhausted by 1851. It had served to draw Young's attention to the question of oil-production, and in 1850 he took out his fundamental patent for the distillation of bituminous substances. This was soon put into operation in Scotland, first with the Boghead coal or Torbanehill mineral, and later with bituminous shales, and though he had to face much litigation Young successfully employed it. He began to manufacture the process, and also to make illuminating oils and paraffin wax, until in 1866, after the patent had expired, he transferred his works to a limited company. In 1872 he suggested the use of caustic lime to prevent the corrosion of iron ships by the bilge water, which he noticed was acid, and in 1878 he began a determination of the velocity of white and coloured light by a modification of H. L. Fizeau's method, in collaboration with Professor George Forbes (b. 1849), at Pitlochry. The final results were obtained in 1880-81 across the Firth of Clyde from Kelly, his house at Wemyss Bay, and a hill above Inellan, and gave values rather higher than those obtained by M. A. Cornu and A. M. Michelson. Young was a liberal supporter of David Livingstone, and also gave £10,000 to endow a chair of technical chemistry at Anderson's College. He died at Wemyss Bay on the 14th of May 1883.

YOUNG, THOMAS (1773-1829), English man of science, belonged to a Quaker family of Milverton, Somerset, where he was born on the 13th of June 1773, the youngest of ten children. At the age of fourteen he was acquainted with Latin, Greek, French, Italian, Hebrew, Persian and Arabic. Desiring to study medicine in London, in 1792, he removed to Edinburgh in 1794, and a year later went to Göttingen, where he obtained the degree of doctor of physic in 1796. In 1797 he entered Emmanuel College, Cambridge. In the same year the death of his grand-uncle, Richard Brocklesby, made him financially independent, and in 1799 he established himself as a physician in Welbeck Street, London. Appointed in 1801 professor of physics at the Royal Institution, in two years he delivered ninety-one lectures. These lectures, printed in 1807 (Course of Lectures on Natural Philosophy), contain a remarkable number of anticipations of later theories. He resigned his professorship in 1803, fearing that its duties would interfere with his medical practice. In the previous year he was appointed foreign secretary of the Royal Society, of which he had been elected a fellow in 1794. In 1811 he became physician to St George's Hospital, and in 1814 he served on a committee appointed to consider the dangers involved by the general introduction of gas into London. In 1816 he was secretary of a commission charged with ascertaining the length of the seconds pendulum, and in 1818 he became secretary to the Board of Longitude and superintendent of the Nautical Almanac. A few years before his death he became interested in life assurance, and in 1827 he was chosen one of the eight foreign associates of the French Academy of Sciences. He died in London on the 10th of May 1829.

Young is perhaps best known for his work in physical optics, as the author of a remarkable series of researches which did much to establish the undulatory theory of light, and as the discoverer of the interference of light (see INTERFERENCE). He has also been called the founder of physiological optics. In 1793 he explained the mode in which the eye accommodates itself to vision at different distances as depending on change of the curvature of the crystalline lens; in 1801 he described the defect known as astigmatism; and in his Lectures he put forward the hypothesis, afterwards developed by H. von Helmholtz, that colour perception depends on the presence in the retina of three kinds of nerve fibres which respond respectively to red, green and violet light. In physiology he made an important contribution to haemodynamics in the character of the circulation. His book "The Heart and Arteries," and his medical writings included An Introduction to Medical Literature, including a System of Practical Nosology (1813) and A Practical and Historical Treatise on Consumptive Diseases (1815).

In another field of research, he was one of the first successful workers at the decipherment of Egyptian hieroglyphic inscriptions; by 1814 he had completely translated the enochial (demotic) text of the Rosetta stone, and a few years later had made considerable progress towards an understanding of the hieroglyphic alphabet (see EGYPT, § Language and Writing). In 1813 he published an Account of the Recent Discoveries in Hieroglyphic Literature and Egyptian Antiquities. Some of his conclusions appeared in the famous article of Egypt which in 1818 he wrote for the Encyclopedic Britannica.

His works were collected, with a Life by G. Peacock, in 1835.

YOUNG MEN'S CHRISTIAN ASSOCIATION, an organization for social and religious work among young men, founded in England by Sir George Williams (1821-1905), a merchant of London. Williams's organization grew out of meetings he held for prayer and Bible-reading among his fellow-workers in a dry goods business in the city of London, and was founded in 1844; on the occasion of its jubilee its originator was knighted. Similar associations, indeed, had been in existence in Scotland at a much earlier date. In 1824 David Naiismith, who also founded city missions in London and Glasgow, started the Glasgow Young Men's Society for Religious Improvement, a movement which spread to various parts of the United Kingdom, France and America: later the name was changed to the Glasgow Young Men's Christian Association. The object of such associations is to provide in large towns a rendezvous for young men who are compelled to live in lodgings or in the apartments provided by the great business houses. An associate of the Y.M.C.A. must not only be of good moral character, but must also express his adherence to the objects and principles of the association. To be a member means a definite acceptance of the doctrines of the Evangelical Christian faith. In 1919 there were about 400 associations in England, Ireland and Wales, and 226 in Scotland—besides various soldiers' and other auxiliaries. The total membership was about 140,000. Some of the buildings, notably in the Midlands and the north of England, are very fine. The London Association, which from 1880 until shortly before its demolition in 1908 used Exeter Hall, Strand, has erected a

1 Commonly abbreviated Y.M.C.A.
handsome block of buildings in Tottenham Court Road, designed to provide, in addition to the usual features, bedrooms at a reasonable rent.

The Young Men’s Christian Association is seen at its best in the United States. It is true that Germany has more associations than any other country, but of its 2129 branches only 142 have their own buildings, and the total membership is 201,250. In America, however, the associations have been built on a broad basis and worked with enterprise and business skill. Thus they have been able to secure the generous support of many of the leaders of commerce. America has over 1900 associations, and the total membership is 4,56,000.

In Greater Britain the associations are numerous and flourishing, and Canada has 35,000 members. There are many active associations in Switzerland, Norway, Denmark and the Netherlands, and indeed the Y.M.C.A. is now well known all over the world. Even in Japan, China and Korea there are 150 branches with a membership of nearly 12,000. The value of the association buildings all over the world is £11,540,000 (America, £8,900,000; Great Britain, £1,912,000; United Kingdom, £1,128,000).

The Young Women’s Christian Association was founded in 1855, by two ladies simultaneously. In the south of England Miss Roberts started a Prayer Union with a purely spiritual aim; in London Lady Kinnaird commenced the practical work of opening house-to-house literature distribution in business. In 1857 the two branches united in the Young Women’s Christian Association, which seeks to promote the all-round welfare of young women by means of residential and holiday homes, club rooms, restaurants, noon rest rooms, classes and lectures, and other useful departments. The Young Women’s Christian Association has spread all over the world, and the total membership is about half a million.

YOUNGSTOWN, a city and the county-seat of Mahoning county, Ohio, U.S.A., on the Mahoning river, about 60 m. S.E. of Cleveland. Pop. (1900) 44,885 (12,07 being foreign-born especially English, Irish and German); (1910 census) 79,066. It is served by the Baltimore & Ohio, the Erie, the Lake Shore & Michigan Southern, the Pennsylvania, and the Pittsburgh & Lake Erie railways, and by interurban electric lines. The Rayen High School (incorporated 1856) was endowed under the will of Judge William Rayen (1776-1854). The Reuben McMillan Public Library (about 25,000 volumes in 1910) is housed in a building finished in 1910 and is named in honour of Reuben McMillan (1820-1868), formerly superintendent of schools. Among other public buildings are the post office and Federal court house, the county court house, the city and the Mahoning Valley hospitals, and the Y.M.C.A. building. The business district lies in the valley on the N. of the river; the residential districts are chiefly on the neighbouring hills. Youngstown is the county-seat of Mahoning county, the Mahoning River flows 44,885 m. to the mouth of the Ohio, and Wick (48 acres), presented to the city by the Wick family, descendants of the merchant Henry Wick (1771-1843). The value of its factory products increased from $33,908,459 in 1900 to $48,126,885 in 1905. The most important establishments are blast-furnaces, iron and steel works (of the U.S. Steel Corporation) and rolling mills.

Youngstown was named in honour of John Young (1762-1825), a native of Petersborough, New Hampshire, who in 1766 bought from the Connecticut Land Company a tract of land upon which the city now stands, and lived there from 1766 until 1803. The first permanent settlement was made probably in 1766 by William Hillman. The tract was set off as a township in 1800, and the first township government was organized in 1802; the town was incorporated in 1848, and was chartered as a city of the second class in 1867. The county-seat of Mahoning county was removed from Canfield to Youngstown in 1876, and after much litigation the legality of this removal was confirmed by the United States Supreme Court in 1879. The first iron-mining in the region was done in 1803 by Daniel Eaton, who in 1804 built the first blast-furnace W. of Pennsylvania and N. of the Ohio river. Eaton also built in 1826 the first blast-furnace within the present limits of Youngstown.

YPRES (Flemish Yperen), a town of Belgium, in the province of West Flanders, of which it was formerly considered the capital. Pop. (1904) 17,073. It is situated 35 m. S. of Ostend and 12 m. W. of Courtrai, on the Yperle, a small river flowing into the Yser, both of which have been canalized. In the 14th century it ranked with Bruges and Ghent, and its population in its prime reached 500,000. It is remarkable chiefly for its five halles or bagthalls, with a façade of over 500 feet in length. The main building was begun in 1201 and completed in 1304. The cathedral of St Martin dates from the 13th century, with a tower of the 15th century. Jansen, bishop of Ypres and the founder of the Jansenist school, is buried in the cathedral. The Butchers’ Hall is also of interest and dates from the 15th century. Although Ypres is unlikely to regain the importance it possessed when its “red-coated” contingent turned the day in the great battle of Courtrai (1302), it has an important linen and lace trade and a great butter market. The Belgian cavalry training-school is established at Ypres.

YPISILANTI, or HYPISILANTI, the name of a family of Phanariot Greeks claiming descent from the Comneni. Alexander Ypsilanti (1775-1805) was dragoman of the Porte, and from 1774 to 1782 hospodar of Wallachia, during which period he drew up a code for the principality. He was again appointed hospodar just before the outbreak of the war with Austria and Russia in 1790. He allowed himself to be taken prisoner by the Austrians, and was interned at Brunn till 1792. Returning to Constantinople, he fell under the suspicion of the sultan and was executed in 1795. His son Constantine (d. 1821) who had joined in a conspiracy to liberate Greece and, on its discovery, fled to Vienna, had been pardoned by the sultan and in 1799 appointed by him hospodar of Moldavia. Deposed in 1805, he escaped to St Petersburg, and in 1806, at the head of some 20,000 Russians, returned to Bucharest, where he set to work on a fresh attempt to liberate Greece. His plans were ruined by the peace of Tilsit; he retired to Russia, and died at Kiev. He left five sons, of whom two played a conspicuous part in the Greek war of independence. Alexander Ypsilanti (1792-1828), eldest son of Constantine Ypsilanti, accompanied his father in 1805 to St Petersburg, and in 1809 received a commission in the cavalry of the Imperial Guard. He fought with distinction in 1812 and 1813, losing an arm at the battle of Dresden, and in 1814 was promoted colonel and appointed one of the emperor’s adjutants. In this capacity he attended Alexander I. at the congress of Vienna, where he was a popular figure in society (see La Garde-Chambon, Souvenirs). In 1817 he became major-general and commander of the brigade of garrisons. In 1826, on the refusal of the Greek dukes of Athos to accept the French proposals, he joined the Greek Heraclius Philike, Ypsilanti was elected, and in 1821 he placed himself at the head of the insurrection against the Turks in the Danubian principalities. Accompanied by several other Greek officers in the Russian service he crossed the Pruth on the 6th of March, announcing that he had the support of a “great power.” Had he advanced on Ibraila he might have prevented the Turks entering the principalities and so forced Russia to accept the fait accompli. Instead, he remained at Jassy, disgracing his cause by condoning the massacres of Turkish merchants and others. At Bucharest, whither he had advanced after some weeks’ delay, it became plain that he could not rely on the Vlach peasantry to rise on behalf of the Greeks; even the disconcerting expedient of his Vlach ally Theodore Vladimirescu, who called on the peasants to present a petition to the sultan against Phanariot misrule, failed to stir the people from their apathy. Then, wholly unexpectedly, came a letter from Capo d’Istria upholding Ypsilanti for misusing the tsar’s name, announcing that his name had been struck off the army list, and commanding him to lay down his arms. Ypsilanti’s decision to explain away the tsar’s letter could only have been induced by the success of a plot which was now hopeless. There followed a series of humiliating defeats, culminating in that of Dragashan on the 19th of June.
Alexander, accompanied by his brother Nicholas and a remnant of his followers, retreated to Rinnik, where he spent some days in negotiating with the Austrian authorities for permission to cross the frontier. Fearing that his followers might surrender him to the Turks, he gave out that Austria had declared war on Russia, and as a result the entire Russian army moved forward under the command of Metternich. He was thus able to escape to the city of Ventspils, and, on pretext of arranging measures with the Austrian commander-in-chief, crossed the frontier. But the Austrians of Francis I. and Metternich had no asylum for leaders of revolts in neighbouring countries. Ypsilanti was kept in close confinement for seven years, and when released at the instance of the emperor Nicholas I. of Russia, retired to Vienna, where he died in extreme poverty and misery on the 31st of January 1828.

DEMETRIOS YPSILANTI (1793–1829), second son of Prince Constantine, distinguished himself as a Russian officer in the campaign of 1814, and in the spring of 1821 went to the Moskow, where the war of Greek independence had just broken out. He was one of the most conspicuous of the Phanariot leaders during the earlier stages of the revolt, though he was much hampered by the local chiefs and by the civilian element headed by Mavrocordato. In January 1822 he was elected president of the legislative assembly; but the ill-success of his campaign in central Greece, and his failure to obtain a commanding position in the national convention of Athens, led to his retirement early in 1823. In 1828 he was appointed by Capo d'Estra commander of the troops in East Hellas. He succeeded, on the 25th May, 1828, in forcing the Turkish commander Aslan Bey to sign a capitulation at the Pass of Petra, which ended the active operations of the war. He died at Vienna on the 3rd of January 1832.

Gregory Ypsilanti (d. 1835), third son of Prince Constantine, founded a princely family still settled near Brunn. Nicholas Ypsilanti wrote Mémoires valuable as giving material for the antecedents of the insurrection of 1820 and the part taken in them by Alexander I. of Russia. They were published at Athens in 1837.

See the works cited in the bibliography of the article Greek Independence, War of, especially the Socle de l'histoire de J. Philemon.

YPSILANTI, a city of Washtenaw county, Michigan, U.S.A., on the Huron river, 36 m. W. by S. of Detroit. Pop. (1900) 7378; (1904) 7597; (1907) 6230. It is served by the Michigan Central and the Lake Shore & Michigan Southern railways, and is the seat of the Michigan State Normal College (1849). There are various manufactures. Ypsilanti was laid out and named in honour of Demetrius Ypsilanti, the Greek patriot, in 1825; it was incorporated as a village in 1833, and as a city in 1842. YPSILANE, YEUGÈNE (1856– ), Belgian violinist, was born at Liége, where he studied with his father and under R. Massart, at the Conservatoire, where he was a pupil until 1872; he had some lessons from Wieniawski, and later from Vieuxtemps. In 1879 Ysaÿe played in Germany, and next year acted as leader of Bilse's orchestra in Berlin; he appeared in Paris in 1883, and for the first time in London at a Philharmonic concert in 1889. He was violin professor at the Brussels Conservatoire from 1886 to 1898, and instituted the celebrated orchestral concerts of which he has been first conductor, and he conducted before a London audience in 1900, and in 1907 conducted Fidelio at Covent Garden. The sonata concerts in which he played with Raoul Pugno (b. 1852), the French pianist, became very popular in Paris and Brussels, and were notable features of several London concert seasons. As a violinist he ranks with the finest masters of the instrument, with extraordinary temperamental power as an interpreter. His compositions include a Programme Symphonie (played in London, 1903), a Piano Concerto, and a Suite Wallonne.

YSTAD, a seaport of Sweden on the S. Baltic coast, in the district (län) of Malmöhus, 39 m. E.S.E. of Malmö by rail. Pop. (1900) 9862. Two of its churches date from the 13th century. Its artificial harbour, which admits vessels drawing 15 ft., is free from ice in winter than any other Swedish Baltic port. Apart from a growing import trade in coal and machinery, its commerce has declined; but it is among the first twelve manufacturing places in Sweden, having large mechanical workshops.

YTERBIUM (Neo-Ytterbium) [symbol, Yb; atomic weight, 172.0 (O=16)], a metallic chemical element belonging to the rare earth group, and an area of about 75,000 sq. m. covered by Marignac in gadolinite in 1878 (see RARE EARTH). The oxide, YbO₃, is white and forms colourless salts; the crystallized chloride, YbCl₃·6H₂O, forms colourless, deliquescent crystals; the anhydrous chloride sublimes on heating (C. Matignon, Ann. chim. phys., 1906 (8), 8, p. 440). In 1907 G. Urbain separated ytterbium into two new elements, neo-ytterbiun and luteum (atomic weight, 174; 0); and in 1908 C. A. von Welsbach published the same result, naming his elements aldebaranum and cassiopeium (on the question of priority see F. Wenzel, Zeit. anorg. Chem., 1909, c. p. 496). YTTRIUM [symbol, Y; atomic weight, 89.0 (O=16)], a metallic chemical element. In its character yttrium is closely allied to, and in nature is always associated with, cerium, lanthanum, didymium and erbium (see RARE EARTHS). For the preparation of yttrium compounds the best raw material is gadolinite, which, according to König, consists of 22-61% of silica, 34-6% of yttria, Y₂O₃, and 42-75% of the oxides of cerium, cerium, didymium, lanthanum, iron, beryllium, calcium, magnesium and sodium. The extraction (as is the case with all the rare earths) is a matter of great difficulty. Metallic yttrium is obtainable by distillation from the dark grey powder by heating it with metallic oxides; or by electrolytising the double chloride of yttrium and sodium. It decomposes water slowly in the cold, and more rapidly on heating. Yttria, Y₂O₃, is a yellowish white powder, which at high temperatures radiates out a most brilliant white light. It is soluble, slowly but completely, in mineral acids. It is recognized by its very characteristic spark spectrum. Solutions of yttria salts in their behaviour to reagents are not unlike those of zirconia. The atomic weight was determined by Clev. YUCATAN, a peninsula of Central America forming the S.E. extremity of the republic of Mexico and including the states of Campeche and Yucatan and the territory of Quintana Roo. Small parts of British Honduras and Guatemala are also included in it. The natural boundary of the peninsula on the S. is formed in part by the ridges extending across N. Guatemala, the line terminating E. at the lower part of Chetumal Bay, and W. at Laguna de Terminos. From this base the land extends N. between the Gulf of Mexico and Caribbean Sea in nearly rectangular form for about 280 m., with about the same extreme width in longitude. It has a mean breadth of about 200 m., but its area is large, and its surface is divided into dry soil, brush land, and water. The coast on the N. and W. is low, sandy and semi-barren, and is made dangerous by the Campechê banks, a northward extension of the peninsula, covered with shifting sands. The outer shore-line on the N. for nearly 200 m. consists of a narrow strip of low sand dunes, within which is a broad channel terminating to the E. in a large lagoon. There are a number of openings through the outer bank and several small towns or ports have been built upon it. The E. coast consists of bluffs, indented with bays and bordered by several islands, the larger ones being particularly the Grande and the Isla de la Poblada. In the W. the coast is characterized by the capes of Contoy. There is more vegetation on this coast, and the bays of Chetumal, Esquipulito Santo, Ascension and San Miguel (on Cozumel Island) afford good protection for shipping. It is, however, sparsely settled and has little commerce.

The peninsula is almost wholly composed of a bed of coraline and porous limestone rocks, forming a low tableland, which rises gradually toward the S. until it is merged in the great Central American plateau. It is characterized by many ridges or plateaux which are reduced to the sea by the slow weathering of the coral rocks. The surface is not so level and monotonous as it appears on many maps; for, although there are scarcely any running streams, it is diversified by a few lakes of which the smallest, Chichankanab, is held by the Indians a remnant of the Chichamah, or, as well as by low isolated hills and ridges in the W., and in the E. by the Sierra Alta, a range of moderate elevation traversing the peninsula from Cataco Point S. to the neighborhood of Lake Peten in Guatemala. The culminating points of the W. ranges do not exceed 900 ft., and some authorities estimate it at 500 ft.
The climate of Yucatan is hot and dry; the Gulf Stream, which sweeps by its N. shores, adds to its naturally high temperature, and the presence of high mountainous ridges to intercept the moisture-bearing clouds from the Atlantic gives it a limited rainfall. The temperature ranges from 75° to 98° F. in the shade, but the heat is modified by the cool sea winds which prevail day and night throughout the greater part of the year. The atmosphere is also purified by the fierce _temporales_, or "northerns," which occasionally sweep down over the Gulf and across this open region. The dry season begins in October and continues until May, the hottest months appear to be in March and April, when the heat is increased by the burning of the corn and honeyfields. The rains are quickly arrested by the light porous soil and leave only temporary effects on the surface, whereas the rainfall is distributed during the rainy season. The chief cultivated plants are maize, the sugar-cane, tobacco, cotton, coffee and especially henequen, the so-called "Sisal hemp," which is a strong, coarse fibre obtained from the leaf sheaths of the _A. henequen_. It requires very little moisture, grows luxuriantly on the thin calcareous soil of Yucatan and is cultivated almost exclusively by the large landowners. It is used chiefly in the manufacture of cordage and hammocks, and is exported in large quantities. The labour needed in this industry is supplied by Indian _peons_, who live in a state of semi-servitude and are paid barely enough to sustain life.

**History and Antiquities.**—The modern history of Yucatan begins with the expedition of Francisco Hernandez de Cordova, a Spanish adventurer settled in Cuba, who discovered the E. coast of Yucatan in February 1517, when on a slave-hunting expedition. He followed the coast round to Campeche, but was unable to penetrate the interior. In 1518 Juan de Grijalva followed the same coast, but added nothing to the information sought by the governor of Cuba. In 1519 a third expedition, under Hernando Cortés, the conqueror of Mexico, came into collision with the natives of the island of Cozumel. In 1525 the inland part of the peninsula was traversed by Cortés during an expedition to Honduras. The conquest of the peninsula was undertaken in 1527 by Francisco de Montejo, who encountered a more vigorous opposition than Cortés had on the high plateaus of Anhuet. In 1549 Montejo had succeeded in establishing Spanish rule over barely one-half of the peninsula, and it was never extended further. The Spaniards found here the remains of a high aboriginal civilization which had already entered upon decline. There were deserted cities falling into ruins, and others, like Chichen-itza, Uxmal and Tulum, which were still inhabited by remnants of their former Maya populations. The Maya have left no record of their institutions or of the causes of their decline, beyond what may be deduced from their ruined structures. The number and extent of these ruined cities, palaces, ball courts, market-places, &c. indicate large towns in the midst of thickly settled, productive districts, for there were then, so far as can be determined, no means of supporting large urban populations through commercial exchanges. The exhaustion of the soil in the vicinity of towns, or epidemics brought on by insanitary habits, might easily cause depopulation in so hot a climate. Other remains which bear witness to the civilization of the Maya are the paved highways and the artificial reservoirs (aguadas) designed for the preservation of water for towns through the long dry season. These aguadas were large basins, paved and cemented, with underground cisterns, also lined with stone and cement, which may have been used for the protection of water against heat when the principal supply had become exhausted. The great problem in all the Maya settlements of Yucatan was that of securing and preserving a water supply for the dry season. Some of their towns were built near large underground reservoirs, called cenotes, that afforded a perennial supply. Since the Spanish conquest, the Maya have clung to the semi-barren, open plains of the peninsula, and have more than once revolted. They seceded in 1839 and maintained their independence until 1843. In 1847 another revolt followed, and the Indians were practically independent throughout the greater part of the peninsula until near the beginning of the Diaz administration. In 1910 there was another revolt with some initial successes, such as the capture of Valladolid, but the Indians withdrew to the unknown fastnesses of Quintana Roo.

The Mexican State of Yucatan is bounded N. by the Gulf of Mexico, E. and S. by the territory of Quintana Roo, S. and W. by the state of Campeche. Pop. (1900) about 306,000. The railways include the three lines of the United Railways of Yucatan (173 m.), and a line from Mérida to Peto (145 m.). The capital is Mérida, and its principal towns, inhabited almost exclusively by Indians and mestizos, are Valladolid, Acanceh, Tekax, Motul, Temaz, Espej, Maxcanú, Hunucmá, Tixkokob, Peto and Progreso, the port of Mérida.

Quintana Roo was separated from the state of Yucatan in 1902 and received a territorial government under the immediate supervision of the national executive. It comprises the sparsely settled districts along the E. coast of the peninsula, and the wooded sections of the S., which have not been thoroughly explored. Its population is estimated at 3000, but as its inhabitants never submitted to Spanish and Mexican rule, and have maintained their independence against overwhelming odds for almost four centuries, this estimate should be accepted as a conjecture. Little is known of the wild tribes of the territory.

**Yucca**, a genus of the order Liliaceae (p.2), containing about thirty species. They occur in greatest frequency in Mexico and the S.W. United States, extending also into Central America, and occurring in such numbers in some places as to form straggling
diagram showing arrangement of the parts of the flower in horizontal plane.

1. A Spanish word meaning "bayonet," recalling the form and character of the leaves.
forests. They have a woody or fibrous stem, sometimes short, and in other cases attaining a height of 13 to 20 ft., and branching at the top into a series of forks. The leaves are crowded in tufts, have at the ends of the stem or branches, and are generally stiff and sword-shaped, with a sharp point, sometimes flaccid and in other cases fibrous at the edges. The numerous flowers are usually white, bell-shaped and pendulous, and are borne in much-branched terminal panicles. Each flower has a perianth of six regular pieces, and has as many hypogynous stamens, with dilated filaments, bearing relatively small anthers. The three-celled ovary is surmounted by a short thick style, dividing above into three stigmas, and ripens into a succulent berry in some of the species, and into a dry three-valved capsule in others. The flower is a characteristic of the genus. It is strong in symbiotic relations.

A coarse fibre is obtained by the Mexicans from the stem and foliage, which they utilize for cordage, and in the S.E. United States the leaves of some species, under the name "bear-grass," are used for seating chairs, &c. The fruits, which resemble small bananas, are cooked as an article of diet; and the roots contain a saponaceous matter used in place of soap.

Many of the species are hardy in Great Britain, and their striking appearance renders them attractive in gardens even when not in flower. They thrive in sandy, fast soil, and are particularly adapted to divisions planted in the open ground, or by pieces of the thick, fleshy roots in sandy soil under heat. Their rigid foliage, inveterate by thick epidermis, enables them to resist the noxious air of towns better than most plants. A popular name for the plant is "Adam's needle." The species which split up at the margins of their leaves into filaments are called "Eve's threads."

YUE-CHI (or YUEH-CHIH), the Chinese name of a central Asiatic tribe who ruled in Bactria and India, are also known as Kushans (from one of their subdivisions) and Indo-Sythians. They appear to have been a nomad tribe, inhabiting part of the present Chinese province of Kan-su, and to have been driven W. by Hiung-nu tribes of the same stock. They conquered a tribe called the Himakapisa (or Khotan), and settled in the basin of the Eri river, and settled for some time in their territory. The date of these events is placed between 175 and 140 B.C. They then attacked another tribe known as Sakas, and drove them to Persia and India. For about twenty years it would seem that the Yue-Chi were settled in the country between the rivers Chu and Syr-Darya, but here they were attacked again by the Hiung-nu, their old enemies, with whom was the son of the defeated Wusun chieftain. The Yue-Chi then occupied Bactria, and little is heard of them for a hundred years. During this period they became a united people, and an Indo-Greek influence is by this period (beginning 100 B.C.) the principal of which, the Kushans (or Kwei-Shuang), supplied the new national name. They also to some extent gave up their nomadic life and became civilized. Bactria about this time was said to contain a thousand cities, and though this may be an exaggeration it was probably a meeting-place of Persian and Hellenic culture: its kings Demetrius and Eucratides had invaded India. It is therefore not surprising to find the warlike and mobile Yue-Chi following the same road and taking fragments of Persian and Greek civilization with them.

The chronology of this invasion and of the history of the Kushans in India must be regarded as uncertain, though we know the names of the kings. Indian literature supplies few data for the period, and the available information has been collected chiefly from notices in Chinese annals, from inscriptions found in India, and above all from coins. From this evidence it has been deduced that a king called Kozulokapises, Kujulakasa or Kieu-tsie-k'iu-lo (A.D. 45-55) united the five tribes, conquered the Kabul valley and annihilated the remnants of Greek dominion. He was succeeded, possibly after an interval, by Oemokapises (Himakapisa or Yen-kao-tsin-tal), who completed the annexation of most of N. India. Then followed Kanishka (? c. A.D. 123-53), who is celebrated throughout eastern Asia as a patron of the Buddhist church and convener of the third Buddhist council. He is also said to have conquered Kashgar, Yarkand and Khotan. His successors were Huvishka and then Vasudeva, who may have died c. A.D. 225. After Vasudeva's reign the power of the Kushans gradually decayed, and they were driven back into the valley of the Indus and N.E. Afghanistan. Here, according to Chinese authorities, their royal family was supplanted by a dynasty called Ki-to-lo (Kidastra), who were also of Yue-Chi stock, and were related to one of the tribes who had remained in Bactria when the Kushans were pushed further S. The occupation of the Kitolo S. of the Hindu Kush was due to the movements of the Jven-Jwen, who advanced W. from the Chinese frontier. Under this dynasty a state known as the Little Kushan kingdom flourished in Gandhara (E. Afghanistan) about A.D. 430, but was broken up by the attacks of the Hunas.

Some authorities do not accept the list of Kushan kings as given above, and think that Kanishka must be placed before Christ and that the Kushans must have been a wild and possibly a Semitic people with a burden of drudgery, and a language unrelated to any modern Semitic tongues, and that there was another king with a name something like Vasuvsha before or after Huvishka. In any case the invasion of the Yue-Chi cannot be a matter of very great importance in any other region of India, and had an important influence on Indian civilization. Their influence was a remarkable union of characteristics, derived from many nations. The general shape and style are Roman; the inscriptions are in Greek or in a Persian language written in Greek letters, or in Kharoshthi: the reverse often bears the figure of a deity, either Greek (Heraclides, Helios, Selene) or Zoroastrian (Mithra, Vata, Vahram) (or an Indian (generally Siva or a war god). One figure called Satrapa appears to be a Persianized version of the small Khi of the usual forms of writing, which were either Greek or Pahlavian, and often strongly resembles the Brahmi system. The name of the Kushan king which is generally given is in form very like the name of the Persian king, but in meaning is different. It is probably a dynastic term, not an Iranian personal name. The name Kanishka is it is probably a dynastic name, and indicates the family of a Persian king. In this alphabet the Greek letter b (or rather a very similar letter with the loop a little lower down) is used to represent sh, and the letter o is usually peculiar, and is almost always used with the expression of the sounds h and w. Thus PAONAO PANO KANHPEE KOFANO is to be read as something like Shkhananda Shk Kanyakhi Koshan: Kanishka the Kushan, king of kings. This title became in later times the special designation of the Kushan kings and is curiously parallel to the use of Arabic and Persian titles (padishan, sultan, &c.) by the Ottoman Turks. The physical type represented on these coins has a strong prominent nose, large eyes, a moderately abundant countenance and somewhat thick or projecting lips. Hence, as far as any physical characters can be formulated for the various tribes (and their validity is very doubtful in the case of Yue-Chi type is Turkish rather than Mongol or Urgo-Finnic. In such points of temperament as military ability and power of assimilating Indian and Persian civilization, the Yue-Chi are comparable to the Turks, and some authorities think that the name Turushka or Turska is the true form of the name, and that the writers is another evidence of the connexion. But the national existence and name of the Turks (q.v.) seem to date from the 5th century A.D., so that it is an anachronism to speak of the Yue-Chi as a division of them. The Yue-Chi and Turks, however, may both represent parallel developments of similar or even originally identical tribes. The Mahomedan writer Alberuni states that among whom he mentions (Kanik or Kanishka) were Turks by race, and this may represent a native tradition as to the affinities of the Yue-Chi. Some authors also identify the Yue-Chi with the Yue-Jen, and hence that the original form of the name was Yut or Get, which is said to appear in the Indian Jät.

See Vincent Smith, Early History of India (1908); Hoerne and Sprengling, Early History of India, vols. 1 and 2; Rapin, Hist. des Indes (1737); Gardiner, Coins of Greek and Sceetian Kings in India (1886); Franken, Beitrage aus Chinesischen Quellen zur Kenntnis der Turkuvilk und
YUKON—YUKON TERRITORY

Skjöld (1904), and numerous articles by Cunningham, Fleet, A. Stein, Vincent Smith, Sylvan Levi, E. H. Parker and others in the Geol. Survey of Canada Repts.; T. M. 1894, 1901, 1902, 1906; and British Quarterly, &c. Owing to the new evidence which is continually being brought forward, the most recent writings on this subject are generally to be preferred. (C. E. L.)

YUKON, the largest river in Alaska, and the fifth largest in N. America. With its longest tributaries not in Alaska, the Lewes and the Teslin (or Hootalinqua), its length is about 2500 m., and it comprises the Yukon District of British Columbia, near the Pacific Ocean, and ending at the Bering Sea coast. Its catchment area is about 330,000 sq. m., or more than one-half of which lies in Canada. The Lewes river rises in Lake Bennett (Yukon District) on the N. slope of the Coast Range, about 25 m. inland from the Lynn Canal (at the head of Chatham Strait), and flows N. through a chain of lakes, its confluence with the Pelly river, at Selkirk, Yukon District, about 120 m. due E. of the Alaskan-Canadian boundary, forming the headwaters of the Yukon. Flowing thence N.W., the Yukon turns abruptly to the S.W. near Fort Yukon, Alaska, on the Arctic Circle, and continues nearly at right angles to its former course to a point S. of the head of Norton Sound, where it turns again and flows in a N.W. direction, emptying into the Sound from its S. shore. The length of the river, from its headwaters to its mouth, is about 1500 m.

The Yukon Valley comprises four sub-provinces, or physiographic divisions; in their order from the headwaters of the river these divisions are designated the “Yukon proper”, the “Rampart Region” and “Lower Yukon.” The “Upper Yukon” Valley is about 450 m. long and from 1 to 3 m. broad, and is flanked by walls rising to the plateau level from 1500 to 3000 ft. above the river. Below Yukon river, its confluence with the smaller rivers, the S. Selwyn, the White and the Pelly, the Yukon Valley is 50 m. broad, and from 75 to 80 m. below the junction of the three rivers. The Yukon, or Alaskan-Yukon, is made up of two parts: the S. Selwyn, the White and the Pelly; and the Yukon river, which extends from the S. Selwyn to its confluence with the Pelly river. The Yukon proper is about 450 m. long and from 1 to 5 m. broad, and is flanked by walls rising to the plateau level from 1500 to 3000 ft. above the river. Below Yukon river, its confluence with the smaller rivers, the S. Selwyn, the White and the Pelly, the Yukon Valley is 50 m. broad, and from 75 to 80 m. below the junction of the three rivers.

The Yukon is navigable from May till September, and steamers ply on several of its largest tributaries, making the aggregate navigable length of the river 2000 m. For about 75 m. below Fort Yukon, the river is navigable by steamers of 5000 h.p. until it enters the Great White Horse Rapids, which, with Miles Canyon, obstruct the river for a few miles; above them the stream is again navigable to its source, about 100 m., beyond the Pacific & Arctic railway from the White Horse to the Yukon. The Yukon is naturally navigable for traffic and travel; and even the dangerous White Horse Rapids may be run by a skillful pilot in a small boat, as was done in 1896 by Felly Norton, Jr., with two gold-seekers. Official Government record shows that the river, seldom less than 150 yds. wide, is navigable by light-draft steamers to Fraser Falls, a distance of nearly 200 m. The Porcupine is navigable, in high water, to about the Alaska-Yukon boundary line (c. 90 m.); the Chandlar for a few miles; the Tanana (which is about 500 m. long) for about 225 m. to the Chena river (which is navigable for about 100 m.); and the Tolovana, another affluent of the Tanana, is also navigable for about 100 m.

In 1842-43 the Yukon was explored by the Russian Lieut. Ivan Zagoskin, who built a trading post at Nulato, ascended the river as far as Yukon, from which he returned. Zagoskin made a sketch drawing of the stream to that point and reported that it was not navigable beyond there. In 1861 Robert Kennicott made his way overland by the Hudson Bay route from the Mackenzie river down the Yukon to Fort Yukon, and in 1865 he and Captain Charles S. Bulkley led the expedition sent out by the Western Union Telegraph Company to survey a route for a land telegraph line to Europe by way of Alaska and Siberia. Kennicott died at Nulato in 1866, and the expedition was abandoned in that year, but explorations were continued by the Northerners, notably Captain J. N. Parker, and in a short time valuable surveys were made and the Yukon identified as the Kwikpak of the earlier Russian surveys. Captain C. W. Raymond made a reconnaissance of the Yukon in 1869; the Indian route by the Lewes to the headwaters of the Yukon was used by gold prospectors as early as 1881, while in 1883 Lieutenant Frederick Schwatka (1849-1892) crossed the Chilkoot Pass (which he called "Perrier Pass"), descended the Lewes to Fort Selkirk, and down the river to the sea. Charles W. Homan, who accompanied Schwatka, made the first sketch survey of the great system; since then it has been frequently explored, but much of the region has not been mapped.

YUKON TERRITORY, the most westerly of the northern territories of Canada, bounded S. by British Columbia, W. by Alaska, N. by the Arctic Ocean and E. by the watershed of the Mackenzie river. It has an area of 207,076 sq. m. The territory is sidetracked by the Yukon river and its tributaries, though the S.E. corner contains the headwaters of the Liard river, flowing into the Mackenzie, occupy a part of its area. The margins of the territory are mountainous, including part of the St Elias Mountains.

William Healey Dall (1845— ), American naturalist, was born in Boston, Massachusetts, served with the United States Coast Survey of Alaska from 1871 to 1884, became honorary librarian of the United States National Museum in 1884, and was appointed professor of invertebrate palaeontology at the Wagner Institute of Science, Philadelphia. He was palaeontologist to the United States Geological Survey in 1884-1909. The white mountain sheep, or Dall's sheep (Ovis dalli), discovered in 1884, was named in his honour.
range with the highest mountains in Canada at the S.W. corner (Mount Logan and Mount St Elias), and the N. extension of the Rocky Mountains along the S. and N. E. sides; here, however, not very lofty. The interior of the territory is high toward the S.E. and sinks toward the N.W., and may be described as a much-dissected peneplain with low mountains to the S. The most important feature of the hydrography is the Yukon (gr. and the rivers which flow into it. The Klondike gold mines are reached by river boats, either coming up from St Michael at its mouth, or down 460 m. from White Horse. The White Horse route is now used almost entirely, since the White Pass railway, 111 m. long, was constructed from Skagway, on Lynn Canal, an inlet of the Pacific. As the voyage up the Pacific coast from Vancouver or Victoria is almost entirely through sheltered waters, the journies to the Klondike is very attractive in summer. Comparatively little snow is seen in crossing White Pass during summer, though there are patches on the low mountains on each side. The Rocky Mountains, N.E. of the interior plateau, are somewhat snowy, but apparently with no large glaciers; but the St Elias range to the S.W. is buried under immense snowfields, from which great glaciers project into the valleys. The rocks are largely ancient schists and eruptives, Palaeozoic or Archean, but considerable areas are covered with Mesozoic and Tertiary rocks, some of which include important seams of coal or copper, or other minerals. Most of the territory is inhabited, and is now entirely under the jurisdiction of White Horse. There have been comparatively recent volcanic eruptions in the region, as shown by a layer of white ash just beneath the soil for many miles along the river, and by a quite perfect cone with a crater and lava stream; but there are no records of volcanic outbreaks within the short modern history of the territory. Before the discovery of gold on the Forty Mile and other rivers flowing into the Yukon the region was inhabited only by a few Indians, but the sensational finds of rich placers in the Klondike (gr.?) in 1896 brought a vigorous population in the territory and in 1898 Dawson City, which was made the capital of the newly constituted Yukon Territory. When the White Pass railway was built, White Horse at its N. terminus became of importance, and since then a fluctuating body of prospectors and miners has been at work, not only in the Klondike but at various points along the other rivers. The territory is ruled by a governor and council, partly elective, seated at Dawson, and has a representative in the parliament of the Dominion. Almost the only economic product of the territory was at first gold, but copper and other ores later began to attract the attention of the new riders. Those near the Pacific the Yukon territory has a rigorous continental climate with very cold winters seven months long, and delightful sunny summers. Owing to the lofty mountains to the W., the amount of rain and snow is rather small, and the line of perpetual snow is more than 4000 ft. above sea-level, so that glaciers are found only on the higher mountains; but the moss-covered ground is often perpetually frozen to a depth of 100 or 200 ft. Vegetation is luxuriant along the river valleys, where fine forests of spruce and poplar are found, and the harder grains and vegetables are cultivated with success. (A. P. C.)

YULE, SIR HENRY (1826-1880), British Orientalist, was born on the 1st of May 1826, at Inveresk, near Edinburgh, the son of Major William Yule (1764-1839), translator of the *Aposthems* of Ali. He was educated at Edinburgh. Addiscombe and Chatham, and joined the Bengal Engineers in 1840. He served in both the Sikh wars, was secretary to Colonel (afterwards Sir) Arthur Phayre's mission to Awa (1853), and his *Narrative of the Mission to the Court of Awa* (1853). He returned in 1856 with the rank of colonel, and devoted his leisure to the medieval history and geography of Central Asia. He published *Cat kay and the Way Thither* (1866), the *Book of Ser Marco Polo* (1871-75), for which he received the gold medal of the Royal Geographical Society, and brought out with Dr Arthur C. Burnell *Hobson-Jobson* (1886), a dictionary of Anglo-Indian colloquial phrases. For the Hakluyt Society, of which he was for some time president, he edited (1863) the *Mirabilia descripta* of Jordanus and *The Diary of William Hedges* (1887-89). The latter contains a biography of Governor Pitt, grandfather of Chatham. From 1875 to 1880 Yule was a member of the Council of India, being appointed K.C.S.I. on his retirement. He died on the 30th of December 1889.

YULE, the season of Christmas (q.v.). This word is chiefly used alone as an archaism or in poetry or poetical language, but is more common in combination, as in "yule-tide," "yule-log," &c. The Old English word appears in various forms, e.g. *golding, iuol, geold, gehedel,* cognate forms are Icel, *jol,* Dan. *jued; Swed. jul.* It was the name of two months of the year, December and January, the one the former yule", (so abra guola), the other the "after yule" (see offera guola), the law coming before and after the winter solstice (*Cotton MS. Tib. B. i.; and Bede, De Temporum Ratione,* 13, quoted in Skeat, *Etym. Dict., 1808*). According to A. Fick (*Vergleichendes Wörterbuch der Indogermanischen Sprachen, vol. iii.* 245, 1874) in proper meaning is noise, clamour, the season being one of rejoicing at the turning of the year among Scandinavian peoples before Christian times.

YUN-NAN (i.e. Cloudy South), a S.W. province of China, bounded N. by Szech-cha’en, E. by Kwei-chow and Kwangsi, S. by Burmah and the Lasu, and W. by the Kwei-chow and the Kiangsi provinces. It is estimated at from 122,000 to 146,000 sq. m. Though the second largest province of the empire, its population is estimated at only 12,000,000. The inhabitants include many races besides Chinese, such as Shans, Iolas and Moatsze. The Musus, in N.W. Yun-nan, once formed an independent kingdom which extended into E. Tibet. Many of the inhabitants are nominally Moslems. The greater part of the province may be said to consist of an extensive plateau, generally from 5000 to 7000 ft. in altitude, containing numerous valley plains, which is divided in the N. by mountain ranges that enter at the N. end of the province and extend to the river White Horse, the Mekong and the Salween. The mountains attain heights of 16,000 ft. The climate is generally healthy and equable; on the plateau the summer heat seldom exceeds 86°, and in winter there is little snow. The principal rivers are the Yangtsze-kiang (locally known as the Kinska-kiang = Golden Sand river), which enters Yun-nan at its N.W. corner, flows first S.E. and then N.E., forming for a considerable distance the N. boundary of the province; the Mekong, which traverses the province from N. to S. on its way to the sea through Annam; the Salween, which forms the boundary between the two nations; and the headwaters of the Songkoi, which rises in the S.E. of the province. This last-named river is navigable from the Gulf of Tongking to Man-hao, a town ten days’ journey from Yun-nan Fu. There are two large lakes—one in the neighbourhood of Ta-li Fu, which is 50 m. long by 5 m. broad, and the other near Yun-nan Fu, which measures from 70 to 80 m. in circumference.

Besides Yun-nan Fu, the capital, the province contains thirteen prefectural cities, several of which—Teng-ch’uen Fu, Ta-li Fu, Yun-ch’ang Fu, Ch’u-siang Fu and Lin-gan Fu, for example—are situated in the valley plains. Mengtsze, Szemao and Momein (or Teng-yueh) are open to foreign trade. Yun-nan Fu is connected by railway (1910) with Tongking. The line which starts from the Shanghai run, in Yun-nan, possibly to Mengtsze hien (a great commercial centre), to the capital. Several important roads intersect the province; among them are—1. The road from Yun-nan Fu to Bhamo in Burma via Ta-li Fu (12 days), Teng-yueh Chor or Teng-yueh Chor (13 days) to the capital. From this point the river is navigable to Canton. 2. The road from Ta-li Fu N. to Patang via Li-kiang Fu, which thus connects W. Yun-nan with Tibet. 3. The road from Bhamo via Kwei-chow, which connect Yun-nan Fu with Pai-se Fu, in Kwang-si, on the Canton West River, a land journey which occupies about twenty days. From this point the river is navigable to Canton.

Agricultural products include rice and maize (the principal crops), wheat, barley and oats. The poppy was formerly extensively cultivated, but after the anti-opium edict of 1906 vigorous attempts were made to stamp out the cultivation of the plant. In certain localities the sugar-cane is grown. Tea from Fu-erh Fu in S. Yun-nan is appreciated throughout the empire. Fruits and vegetables are plentiful, and there are large herds of buffaloes.
YUN-NAN FU—YVETOT

947

goats and sheep. Silkworms are reared. The chief wealth of Yun-nan consists, however, in its minerals. Copper is the most important of the minerals worked. Silver and gold are produced, but they are not known to exist in any large quantities. Lead and zinc are also found, and several salt mines are worked. The ores are generally of good quality, and are easy of extraction. Cotton yarn and cloth, petroleum, timber and furs are among the chief imports; copper, tin, hides and tea are important exports; medicines in the shape not only of herbs and roots, but also of fossils, shells, bones, teeth and various products of the animal kingdom; and precious stones, principally jade and rubies, are among the other exports.

Yun-nan, long independent, was subdued by Kublai Khan, but was not finally incorporated in the empire until the 17th century. It was the principal centre of the great Mahommedan rebellion, which lasted sixteen years and was suppressed in 1672. Even in 1810 the province had not wholly recovered from the effects of that struggle and the barbarity with which it was stamped out. The opening of Christian (Protestant) mission work in Yun-nan began in 1877, and was one result of the murder of Mr Margary (see CHINA, History, § D).

See H. R. Davies, Yun-nan, the Link between India and the Yangtze (Cambridge, 1909); A. Little, Across Yunnan (London, 1904); E. J. H. Burrows, "The Frontiers of Yunnan," in The Chinese Empire (London, 1907); L. Richard, Comprehensive Geography of the Chinese Empire (Shanghai, 1908).

YUN-NAN FU, the capital of the province of Yun-nan, China, in 25° 6' N., 102° 52' E. It is about 500 m. by rail N.W. of the port of Haiphong, Tonking. The population was returned in 1897 at 45,000. Originally the surrounding district was known as the "land of the southern barbarians." The city is situated on a plain, and is surrounded by fortified walls, 63 m. in circuit. For many years Mahommedans have been numerous in the city and neighbourhood; and in 1855 a Mahommedan rising occurred. Before the rebellion Yun-nan Fu had a prosperous aspect; the shops were large and well supplied with native silken goods, saddlery, &c., while English cotton, Russian cloths and raw cotton from Burma constituted the main foreign merchandise. Employment for large numbers of workpeople was found in the copper factories. A mint at Yun-nan Fu issued annually 100,000,000 cash. Nearly ruined by the rebellion, the city took many years to recover its prosperity. A fresh impetus to commerce was given by the opening in 1910 of the railway from Tongking, a line built by French engineers and with French capital. The construction of a British railway to connect Burma with Yun-nan Fu and onwards to the Yangtsze-kiang has been in contemplation.

YURIEV (formerly DORPAT, also Döpp; Russian, Derpt; Estonian, Tartu and Tartolinn; inlettish, Tihrboto), a town of W. Russia, in the government of Livonia, situated on the Embarch, 158 m. by rail N.E. of Riga, in 56° 25' N. and 26° 23' E. Pop. 42,471. The principal part of the town lies S. of the river, and the more important buildings are clustered round the two eminences known as the Dombeg (cathedral hill) and the Schlosberg (castle hill), which in the middle ages were occupied by the citadel, the cathedral and the episcopal palace. Owing to a great fire in 1777, the town is almost entirely modern; and its fortifications have been transformed into promenades. Besides a good picture gallery in the Ratshof, and the 13th-century church of St John, Yuriev possesses a university, with an observatory, an art museum, a botanical garden and a library of 250,000 volumes, which are housed in a restored portion of the cathedral, burned down in 1624. The university was founded by Gustavus Adolphus of Sweden in 1632; but in 1690 teachers and students removed to Pernau on the advance of the Russians, and on the occupation of the country by Peter the Great again took flight to Sweden. In spite of the treaty of 1710 and the efforts of the Livonian nobles, it was not till 1802 that its restoration was effected under the patronage of Alexander I. Down to 1805, in which year it was thoroughly Russified, the university was German in spirit and in sentiment. It is now attended by some 1700 students annually. The astronomical department is famous, owing partly to the labours of F. G. von Struve (1829–39), and partly to Fraunhofer's great refracting telescope, presented by the emperor Alexander I. There are monuments to the memory of K. E. von Baer (1886) and Marshal Barclay de Tolly (1849), and the town is the headquarters of the XVIII. army corps.

The foundation of Dorpat is ascribed to Yaroslav, prince of Kiev, and is dated 1039. In 1224 the town was seized by the Teutonic Knights, and in the following year Bishop Hermann erected a cathedral on the Dombeg. From that date till about 1528 the town enjoyed great prosperity, and the population reached 50,000. In 1538 it was captured by the Russians, but in 1582 was yielded to Stephen Bathori, king of Poland. In 1600 it fell into the hands of the Swedes, in 1623 reverted to the Poles, and in 1625 was seized by Gustavus Adolphus of Sweden. The Russians again obtained temporary possession in 1666, but did not effect a permanent occupation till 1704. In 1708 the bulk of the population were removed to the interior of Russia.

YUSAFZAI, a large group of Pathan tribes, originally immigrants from the neighbourhood of Kandahar, which includes those of the Black Mountain, the Bunerwalas, the Swalis, the people of Dir and the Panjkora valley, and also the inhabitants of the Yusafzai plain in Peshawar district of the North-West Frontier Province of India. Three sections of the tribe, the Hassani, Akazias and Chargazingas, inhabit the W. slopes of the Black Mountain, and the Yusafzai country stretches thence to the Utman Khel territory. The trans-border Yusafzais are estimated at 65,000 fighting men, giving a total population of about 250,000. The Yusafzais are said to be descended from one Mandai, who had two sons, Umar and Yusaf. Umar died, leaving one son, Mandan; from Mandan and Yusaf come the two primary divisions of the Yusafzais, which are split into numerous subdivisions, including the Isazai, Malaizai, Akazais, Ranizai and Utmanzais.

YUGUT, the chief town of a sanjak of the same name in the Angora vilayet of Asia Minor, altitude 4380 ft., situated 105 m. E. of Angora, near the head of a narrow valley through which the Angora-Sivas road runs. The town was built largely out of the ruins of Nefez Keui (anc. Tuatium), by Chapam Oghlu, the founder of a powerful Dere Bay family. There is a trade in yellow berries and mohair. The sanjak is very fertile, and contains good breeding-grounds, upon which horses, camels and cattle are reared. The population, about 15,000, includes a large Armenian community.

YVETOT, a town of N. France, capital of an arrondissement in the department of Seine-Inferieure, 24 m. N.W. of Rouen on the railway to Havre. Pop. (1906) 6214. Cotton goods of various kinds and hats are made here, and trade is carried on in agricultural products. The church (18th century) contains a marble altar from the Carthusian monastery at Rouen, fine woodwork of the 17th century from the abbey of St Wandrille, and a handsome pulpit. The town is the seat of a sub-prefecture and has tribunals of first instance and of commerce, and a chamber of arts and manufactures. The lords of Yvetot bore the title of king from the 15th till the middle of the 16th century, their petty monarchy being popularized in one of Bérançon's songs. In 1592 Henry IV. here defeated the troops of the League.
the twenty-sixth letter of the English alphabet and the last, although till recent times the alphabets used by children terminated not with z but with & or or. For & the English name is amperand, i.e. "and se and," though the Scottish name eperorhand, i.e. "Et, per se and," is more logical and also more clearly shows its origin to be the Latin et, of which it is but the manuscript form. To the following of 2 by & George Eliot refers when she makes Jacob Storey say, "He thought it (z) had only been put to finish off th' alphabet like, though amperand would ha' done as well, for what he could see." Z is put at the end of the alphabet because it occupied that position in the Latin alphabet. In early Latin the sound represented by z passed into r, and consequently the symbol became useless. It was therefore removed from the alphabet and G (g.s.) put in its place. In the 1st century B.C. it was, like y, introduced again at the end, in order to represent more precisely than was before possible the value of the Greek Ζ, which had been previously spelt with s at the beginning and ss in the middle of words: οςον = ἵων, " belt "; τορφεσία = ἱπτερίς, "banker." The Greek form was a close copy of the Phoenician symbol Ζ, and the Greek inscripational form remained in this shape throughout. The name of the Semitic symbol was Zayin, but this name, for some unknown reason, was not adopted by the Greeks, who called it Zeta. Whether, as seems most likely, Zeta was the name of one of the other Semitic silabons Zade (Tzaddi) transferred to this by mistake, or whether the name is a new one, made in imitation of Eta (z) and Theta (θ), is disputed. The pronunciation of the Semitic letter was the voiced s, like the ordinary use of z in English, as in zodiac, race. It is probable that in Greek there was a considerable variety of pronunciation from dialect to dialect. In the earlier Greek of Athens, North-west Greece and Lesbos the pronunciation seems to have been zd, in Attic from the 4th century B.C. onwards it seems to have been only a voiced s, and this also was probably the pronunciation of the dialect from which Latin borrowed its Greek words. In other dialects, as Elean and Cretan, the symbol was apparently used for sounds resembling the English voiced and unvoiced th (ð, þ). In the common dialect (κοινό) which succeeded the older dialects,  CONSTANTS became a voiced s, as it remains in modern Greek. In Vulgar Latin the Greek Ζ seems to have been pronounced as dy and later y; 2 was being found for z in words like baptismus for baptismum, baptismus, "baptize," while conversely z appears for dy in forms like zacusus, zabulus, for diaconus, "deacon," diabulus, "devil." Z also is often written & in colloquial Latin in many words of Arabic and Semitic origin (see Grandgent, Introduction to Vulgar Latin, §§ 277, 330). Besides this, however, there was a more cultured pronunciation of z as dz, which passed through French into Middle English. Early English had used z alone for both the unvoiced and the voiced sibilant; the Latin sound imported through French was new and was not written with s but with g or i. The successive changes can be well seen in the double forms from the same original, jealous and zealous. Both of these come from a late Latin seclusus, derived from the imported Greek συκοσα. Much the earlier form is jealous; its initial sound is the dz which in later French is changed to 2 (voiced s). It is written gelous or telous by Wycliffe and his contemporaries, the form with i is the ancestor of the modern form. The later word zealous was borrowed after the French dz had become z. At the end of words this z was pronounced 2s as in the English assets, which comes from a late Latin ad saitis through an early French asea, the "enough." With 2 also is frequently written zh, the voiced form of s, as in attire, seizure. But it appears even more frequently as s before u, and as si or ti before other vowels in measure, decision, transition, &c., or in foreign words as g, as in rouge. For the 3 representing g and y in Scottish pronunciation we see under Y.

ZAANDAM (incorrectly Saardam), a town of Holland, in the province of North Holland, on the river Zaan, 6½ m. N.W. of Amsterdam, with which it is connected by railway and steamer. Pop. (1895) 23,773. It is of typically Dutch appearance, with low, brightly coloured houses. It has an important trade in timber, and numerous windmills in the vicinity provide power for oil, cement and paper works, timber-sawing and corn-grinding. At Zaandam is preserved the wooden hut which Peter the Great occupied for a week in 1697 while studying shipbuilding and paper-making.

ZABERN (French, Souverain), a town of Germany, in the imperial province of Alsace-Lorraine, district of Lower Alsace, situated on the Rhine-Marne canal at the foot of a pass over the Vosges, and 27 m. N.W. of Strasbourg by the railway to Deutsch-Avricourt. Pop. (1900) 8499. Its principal building, the former episcopal residence, rebuilt by Cardinal de Rohan in 1779, is now used as barracks. There are also a 13th century church and an antiquarian museum. Hence a beautiful road, immortalized by Goethe in Dichtung und Wahrheit, leads across the Vosges to Pforzheim.

ZABREZ, a town of Germany, in the extreme S.E. of Prussian Silesia, on the railway between Gleiwitz and Königsbitter. Pop. (1905) 55,634. Like other towns in this populous region, it is an important manufacturing centre, having coal-mines, iron, wire, glass, chemical and oil works, breweries, &c.

ZACATECAS, a state of Mexico, bounded N. by Durango and Coahuila, E. by San Luis Potosí, S. by Aguascalientes and Jalisco, and W. by Jalisco and Durango. Area, 24,777 sq. m. Pop. (1900) 462,100. It belongs wholly to the great central plateau of Mexico, with an average elevation of about 7700 ft. The state is somewhat mountainous, being traversed in the W. by lateral ranges of the Sierra Madre Occidental, and by numerous isolated ranges in other parts—Mazapil, Norillos, Guadalupe and others. There are no large rivers, only the dry river beds, and the rainfall is not frequent enough to prevent crop failure. There is a considerable production of peaches, apricots and grapes, the last being made into wine. A few cattle are raised, and considerable attention is given to the rearing of sheep, goats and swine. A natural product is guayule, a shrub from which rubber is extracted. The chief industry of Zacatecas, however, is mining for silver, gold, mercury, copper, iron, zinc, lead, bismuth, antimony and salt. Its mineral wealth was discovered soon after the conquest, and some of its mines are among the most famous of Mexico, dating from 1546. One of the most productive of its silver mines, the Alvarado, has records which show a production of nearly 1,000,000 lb. of silver between 1546 and 1677. The state is traversed by the Mexican Central and the Mexican National railways. Its manufactures are limited chiefly to the
reduction of mineral ores, the extraction of rubber from guayule, the making of sugar, rum, mescal, pulque, woolen and cotton fabrics, and some minor industries of the capital. The capital is Zacatecas, and the other principal towns are Sombrerete (pop. 10,000), an important silver-mining town 70 m. N.W. of the capital (elevation 8,430 ft.); Ciudad Garcia (about 9,500); Guadalupe (9,000); Pinos (8,000), a mining town; San Juan de Mezquital (900); and Fresnillo (6,000), an important silver- and copper-mining centre.

ZACATECAS, a city of Mexico, capital of the state of Zacatecas, 442 m. by the Mexican Central railway N.W. of Mexico city. Pop. (1900) 30,912. It is built in a deep, narrow ravine, 8050 ft. above sea-level, with narrow, crooked streets climbing the steep hillsides, and white, flat-roofed houses of four and five storeys overtopping each other. Its streets are well paved, and are lighted with electricity. The city is well drained and has a fine aqueduct for its water supply. The cathedral is an elaborately carved red-stone structure with unfinished towers and richly decorated interior. Several domed churches occupy prominent sites. The National College and the Colegio de Nuestra Senora de Guadalupe is the oldest of the principal religious buildings and may be noticed. Overlooking the city from an elevation of 500 ft. is the Bufa Hill, which is crowned by a chapel and is a popular pilgrimage resort. The Guadalupe chapel near the city has elaborate decorations, including frescoes, onyx steps, silver rails and paintings, and a curious tiled dome. The industries comprise carriage building, weaving and the manufacture of coarse pottery. The town is an important commercial centre.

Zacatecas was founded in 1546 and was built over a rich vein of silver discovered by Juan de Tolosa in the same year. The and other mines in the vicinity attracted a large population, and it soon became one of the chief mining centres of Mexico. It was a city in 1585 by Philip II.

ZACH, FRANZ XAVER, BARON VON (1754-1832), German astronomer, was born at Pesth on the 4th of June 1754. He served for some time in the Austrian army, and afterwards lived in London from 1783 to 1786 as tutor in the house of the Saxon minister, Count Brühl. In 1786 he was appointed by Ernest II. of Saxe-Coburg-Gotha director of the new observatory on the Seeberg at Gotha, which was finished in 1791. From 1806 Zach to the duke of Saxe-Coburg-Gotha travelled his fine library may be noticed. Overlooking the city from an elevation of 500 ft. is the Bufa Hill, which is crowned by a chapel and is a popular pilgrimage resort. The Guadalupe chapel near the city has elaborate decorations, including frescoes, onyx steps, silver rails and paintings, and a curious tiled dome. The industries comprise carriage building, weaving and the manufacture of coarse pottery. The town is an important commercial centre.

Zach was born in London in 1754. He was appointed by Ernest II. of Saxe-Coburg-Gotha director of the new observatory on the Seeberg at Gotha, which was finished in 1791. From 1806 Zach to the duke of Saxe-Coburg-Gotha travelled his fine library may be noticed. Overlooking the city from an elevation of 500 ft. is the Bufa Hill, which is crowned by a chapel and is a popular pilgrimage resort. The Guadalupe chapel near the city has elaborate decorations, including frescoes, onyx steps, silver rails and paintings, and a curious tiled dome. The industries comprise carriage building, weaving and the manufacture of coarse pottery. The town is an important commercial centre.

Zach published Tables of the Sun (Gotha, 1792; new and improved edition, ibid., 1804), and numerous papers on geographical subjects, particularly on the geographical positions of many towns and places in Germany. With such subjects his principal interest was, however, as editor of three scientific journals of great value: Allgemeine Geographische Ephemeriden (4 vols., Gotha, 1798-93), Monatliche Correspondenz zur Beforderung der Erd- und Himmels-Kunde (28 vols., Gotha, 1800-13, from 1807 edited by B. von Lindenau), and Correspondenz astronomique, géographique, hydrographique, et statistique (Genoa, 1818-26, 14 vols., and one number of the 15th suppressed at the instigation of the Jesuits).

ZACHARIAE VON LINGENTHAL, KARL SALOMO (1760-1843), German jurist, was born on the 14th of September 1760 at Meissen in Saxony, the son of a lawyer, and received his early education at the famous public school of St Afra in that town. He afterwards studied philosophy, history, mathematics and law at the university of Leipzig. In 1792 he went to Wittenberg University as tutor to one of the counts of Lippe, and continued his legal studies. In 1794 he became privatdozent, lecturing on canon law, in 1798 extraordinary professor, and 1802 ordinary professor. He died, after a few days' illness, on the 27th of June 1843, with the exception of a short period in which public affairs occupied him, he poured out a succession of works covering the whole field of jurisprudence, and was a copious contributor to periodicals. In 1807 he received a call to Heidelberg, then beginning its period of splendour as a school of law. There, resisting many calls to Göttingen, Berlin and other universities, he remained until his death. In 1820 he took his seat, as representative of his university, in the upper house of the newly constituted parliament of Baden. Though he himself prepared many reforms—notably in the harsh criminal code—he was, by instinct and conviction, conservative and totally opposed to the violent democratic spirit which dominated the second chamber, and brought it into conflict with the grand-duke and the German federal government. After the remodelling of the constitution in a "reactionary" sense, he was returned, in 1825, by the district of Heidelberg to the second chamber, of which he became the first vice-president, and in which he proved himself more "loyal" than the government itself. With the growth of parliamentary liberalism, however, he grew disillusioned with politics, from which he retired altogether in 1829. He now devoted himself wholly to juridical work and to the last days of his life toiled with the arduous of a young student. His fame extended beyond Germany. The German universities then enjoyed, in regard to legal questions of international importance, a jurisdiction dating from the middle ages; and Zachariae was often consulted as to questions arising in Germany, France and England. Elaborate "opinions," some of them forming treatise in the "Einkettte Staatstheik" and der Kirche mit Recht und Gauk, the Die Geschichte der deutschen Rechtsverfassung (1797), a work on the relations of church and state, with special reference to the constitution of the empire, which displayed the writer's power of analysis and his skill in making a complicated set of facts appear to be deductions from a few principles. In 1805 appeared Versuch einer allgemeinen Hermanns der Rechts; and in 1806 Die Wissenschaft der Gesetzegebung, an attempt to find a new theoretical basis for society in place of the political theories of Montesquieu and the "cataclysm" of the French Revolution. This basis he seemed to discover in something resembling Bentham's utilitarianism. Zachariae's last work was Verteilung des Staates (1855-58), to which his admirers point as his enduring monument. It is devoted to Montesquieu's "L'Esprit des lois, and covers no small part of the field of Buckle's first volume of the History of Civilization. But the work contains profound and interesting thoughts as to the future of the state and of law, it lacks logical sequence, and is, consequently, full of contradictions. Its fundamental theory is, that the state had its origin, not in a contract (Rousseau); but in the consciousness of a legal duty. What Machiavelli was to the Italians and Montesquieu to the French, Zachariae aspired to become to the Germans; but he lacked their patriotic inspiration, and so failed to exercise any permanent influence on the constitutional law of his country. Among other important works of Zachariae are his Staatsrecht, and his treatise on the Code Napoléon, of which several French editions were published, and which was translated into German. Zachariae was a man of many parts, and Joseph Mittermaier the Kritische Zeitschrift für die Reichswissenschaft und Gesetzgebung des Auslandes, and the introduction which he wrote illustrates his wide reading and his constant desire for new light upon old problems. His works were superseded, they were in their day epoch-making, and they have been superseded by books which, without them, could not have been written.

For an account of Zachariae and his works, see Robert von Mohl, Geschichte u. Literatur der Staatswissenschaften (1855-58); and Charles Brocher, K. S. Zachariae, sa vie et ses œuvres (1870); and Allgemeine Deutsche Biographie (vol. 44). See also Wilhelm Fischer, and Holtzendorff, Rechts-Lexicon, Zachariae von Lingenthal.

His son, KARL EDUARD ZACHARIAE (1812-1894), also an eminent jurist, was born on the 24th of December 1812, and studied philosophy, history, mathematics and languages, as well as jurisprudence, at Leipzig, Berlin and Heidelberg. Having
made Roman and Byzantine law his special study, he visited Paris in 1832 to examine Byzantine MSS., went in 1834 to St Petersburg and Copenhagen for the same purpose, and in 1835 worked in the libraries of Brussels, London, Oxford, Dublin, Edinburgh and Cambridge. After a few months as a practising lawyer and privadozent at Heidelberg, he went in 1837, in search of materials, to Italy and the East, visiting Athens, Constantinople and the monasteries of Mount Athos. Having a taste for a country life, and none for teaching, he gave up his position as extraordinary professor at Heidelberg, and in 1845 bought an estate in the Prussian province of Saxony. Here he lived, engaged in scientific agriculture and interested in Prussian politics, until his death on the 3rd of June 1894.

He produced an enormous mass of works of great importance for students of Byzantine law. The task to which he devoted his life was, to discover and classify the sources of Byzantine law hidden away in the libraries of the East and West; to re-edit, in the light of modern criticism, those sources which had already been published; to write the history of Byzantine law on the basis of this hitherto undiscovered material; and finally, to apply the results to the scientific elucidation of the Justinian law. His Just Graeco-Romanum, of which the first part was published in 1856, the last in 1903, is the best and most complete collection of the sources known hitherto, and of the period of Justin II. to 1453. On the general history of the subject he wrote two epoch-making works, the Historiae Graeco-Romanii juris de- lineatio, in two parts (Heidelberg, 1867), and Geschichte des griechisch-römischen Rechts. I. Personarecht; II. Handrecht; III. Die Geschichte des Sachenrechts und Obligationenrecht (Leipzig, 1856), the third edition of which appeared under the title Geschichte des griechisch-römischen Rechts (1892). In this last work, which covered ground hitherto unexplored, Byzantine law is treated as a development of Justinian law, and incidentally many obscure points in the economic and agrarian conditions of the Eastern empire are elucidated. For list of Zacharias' other works, see Allgem. Deutsche Biogr., art. by Wilhelm Fischer.

ZACHARIAS, ST, pope from 741 to 752, was a Greek by birth, and appears to have been on intimate terms with Gregory III., whom he succeeded (November 741). Contemporary history dwells chiefly on his great personal influence with the Lombard king Luitprand, and with his successor Rachis; it was largely through his tact in dealing with these princes in a variety of emergencies that the exarchate of Ravenna was rescued from becoming part of the Lombard kingdom. A correspondence, of considerable extent and of great interest, between Zacharias and St Boniface, the apostle of Germany, is still extant, and shows how great was the influence of this pope on events then passing in France and Germany: he encouraged the deposition of Childeric, and it was with his sanction that Boniface crowned Pippin as king of the Franks at Soissons in 752. Zacharias is stated to have remonstrated with the emperor Constantine Copronymus on the part he had taken in the Iconoclastic controversy, but died on the 14th of March 752, and was succeeded by Stephen II.

The letters and decrees of Zacharias are published in Migne, Patrolog. lat. xxxx. p. 917-960.

ZAGAZIG (Zahlazik), a town of Lower Egypt, capital of the province of Sharkia. Pop. (1907) 34,990, including 2617 Copts and 1353 Greeks. It is built on a branch of the Fresh Water or Ismailia canal, and on the Al-Moizz canal (the ancient Tantius channel of the Nile), and is 47 m. by rail N.E. of Cairo. Situated on the Delta in the midst of a fertile district, Zagazig is a great centre of the cotton and grain trade of Egypt. It has large cotton factories and the offices of numerous European merchants. About a mile south of the town are the ruins of Buhabas (q.v.).

ZÄHRINGEN, the name of an old and influential German family, taken from the castle and village of that name near Freiburg-im-Breisgau. The earliest known member of the family was probably one Bezelin, a count in the Breisgau, who was living early in the 11th century. Bezelin's son Bertold I. (d. 1078) was count of Zähringen and was related to the Hohenstaufen family. He received a promise of the duchy of Swabia, which he was not able to contest, from the young duke of Carinthia. Although this dignity was a titular one only Bertold lost it when he joined a rising against the emperor Henry IV. in 1072. His son Bertold II. (d. 1111), who like his father fought against Henry IV., inherited the land of the counts of Rheinfelden in 1090 and took the title of duke of Zähringen; he was succeeded in turn by his sons, Bertold III. (d. 1122) and Conrad (d. 1152). In 1127 Conrad inherited some land in Burgundy and about this date he was appointed by the German king, Lothair the Saxon, rector of the kingdom of Burgundy or Arles. This office was held by the Zähringens until 1218 and because they are sometimes called dukes of Burgundy. Bertold IV. (d. 1186), who followed his father Conrad, spent much of his time in Italy in the train of the emperor Frederick I.; his son and successor, Bertold V., showed his prowess by reducing the Burgundian nobles to order. This latter duke was the founder of the town of Bern, and when he died in February 1218 the main line of the Zähringen family became extinct. By extensive acquisitions of land the Zähringens had become very powerful in the districts now known as Switzerland and Baden, and when their territories were divided in 1218 part of them passed to the counts of Kyburg and thence to the house of Habsburg. The family now ruling in Baden is descended from Hermann, margrave of Verona (d. 1074), a son of Bertold I., and the grand-duke is the present representative of the Zähringens.

See E. J. Leichtlen, Die Zähringer (Freiburg, 1831); and E. Heyck, Geschichte der Herzöge von Zähringen (Freiburg, 1891), and Urkunden, Siegel und Wappen der Herzöge von Zähringen (Freiburg, 1851).

ZÄHRINGEN, a village of Germany, in the grand duchy of Baden, situated under the western slope of the Black Forest, 2 m. from Freiburg-im-Breisgau, and on the railway from Heidelberg to Basel. Pop. (1900) 1200. Above the village on a spur of the mountains, 1500 ft. above the sea, lie the ruins of the castle of Zähringen, formerly the stronghold of the ducal line of that name (see above).

See Schöpfelin, Historia Zaringo-Badensis (Karlsruhe, 1763-66).

ZAILA, or ZELLA; a town on the African coast of the Gulf of Aden, 124 m. S.W. of Aden and 200 m. N.N.E. of Harrar. Zaila is the most western of the ports of the British Somaliland protectorate, being 170 m. N.W. of Berbera by the coast caravan track. The town is surrounded on three sides by the sea; landward the country is unbroken desert for some fifty miles. The principal buildings, which date from the days of Egyptian occupation (1875-1884) are of white (coral) stone; the Somali dwellings are made of grass. Zaila has a good sheltered anchorage much frequented by Arab sailing craft, but heavy draught steamers are obliged to anchor a mile and a half from the town. Small trading boats lie off the pier and there is no difficulty in loading or discharging cargo. The water supply of the town is drawn from the wells of Takasha, about three miles distant; every morning camels, in charge of old Somali women and bearing goatskins filled with water, come into the town in picturesque procession. The population varies from 3000 to 7000, the natives, who come in the cool season to barter their goods, retiring to the highlands in hot weather. The chief traders are Indians, the smaller dealers Arabs, Greeks and Jews. The imports, which reach Zaila chiefly via Aden, are mainly cotton goods, rice, jawaree, dates and silk; the exports—which of 90 per cent. are from Abyssinia—are principally coffee, skins, ivory, cattle, ghee and mother-of-pearl.

Zaila owed its importance to its proximity to Harrar, the great entrepôt for the trade of southern Abyssinia. The trade of the port received, however, a severe check on the opening (1901-2) of the railway to Harrar from the French port of Jibuti, which is 35 m. N.W. of Zaila. A steamer from Aden to Zaila takes fifteen hours to accomplish the journey; caravans proceeding from Zaila to Harrar occupy from ten days to three weeks on the road.

For history and trade statistics, see SOMALILAND, BRITISH.

ZAIMUKHT, the name of a small Pathan tribe on the Kohat border of the North-West Frontier Province of India. The Zaimukhts inhabit the hills to the south of the Orakzais.
between the Miranazai and Kurrum valleys. Their country may be described as a triangle, with the range of hills known as the Samana as its base, and the village of Thal in the Kurrum valley as its apex. This includes a tract on its western side occupied by an Orakzai clan. The total area is about 400 sq. m., of which the Orakzais occupy a fourth. The Zalmukhats are a fine-looking powerful race, with a fighting strength of some 3000 men.

Zaire, a name by which the river Congo was formerly known. Zaire is a Portuguese variant of a Bantu word (nzaari) meaning river. In the 16th and 17th centuries the powerful native kingdom of Congo possessed both banks of the lower river, and the name of the country was in time given to the river also. Until, however, the last quarter of the 19th century "Zaire" was frequently used to designate the stream. It is so called by Canoens in the Lusiads. Since H. M. Stanley's discoveries "Congo" has become the general name for the river from its mouth to Stanley Falls, despite an effort on the part of Stanley to have the stream renamed Livingstone (see Congo, river.)

Zaisan, or Zaisansk, a town of Russian Central Asia, in the province of Semipalatinsk, near the Chinese frontier, at an altitude of 2200 ft. and near the S.E. corner of Lake Zaisan. Pop. (1897) 4471. Lake Zaisan, situated in an open valley between the Altai range on the north-east and the Tarbagatai on the south, lies at an altitude of 1355 ft. It has a length of 65 m., a width of 14 to 30 m., an area of 707 sq. m., and a maximum depth of 50 ft. Its water is fresh, as it receives the Irtysh and Kerulen rivers. It is crossed by several small streams from the west, all of which leave the lake at its north-west extremity by the White Irtysh. The fisheries, which yield abundantly, are in the hands of the Siberian Cossacks. The lake is generally frozen from the beginning of November to the end of April.

Zaleucus, of Locri Epizephyrii in Magna Graecia, Greek lawgiver, is supposed to have flourished about 660 B.C. The statement that he was a pupil of Pythagoras is an anachronism. Little is known of him, and Timaeus even doubted his existence, but it is now generally agreed that this is an error. He is said to have been the author of the first written code of laws amongst the Greeks. According to the common story, the Locrians consulted the Delphic oracle as to a remedy for the disorder and lawlessness that were rife amongst them. Having been ordered to make laws for themselves, they commissioned one Zaleucus, a shepherd and slave (in later tradition, a man of distinguished family) to draw up a code. The laws of Zaleucus, which he declared had been communicated to him in a dream by Athena, the patron goddess of the city, were few and simple, but so severe that, like those of Draco, they became proverbial. They remained essentially unchanged for centuries, and the Locrians subsequently enjoyed a high reputation as upholders of the law. One of the most important provisions was that the punishment for different offences was definitely fixed, instead of being left to the discretion of the judge before whom a case was tried. The penalty for adultery was the loss of the eyes, and in general the application of the lex talionis was enjoined as the punishment for personal injuries. Special enactments concerning the rights of property, the alienation of land, settlement in foreign countries, and various sumptuary laws (e.g., the drinking of pure wine, except when ordered medicinally, was forbidden) are attributed to him. After the code was firmly established, the Locrians introduced a regulation that, if a citizen interpreted a law differently from the cosmopolis (the chief magistrate), each had to appear before the council of One Thousand with a rope round his neck, and the one against whom the council decided was immediately strangled. Any one who proposed a new law or the alteration of one already existing was subjected to the same test, which continued in force till the 4th century and even later. Zaleucus is often confused with Charondas, and the same story is told of their death. It is said that one of Zaleucus's laws forbade a citizen, under penalty of death, to enter the senate-house bearing a weapon. During the stress of war, Zaleucus violated this law; and, on its being pointed out to him, he committed suicide by throwing himself upon the point of his sword, declaring that the law must be vindicated.

See Bentley, Dissertation on the Epistles of Phalaris; F. D. G. De Vries, Charondas, Pythagoras (1858); G. Busolt, Griechische Geschichte, i.; Schol. ad Pandar. Ox. x. 17; Strabo ii. p. 259; Diod. Sic. xii. 20, 21; Demosthenes, In Timocretam, p. 747; Stobaeus, Florilegium, xiv. 20, 21, where the supposed Greek of Zaleucus is quoted, 744 F.; Eustathius of Thessalonica (v. 505), who attributes the death of Zaleucus to a bolt of lightning; Suidas, s.v., who makes him a native of Thrace; Cicero, De Legibus, ii. 6. See also article GREEK LAW.

Zalmonias, or Zolmonisis, a semi-mythical social and religious reformer, regarded as the only true God by the Thracian Getae. According to Herodotus (v. 94), the Getae, who believed in the immortality of the soul, looked upon death merely as going to Zalmonias. Every five years they selected by lot one of the tribesmen as a messenger to the god. The man was thrown into the air and caught upon the points of spears. If he did not die, he was considered unfit to undertake the mission and another was chosen. By the euhemeristic Hellenspontine Greeks Herodotus was told that Zalmonias was really a man, formerly a slave of Pythagoras at Samos, who, having obtained his freedom and amassed great wealth, returned to Thrace, and instructed his fellow-tribesmen in the doctrines of Pythagoras and the arts of civilization. He taught them that they would pass at death to a certain place, where they would enjoy all possible benefits for all eternity, and to convince them of this he had a subterranean chamber constructed, the fortune of which was to continue for three years. Herodotus, who declines to commit himself as to the existence of Zalmonias, expresses the opinion that in any case he may have lived long before the time of Pythagoras. It is probable that Zalmonias is Sabazius, the Thracian Dionysus or Zeus; Mnaseas of Patrae identified him with Cronus. In Plato (Charides, 138 B) he is mentioned with Abaris as skilled in the arts of incantation. No satisfactory etymology of the name has been suggested.

Zamakhshari [Abū-Jā‘īsī Muḥammad ibn ‘Umar-uz-Zamakhsharī (1079-1153, Arabian theologian and grammarian, was born at Zamakhshar, a village of Khwarzim, studied at Bokhara and Samarkand, and enjoyed the fellowship of the jurists of Bagdad. For many years he stayed at Mecca, from which circumstance he was known as Jārūllāh ("God's client "). Later he returned to Khwarzim, where he died at the capital Jurjānyīa. In theology he was a pronounced Mo‘tāzilīte (see MAHOMMEDAN RELIGION: sects Sects). Although he used Persian for some of his works he was a strong supporter of the superiority of the Arabic language and an opponent of the Qādirī movement. Zamakhshari’s fame as a commentator rests upon his commentary on the book al-Kashf al-Bashiri ("the Revealer "). In spite of its Mo‘tāzilīte theology it was famous among scholars and was the basis of the widely-read commentary of Baidāwī (q.v.). It has been edited by W. Nassau Lees (Calcula, 1856), and has been printed at Cairo (1890). Various glosses on it have been written by different authors. His chief grammatical work is the Kitāb ul-muṣafājat, written about 1120 and edited by J. B. Broch (2d ed., Christiania, 1879). Many commentaries have been written on this work, the fullest being that of Ibn Yā‘īsh (d. 1243), edited by G. Jahn (2 vols., Leipzig, 1876-1886).

Zambesi, the fourth in size of the rivers of Africa, and the largest of those flowing eastwards to the Indian Ocean. Its length (taking all current variations into consideration) is about 2200 m. The area of its basin, according to Dr Bludau, is 313,500 sq. m.,
or rather than less than half that of the Nile. The main channel is clearly marked from beginning to end. The river takes its rise in 11° 21' 3" S., 24° 22' E. The source lies in British territory in a depression of an undulating country 5000 ft. above the sea, covered with bracken and open forest. The water, like that of all the rivers of the neighbourhood, issues from a black-marble cleft, and is of a beautiful clear, wine-coloured, well-defined water. In the first hundred miles of its course the river is known as the Zambezi—its sound almost identical with its name in its lower course, though intervening sections are known as Liami-bese, Lianriamb, &c. Eastward of the source the water-parting between the Congo and Zambezi basins is a well-marked belt of high ground, falling abruptly north and south, and running nearly east and west between 11° and 12° S. This distinctly cuts off the basin of the Luapula (the main branch of the upper Congo) from that of the Zambezi. In the neighbourhood of the source, however, the water-parting is not so clear, but the two river systems do not connect. The Upper River.—The infant Zambezi, after pursuing a southerly course for about 150 miles, turns more directly south and, soon after the 12° S. is crossed, is joined by a stream (coming from the west and waters of a much larger stream than the Kambombo, 4000 ft. above sea-level in 11° 59' 20" S., 22° 10' E.), Lake Dilolo was at one time believed to communicate with the Kasai river, one of the great affluent of the Congo flowing north-west, but this is not the case. Lake Dilolo is one of the few waterfalls. Between it and the two gorges the river is generally unobstructed, but at the western end of the second Kariba navigation is difficult. Above the Shire (gorges) the Luapula and the Kafukwe (also called Katwe) are deflected and the river divides into a number of small tributaries of the Zambezi. The Kafukwe joins the main river in 15° 57' S. in a quiet deep stream about 200 yards wide. From this point the northward up of numberless branches and the stream continues due east. At the confluence of the Luapanga (15° 57' S.) it enters Portuguese territory, and from this point to the sea both banks of the river belong to that kingdom. At the Kebrabasa Rapids, 50 miles below the Victoria Falls, the Zambezi is sharply deflected to the south, the river at this point breaking through the continental escarpment to receive the sea. The Kebrabasa Rapids, which occurred about 45 miles above the Victoria Falls, are absolutely navigable, and with a wind of 25 knots the Zambezi as definitely ends as does the upper river at the Victoria Falls.

The Lower River.—The lower Zambezi—500 miles from Kebrabasa to the sea—presents no obstacles except the shallowness of the stream in many places in the dry season. This shallowness arises from the difference of the character of the river basin, being the southern branch of the Zambezi, flowing mainly through hilly country with well-defined basins, the river traversing a broad valley and spreads out over a large area. Only at one point, the Lupata Gorge, 200 miles from its mouth, is the river confined between high banks. The river itself is from 3 to 5 m. wide, flowing gently in many streams. The river-bed is sandy, the banks are low and reed-fringed. At places, however, and especially in the rainy season, the streams unite into one and the swift-flowing river is about 100 m. wide. The Zambezi receives the drainage of Lake Nyasa through the river Shiré. On approaching the ocean, which it reaches in 18° 50' S., the channel is still well-marked, and the river has a waterway, although its depth at any given time is small. At the Victoria Falls, 60 miles further north is a river called the Qua-Qua or Quellimane, from the town founded by the Portuguese at its mouth. This stream, which is sitting up, receives a considerable amount of water from the upper river.

The region drained by the Zambezi may be represented as a vast broken-edged plateau 3000 or 4000 ft. high, composed in the greater part of the interior of the continent the Zambezi, like all other large African rivers, in greater or less degree, suffers on account of the bar at its mouth, the shallowness of its stream, and the rapids and cataracts which interrupt its course. Nevertheless its importance to commerce is immense. In the southern part of the river, the cataracts, rapids, and sand-bars are numerous, but the course continues as far as the Victoria Falls in 11° 57' S., the point where the river flows out of the plateau, and below it continues as far as the mouth. The river flows swiftly through the gorge, the current being continually interrupted by reefs. West of the gorge are a succession of rapids, amongst which are a few that are difficult, and which caused the early navigators to name them the Victoria Falls. In this distance the fall of the river is 500 ft. From the Devil's Gorge the Zambezi takes a decided trend north whilst still pursuing its general easterly course. For the next 700 miles, until it reaches the Luapula, the Zambezi River is well defined and occasionally rocky banks. Besides the rapids already mentioned there are several others in the middle stretch of the river. The rapids are not particularly abrupt, and consist in most cases of small cascades on a gently sloping bed. They are not capable of being navigated. The possibility of connecting the
Kwando with the navigable waters of the Okavango, at the point where the overflow mentioned below takes place, has likewise been suggested. The Shiri is also navigable for a considerable distance. The sum of such navigable reaches within the Zambezi basin as Extensively known is nearly 4000 m.

**Tributaries.**—The tributaries of the Zambezi are very numerous. The course of the more important streams is as follows: The Kabombo, which flows in from the east about 45° 50' E., enters the Zambesi river in high land which forms the eastern watershed between the Zambezi and Congo systems. In 13° S. it receives on the right bank a tributary, the Lunga, said to be formed by the jointing of two streams which unite itself, and which is a tributary somewhat farther north. The Lungwebungu, which enters the Zambezi from the west in 14° 35' S., is a strong, deep stream 200 yds. wide in its upper course, flowing in a valley bordered by undulation and thick forest, its floor forming at times an inundated plain 2 to 3 m. wide.

The Zambezi, largest of the western affluents of the Zambezi, formerly known as Uggha and from it is spoken of as the Livingstone, is the most ruined capital of the Makoloko, situated on its lower course, rises in about 12° 40' S., 18° 50' E., and flows in a generally straight course south-east to 17° 30' S., at which point it makes a sudden bend to the north. In this eastward stretch the Kwando for some 70 m. flows through a vast reedy swamp or lake studded with alluvial islands. Apart from its head-streams, it receives most of its tributaries on its right bank, and most of its affluents on its more to the north, the Magwe'-kwana, which in time of flood receives some of the surplus water of the Okavango (see Ngami). This surplus water, received afterwards by the Gaborone, has passed the level of the lake and holds up the waters of the Kwando for some miles above it.

The streams which enter the upper Zambezi from the east, the largest of which rises in the Luangwa, which rises in 16° 55' S., 26° E., and flows first north-west, afterwards west-south-west, joining the main river a little north of 15° S. Others are the Nkoko joining in 17° 8' S., the Machili, which enters in about 25° E., the Luvungi, 18° 45' S., and the Umguze, 18° 32' S. The largest tributary of the middle Zambezi—the Kafue—rises in about 11° 35' S. at an elevation of 4000 ft. in thick forest country. The main river, after flowing for a distance of 165 m. and about 400 m. to the west, is joined in 14° 35' S. by the Lunga or Luangwa, an important right-bank tributary, the united stream then flowing first south, afterwards due east. The lower Kafue is a large navigable river until about 40 m. from its mouth, then descending by the sudden plunge of the plateau by a series of falls and cataracts, the drop being over 1000 ft. in 15 m., one very high fall occurring in a stupendous cataract. The next great tributary to the east is the Luangwa (also called Luangwa) which in its upper course runs parallel to the western shores of Lake Nyasa, having its source not far from the north-west corner of the lake. The main stream flows in a generally level valley, bounded by steeply sloping uplands, and is for the most part shallow and rapid, though fairly wide. In 14° 30' S., however, it passes through narrow gorges with a speed of 8 or 9 m. an hour. In 15° 5' S. it is joined by the Lusumu, which, with its tributaries, drains nearly the whole western half of the western half of theLuangwa. The Luangwa joins the Zambezi a little above the town of Zombo, some distance (40 m.) from the mouth of the river from the southern portion between Portuguese and British territory. From the south the middle Zambezi receives various rivers which water northern Matabele and Mashona lands—namely, the Shangani, Sanyati, and Hanyangwe besides minor streams. The Mazoe, which also rises in Mashonaland, joins the Zambezi below the Kebrabasa Rapids.

**Exploration of the River.**—The Zambezi region was known to the medieval geographers as the empire of Monomotapa and the course of the river, as well as the position of Lakes Ngami and Nyasa, was filled in with a rude approximation to accuracy in the earlier maps. These were probably constructed from Arab information. The first European to visit the upper Zambezi was David Livingstone in his exploration from Bechuanaland between 1851 and 1853. Two or three years later he descended the Zambezi to its mouth and in the course of this journey discovered the Victoria Falls. During 1858–60, accompanied by Dr. (afterwards Sir) John Kirk, Livingstone ascended the Zambezi and its tributaries, and in the course of his journey tracing the course of its tributary the Shiri and discovering Lake Nyasa. For the next thirty-five years practically no additions were made to our knowledge of the river system. In 1888 the entrance of vessels from the sea was much facilitated by the discovery by Mr. D. J. Rankin of the Chinde channel north of the main mouths of the river. Major A. St. Hill Gibbons and his assistants, during two expeditions, in 1895–96 and 1898–99, ably continued the work of exploration begun by Livingstone in the upper basin and central course of the river. Of non-British travellers Major Serpa Pinto examined some of the western tributaries of the river and made measurements of the Victoria Falls (1828). Steamers had been used on the lower river—the "Ma-Robert" and the "Pioneer"—by the Livingstone expedition of 1858–61, but the utilization of the Zambezi as a commercial highway was insufficient until after the discovery of the Chinde mouth. The first steamer placed on the river above the Kebrabasa Rapids was the "Constance" launched by the Gibbons expedition at Chikoa in September 1858. She steamed to beyond the Guay confluence, and being ultimately supplanted by a new vessel, was used to carry goods on the middle Zambezi. The first steamer placed on the river above the Victoria Falls was the "Livingstone," launched in August 1902.

See David and Charles Livingstone, Narrative of an Expedition to the Zambezi and its Tributaries (1866); A. de Serpa Pinto, How I Crossed Africa (1881); D. J. Rankin in Proc. R. G. S. (March, 1890); A. Sharpe, ibid. (December, 1890); H. S. Bivor, "Curso medio do Zambeze," B. S. G. Litaba, vol. xxiv. (1906); G. W. Lamplugh in Geo. Jnl., vol. xxxi. (1908); F. ZAMBOANGA, the capital of the Moro Province, and of the District (or Comandancia) of Zamboanga, and a port of entry, on the island of Mindanao, Philippine Islands, at the S. extremity of the western peninsula. Pop. (1903) 3281; of the comandancia, 26,692. Zamboanga has one of the most healthful sites in the islands, its climate being decidedly cooler than that of Manila. Since the American occupation the trade has greatly increased and various improvements have been planned. The town is an excellent fishing port, with good docks, piers, and wharves. It is connected by road with the interior, and has telegraphs, electric lights, good houses, better facilities for docking, piers, bridges, and public parks. The Provincial Capitol, one of the finest public buildings in the Philippines, was completed in 1908. There is considerable valuable timber in the vicinity, live-stock is extensively raised, and rice, copra, hemp, sugar-cane, tobacco, and sweet potatoes are other important products. Zamboanga was one of the oldest Spanish settlements in the islands, it having been taken and fortified as a base against the Moros, and it still contains an old stone fort. Many of the inhabitants are descendants of Moros who escaped from the Moslem and sought Spanish protection. A Spanish patiño, called "Zamboangueso," is spoken by most of the native inhabitants.

ZAMINDAR, or ZEMINDAR (from Persian zaman = "land"), an Indian landholder. In official usage the term is applied to any person, whether owner of a large estate or cultivating member of a village community, who is recognized as possessing some property in the soil, as opposed to the ryot (q.v.), who is regarded as having only a right of occupancy, subject in both cases to payment of the land revenue assessed on his holding. The zamindari system obtains throughout northeastern and central India, and also in the permanently settled estates of Madras.

The raja of Benares had certain special rights as zaminder, and in 1910 it was arranged to make part of his "family domain" a new native state with an area of 887 sq. m. (pop. 362,000).

ZAMINDAWAR, a district of Afghanistan, situated on the right bank of the Helmund river to the N.W. of Kandahar, bordering the road which leads from Kandahar to Herat via the Kandahar to Kandahar road. The Zamindawar district is a thinly populated, and fertile valleys watered by important affluents of the Helmund. The principal town is Musa Kala, which stands on the banks of a river of the same name, about 60 m. N. of Girishk. The whole of this region is a well-known hotbed of fanaticism, the headquarters of the Achakzais, the most aggressive of all Durani tribes. It was from Zamindawar that much of the strength of the force which besieged Kandahar under Ayub Khan in 1880 was derived; and it was the Zamindar
dawar contingent of tribesmen who so nearly defeated Sir Donald Stewart's force at Ahmad Khel previously. The control of Zamindawar may be regarded as the key to the position for safeguarding the route between Herat and Kandahar.

**ZAMORA**, an inland province of north-western Spain, one of the three into which the former province of Leon has since 1833 been divided; bounded on the W. by Portugal and Orense, N. by Leon, E. by Valladolid, and S. by Salamanca. Pop. (1900) 275,545; area, 4,097 sq. m. Zamora is traversed from east to west by the river Duero or Douro (q.v.), which receives with the Grijalba and Valderas the Agueda on the right and the Guareña on the left; the Turmes also skirts the south-western boundary for some 25 m. Except in the north-west, where it is entered by two outlying ridges of the Cantabrian Mountains, the Sierra de la Culebra and Sierra de Peña Negra, the surface consists of a level or slightly undulating plateau; its lowest point is 170 ft. above sea-level. Its plains, especially the valley of the Esla, yield large quantities of grain and pulse; wine and flax are also produced; and on the higher grounds large numbers of merino sheep and goats are reared, chiefly for export to Portugal. The manufactures of Zamora are unimportant, the most important are woollen cloths and lace, produced in Salamanca on the S., and Medina del Campo on the E., traverse the province and meet at the city of Zamora; there is a lack of good roads, and it is largely for this reason that the mines and extensive forests are neglected. The only towns with more than 5000 inhabitants are Zamora (pop., 1900, 16,287) and Toro (8379), which are described in separate articles. The people of the province are very poor, badly educated, and lacking in enterprise. (See also Leon.)

**ZAMORA**, an Episcopal city, and the capital of the Spanish province of Zamora, on the right bank of the river Duero (Douro), and at the junction of railways from Salamanca, Medina del Campo and Astorga. Pop. (1900) 16,283. Zamora occupies a rocky height overlooking the Duero, a little below its confluence with the Valderaduey. The river is crossed by a fine 14th-century bridge of sixteen pointed arches. The citadel of Zamora dates from the 8th century. The small but beautiful cathedral, one of four 12th-century churches in the city, is a Romanesque building, with a square tower, a dome above the crossing, and an elaborately-decorated interior. It was completed about 1175, and contains some interesting medieval tombs, and paintings by Fernando Gallegos (1475-1550). The other principal buildings are the 14th-century town-hall, the palace of the provincial assembly, a hospital with curious Gothic windows, an ecclesiastical seminary, and a school of engineering. The trade is chiefly agricultural, but linen and woollen goods, pottery, hats, leather, and spirits are manufactured in small quantities.

In the early period of the Christian re-conquest Zamora, from its position on the north bank of the Duero, was a place of considerable strategic importance. It was taken from the Moors by Alphonso I. of Leon in 748, but was again held by them for short periods in 813, 930, 963, 984 and 986. It was entirely repaired by Ferdinand I. of Castile and Leon, who in 1061 gave it to his daughter Doña Urraca. After his death in 1065 his son Sancho II. deserted possession with Urraca and laid siege to the city, but without success, although the famous Ruy Diaz de Bivar was among his warriors, and indeed at this time received his title of "The Cid." Zamora became subject to Alphonso VI. in 1073.

**ZAMOYSKI, JAN** (1541-1609). Polish statesman, was the son of George Zamoyski and grandson of Stanislaus of Chelm, and Anna Herbutowna, who belonged to one of the most ancient and illustrious families in Poland. After completing his education at Paris, Strasbourg, and at Padua, where as rector of the academy he composed his celebrated work *De senatu romano* (Venice, 1563), he returned home in 1565, one of the most consummate scholars and jurists in Europe. His essentially bold and practical genius sought at once the stormy political arena. He was mainly instrumental, after the death of Sigismund II., in remodelling the Polish constitution and procuring the election of Henry of Valois. After the flight of that prince Zamoisy seems to have aimed at the throne himself, but quickly changed his mind and threw all his abilities into the scale in favour of Stephen Báthory and against the Austrian influence. By his advice, at the beginning of January 1576 a diet was summoned to Jedrzejow to confirm the election of Báthory, and from the time of that monarch's arrival in Poland till his death ten years later Zamoisky was his foremost counsellor. Immediately after the coronation, on the 1st of May 1576, Zamoisky was appointed chancellor, and in 1580 wielki hetman, or commander-in-chief, of the Polish army. As such he was the first of the highest dignity in the Polish kingdom. He strenuously supported Stephen during his long struggle with Ivan the Terrible, despite the obstruction and parsimony of the diet. He also enabled the king in 1585 to bring the traitorous Samuel Zborowski to the scaffold in the face of a determined resistance from the nobility. On the death of Stephen, the Zborowski recovered their influence and did their utmost to keep Zamoisky in the background. Their violence prevented the "pasha," as they called him, from attending the convention summoned to Warsaw on the death of Báthory; but at the subsequent election diet, which met at Warsaw on 20th January 1587, and at which the Zborowiski, and intrenched himself with his partisans in what was called the Black Camp in contradistinction to the General Camp of the Zborowski. Zamoisky was at first in favour of a member of the Báthory family, with which he was united by ties of amity and mutual interest; but on becoming convinced of the impossibility of any such candidate, he pronounced for a native Pole, or for whichever foreign prince might he found most profitable to Poland. The Habsburgs, already sure of the Zborowski, bid very high for the support of Zamoisky. But though he was offered the title of prince, with the Golden Fleece, and 200,000 ducats, he steadily opposed the Austrian faction, even at the imminent risk of a civil war; and on the 15th of August procured the election of Sigismund of Sweden, whose mother was Catherine Jagiellonica. The opposition party immediately elected the Austrian Archduke Maximilian, who thereupon made an attempt upon Cracow. But Zamoisky traversed all the plans of the Austrian faction by routing the archduke at the battle of Byczyna (January 24, 1588) and taking him prisoner. From the first there was a certain coldness between the new king and the chancellor. Each had his own plan for coping with the difficulties of the situation; while Zamoysky regarded the Habsburgs with suspicion, Sigismund III. was disposed to act in concert with them as being the natural and strongest possible allies for a Catholic power like Poland. Zamoysky feared their influence upon Poland, which he would have made the head of the Slavonic powers by its own endeavours. Zamoysky was undoubtedly most jealous of his dignity; his patriotism was seldom proof against private pique; and he was not always particular in his choice of means. Thus at the diet of 1586 he prevailed over the king by threatening to leave the country defenceless against the Turks, if in the elections the Austrians were not excluded from the succession. In general, however, his Turkish policy was sound, as he consistently adopted the Jagiellonic policy of being friendly with so dangerous a neighbour as the Porte. His views on this head are set out with great force in his pamphlet, *La defaite des Tartares et Turcs* (Lyons, 1590). The ill-will between the king and the chancellor reached an acute stage when Sigismund appointed an opponent of Zamoyski vice-chancellor, and made other ministerial changes which limited his authority; though ultimately he had the aid of his partisans and the adoption of desperate expedients as the summoning of a confederation to annul the royal decrees in 1592, Zamoyski recovered his full authority. In 1595 Zamoyski, in his capacity of commander-in-chief, at the head of 8000 veterans dethroned the anti-Polish hospodar of Moldavia and installed in his stead a Catholic convert, George Mohila. On his return he successfully sustained in his camp at Cezora a siege by the Tatar khans. Five years later (October 20, 1600) he won his greatest victory at Ter-goist, when with a small well-disciplined army he routed
Michael the Brave, hospodar of Walachia and Moldavia. But beyond securing the Polish frontier Zamoysky would never go. He refused to wage war with Turkey even under the most favourable circumstances, nor could he be drawn into the Holy League against the Ottomans in 1600. When pressed by the papal legate and the Austrian envoys to co-operate at the head of all the forces of the league, he first demanded that in case of success Moldavia, Walachia and Bessarabia should fall to Poland, and that she should in the meantime hold Olmutz and Breslau as guarantees. The refusal of the Austrians to accede to his demand fully justified Zamoysky's suspicion that the league would use Poland as a cat's-paw, and the negotiations came to nothing. Statesman though he was, Zamoysky cannot, however, be called a true patriot. Polish historians, dazzled by his genius and valour, are apt to overlook his quasi treasonable conduct and blame Sigismund III, for every misadventure; but there can be no doubt that the king took a far broader view of the whole situation when he attempted to reform the Polish constitution in 1605 by strengthening the royal power and deciding all measures in future by a majority of the diet. To this project, however, he did not live to see the issue.

The last speech he delivered was in favour of the anarchical principle of free election. He died suddenly at Zamosc on the 3rd of June 1605.

ZANARDELLI, GIUSEPPE (1826-1903), Italian jurisconsult and statesman, was born at Brescia on the 29th of October 1826. A combatant in the volunteer corps during the war of 1848, he returned to Brescia after the defeat of Novara, and for a time earned a livelihood by teaching law, but was molested by the Austrian police and forbidden to teach in consequence of his refusal to contribute pro-Austrian articles to the press. Elected deputy in 1859, he received various administrative appointments, but only attained a political office in 1876 when the Left, of which he had been a prominent and influential member, came into power. Minister of public works in the first Depretis cabinet of 1876, and minister of the interior in the Cairoli cabinet of 1878, he in the latter capacity drafted the franchise reform, but created the discontent of its administrative acts, particularly in regard to the Irredentist agitation, and by his theory of repressing and not in any way preventing crime, which led for a time to a perfect epidemic of murders. Overthrown with Cairoli in December 1878, he returned to power as minister of justice in the Depretis cabinet of 1881, and succeeded in completing the commercial code. Abandoned by Depretis in 1883, he remained in opposition until 1887, when he again joined Depretis as minister of justice, retaining his portfolio throughout the ensuing Crispi ministry until the 31st of January 1891. During this period he promulgated the Criminal Code, and began the reform of the magistracy. After the fall of the Giolitti cabinet in 1893, Zanardelli made a strenuous but unsuccessful attempt to form an administration. Elected president of the chamber in 1894 and 1896, he exercised that office with ability until, in December 1897, he accepted the portfolio of justice in the Rudini cabinet, only to resign in the following spring on account of dissensions with his colleague, Visconti Venosta, over the measures necessary to prevent a recurrence of the tumults of May 1898. Returning to the presidency of the chamber, he again abandoned his post in order to associate himself with the obstructionist campaign against the Public Safety Bill (1899-1900), and was rewarded by being enabled to form an administration with the support of the Extreme Left upon the fall of the Saracco cabinet in February 1901. He was unable to achieve much during his last term of office, as his health was greatly impaired; his Divorce Bill, although voted in the chamber, had to be withdrawn on account of the strong opposition of the country. He retired from the administration on the 2nd of November 1903, and died on the 21st of December following.

ZANELLA, GIACOMO (1829-1888), Italian poet, was born at Chiampo, near Vicenza, on the 9th of September 1829, and was educated for the priesthood. After his ordination he became professor at the lyceum of his native place, but his patriotic sympathies excited the jealousy of the Austrian authorities, and although protected by his diocesan, he was compelled to resign in 1853. After the liberation of Venetia, the Italian government conferred upon him a professorship at Padua, and he achieved distinction as a poet on the publication of his first volume of poems in 1868. In 1872 grief for the death of his mother occasioned a mental malady, which led to the resignation of his professorship. After his complete and permanent recovery he built himself a villa on the bank of his native river, the Astichello, and lived there in tranquillity until his death on the 17th of May 1888. His last published volume contains a series of sonnets of singular beauty, addressed to the river, resembling Wordsworth's "Sonnets to the Dodder," but more perfect in form; and a blank verse idyll, "Il Pettrioso" ("The Redbreast"), bearing an equally strong, though equally accidental, resemblance to the similar compositions of Coleridge. The divinity of Dante, and the setting of his poetry, are distinguished by great dignity. Of his other compositions, the most individual are those in which, deeply impressed by the problems of his day, he has sought to reconcile science and religion, especially the fine dialogue between Milton and Galileo, where the former, impressed by Galileo's predictions of the intellectual consequences of scientific progress, resolves "to justify the ways of God to man." Zanella was a broad-minded and patriotic ecclesiast, and his character is justly held in equal honour with his poetry, which, if hardly to be termed powerful, wears a stamp of peculiar elegance and finish, and asserts a place of its own in modern Italian literature.

ZANESVILLE, a city and the county-seat of Muskingum county, Ohio, U.S.A., on the Muskingum river, at the mouth of the Licking river, about 60 m. E. of Columbus. Pop. (1890) 21,000; (1900) 23,538, of whom 1435 were foreign-born; (1910, census) 28,026. Zanesville is served by the Baltimore & Ohio, the Pennsylvania, the Cleveland, Akron & Columbus, the Ohio River & Western, the Wheeling & Lake Erie, the Zanesville & Western, and the Ohio & Little Kanawha (D. & O. system) railways, by a belt line around the city, and by 600 miles of electric, and the 40-m. East & West electric railway. By an increase of lines by a series of locks and dams the Muskingum river has been navigable for small vessels to the Ohio and above Zanesville to Dresden, where connexion is made with the Ohio Canal extending north to Cleveland. Within the city limits the Muskingum is crossed by seven bridges (including a notable concrete Y bridge) and the Licking by two. The business districts of the city lie on both sides of the two rivers; the residential districts being chiefly on the hills to the north and west. Among the principal buildings are the Federal building, the county court-house, the Soldiers and Sailors Monumental Building, containing a large auditorium, the Masonic and Oddfellows' temples, the Market building, containing city offices, a National Guard armoury, the John McIntire public library, the John McIntire Children's Home (1880), the Helen Purcell home for women, the county infirmary, the Bethesda Hospital (1890), and the Good Samaritan hospital (1902; under the Franciscan Sisters). The John McIntire public library (about 20,000 volumes) is a consolidation of the Zanesville Athenacum (1827) and the Eunice Buckingham library of the former Putnam Female Seminary (1835) here; Andrew Carnegie contributed $50,000 for the erection of the present building. John McIntire (1759-1815), one of the early settlers, provided by will for the maintenance of a school for poor children, and such a school was maintained from 1836 to 1856, when it was transferred to the city school system, annual contributions being made from the fund for poor children; later the McIntire Home was founded, and in 1902 donations to the city school system were discontinued and the entire revenues of the estate devoted to the maintenance of the Home, which is a model of its kind. Zanesville is an important centre for the
manufacture of art and domestic pottery, plain and ornamental tile, building and paving bricks, and other clay products. In 1905 it ranked sixth among the cities of the country in the amount of pottery produced, and third in the degree of the specialization of that industry. In 1905 the value of all factory products was $7,047,637, of which $1,144,834 (16.2 per cent) represented pottery, terra-cotta, and fireclay products.

Zanesville was first settled in 1800 by Ebenezer Zane (1747–1811) of Wheeling, Virginia (see Zane), and his brother Jonathan, who was also a veteran of the Revolution. Jonathan Zane and McIntire selected the land at the point where the new road crossed the Muskingum river. The settlement was first called Westbourne and later was named Zanesville; a post office was established in 1802. Zanesville became the county-seat upon the creation of Muskingum county in 1804, was the capital of the state from 1810 to 1812, was incorporated as a town in 1814, and was chartered as a city in 1830.

ZANGWILL—ZANY

ZANGWILL, Israel (1864– ), Jewish man of letters, was born in London on the 14th of February 1864. His early childhood was spent in Plymouth and at Bristol, where he received his first schooling. He was in his ninth year when his parents settled in Spitalfields, and he entered the Jews' Free School, where eventually he became a teacher. Concurrently with his teaching work he took his degree with honours at London University. He had already written a fantastic tale entitled The Premier and the Painter in collaboration with Louis Cowen, whom he then shared a room with and taught as a teacher along with the school managers and ventured into journalism. He founded and edited Ariel, The London Puck, and did much miscellaneous work on the London press. He made his literary reputation with a novel, The Children of the Ghetto (1892), which was followed by Ghetto Tragedies (1893); The Master (1893); Dreamers of the Ghetto (1898); The Mantle of Elijah (1901); and other tales and novels of great interest dealing with Jewish life. Children of the Ghetto was produced in a play in New York with success in 1899, and has since been extensively played both in English and Yiddish. Others of his plays are: Merely Mary Ann, played at the Duke of York's theatre; and The Serio-Comic Governor; Nurse Marjorie; and The Melting Pot, all produced in New York. Mr Zangwill was the founder of the International Jewish Territorial Organization (see Zionism).

ZANTE (anc. Zanciuthus), an island of Greece, one of the Ionian group, in the Ionian Sea, in 37° 40' N. lat. and 21° E. long., is 25 m. long, about 12,500 m. wide, and has an area of 277 sq. m., and a population in 1907 of 42,502. Zante lies 8 m. S. of Cephalonia, forming with it, Leucas and Ithaca a crescent-shaped insular group, which represents the crests of a submerged limestone ridge facing the Gulf of Patras. Zante is of somewhat irregular oval shape, with its main axis disposed in the direction from north-west to south-east, and indented by a deep inlet at its southern extremity. The surface is mainly occupied by an extensive and highly productive central plain, skirted on the west side by a range of bare limestone hills from 1000 to 1200 ft. high, which fall gently landwards, but present bold steep cliffs towards the sea, and which culminate northwards in Mount Skopos, the ancient Elatos (1600 ft.), the highest point in the island. On the east side the plain is also limited by a low ridge, which still justifies the epithet of 'Phocis' ever attached by Virgil to Zante's bay. These hills are densely clothed to their summits with an exuberant growth of olives, figs, myrtles, laurels, oranges, aloes, vines and other sub-tropical plants. The central plain is highly cultivated, forming an almost continuous stretch of gardens and vineyards, varied here and there with a few patches of cornfields and pasture lands. Here is grown a peculiar dwarf grape, whose fruit, the currant from Corinth of commerce, forms the chief resource and staple export of Zante, as well as of the neighbouring mainland. The vine, which grows to a height of 3 ft., begins to yield in seven years and lasts for over a century. From the grape, which has a pleasant bitter-sweet taste, a wine is also extracted, which is said to excel all others in flavour, fire and strength. Besides this species, there are nearly forty different kinds of vine and ten of the olive, including the karou-dolia, which yields the best edible olive berry. For size, vigorous growth and productiveness the olive tree of Zante is rivalled only by that of Corfu.

The island enjoys a healthy climate; and, although there are no mountains sufficiently high to yield an abundant supply of good water, it is obtained from the numerous springs, occurring especially in the eastern and central districts. But earthquakes are frequent and at times disastrous. During recent times the most destructive were those of 1811, 1820, 1840 and 1853; and, although the prevailing geological formations are sedimentary, chiefly calcareous, there seems no doubt that these disturbances are of igneous origin. Other indications of volcanic agency are the oil springs occurring on the coast, and even in the bed of the sea near Cape Skinari on the north side, and especially the famous pitch or bituminous wells already mentioned by Herodotus, 2. 94, 18. They have been productive throughout the historic period and still yield a considerable supply of pitch. They are situated in a swamp near the coast village of Chieri, and comprise two basins, with alternate layers of water and bitumen, the lower sheet of water apparently communicating with the sea.

Zante, capital of the island, is a considerable seaport on the east side, with a population in 1907 of 13,501. It occupies the site of the ancient city of Zacynthus, said to have been founded by Zacynthus, son of a legendary Arcadian chief, Dardanus, to whom the island was also attributed by Homer. The name was first bestowed on the island by Philip V. of Macedon. But this of, as well as of the temple of Artemis that formerly crowned Mount Skopos, no vestiges can now be discovered.

Traditionally the island formed part of the territory of Ulysses, king of Ithaca. It was peopled in ancient times by settlers variously represented as coming from Achaea or Arcadia. It figures occasionally in history as a base for belligerents in the Ionian Sea. Thus during the Peloponnesian War it served as a naval station for the Athenians, who again in 374 B.C. endeavoured to acquire it for a similar purpose; in 357 it became the headquarters of Dion on his expedition against Syracuse (357); in 354 it was seized by Philip V. of Macedon. The Romans captured it in 211, but restored it temporarily to Philip; in 191, wishing to keep it out of the hands of ambitious Greek powers, they definitely annexed it. In 86 it was raided by Mithridates' admirals Archelaus during a short foray into Ionian waters. Under the Roman Empire Zante was included in the province of Epirus. In the 11th century it passed to the Norman kings of Sicily; after the Fourth Crusade it belonged at various times to the despots of Epirus, the emperors of Constantinople, and the Orsini, counts of Cephalonia. After remaining from 1357 to 1482 in the hands of the Tocco family, it became a Venetian possession. In 1797 it was ceded to France, and after a short occupation by the Russians it was brought under British protection; in 1864 it was ceded with the other Ionian islands to the Greek kingdom.

The long Venetian occupation is reflected in the appearance, character, and to some extent even the language and religion of the Zantiots. Nearly all the aristocracy claim Venetian descent; most of the upper classes are bilingual, speaking both Greek and Italian; and a considerable section of the population are Roman Catholics of the Latin rite. Even the bulk of the people, although mainly of Greek stock, form in their social usages a connecting link between the Hellenes, whose language they speak, and the Western nations by whom they were so long ruled.

See B. Schmidt, Die Insel Zakynthos (Freiburg, 1899); B. V. Head, Historia Numorum (Oxford, 1887), pp. 359–60.

ZANY, a fool or silly person. The word came into English in the 16th century from Ital. Zano, mod. Zanni, an abbreviation of the name Giovanni (John). This familiar form of the name was given by Italians to a special type of clown or buffoon who acted as an attendant or follower of the regular
ZANZIBAR, a sultanate and British protectorate of East Africa. The sultanate, formerly of much larger extent (see below, History), was reduced in 1890 to the islands of Zanzibar and Pemba, some adjacent islets, the nominal sovereignty of the coast line—for ten miles inland—of the protectorate of British East Africa (q.v.), and the possession, also nominal, of five ports on the Benadir coast, leased to Italy. (In 1905 the sultan of Zanzibar sold his sovereign rights to these ports to Italy. See SOMALIAND: § Italian.) The islands of Pemba and Zanzibar have a collective area of 1920 sq. m. and an estimated population (1905) of 300,000.

Topography, &c.—The political and commercial, as well as the geographical, centre of the state is the fertile and densely peopled island of Zanzibar, which lies at a mean distance of 20 m. from the mainland, between 5° 40' and 6° 30' S. Pemba (q.v.) to the north and the more distant Mafia (to the south) form with the perch and gilchrist an independent geological system, resting on a foundation of coralline reefs, and constituting a sort of outer coast-line, which almost everywhere presents a rocky barrier to the Indian Ocean. All through its length is separated from the mainland by several tolerable natural harbours, used only by Arab dhows, the port of Zanzibar suffering for the general trade. The forests which formerly covered the island have largely disappeared; the eastern half is now only covered with low scrub. The western part is noted for the luxuriance and variety of its flora, notwithstanding the absence of timber. Among fruit-trees the coco-nut palm is conspicuous. Each tree yields 10 or 15 bunches a year of the valuable nuts. In groves of these trees, elsewhere the palms grow indiscriminately among other trees, which include the mangrove (in swampy districts), lemons, soursop, and sugarcane, bread fruit, papaw, pomegranate, tamarind, the orange and mango trees. The two last-named and plantains and bananas are abundant. The mango trees attain a great size. Many of the fruit-trees and plants have been introduced from India and Malayasia, such as the mangoes, guava, durian, cinnamon, nutmeg and cloves, all of which thrive well. The soil seems specially suited for the clove, which, although nearly destroyed by a terrible cyclone in 1872, is completely recovered from the effects of the destruction.

Although the fauna is almost exclusively continental, Zanzibar till recently possessed a distinct variety of monkey (Colobus kirkii), which is as noted for its habits as the native is noted for his. Although the islands are never visited, the cattle and sheep are mainly of the Bantu-speaking inhabitance, and the number of these groups are noted as good fishermen, cattle raisers, and skilled artisans. In the west, and especially in the capital (for which, see below), the population is of an extremely heterogeneous character, including full-blood and half-caste Arabs, Goanese, Parsees, Hindus, Comoro Islanders, Swahili (q.v.) of every shade, and representatives of tribes from all parts of East Africa. The Arabs number about 7000; Asiatics (mostly British Indians), 20,000; whites (chiefly British), 250. Besides the port of Zanzibar there are no large towns. Chuka is a pleasant health resort on the eastern shore facing the Indian Ocean.

Production.—Clove and copra are the chief products of the island. There are also extensive chilli and rubber plantations. The muhogo (cassava), the tobacco plant and vanilla are cultivated on a smaller scale; experiments in cotton-growing proved unsuccessful. The shambas (plantations) are mostly the property of Arabs. The labourers are chiefly Swahilis, and were formerly slaves. The labour available at harvest time is often inadequate, and year after year a large proportion of the clove crop has remained unpicked. As its prosperity depended much more on its transit trade (Zanzibar being the entrepot for all the East African ports as far south as the Zambezi) than on its agriculture the latter at one time was neglected; but when in the early years of the 20th century the competition of Mombasa and Dar-es-Salaam was felt, efforts were made to increase the number and productivity of the crops and also to decrease costs by providing better means of transport. Good roads were made by the government, and an American company built a 3-ft. gauge railway from Zanzibar town to the north of the island, where are the chief plantations. Rice is imported in large quantities from Rangoon and Bombay. Besides rice, cassava, grown on the island, and fish (which is caught on the coral reefs) are the principal articles of food. The coconut pigeon pea (cajanua Indica) is commonly grown, and the Wahadimu and Watumbata cultivate the betel-nut creeper.

Revenue and Currency.—Custom duties are the chief source of revenue. Other sources are registration and market fees, hut tax (one dollar per hut) on government ground, post office receipts, &c., and the produce of crown shambas. A sum of $17,000 a year is paid to the British government in respect of the German East African sultanate, for the right to administer the mainland portion of the sultanate; the Zanzibar government also receives some $10,000 a year interest on the purchase money paid by Germany and Italy for the part of Zanzibar territory acquired by those Powers. In 1909 the revenue was $123,000 and the expenditure $131,000. In 1902 the sultan, on the advice of the British government, appointed a financial adviser, under whose care the finances steadily improved. In 1906 the customs revenue amounted to $125,000, and the expenditure to $104,000. In 1907 the fiscal year there was a public debt of $88,000. The principal items of expenditure come under the heads of administration, public works, civil list and military police.

The coinage system is somewhat complicated. The Maria Theresa dollar (equalling approximately 3s. 9d.) is used as a standard of value in price quotations, but the coin is not in circulation. The Indian rupee is in universal currency and the British sovereign is legal tender at the fixed rate of 15 rupees to £1. The division of the rupee into annas and pice was abolished in 1908 and the anna was afterwards discontinued. The government issued notes of 5, 10, 20, 50 and 100 rupees. British weights and measures are used in wholesale transactions, with the exception of the frassil, which equals 35 lb. avoirdupois.

Religion.—Mahomedanism is the dominant religion. Most of the inhabitants are Sunnis of the Shafi school, but the sultan and his relatives are schismatics of the Izaahni sect. There are several Protestant and Roman Catholic missions with branches on the mainland. These missions maintain schools. The government supports kuttabs in which elementary education is given in Arabic and the vernacular, and more advanced schools in which English, geography and arithmetic are taught. In December 1892 the sultan delegated to the British agent and consul-general his right to try all cases in which a British subject is plaintiff or accused, and the defendant or accused is a Zanzibar subject. The British court also tries all cases in which Europeans (and Americans) are concerned, the consular jurisdiction exercised by other Powers having been finally abolished in 1907. Cases between natives are tried by Moslem tribunals. There is a military police force under a British officer.

History.—From the earliest times of which there is any record the African seaboard from the Red Sea to an unknown point to the southward was under the influence and control of the Arab empire, and the Arabic language was generally understood. At a later period the coast towns were founded or conquered by Persian and Arab Mahomedans who, for the most part, fled to East Africa between the 8th and 11th centuries on account of the religious differences of the times, the refugees being schismatics. Various small states thus grew up along the coast, Mombasa seeming to be the most important. These states are sometimes spoken of as the Zenj empire, though they were never, probably, united under one ruler. Kilwa (q.v.) was regarded as the capital of the "empire." The

professional clown on the stage and made clumsy and ludicrous attempts to mimic his performance.
seaboard itself took the name of Zanquebar (corrupted to Zanzibar by the Banyan traders), the Balid ez-Zenj, or "Land of the Zenj" of the Arabs, a term which corresponds to the Hindu-bar, or "land of the Hindu," formerly applied to the west coast of India. By Ibn Batuta, who visited the coast in 1328, and other Arab writers the Zenj people are referred to in a general way as Mahomedan negroes, and they are the towns still represented by the semi-civilized Mahommedan Rais of Benga, now collectively known as the Swahili or "coast people," and in whose veins is a large admixture of Asiatic blood. The Zenj "empire" began to decline soon after the appearance of the Portuguese in East African waters at the close of the 15th century. To them fell in rapid succession the great cities of Kilwa with its 300 mosques (1503), Mombasa the "Magnificent" (1505), and soon after Malindi and Mokudisho the "Immens" (Ibn Batuta). The Portuguese rule was troubled by many revolts, and towards the end of the 16th century the chief cities were ravaged by the Turks, who came by sea, and by Bar Zimba, a fierce negro tribe, who came overland from south of the Zambezi. On the ruins of the Portuguese power in the 17th century was built up that of the Imams of Muscat. Over their African dominions the Imams placed-Isl or viceroys, who in time became independent of their overlords. In Mombasa power passed into the hands of the Mazrui family. The island of Zanzibar, conquered by the Portuguese in 1503-8, was occupied by the Arabs in 1539, and in 1852 the town of Zanzibar, then a place of no note, was made the capital of his dominions by Sayyid Sulaiman, who rested the separate dominions formerly owning allegiance to the Imams, Mombasa being taken by treachery in 1837. On the death of Said in 1856 his dominions were divided between his two sons, the African section falling to Majid, who was succeeded in 1870 by his younger brother Bargash ibn Said, commonly known as sultan of Zanzibar. Bargash witnessed the dismemberment of his dominions by Great Britain, Germany and Italy (see Africa, § 5), and in March 1885 left to his successor, Sayyid Khalifa, a mere fragment of the territories over which he had once ruled. The Sayyids Majid and Bargash acted largely under the influence of Sir John Kirk (q.v.), who from 1860 to 1875 was consular representative of Great Britain at Zanzibar. By Sir John's efforts a treaty for the suppression of the slave trade throughout the sultanate had been concluded in 1873.

In the negotiations between the Powers for the partition of Africa the supremacy of British interests in the island was acknowledged by Germany, Italy and France, thus rendering a treaty made in 1862 between France and Great Britain recognizing the "independence" of Zanzibar of no effect. On the 4th of November 1890 the sultanate was proclaimed a British protectorate, and the submission of the town of Zanzibar was acknowledged by Great Britain on her part ceded Heligoland to Germany and renounced all claims to Madagascar in favour of France. Sultan (Sayyid) Ali, who had succeeded his brother Sayyid Khalifa in February 1890, in August following issued a decree which resulted in the liberation of large numbers of slaves. Sayyid Ali was succeeded in March 1893 by Hamed bin Thain, on whose death in August 1896 his cousin, Sayyid Khalid, proclaimed himself sultan, and seized the palace. The British government disapproved, and to compel Khalid's submission the palace was bombarded by the British steamer, which rested the town of Zanzibar, was removed to the mainland, and Hamed bin Mahommed, brother of Hamed bin Thain, was installed sultan by the British representative (27th of August 1896). The government was reconstituted under British auspices in October 1891, when Sir Lloyd Mathews* was appointed prime minister, and the

1 By the Zanzibar Order in Council, 1906, the protectorate of Zanzibar was limited to the islands of Zanzibar and Pemba, including the territorial waters thereof and any islets within those waters.

2 Sir Lloyd Mathews (1850-1901) was a British naval officer. He served in Ashanti 1873-74 and went to Zanzibar in 1875 as lieutenant on a ship engaged in the suppression of the slave trade. In 1877 he was selected to command the military force being raised by Sayyid Bargash and thereafter devoted his services entirely to the Zanzibar government. He was made a K.C.M.G. in 1894.
ZAPAROS—ZARHÓN

Submarine cables connect Zanzibar with all parts of the world, whilst lines of steamships from Europe and India make it a regular port of call. It was not, however, until 1910 that direct steamship communication with London was established. The average annual value of the external trade for the five years 1902–6 was: imports, £1,075,580; exports, £1,084,724. In 1907 the imports were valued at £1,232,057, the exports at £1,070,067. The figures for 1908 were: imports, £960,841; exports, £977,628. Many of the imports of the British merchants have been cottons, and the export of copra, sent to the United Kingdom; India, however, has a larger trade with Zanzibar than any other country. From it are imported food stuffs (rice, grain, flour, ghee, groceries) and piece goods. The copra is sent almost exclusively to Marseilles. The most valuable articles of import are piece goods and rice. The piece goods come chiefly from the United Kingdom, India, America and the Netherlands, the rice entirely from India. Other imports of value are building materials, coal, petroleum and sugar.

The trade of Zanzibar is indicative of the commercial importance of the city. Its geographical position has made it the key of East Africa from Cape Guardafui to Delagoa Bay. "When you play on the flute at Zanzibar" (says an Arab proverb) "all Africa as far as the lakes dance." From the time (1832) when Seyyid Said of Muscat fixed on the town as the capital of his empire, Zanzibar became the centre of the trade between the African continent, India, Arabia and the Persian Gulf, as well as Madagascar and the Mauritius. It also speedily obtained a large trade with Europe and America. The Americans were the first among white merchants to realize the possibilities of the port, and a United States consulate was established as early as 1836. The name Merikani, applied to cotton goods and blankets on the east coast, is a testimony to the enterprise of the American trader. Zanzibar is to a greater degree than any other city the capital of negro Africa; made so, however, not by the negroes but by Arab conquerors and traders. The aspect of the city has changed since the establishment of the British protectorate, the suppression of the slave market and of slavery itself, and the enforcement of sanitation; but Professor Henry Drummond in Tropical Africa sketched the characteristics of Zanzibar in pre-protectorate days when he wrote of it as a "cesspool of wickedness Oriental in its appearance, Mahomedan in its religion, Arabian in its morals...a fit capital for the Dark Continent." Nevertheless Zanzibar in those days was the focus of all exploring and missionary work for the interior, the portal through which civilizing influences penetrated into the eastern section of equatorial Africa. The growth of the British and German protectorates on the neighbouring shores led in the early years of the 20th century to considerable trade which had hitherto gone through Zanzibar being diverted to Mombasa and Dar-es-Salaam, but Zanzibar maintains its supremacy as the great distributing centre for the eastern seaboard.

ZAPAROS, a tribe or group of tribes of South American Indians of the river Napo. They occupy some 12,000 sq. m. between the Napo and the Pastaza. Their only industries are hammock plaiting and fishing-net weaving. Polygamy is general. They wear a long skirt of bark fibre.

ZARA (Serbo-Croatian Zadar), the capital of Dalmatia, Austria-Hungary. The town proper lies on a height 32 m. S.E. of Trieste, and opposite the islands of Ugljan and Pasman, from which it is separated by the narrow Channel of Zara. It is the meeting-place of the provincial diet, and the seat of a Roman Catholic archbishop and an Orthodox bishop. The promontory on which it stands is separated from the mainland by a deep moat, practically making an island of the city. In 1873 the ramparts of Zara were converted into elevated promenades commanding extensive views to seaward and to landward. Of its four old gates one, the Porta Marina, incorporates the relics of a Roman arch, and another, the Porta di Terraferma, was designed in the 16th century by the Veronese artist Sannichelli. The chief interest of Zara lies in its churches, the most remarkable of which is the cathedral of St Anastasia, a fine Romanesque basilica, built between 1202 and 1205. The churches of St Chrysogonus and St Simeon are also in the Romanesque style, and St Mary's retains a fine Romanesque campanile of 1015. The round church of St Donatus, traditionally but erroneously said to have been erected in the 9th century on the site of a temple of Juno, is used for secular purposes. The church treasuries contain some of the choicest Byzantine and Arab manuscripts. The art of the 14th century, with the exception of copra, are sent to the United Kingdom; India, however, has a larger trade with Zanzibar than any other country. From it are imported food stuffs (rice, grain, flour, ghee, groceries) and piece goods. The copra is sent almost exclusively to Marseilles. The most valuable articles of import are piece goods and rice. The piece goods come chiefly from the United Kingdom, India, America and the Netherlands, the rice entirely from India. Other imports of value are building materials, coal, petroleum and sugar.

Nevertheless Zanzibar in those days was the focus of all exploring and missionary work for the interior, the portal through which civilizing influences penetrated into the eastern section of equatorial Africa. The growth of the British and German protectorates on the neighbouring shores led in the early years of the 20th century to considerable trade which had hitherto gone through Zanzibar being diverted to Mombasa and Dar-es-Salaam, but Zanzibar maintains its supremacy as the great distributing centre for the eastern seaboard.

ZARILLO Y ALCARAZ, FRANCISCO (1707–1781), Spanish sculptor, was born in Murcia on the 12th of May 1707. At the age of twenty he completed the statue of St Ines of Montepulciano, which had been begun for the Dominicans at Murcia by his father. On the death of the latter the care of the family fell upon Francisco, who with the help of his brothers and sisters organized a workshop. In 1765 he also founded a small academy, which, however, was speedily dissolved owing to disunion among the members. In the Ermita de Jesús in Murcia may be seen Zarillo's scenes from the Passion of Our Lord, a vast work in which all the sculptor's qualities and defects are revealed. In the church of St Miguel are an Immaculate Conception and a St Francis. Mention should also be made of the Christ at the Well in the church of Santa María delas Gracias in Murcia, and of the sculptures in San Pedro and in the Capucine monastery in Murcia. Zarillo worked in wood, which was coloured. The ascription of the stone sculptures on the façade of the St Nicolás Church in Murcia to him rests on conjecture. He died at Murcia in 1781.

See B. Haendelc, Studien zur Geschichte der spanischen Plastik (Strassburg, 1900).

ZARHÓN, a mountain in Morocco, 93 m. N. of Mequinez, on whose hillside is the town Mulai Idris Zarhón, so called after Mulai Idris I., the founder of the Moorish empire, who was buried there in A.D. 791. The whole town is considered as a sanctuary, pays no taxes, provides no soldiers and is never visited save by Mahomedans. Near the town are the ruins
of Volubilis—Kasar Fara'on or Pharaoh's Castle, once the Roman capital, and the first home of Idris.

ZARIA, a province of the British protectorate of Northern Nigeria. It lies approximately between 5° 30' and 8° 30' E. and 0° 20' and 11° 30' N. It has an area of 22,000 sq. m. and an estimated population of about 250,000. The province, of which a great portion consists of open rolling plains, is watered by the Kaduna affluent of the Niger and its many tributaries, and is generally healthy and suitable for cultivation. The chief towns are Zaria, the capital of the emirate, 87 m. S.W. of Kano, and Zungeru, the headquarters of the British administration for the whole of Northern Nigeria. The British station at Zaria town, with an elevation of 2150 ft., has so far proved the healthiest and most agreeable point of occupation in the protectorate. The climate here for a great portion of the year is bracing, and in the cold season there is frost at night.

The British capital at Zungeru, in the south-western corner of the province, less fortunate than Zaria, has only an elevation of about 450 ft. above the sea. The climate, though better than that of Kokoja, is still relaxing and trying for Europeans. The site of Zungeru, 6° 40' E. 9° 38' 32" N., was selected in 1901. By the summer of 1902 brick houses for the public departments, a residency, a hospital, barracks and a certain number of houses for the civilian staff had been erected, and the town is now a flourishing settlement, having all the appearance of an English suburban town with shaded avenues and public gardens clustering on either side of the river Dago, over which several bridges have been thrown.

Zaria is not a great grain-producing province. Its principal crop is millet, and the surplus is available for purposes of trade, and among the Mahommadan population there is a growing demand for cloth, agricultural and culinary implements, Birmingham goods, soap, oil, sugar and European provisions. The construction of roads, telegraphs and other public works consequent upon the British occupation of the province makes somewhat heavy calls upon the local labour supply and accentuates to some of the large landowners the inconvenience resulting from the abolition of the slave trade, but the practice of owning domestic slaves is not forbidden, and it is the policy of the administration to render the transition from slave labour to freedom as gradual as possible.

The ancient state of Zaria, also called Zeg-Zeg by the geographers and historians of the middle ages, was one of the original seven Hausa states. It suffered all the fluctuations of Hausa history, and in the 13th and early 14th centuries seems to have been the dominating state of Hausaland. At later periods it underwent many conquests and submitted in turn to Kano, Songhol and Bornu. At the end of the 18th century it was an independent state living under its own Mahommadan rulers; but, like the rest of northern Hausaland, it was conquered in the opening years of the 19th century by the emisaries of the Fula Dan Fodio. It remained a Fulani emirate paying allegiance to Sokoto up to the period of the British occupation of Nigeria, January 1900. Early in 1900 a British garrison was placed at Wushishi, a town in the south-western corner of the emirate which marks the limit of navigation of the Kaduna river. The emir of Zaria professed friendship to the British, and at his own request British troops were quartered at his capital, in order to protect him from the threatened attacks of Kontagora. In March 1902 the province was taken under British administrative control throughout that year it was found that, notwithstanding his friendly professions, the emir of Zaria was intriguing with Kano and Sokoto, and then openly hostile to Great Britain, while at the same time he continued, contrary to his undertaking in return for British protection, to raid for slaves and to perpetrate acts of brutal tyranny and oppression. He was deposed in the autumn of 1902, and after the Sokoto-Kano campaign of 1903, which assured the supremacy of Great Britain in the protectorate, another emir was appointed to Zaria. The new emir, Dauda Sali, an ally of Kano, paid obedience to the British crown and accepted his appointment on the conditions required of all the Nigerian native rulers.

The province has been organized for administration on the same system as the rest of the protectorate. It has been divided into four administrative districts, each under a British assistant resident. A good cart road suitable for wheeled traffic has been constructed between Zungeru and Zaria, and the Kaduna has been handsomely bridged at a point near Wushishi, which is the meeting-point of main caravan roads, and whence there is at certain seasons of the year uninterrupted water carriage to the mouth of the Niger. The development of trade was further facilitated in the early days of the British occupation by the building of a light railway from Barijuko, a point on the Kaduna river below Wushishi, to Zungeru. This line was superseded by the construction, in 1907-1909, of a 3 ft. 6 in. railway from Baro, a port on the lower Niger, to Zungeru, whence the line was continued to Zaria.

The taxation scheme introduced by the British administration works satisfactorily, and the revenue shows a regular surplus, the entire income being distributed fairly among the inhabitants. The district courts of justice have been established (E. L. L.)

ZARLINO, GIOSEFFO (1517-1590), Italian musical theorist, surnamed from his birthplace ZARLINO CODENSIUS, was born at Chioiggia, Venice, in 1517 (not 1540, as Burney and Hawkins say). Studying in his youth for the Church, he was admitted to the minor orders in 1539 and ordained deacon in 1541 at Venice; but he soon devoted himself entirely to the study of music under the guidance of Adrian Willaert, then choirmaster at St Mark's. Willaert, dying in 1562, was succeeded by Cipriano di Rore, on whose removal to Parma in 1565 Zarlino was elected choirmaster. Though now remembered chiefly for invaluable contributions to the theory of music, it is evident that he must have been famous both as a practical musician and as a composer; for, notwithstanding the limited number of his printed works, consisting of a volume entitled Modulazioni Sex Vocum (Venice, 1566), and a few motets and madrigals scattered through the collections of Scotto and other contemporary publishers, he both produced and superintended the public performance of some important pieces in the service of the republic. First among these was the music written to celebrate the battle of Lepanto (on the 7th of October 1571). Again, when Henry III. of France passed through Venice on his return from Poland in 1574, Zarlino directed on board the "Bucentaur" the performance of an ode for which he himself had composed the music, to verses supplied by Rocco Benedetti and Cornelio Frangipani. The ode was followed by a solemn service in St Mark's, in which Zarlino's music formed a prominent feature, and the festival concluded with the representation of a dramatic piece entitled Orfeo composed by Zarlino. When the church was in the hands of the Jesuits, with the permission of the plague, he composed a solemn mass for the occasion. No one of these works is now known to be in existence; the only
example we possess of Zarlino’s compositions on a grand scale is a MS. for four voices, in the library of the Philharmonic Lyceum at Bologna. He died at Venice on the 14th, or some time the 4th, of February 1590.

Zarlino’s first theoretical work was the *Istitutioni Armoniche* (Venice, 1558; reprinted 1562 and 1573). This was followed by the *Dimostrazioni Armoniche* (Venice, 1571; reprinted 1573) and the *Discorso Intorno alle Opere di Messer Gioseffe Zarlino* (Venice, 1587), which was the last work he published before his death. Zarlino also reprinted three treatises, accompanied by a *Tract on Patience*, a *Discourse on the True Date of the Crucifixion of Our Lord*, an *essay on the correct division of Solfège* Concerning the Correction of the Julian Calendar (Venice, 1590). 1

The *Istitutioni* and *Dimostrazioni Armoniche* deal, like most other theoretical works of the period, with the whole science of music as it was understood by the earlier composers. Zarlino was chiefly interested in the foundations of the science, differing but little in their line of argument from the principles laid down by Pietro Aron, Zacconi, and the other early writers of the Boerit school; but in bk. ii. of the *Istitutioni* Zarlino boldly attacks the false system of tonality to which the proportions of the Pythagorean tetrachord, if strictly carried out in practice, must inevitably lead. The fact that, so far as can now be ascertained, they were never strictly carried out in the Italian medieval schools, at least after the invention of counterpoint, in no wise diminishes the theoretical strength of the argument, and the inevitable results which must follow from the use of the tetrachord in the harmonic system, are to be found both in the monophonic and the polyphonic. Zarlino was, in addition, one of the most redoubtable champions of the monodic style, and this is no more observable than in the book of *Istitutioni*.

Discorso Intorno alle Opere di Messer Gioseffe Zarlino, and followed it up in his famous *Dialogo*, defending the Pythagorean system in very unmeasured language. It was in answer to these strictures that Zarlino published his *Supplementi*.

ZARZNEK, FRIEDRICH KARL THEODOR (1825-1891), German philologist, was born on the 7th of July 1825 at Zahrenstorf, near Briel, in Mecklenburg, the son of a country pastor. He was educated at the Rostock gymnasium in 1837-1841; studied (1844-1847) at the universities of Rostock, Leipzig and Berlin. In 1848 he was employed in arranging the valuable library of Old German literature of Freiherr Karl Hartwig von Meuschach (1781-1847), and superintending its removal from Baumgartenbrück, near Potsdam, to the Royal Library at Berlin. In 1850 he founded at Leipzig the *Literarischen Centralblatt für Deutschland*. In 1852 he established himself as Privatdozent at the university of Leipzig, and published an excellent edition of Sebastian Brant’s *Narrenschiff* (1854), a treatise *Zur Nibelungenfrage* (1854), followed by an edition of the *Nibelungenlied* (1856, 12th ed. 1882), and Beiträge zur Erläuterung Geschichte des Nibelungenliedes (1857). In 1858 he was appointed full professor, and commenced a series of noteworthy studies on medieval literature, most of which were published in the reports (Berichte) of the Saxon Society of Sciences. Among them were that on the old Hihi German poem *Muspilli* (1860); *Gesang vom heiligen Georg* (1874); the legend of the *Priester Johannes* (1874); *Der Grollempel* (1876), and the *Annalied* (1887). He also wrote a valuable treatise on Christian *Kultur* and the development of German literature, *Die Entwicklung* (1871) and *Die deutschen historischen Werke* (1871). He was particularly devoted to the history of Leipzig university, *Die urkundlichen Quellen zur Geschichte der Universität Leipzig* (1857) and *Die deutschen Universitäten im Mittelalter* (1857). Two volumes of his Kleine Schriften appeared in 1897.

ZEALAND (also Sealant or Sealand; Danish *Sjælland*), the largest island of the kingdom of Denmark. It is bounded N. by the Cattegat, E. by the Sound, separating it from Sweden, and the Baltic Sea, S. by narrow straits separating it from Falster, Møen, and smaller islands, and W. by the Great Belt, separating it from Fyn. Its nearer point to Sweden is 3 m., to Fyn 11. Its greatest extent from N. to S. is 82 m., from E. to W. 68 m., but the outline is very irregular. The area is 1690 sq. m. The surface is for the most part barren, but on the southern and eastern coasts the highest elevations are in the southeast, where Cetacraus hill (the oldest geological formation on the island) reach heights of upwards of 350 ft. The coast is indented by numerous deep bays and fjords; the Lise Fjord in the north, with its branches the Roskilde Fjord on the east and the Lamme Fjord on the west, penetrates inland for about 25 m. There are no rivers of importance; but several large lakes, the most considerable being Arre and Esrum, occur in the north-east. The soil is fertile and produces grain, especially rye and barley, in great abundance, as well as potatoes and other vegetables, and fruit. The scenery, especially in the neighbourhood of the fjords, is pleasant, lacking the barrenness of some portions of the kingdom.

Zealand is divided into five amter (counties). (1) Frederiksborg, in the north, named from the palace of Frederiksborg. In the north-east, where the coast approaches most nearly to Sweden, is Roskilde or Eslerslev. (2) Kjøbenhavns, south of Frederiksborg. The capital is that of the kingdom, Copenhagen (Kjøbenhavns). The only other town of importance is the old cathedral city of Roskilde on the fjord of that name. Off the little port of Kjøge in the eastern part of the island is the Roskilde Fjord. (3) Hovedøerne, and in another engagement in 1710 the famous Danish commander Hvitfeldt sank with his ship. (4) Holbæk, west of Kjøbenhavns. The chief town, Holbæk, lies on an arm of the Lise Fjord. In the north is a port of Hvidovre, Kjøbenhavn, with large shipping, and by steamer with Aarhus in Jutland. It has a singular Romanesque church of the 12th century. The district is diversified with small islands, the most prominent of which are the Lolland, in the centre of the island. The chief town, Søllerød, lies among woods on the small Soro lake. It was formerly the seat of a university, and remains an important educational centre. Its church, of the
12th century, contains the tombs of the poet Holberg (d. 1754) and of some of the Danish kings. Slagelse in the west, an agricultural centre, is an ancient town dating back to the 12th century. Here Hans Christian Andersen, the poet, received part of his education. Korsør is an important seaport; (5) Praestø, the most southerly county. The capital, Praestø, is a small port on the inner lagoon of this bay of this name, on the east coast. In the west is the ancient town of Naestved; in the south, Vordingborg, with a ruined castle and a small harbour. The railway here crosses a great bridge on to the small Masnedø, whereas there is a ferry to Ørholm on Falster island, a link in the direct route between Copenhagen and Berlin.

**ZEBRA**, the name used for all the striped members of the horse-tribe, although properly applicable only to the true or mountain zebra. The latter species (Equus zebra) inhabits the mountainous regions of the Cape Colony, where, owing to the advances of civilized man into its restricted range it has become very scarce, and is even threatened with extermination, but it exists in the form of a local race in Angola. The second species, Burchell's zebra (Equus burchelli), is represented by a large number of local races, ranging from the plains north of the Orange river to north-east Africa.

Equus zebra is the smaller of the two (about 4 ft. high at the shoulders), and has longer ears, a tail more scantily clothed with hair, and a shorter mane. The general ground colour is white, and the stripes are black; the lower part of the face is bright brown. With the exception of the abdomen and the inside of the thighs, the whole of the surface is covered with stripes, the legs having narrow transverse bars reaching quite to the hoofs, and the base of the tail being also barred. The outsides of the ears have a white tip and a broad black mark occupying the greater part of the surface, but are white at the base. Perhaps the most constant and obvious distinction between this species and the next is the arrangement of the stripes on the hinder part of the back, where there are a number of short transverse bands reaching to the median longitudinal dorsal stripe, and unconnected with the uppermost of the broad stripes which pass obliquely across the haunch from the flanks towards the root of the tail. There is often a median longitudinal stripe under the chest.

Typically, Burchell's zebra, or the bonte-zebra (Equus burchelli), is a rather larger and more robust animal, with smaller ears, a longer mane, and fuller tail. The general ground-colour of the body is pale yellowish brown, the limbs nearly white, the stripes dark brown or black. In the typical form the stripes do not extend on to the limbs or tail; but there is a great variation in this respect, and as we proceed north the striping increases, till in the north-eastern *E. burchelli granti* the legs are striped to the hoofs. There is a strongly marked median longitudinal ventral black stripe, to which the lower ends of the transverse side stripes are usually united, but the dorsal stripe (also strongly marked) is completely isolated in its posterior half, and the uppermost of the broad haunch stripes runs nearly parallel to it. A much larger proportion of the ears is white than in the other species. In the middle of the wide intervals between the broad black stripes of the flanks and haunches fainter stripes are generally seen. It is closely allied to the quagga, but the typical form, in which the resemblance is closest, is extinct. The Abyssinian and Somali Grevy's zebra (*E. grevyi*) is markedly distinguished by its enormous ears and more numerous and narrower black stripes. The flesh of Burchell's zebra (or quagga, as it is often called) is relished by the natives as food, and its hide is very valuable for leather. Although the many attempts that have been made to break in and train zebras for riding and driving have sometimes been rewarded with partial success, the animal has never been domesticated in the true sense of the word (see Horses)

**ZECHARIAH**, son of Berechiah, son of Iddo (or by contraction, son of 'Iddo), a prophet of the Old Testament. He appeared in Jerusalem along with Haggai (q.v.), in the second year of Darius Hystaspis (520 B.C.), to warn and encourage the

---

1 A connexion with a divine name (cf. Baal-Zebul) is not improbable; see H. W. Hogg, Ency. Bib., art. "Zebulun."
Jews to address themselves at length to the restoration of the Temple.† Supported by the prophets, Zerubbabel and Joshua set about the work, and the elders of Judah built and the work went forward (Ezra v. 1 seq., vi. 14). The first eight chapters of the book of Zechariah exactly fit into this historical setting. They are divided by precise chronological headings into three series: (a) v. 1-6; (b) v. 7-vi. 15; on the twenty-fourth day of the eleventh month of the same year; (c) chap. vii.-viii., on the fourth day of the ninth month of the fourth year of Darius. The first section is a preface containing exhortation in general terms. The main section is the second, containing a series of night visions, the significant features of which are pointed out by an angel who stands by the prophet and answers his questions.

i. 7-17. The divine chariots and horses that make the round of the world by Yahweh's orders return to the heavenly palace and report that there is still no movement among the nations, no sign of the Messianic crisis. Seventy years have passed, and Zion and the cities of Judah still mourn. Sad news! Yahweh gives comforting assurance of His gracious return to Jerusalem and the rebuilding of His temple.

i. 18-21 (Heb. ii. 1-4). Four horns, representing the hostile world that oppresses Israel and Jerusalem, are cast down by four smiths.

ii. 1-13 (Heb. ii. 5-17). The new Jerusalem is laid out with the measuring line. It is to have no walls, that its population may not be confined to the limits set by its present boundaries; the catastrophe of "the land of the north" is near to come; then the exiles of Zion shall stream back from all quarters, the converted heathen shall dwell in the midst of them, and even now He stirs Himself from His holy habitation.

iii. 1-10. The high priest Joshua is accused before Yahweh by Satan, but is acquitted and given rule in Yahweh's house and courts, with the right of access to Yahweh in priestly intercession. The restoration of the temple and its service is a pledge of still higher things. The promised "branch" (or "shoot," "simeah"). the Messiah, will come; the national kingdom is restored in its old splendour; and a time of general deliverance dawns, when every man shall sit happy under his vine and under his fig tree. As by rights the Messianic kingdom should follow immediately on the exile, it is prophetic that Zechariah designs to hint in a guarded way that Zerubbabel, who in all other places is mentioned along with Joshua, is on the point of ascending the throne of his ancestor David. The jewel with seven facets is already there, the inscrip.

iv. 1-14. Beside a lighted candlestick of seven branches stand two olive trees—Zerubbabel and Joshua, the two anointed ones of Yahweh. The orchards of the whole earth. This explanation of the vision is separated from the description by an animated dialogue, not quite clear in its expression, in which it is said that the mountain of obstacles shall disappear before Zerubbabel, and that, having begun the building of the temple, he shall also bring it to an end in spite of those who now mock at the day of small beginnings.

v. 5-11. Guilt, personified as a woman, is cast into an ephah-measure with a heavy lid and carried from Judah to Chaldaea, where it shall be kept for the future.

vi. 1-8. The divine teams, four in number, again traverse the world toward the four winds, to execute Yahweh's commands. That which goes northward is charged to wreak His anger on the northern country. The series of visions has now reached its close, returning to its starting-point in v. 7 seq.

An appendix follows (vi. 9-15). Jews from Babylon have brought gold and silver to Jerusalem; of these the prophet must make a personal design. The house with two rooms and with a house and sitting on the throne, but retain a good understanding with the high priest. Zerubbabel is certainly here meant, and, if the revised text names Joshua instead of him (vi. 11), this is only a correction, made for reasons easy to understand, which breaks the context and destroys the sense and the reference of "them both" in verse 13.

The third section (chaps. vii.-viii.), dated from the fourth year of Darius, contains an inquiry whether the fast days that arose in the captivity are still to be observed, with a comforting and encouraging reply of the prophet.

Thus, throughout the eight chapters the scene is Jerusalem in its early part of the reign of Darius. Zerubbabel and Joshua, the prince and the priest, are the leaders of the community. The great concern of the time and the chief practical theme of these chapters is the building of the temple; but its restoration is only the earnest of greater things to follow, viz., the glorious restoration of David's kingdom. The horizon of these prophecies is everywhere limited by the narrow conditions of the time, and their aim is clearly seen. The visions hardly veil the thought, and the mode of expression is usually simple, except in the Messianic passages, where the tortuousness of a personalistry and the secrecy of the holy Eden is hinted at. The affinity between some notions evidently not first framed by the prophet himself and the prologue to Joh—the heavenly hosts that wander through the earth and bring back their report to Yahweh's throne, the figure of Satan, the idea that suffering and calamity are evidences of guilt and of accusations presented before God.

Passing from chaps. i.-vii. to chaps. ix. seq., we at once feel ourselves transported into a different world.

(1) Yahweh's word is accomplished on Syria-Phoenicia and Philistia; and then the Messianic kingdom begins in Zion, and Jerusalem is built on the foundation of Solomon's house. The former combined, receive a part in it. The might of the sons of Javan is broken in battle against this kingdom (ch. ix.). After an interlude (x. 1-6: "vision of Yahweh, not of the diviners") a second and quite analogous Messianic prophecy follows.

(2) The difficult passage about the shepherds follows. The shepherds (rulers) of the nation make their flock an article of trade and exchange it, while the sheared flock is scattered to the four winds. The inhabited world shall fall a sacrifice to the tyranny of its kings, while Israel is delivered to a shepherd who feeds the sheep for those who make a trade of the flock (Is 9:12, xii. 1- "they who sell them," ver. 5) and enters on his office with two staves, "Favour" and "Union." He destroys the three shepherds in one month, but is soon weary of his flock and the flock of him. He breaks the staff "Favour," i.e. the covenant of peace with the nations, and asks the traders for his hire. Receiving thirty pieces of silver, he casts it into the temple treasury and breaks the staff "Union," i.e. the brotherhood between Judah and Israel. He is succeeded by a foolish shepherd, who neglects his flock and lets it go to ruin. At length Yahweh intervenes; the foolish shepherd falls by the sword; two-thirds of the people perish with him in the Messianic crisis, but the remnant of one-third forms the seed of the new theocracy, with Yahweh as their King, etc. (xvi. 9-14: the necessary transposition proposed by Ewald). All this must be an allegory of past events, the time present to the author and his hopes for the future beginning only at xi. 17, xii. 7-9.

(3) Chap. xii. presents a third variation on the Messianic promise. All heathendom is gathered together against Jerusalem and perishes there. Yahweh first gives victory to the countryfolk of Judah and Babylon, who rescue the capital. After this triumph the noble houses of Jerusalem hold each by itself, a great lamentation over a martyr "whom they have pierced" (or "whom men have pierced")

The historical occasion of the emergence of Haggai and Zechariah was supplied by the series of revolts following the suc-

† The alleged foundation of the second temple in 536 (Ezra iii. 8-13; cf. iv. 1-5, 24) is open to doubt, because (a) the statements of the compiler of Ezra are not contemporary evidence, (b) the compiler's narrative goes against the rough chronology mentioned that this work first began in 520 (Hag. ii. 18; Zech. viii. 9; cf. Ezra vii. 9), on the ground of Ezra v. 16, we accept the truth of an original foundation in 536 (so Driver, Minor Prophets, p. 148), that event was probably from the lifetime of Zerubbabel and Joshua, since the beginning was made in 520. Wellhausen (I. s. und. Zed. Gesch. 3rd ed., p. 160) rejects the earlier foundation; on the other hand, he insists, with the majority of scholars and against Koster, on the actual return of exiles in 537 to form the nucleus of the post-exilic community (loc. cit., p. 157 n.).
pierced”). It is taken for granted that the readers will know who the martyr is, and the exegesis of the Church applies the passage to Christ. Chap. xiii. 1–6 is a continuation of chap. xii.; the dawn of the day of salvation is accompanied by a general purging away of idolatry and the enthusiasm of false prophets.

The prophet’s hope of the incoming of the Messianic deliverance is given in chap. xiv. The heathen gather against Jerusalem and take the city, but do not utterly destroy the inhabitants. They destroy all with all his saints on Mount Olivet and destroy the heathen in battle, while the men of Jerusalem take refuge in their terror in the great cleft, that opens where Yahweh sets His foot. Now the new era begins, and even the heathen do homage to Yahweh, and the gospel of the kingdom of heaven is preached to Gentiles. All in Jerusalem is holy down to the bells on the horses and the cooking-pots.

There is a striking contrast between chaps. i.–viii. and chaps. ix.–xiv. The former prophecy is closely linked to the situation and wants of the community of Jerusalem in the second year of Darius I., and relates to the restoration of the temple and, perhaps, the elevation of Zerubbabel to the throne of David. In chaps. ix.–xiv., however, there is nothing about the restoration of the temple, or about Joshua and Zerubbabel; but we read of the evil rulers, foreign and native alike, who maltreat their subjects, and enrich themselves at their expense. There are corresponding differences in style and speech, and it is particularly to be noted that, while the superscriptions in the first part name the author and give the date of each oracle with precision, those in the second part (ix. i., xii. i.) are without name or date. That both parts do not belong to the same author is now generally admitted, as is also the fact that chaps. ix.–xiv. are of much later date. The predictions of these chapters have no affinity either with the prophecy of Amos, Hosea and Isaiah, or with that of Jeremiah. The kind of eschatology which we find in Zech. ix.–xiv. was first introduced by Ezekiel, who in particular is the author of the conception that the time of deliverance is to be preceded by a joint attack of all nations on Jerusalem, in which they come to final overthrow (Ezek. xxxvii. seq.; Isa. lxvi. 18–24; Joel). The importance attached to the temple service, even in Messianic times (Zech. xiv.), implies an author who lived in the ideas of the religious commonwealth of post-exile times. A future king is hoped for; but in the present there is no Davidic king, only a Davidic family standing on the same level with the noble families in Jerusalem (xii. 7, 12). The “bastard” (mixed race) of Ashdod reminds us of Neh. xiii. 23 sqq.; and the words of ix. 12 (“to-day, also, do I declare that I will render double unto thee”) have no sense unless they refer back to the deliverance from Babylonian exile. But the decisive argument is that in ix. 13 the sons of Javan, i.e. the Greeks, appear as the representatives of the heathen world-power. This part of the prophecy, therefore, is later than Alexander, who overthrew the Persian empire in 333. Egypt and Assyria (x. 10, 11) must be taken to represent the Ptolemic and Seleucid kingdoms, which together made up for the Jews the empire of the sons of Javan.

The whole prophecy, however, is not a unity. By reference to the analysis given above, it will be seen that there are four sections in Zech. ix.–xiv., viz. (1) ix. i., (x. i.–3); (2) xi. 4–17, xiii. 7–9; (3) xii. 1–6; (4) xiv. iv., which are more or less independent of each other. The (3) and (4) sections are marked by a similar character, and show little contact with definite historical events except xii. 7, which suggests the Maccabean age. On the other hand (1) implies a period when the Jews were governed by the Gentiles; and (2) refers to some time in the Maccabean dash of persecution. The prophetic mode of directing revelation is a mark of the first directed (ix. 1, 2). This section, therefore, belongs to the first third of the 2nd b.c. When the Jews were first held to be a “people of the great God and the Lord of Heaven” the temple of Jerusalem was already in ruins, and the evil shepherd of xl. 15 f. may be Meneaclus, whilst the disinherited speaker may be Hecuroclus ben Tobias (cf. xiii. 13 and II. Macc. iii. 11).

Recent criticism (for further details see G. A. Smith, The Book of the Twelve Prophets, ii. pp. 450 f., and Driver, Minor Prophets, pp. 232–234) shows some difference of opinion as to the question of unity; and also of actual date within the Greek period. Whilst G. A. Smith (following Stade) and Marti find no adequate ground for the further division of Zech. ix.–xiv., Driver (following Nowack) accepts the fourfold division indicated above ("Four anonymous Prophecy", periphrastic work of four distinct Prophets, cf. p. 235). In regard to date, G. A. Smith (here also following Stade) accepts the earlier part of the Greek period (366–276). With this Driver provisionally agrees, whilst Nowack thinks no more can be said than that (1) belongs to the Greek and (2)–(4) to the post-exilic period in general. On the other hand, Marti assigns the whole to 160 b.C. (Maccabean period); a little later than Wellhausen.

Recent Literature.—Nowack, Die Kleinen Propheten (1897; ed. 2, 1903); Wellhausen, Die Kleinen Propheten,1 (1898); G. A. Smith, The Book of the Twelve Prophets (The Expositor’s Bible), vol. ii. pp. 233–238, 447–450 (1908); Marti, Die Propheten im Maccabäerzeit, ii. (1904); Driver, Minor Prophets, ii. (in The Century Bible, 1906; the most useful for the general reader). The article in Hastings’s Dictionary of the Bible (vol. iv., pp. 967–970) (1902), by Nowack, is a reproduction from his work cited above; the article in the Encyc. Bibl. by Wellhausen is a revision of his article in the 9th edition of the Encyc. Brit., and the present independent revision is in some points indebted to it. (J. W.; H. W. R.)*

ZEDEKIAH—ZEEHAN

ZEDEKIAH (Hebrew for "righteousness of Yahweh"), son of Josiah, and the last king of Judah (2 Kings xxiv. 17 seq.; 2 Chron. xxxvi. 10 seq.). Previously known as Mattaniah ("gift of Yahweh"), he was appointed king by Nebuchadrezzar after the capture of Jerusalem (597 B.C.) and his name changed to Zedekiah. He held his position under an oath of allegiance, but after three years (cf. Jehoiakim, 2 Kings xxiv. 1) began an intrigue with Moab, Edom, Ammon, Tyre and Sidon, which the prophet Jeremiah vigorously denounced (Jer. xxvii. seq.; cf. also Ezek. xvii. 11–21). It is possible that he was summoned to Babylon to explain his conduct (Jer. li. 53; the Septuagint reads "from Zedekiah"; see also xxix. 3). Nevertheless, relations were maintained with Nebuchadrezzar, as very evident from the text. The Babylonian army began to lay siege to Jerusalem in the ninth year of his reign, and a vain attempt was made by Pharaoh Hophra to cause a diversion. The headings to the prophecies in Ezek. xxix. seq. suggest that fuller details of the events were once preserved, and the narratives in Jer. xxxii.–xxxiv., xxxvii. give some account of the internal position in Jerusalem at the time. After six months a breach was made in the city, Zedekiah’s flight was cut off in the Jordan Valley and he was taken to Nebuchadrezzar at Riblah. His sons were killed, and he was blinded and put into a pit (cf. Ezek. xii. 10–14). Vengeance was taken upon Jerusalem, the city was burned, and the seventh day of the fifth month, 586 B.C., Nebuzaradan sacked the temple, destroyed the walls and houses, and deported the citizens, only the poorest peasantry of the land being left behind. See Jews (History), § 17 seq. (S. A. C.)

ZEDEKAN, a town of Montagu county, Tasmania, 225 m. direct N.W. of Hobart, on the Little Henty river. Pop. (1901) 5014. It is an important railway centre, and from it it radiates lines to Strahan, its port on the Macquarie Harbour, to Dunspaugh, to Wilmersford, and to Burnie, where connection is made to the main Queensland railway line. (R. C.)

*Hadrach, i.e. the Assyrian Hatarika, apparently denotes a district S. of Hamath (between Palmyra and the Mediterranean).

1 Wellhausen, Sketch of the History of Israel and Judah, pp. 137, 139.
Launceston and Hobart. The town is lighted by electricity and has an academy of music and a state-aided school of mines. It is the principal centre of the silver-lead mining district, and has large smelting works.

**Zeeland** (or **Zealander**), a province of Holland, bounded S.E. and S. by Belgium, W. by the North Sea, N. by South Holland, and E. by North Brabant. It has an area of 690 sq. m. and a population (1905) of 227,202. Zeeland consists of the delta islands formed about the estuaries of the Maas and Scheldt with its two arms, the Honte or Western Scheldt, and the Ooster Scheldt, together with a strip of mainland called Zeeland-Flanders. The names of the islands are Schouwen and Duiveland, St Flipsland, Tolten, North Beveland, South Beveland and Walcheren. The history of these islands is in every case one of varying loss and gain in the struggle with the sea. They were built up by the gradual accumulation of mud deposits in a shallow bay, separated by dunes from the North Sea. As late as the 12th and 13th centuries each of these islands consisted of several smaller islands, many of whose names are still preserved in the fertile *polders* which have taken their place.

Lying for the most part below sea-level, the islands are protected by a continuous line of artificial dikes, which hide them from view on the seaward side, whence only an occasional church steeple is seen. The islands of Schouwen and Duiveland are united owing to the damming of the Dykewater; St Flipsland, or Philipsland, and South Beveland are connected with the mainland of North Brabant by naturally formed mud banks.

The soil of Zeeland consists of a fertile sea clay which especially favours the production of wheat; rye, barley (for malting), beans and peas, and flax are also cultivated. Cattle and swine are reared, and dairy produce is largely exported; but the sheep of the province are small and their wool indifferent. The industries (linen, yarn-spinning, distilling, brewing, salt-refining, shipbuilding) are comparatively unimportant. The inhabitants, who retain many quaint and archaic peculiarities of manner and dress, speak the variety of Dutch known as Low Frankish.

The chief towns on the island of Schouwen are the ports of Zierikzee and Brouwershaven. On the well-wooded fringe of the dunes on the west side of the island are the two villages of Renesse and Haamstede, the seats in former days of the two powerful lordships of the same name. St Maartensdyk on the adjoining island of Tolen was formerly a seat of a lordship which belonged successively to the families of Van Borssela, Burren and Orange-Nassau. There is a monument of the Van Borssela family on the church at Tolen.

The castle built here in the first half of the 14th century was demolished in 1819. The island of South Beveland frequently suffered from inundations and experienced a particularly disastrous one in 1530. In the same century the flourishing walled town of Reimerswaal and the island of Borosse or Borosse disappeared beneath the waves; but the last-named was gradually recovered during the 17th century. This island gave its name to the powerful lordship of the same name. Goes is the chief town on South Beveland. Oyster-breeding is practised on the north coast of the island, especially at Wemeldinge and Jerske or Yerske. Jerske was once a town of importance and the seat of a lordship, while at Wemeldinge there was formerly an establishment of the Templars. In 1866 South Beveland and Walcheren were joined by a heavy railway dam, a canal being cut through the middle of the former island to restore the connexion between the East and West Scheldt. South Beveland is sometimes called the "granary" and Walcheren the "gardens" of Zeeland. The principal towns in Walcheren are Middelburg, the chief town of the province, Flushing and Veere; all three connected by a canal (1857-72) which divides the island in two. The fishing village of Arnemuiden flourished as a harbour in the 16th century, but decayed owing to the silting up of the sand. Domburg is pleasantly situated at the foot of the dunes on the west side of the island, and in modern times has become a popular but primitive watering-place. It is a very old town, having received civic rights in the 13th century, and from time to time Roman remains and other antiquities have been dug out of the sands. Between Domburg and the village of Westkapelle there stretches the famous Westkapelle sea-dike. The mainland of Zeeland-Flanders was formerly also composed of numerous islands which were gradually united by the accumulation of mud and sand, and in this way many once flourishing commercial towns, such as Sluis and Aardenburg, were reduced in importance. The famous castle of Sluis, built in 1385, was partly blown up by the French in 1794, and totally demolished in 1818. Yzemdyke represents a Hanse town which flourished in the 13th century and was greatly engulfed by the sea. Similarly the original port of Breskens was destroyed by inundations in the 15th and 16th centuries. The modern town rose into importance in the 15th century on account of its good harbour. The old towns of Axel and Halst were formerly important fortresses, and as such were frequently besieged in the 16th, 17th and 18th centuries. Ter Neuzen was strongly fortified in 1833-39, and has a flourishing transit trade, as the port of Ghent, by the canal constructed in 1825-27.

**Zeerust**, a town of the Transvaal, 140 m. by rail, via Krugersdorp, N.N.W. of Pretoria and 33 m. N.E. of Mafeking. Pop. (1903) 1945. It was founded in 1868 and is the chief town of the Marico district, one of the most fertile regions of South Africa. In the neighbourhood are lead, zinc and silver mines, and some 20 m. S. are the Malmant goldfields. The Marico River was once a fairly important tributary of the Orange, the mouth of which was for a time the chief port of Mafeking, a town which had come from Zululand. They were driven out by Boer trekkers in 1837. To Boer cultivation the valley of the Marico river owes its fertility. Wheat and oats are largely cultivated and almost all sub-tropical fruits flourish. Following the relief of Mafeking, 17th of May 1900, Zeerust was occupied by the British under General R. S. S. Baden-Powell. Railway connection with Pretoria was established in 1907.

**Zeisberg, Heinrich**, Ritter von (1830-1899), Austrian historian, was born in Vienna on the 8th of July 1839, and in 1865 became professor of history at the university of Lemberg. In 1871 he removed to Innsbruck; in 1873 he was appointed professor at the university of Vienna, and here he was historical tutor to the crown prince Rudolph. In 1891 he was made director of the Vienna institute for historical research, and in 1896 director of the imperial court library at Vienna. He resigned his professorial chair in 1897 and died on the 27th of May 1899.

Zeisberg's writings deal mainly with the history of Austria and of the Austrian imperial and Holy Roman empire, and among them the following may be mentioned: *Die polnische Geschichtsschreibung des Mittelalters* (Leipzig, 1873); Zeisberg, Arno, erster Erzbischof von Salzburg (Vienna, 1863); *Die Kriege Kaiser Heinrichs II. mit Herzog Boleslaw I. von Polen* (Vienna, 1868); *Rudolf von Habsburg und der österreichische Staatsgründungen* (Vienna, 1882); *Über das Rechtverfahren Rudolfs von Habsburg gegen Otto von Böhmen* (Vienna, 1887); and *Der österreichische Erfolgsstreit nach dem Tode des Königs Ludwigs* Posthumus* 1457-58* (Vienna, 1879). Dealing with more recent times he wrote:—*Zur deutschen Kaiserpolitik Österreichs: ein Beitrag zur Geschichte des Revolutionsjahrzehnts 1795* (Vienna, 1893); *Zwei Jahre beigleicher Geschichte 1791-92* (Vienna, 1891); *Belgien unter der Generalstaatsbehörde Erzherzog Karl 1793-94* (Vienna, 1893-94); *Erzherzog Karl von Österreich, Lebensbild* (Vienna, 1895); and *Franz Josef I.* (Vienna, 1888). He edited three volumes of the *Quellen zur Geschichte Deutschlands: Kaisers August der starke und die französischen Revolutionskriege 1792-1801* (Vienna, 1882-1885, 1890).

**Zeitun** ("olive"), the name of several places in Turkey and Egypt, but principally an Armenian town in the Aleppo vilayet, altitude about 2000 ft., situated in the heart of Mt. Taurus, about 20 m. N.N.W. of Marash. The inhabitants, about 16,000, all Christians, are of a singularly fine physical type, though too much inbred, and are interesting from their character and historical position as a remnant of the kingdom of Lesser Armenia. The importance of Zeitun dates from the capture of Leo VI. by the Egyptians in 1375, and it probably became then a refuge for the more active and irreconcilable Armenians; but nothing certain is known of the place till 300 years later. It long maintained practical independence as
a nest of freebooters, and it was only in 1878 that the Turks, after a long conflict, were enabled to station troops in a fort above the town. In 1890 there was a serious revolt, from the worst consequences of which the town was saved by the intercession of the British consul at Aleppo warned in time by the devoted energy of T. Christie, American missionary at Marash; and in 1895, after the Armenian massacres had commenced elsewhere, the people again rose, seized the fort, and, after holding out for more than three months against a large Turkish force, secured honourable terms of peace on the mediation of the consul of the Powers at Aleppo. The inhabitants seem to be abandoning their robber customs and devoting themselves to oil and silk culture. In consequence transit trade through the passes of eastern Taurus (see MARASH), long almost annihilated by fear of the Zeitunli marauders, revived considerably. The governor must be a Christian, and certain other privileges are secured to the Zeitunli during their good behaviour.

(D. G. H.)

ZEITZ, a town of Germany, in the extreme south of the Prussian province of Saxon, pleasantly situated on a hill on the Weisse (White) Elster, 28 m. by rail S.S.W. of Leipzig on the line to Gera, and with branches to Altenburg and Weissenfels. Pop. (1885) 19,797; (1900) 27,592. The river is here crossed by two iron bridges, and on the lime-bridge, and the upper and lower towns are connected by a tunnelling railway. The Gothic abbey church dates from the 12th century, but its Romanesque crypt from the 11th. The old Franciscan monastery, now occupied by a seminary, contains a library of 20,000 volumes. Just outside the town rises the Moritzburg, built in 1564 by the dukes of Saxe-Zeitz, on the site of the bishop's palace; it is now a reformatory and poorhouse. Zeitz has manufactures of cloth, cotton and other textiles, machinery, wax-cloth, musical instruments, vinegar, cigars, &c., and wood-cutting, dyeing and calico-printing are carried on. In the neighbourhood there are considerable deposits of lignite, and mineral-oil works. Zeitz is an ancient place of Slavonic origin. From 968 till 1028 it was the seat of a bishopric, afterwards removed to Naumburg, 153 m. to the N.W., and styled Naumburg-Zeitz. In 1564 the last Roman Catholic bishop died, and his dominions were thenceforward administered by princes of Saxon. From 1653 till 1718 Zeitz was the capital of the dukes of Saxe-Zeitz or Sachsen-Zeitz. It thereafter remained in the possession of the electors of Saxony until 1815, when it passed to Prussia. He became professor of philosophy at Heidelberg in 1862, removed to Berlin in 1872, and retired in 1895. His great work is his Philosophie der Griechen (1844–52). This book he continued to amplify and improve in the light of further research; the last edition appeared in 1902. It has been translated into most of the European languages and became the recognized text-book of Greek philosophy. He wrote also on theology, and published three volumes of philosophical essays. He was also one of the founders of the Theologische Jahrbucher, a periodical which acquired great importance until 1875, when it passed to R. Strauss and Christian Baur. Like most of his contemporaries he began with Hegelianism, but subsequently he developed a system on his own lines. He saw the necessity of going back to Kant in the sense of demanding a critical reconsideration of the epistemological problems which Kant had made but a partially successful attempt to solve. None the less his merits as an original thinker are far outshone by his splendid services to the history of philosophy. It is true that his view of Greek

thought is somewhat warped by Hegelian formalism. He is not alive enough to the very intimate relation which thought holds to national life and to the idiocracy of the thinker. He lays too much stress upon the "concept," and explains too much by the Hegelian antithesis of subjective and objective. Nevertheless his history of Greek philosophy remains a noble monument of solid learning informed with natural sagacity. He received the highest recognition, not only from philosophers and learned societies all over the world, but also from the emperor and the German people. In 1894 the Emperor William II. made him a "Wirklicher Geheimrat" with the title of "Excellenz," and his bust, with that of Helmholtz, was set up at the Brandenburg Gate near the statues erected to the Empress and Empress Frederick. He died on the 19th of March 1908.

The Philosophie der Griechen has been translated into English by S. F. Alleyne (2 vols., 1881) in sections: S. F. Alleyne, Hist. of Gk. Phil. to the time of Socrates (1881); O. J. Reichel, Socrates and the Socratic Schools (1868; 2nd ed. 1877); S. F. Alleyne and T. Goodwin, Plato and the Older Academy (1876); Costelloe and Muirhead, Aristotle and the Earlier Peripatetics (1897); O. J. Reichel, Stoics, Epicureans and Skeptics (1870 and 1880); S. F. Alleyne, Hist. of Ecclesiastic in Gk. Phil. (1883). The Philosophy appeared in the Gesellschaft der Wissenschaften zu Leipzic (1883; 3rd ed. 1889); Eng. transl. by Alleyne and Evelyn Abbott (1886), under the title, Outlines of the Hist. of Gk. Phil. Among his papers are—Abhandlungen und Zettel (1873); Grundriss der Geschichtskunde (1854; Eng. trans. by J. D. Dampier, 1857–76); Entwurf der Geschichte d. Philosophie (1862); Gesch. d. christl. Kirche (1868); Gesch. d. deutsch. Philos. seit Leibniz. (1873; Eng. trans. 1875); Staats- und Kirchen (1873); Geschichtliche und Schriften (1874; Eng. trans. 1875); Uber Bedeutung und Ausgabe d. Erkenntnis-Theorie (1866); Uber teleolog. und mechan. Naturerklarung (1876); Vortrage und Abhandlungen (1866–84); Philosophie der Griechen (1886, ed. 1871); Philosophie der Griechen (1887).

ZEMARCHUS (fl. 68), Byzantine general and traveller. The Turks, by their conquest of Sogdiana in the middle of the 6th century, gained control of the silk trade which then passed through Central Asia into Persia. But the Persian king, Chosroes Nushirvan, dreading the intrusion of Turkish influence, refused to allow the old commerce to continue, and the Turks after many rebuffs consented to a suggestion made by their mercantile subjects of the Soghd, and in 568 sent an embassy to Constantinople to form an alliance with the Byzantines and "transfer the sale of silk to them." The offer was accepted by Justin II, and in August 568, Zemarchus, "a Cilician, "General of the cities of the East," left Byzantium for Sogdiana. The embassy was under the guidance of Maniakh, "chief of the people of Sogdiana," who had first, according to Menander Protector, suggested to Dizabul (Disiboulos, the Bu min khan of the Turks, the Mogen of the Chinese), the great khan of the Turks, this "Roman" alliance, and had himself come to Byzantium to negotiate the same. On reaching the Sogdian territories the travellers were offered iron for sale, and solemnly exorcised; Zemarchus was made to "pass through the room instead of two fires," and strange ceremonies were performed over the baggage of the expedition, a bell being rung and a drum beaten over it, while flaming incense-leaves were carried round it, and incantations muttered in "Scythian." After these precautions the envoys proceeded to the camp of Dizabul (or rather of Dizabul's successor, Bu Min khan having just died) "in a hollow encompassed by the Golden Mountain," apparently in some locality of the Altai. They found the khan surrounded by astonishing barbaric pomp—gilded thrones, golden peacocks, gold and silver plate and silver animals, hangings of gold and silver, a tent of scarlet, a building of meadow-straw, around a large column. Zemarchus sat upon his march against Persia, passing through Talas or Turkistan in the Syr Daria valley, where Hsuan Tsang, on his way from China to India sixty years later, met with another of Dizabul's successors. Zemarchus was present at a banquet in Talas where the Turkish kagan and the Persian envoy exchanged abuse; but the Byzantine does not seem to have witnessed actual fighting. Near the river Oekhi (Syr Daria?) he was sent back to Constantinople with a Turkish embassy and with
envoys from various tribes subject to the Turks. Halting by the "vast, wide lagoon" (of the Aral Sea?), Zemarchus sent off an express messenger, one George, to announce his return to the emperor. George hurried on by the shortest route, "desert and waterless," apparently the steppes north of the Black Sea, while his superior, moving more slowly, marched twelve days by the sandy shores of the lagoon; crossed the Emha, Ural, Volga, and Kuban (where 4000 Persians vainly lay in ambush to stop him); and passing round the western end of the Caucasus, arrived safely at Trebizond and Constantinople. For several years this Turkish alliance subsisted, while close intercourse was maintained between Central Asia and Byzantium; when another Roman envoy, one Valentinos (Ováäxévrwos), goes on his embassy in 575 he takes back with him 166 Turks who had been visiting Byzantine lands; but from 579 this friendship rapidly began to cool. It is curious that all this travel between the Bosporus and Transoxiana seems not to have done anything to correct, at least in literature, the widespread misapprehension of the Caspian as a gulf of the Arctic Ocean.

ZENÁGA (Sanhája, Senajé), a Berber tribe of southern Morocco who gave their name to Senegal, once their tribal home. They formed one of the tribes which, uniting under the leadership of Yusuf bin Tashfin, crossed the Sahara and gave a dynasty to Morocco and Spain, namely, that of the Almoravides (q.v.). The Zirid dynasty which supplanted the Fatimites in the Maghrib and founded the city of Algiers was also of Zenaga origin. The Zenaga dialect of Berber is spoken in southern Morocco and on the banks of the lower Senegal, largely by the negro population.

ZENANA (Persian zanana), the apartments of an Eastern house in which the women of the family are secluded (see Harem). This is a Mahomedan custom, which has been introduced into India and has spread amongst the Hindoos. The zenana missions are missions to Indian women in their own homes.

ZENATA, or ZANÁTA, a Berber tribe of Morocco in the district of the central Atlas. Their tribal home seems to have been south of Oran in Algeria, and they seem to have early claimed an Arab origin, though it was alleged by the Arabs that they were descendants of Gombars or Gommar (Ibn Khaldun, vol. iii. p. 184 and vol. iv. p. 597). They were formerly a large and powerful confederation, and took a prominent part in the history of the Berber race. The Benimarin and Wattasi dynasties which reigned in Morocco from 1213 to 1548 were of Zenata origin.

ZEND-AVESTA, the original document of the religion of Zoroaster (q.v.), still used by the Parsees as their bible and prayer-book. The name "Zend-Avesta" has been current in Europe since the time of Anquetil Duperron (c. 1771), but the Parsees still sometimes mean (a "misunderstanding"") being specially employed to denote the translation and exposition of a great part of the Avesta which exists in Pahlavi. Text and translation are often spoken of together in Pahlavi books as Avishtak va Zend ("Avesta and Zend"); whence—through a misunderstanding—our word Zend-Avesta. The origin and meaning of the word "Avesta" (or in its older form, Avishtak) are alike obscure; it cannot be traced further back than the Sassanian period. The language of the Avesta is still frequently called Zend; but, as already implied, this is a misname. We possess no other document written in it, and on this account modern Parsee scholars, as well as the older Pahlavi books, speak of the language and writing indifferently as Avesta. As the original home of the language can only be very doubtfully conjectured, we shall do well to follow the usage sanctioned by old custom and apply the word to both. Although the Avesta is a work of but moderate compass (comparable, say, to the Iliad and Odyssey taken together), there nevertheless exists no single MS. which gives it in entirety. This circumstance alone is enough to reveal the true nature of the manuscript which contains the Avesta, and as a hypothesis a copy or copies of the Avesta, as the Old Testament is. It consists, as we shall afterwards see, of the last remains of the extensive sacred literature in which the Zoroastrian faith was formerly set forth.

Sections.—As we now have it, the Avesta consists of five parts—the Yasna, the Visperad, the Vendidad, the Yashts, and the Khordad Avesta.

1. The Yasna, the principal liturgical book of the Parsees, in 72 chapters (hastá, há), contains the texts that are read by the priests at the solemn yasna (Izshee) ceremony, or the general sacrifice in honour of all the deities. The arrangement of the Yasna is rather irregular, and it has nothing to do with the liturgical action. The kernel of the whole book, around which the remaining portions are grouped, consists of the Gathás (chap. 28-54) and the Gathas of Zoroaster (q.v.), the most sacred portion of the entire canon. The Yasna accordingly falls into three sections of about equal length:—(a) The introduction (chs. 1-27) is, for the most part, made up of long-winded, monotonous tracts, the so-called Vispered, which are mostly of a religious or moral character and are written in a metrical style and an archaic language, different in many respects from that ordinarily used in the Avesta. As to the second part of these tracts, they are arranged according to the metres in which they are written, fall into five subdivisions (28-34, 43-46, 47-50, 51, 53). Between chap. 37 and chap. 43 is inserted the so-called Seven-Chapter Yasna (Yazagsháh), a famous small prayers and invocations of the Persians, written after the Gatha; in antiquity (b) The so-called Later Yasna (Apáro Yasna) (chs. 54-72) has contents of considerable variety, but mainly consists of invocations. Special mention ought to be made of the Spenta (Sêna) Yasht (67), the prayer to fire (62), and the great liturgy for the sacrifice to divinities of the water (65-66).

2. The Visperad, a minor liturgical work in 24 chapters (karde), is also in form and substance completely dependent on the Yasna, but is a shorter summary and abridgment to which it is a liturgical appendix. Its separate chapters are interpolated in the Yasna in order to produce a modified—or expanded—Yasna ceremony. The name Vispered, meaning "all the Gathás (zhá) or hymns" of Zoroaster (q.v.), has reference to the spiritual heads of the religion of Ormuzd, invocations to whom form the contents of the first chapter of the book.

3. The Vendidad, the primary code of the Parsees, contains in 22 chapters (Fargard) a kind of dualistic account of the creation (chap. 1), the legend of Yima and the golden age (chap. 2), and in the bulk of the remaining chapters the precepts of religion with their practical applications (chap. 3). It is the care of animals, the protection of the sacred elements, such as earth, fire and water, the keeping of a man's body from defilement, together with the requisite measures of precaution, elaborate ceremonies of purification, etc. The prescriptions, arranged in a religious code, are marked by a conscientious classification based on considerations of material, size and number; but they lose themselves in an exaggerated casuistry. Still the whole of Zoroastrian legislation is subordinate to one great point of view: the war—preached without intermission—against Satan and his noxious creatures, from which the whole book derives its name; for "Vendidad is a modern corruption for zá-dá-dàtim—"the anti- demonic Law." Fargard 18 treats of the true and false priest, of the value of the house-cock, of the four paramours of the she-devil, and of unlawful lust. Fargard 19 is a fragment of the Zoroaster legend of the Smerdis, the pseudo-Zoroaster myth for the revelation of the law, Ahraman and the devils despair, and flee down into hell. The three concluding chapters are devoted to the medicinal system. The Yasna, Visperad and Vendidad together constitute the Avesta in the stricter sense of the word, and the reading of them appertains to the priest alone. For liturgical purposes the separate chapters of the Vendidad and the Yasna and Visperad are laid among those of the Yasna and Visperad. The reading of the Vendidad in this case may, when viewed according to the original intention, be taken as corresponding in some sense to the sermon, while that of the Yasna and Visperad may be said to answer to the hymns and prayers of Christian worship.

4. The Yashts, i.e. "songs of praise," in so far as they have not been already included among the Yasna and Visperad, are the Yashts, and Visperad, written in an poetical mood, and represent the religious poetry of the ancient Iranians. So far they
may be compared to the Indian Rig-Veda. Several of them may have been cemented together from a number of lesser poems or songs. They are a rich source of mythology and legendary history. Side by side with the vivid, fully developed stories of the Zoroastrian deities, they frequently interweave, as in the epicles, stories from the old heroic fables. The most important of all, the 19th Yashat, gives a consecutive account of the Iranian heroic saga in great blocks of lines, together with a prophetic presentation of the end of the world.

5. The Khordah Avesta, i.e. the Little Avesta, comprises a collection of shorter prayers designed for all believers—the fairy included. In the later parts of the Avestan writings, these are the sources of much wisdom. For that reason, we have not included them in this study. The Khordah Avesta is in reality a collection of prayers for all occasions of everyday life. It is the main collection of the sacred Yaznas.

The Larger Avesta and the Twenty-One Nasks:—In its present form, however, the Avesta is only a fragmentary remains of the old priestly literature of Zoroastrism, a fact confessed by the learned tradition of the Parsees themselves, according to which the number of Yashts was originally thirty.

The truth is that we possess but a trifling portion of a very much larger Avesta, if we are to believe native tradition, carrying us back to the Sassanian period, which tells of a larger Avesta in twenty-one books (nasks or naskh), as to the names of which we have several more or less detailed accounts, particularly in the Pahlavi Dinkard (9th century A.D.) and in the Richard Hakluyt’s same works. We learn that this larger Avesta was only a part of a yet more extensive original Avesta, which is said to have existed before Alexander. We are told that of that number of nasks only a small portion was found to be extant after Alexander. For example, of the seventh naskh, which “before Alexander” had as many as fifty chapters, there then remained only thirteen; and similar allegations are made with regard to the eighth, ninth, tenth and other nasks. The Rivayats state that, when after the calamity of Alexander they sought for the books again, they found a portion of each naskh broken into small fragments, incompleteness except the Vendidad.

But even of the remains of the Avesta, as these lay before the author of the 18th century, only a small residue has survived to our time. Of all the nasks one only, the nineteenth, has come down on us intact—the Vendidad. All else, considered as wholes, have vanished in the course of the centuries.

It would be rash summarily to dismiss this old tradition of the twenty-one nasks as pure invention. The number twenty-one points, indeed, to an artificial arrangement of the material; for twenty-one is a sacred number, and the most sacred prayer of the Parsees, the Ashvins, is composed of twenty-one words; and it is also true that in the enumeration of the nasks we miss the names of the books we know, like the Yasna and the Yastis. But we must assume that these were included in such or such a naskh, as the Yastis in the seventeenth or Bûdân Yasth; or, it may be that other books, especially the Yasna, are a compila extracted for liturgical purposes from various books.

Further, the statements of the Dinkard leave on us a very distinct impression that the author actually had before him the text of the nasks, or at all events of a large part of them: for he expressly states that the eleventh naskh was entirely lost, so that he is unable to give the slightest account of its contents. And, besides, in other directions there are numerous indications that such books once really existed. In the Khordah Avesta, as we now have it, we find the same facts; with regard to the first, Yasna, the expression of the fact is given in the Old MSS., that it was taken from the Hûddakh (the twelfth, according to the Dinkard). From the same naskh also a considerable fragment (Vis. 21 and 22 in Westergaard) has been taken. So, also, the Nirangast is a portion of the seventeenth (or Íštrâpam) naskh. Lastly, the numerous other fragments, the quotations in the Pahlavi translation, the many references to the Avesta in the Bundahish to passages of this Avesta not now known to us, all prove that there was in the Sassanian age a large amount of the extensive Avesta literature that the mere prayer-book now in our hands. The existence of a larger Avesta, even as late as the 9th century of our era, is beyond a doubt.

But it is also by no means a certain that a collection of twenty-one nasks, with its twenty-one nasks, we may well believe the Parsees themselves, when they affirm that their sacred literature is made up of successive stages of development, of which is represented by the present Avesta. In fact we can clearly trace this gradual process of decay in certain portions of the Avesta during the last few centuries. The great Yashats are not of very frequent occurrence in the manuscripts: some of them, indeed, are already met with but seldom, and MSS. containing all the Yashats are of extreme rarity. Of the fifteenth, seventeenth and nineteenth Yashats the few useful copies that we possess are derived from a single MS. of the year 1591 A.D.

Origin and History.—While all that Herodotus (i. 132) has to say is that the Magi sang “the theogony” at their sacrifices, Pausanias is able to add (v. 27. 3) that they read from a book. Hermippus, in the 3rd century B.C., affirmed that Zoroaster, the founder of the doctrine of the Magi, was the author of more than a hundred books, each containing 100,000 verses. According to the Arab historian, Tabari, these were written on 12,000 cowhides, and the imperial court of the Caliph of Persia sent an envoy to Zoroaster and gave him the book of the Persians the book called Avesta. It consisted of twenty-one parts, each containing 200 leaves. This book, in the writing which Zartusht invented and which the Magi called the writing of religion, was written on 12,000 cowhides, bound together by golden bands. Its language was the Old Persian, which no one understands.” These assertions sufficiently establish the existence and great bulk of the sacred writings.

Parsee tradition adds a number of interesting statements as to their history. According to the Arda-Viraf-Nama the period for the编纂 of the Avesta (i.e. the collection of the sacred books) was 300 years, when Iskander Rumi (Alexander the Great) invaded and devastated Iran, and burned the Avesta which, written on cowhides with golden ink, was preserved in the archives at Persepolis. According to the Dinkard, there were two copies, of which one was burned, while the second came into the hands of the Greeks. One of the Riviyato relates further: “After the villainy of Alexander, an assemblage of several high-priests brought together the Avesta from various places, and made a collection which included the sacred Yasna, Vairap, Vendid and other scraps of the Avesta.” As to this re-collection and redaction of the Avesta the Dinkard gives various details. One of the Arsacid kings, Vologeses (I. or III.?), ordered the scattered remnants of the Avesta to be carefully preserved and recorded. The first of the Sassanian kings, Ardshahr Babagan (226–240), caused his high-priest, Tanvaras, to bring together the dispersed portions of the holy book, and to compile from these a new Avesta, which, as far as possible, should be a faithful reproduction of the original. King Shapur I. (241–272) enlarged this re-edited Avesta by the addition of new compositions and incorporation of works on medicine, astronomy, geography and philosophy. Under Shapur II. (309–358) the naks were brought into complete order, and the new re-script of the Avesta reached its definitive conclusion.

Historical criticism may regard this tradition, in many of its features, as mere fiction, or as a perversion of facts made for the purpose of transferring the blame for the loss of a sacred literature to other persons than those actually responsible for it. We may, if we choose, absolve Alexander from the charge of vandalism of which he is accused, but the fact nevertheless remains, that he ordered the palace at Persepolis to be burned (Diod., viii. 72; Curt., v. 7). Even the statement as to the one or two complete copies of the Avesta may be given up as the invention of a later day. Nevertheless the essential elements of the tradition remain unshaken, viz. that the original Avesta, or old sacred literature, divided on account of its great bulk and heterogeneous contents into many portions and a variety of separate works, had an actual existence in numerous copies and also in the memories of priests, that, although gradually diminishing in bulk, it remained extant during the period of foreign domination and ecclesiastical decay after the time of Alexander, and that it served as a basis for the reduction subsequently made. The kernel of this native tradition—the fact of a late collection of older fragments—appears indisputable. The character of the book is entirely that of a compilation.

In its outward form the Avesta, as we now have it, belongs to the Sassanian period—the last survival of the compilers’ work already alluded to. But this Sassanian origin of the Avesta must not be misunderstood: from the remnants and heterogeneous
fragments at their disposal, the disusecast or disusecast compo-
posed a new canon—erected a new edifice from the materials of the 
old. In point of detail, it is now impossible to draw a 
sharp distinction between that which they found surviving ready to their hand and that which they themselves added, or to 
define how far they reproduced the traditional fragments with 
verbal fidelity or indulged in revision and remoulding. It may 
reasonably be supposed, not only that they constructed the 
external framework of many chapters, and also some 
additions of their own—a necessary process in order to weld 
their motley collection of fragments into a new and coherent book—but also that they fabricated anew many formulae and 
imitative passages on the model of the materials at their dis-
posal. In this consisted the completion of Tanwasar, ex-
pressed more correctly in the account of the Dinkard. All those 
texts in which the grammar is handled, not with a sense of want of skill, and again with absolute barbarism, may probably 
be placed to the account of the Sassanian redactors. All the 
grammatically correct texts, together with those portions of the 
Avesta which have intrinsic worth, especially the metrical 
passages, are indubitably authentic and taken ad verum from 
the original Avesta. To this class, above all, belong the 
Gathas and the nucleus of the greater Yashts. Opinions differ 
greatly as to the precise origin of the original texts brought 
together by subsequent redactors; according to some, they are 
pre-Achaemenian; according to others, they were written in Media under the Achaemenian dynasty; according to some, their source must be sought in the east, 
according to others, in the west of Iran. But to search for a 
precise time or an exact locality is to deal with the question too 
narrowly; it is more correct to say that the Avesta was 
worked at from the time of Zoroaster down to the Sassanian 
period. Its oldest portions, the Gathas, proceed from the prophet 
himself. This conclusion is inevitable for every one to whom 
Zoroaster is an historical personality, and who does not shun 
the labour of an unprejudiced research into the meaning of thought and language in the Zoroastrian era, the rest of the Avesta, 
in spite of the opposite opinion of orthodox Parsees, does not 
even claim to come from Zoroaster. As the Gathas now con-
stitute the kernel of the most sacred prayer-book, viz. the 
Yasna, so they ultimately proved to be the first nucleus of a 
religion literature in general. The language in which Zoroaster 
could, especially a later development of it, remained as the 
standard with his followers, and became the sacred language 
throughout a large part of the Sassanian Empire, attaining to 
a precise time or an exact locality. But neither the spiritual 
literature nor the sacred tongue remained limited to the east. 
The geography of the Avesta points both to the east and the west, 
particularly the north-west of Iran, but with a decided 
tendency to gravitate towards the east. The vivid descrip-
tion of the basin of the Hilment (Yash 19, 65-66) is peculiarly 
instructive. The language of the Avesta travelled with the 
Zoroastrian religion and with the main body of the priesthood, 
in all probability, that is to say, from east to west; within the 
limits of Iran it became international.

As has been already stated, the Avesta now in our hands is 
based on two portions of the text: first and most important, 
the original Avesta; second, the more barbarous, and under the Sassanians. The larger part perished under the Magian barbarism 
and under the more barbarous tyranny of the Tatars, when through 
conversion and extermination the Zoroastrians became a mere 
remnant. The study of the Avesta was continued, though at a 
slow reproduction of manuscripts. A most meagre proportion only of the 
real religious and ritual writings, the sacred law and the liturgy, 
have been preserved to our time. The great bulk—over three-
quarters—of the whole is now lost. But, when the lay literature collected, has fallen a prey to oblivion. The under-
standing of the older Avesta texts began to die away at an early 
period. It was quite clear that a new translation and interpretation 
was needed; and under the Later Sassanians, one of the books, 
if not the whole of them, were rendered into the current Pahlavi. 
A thorough use of this translation will not be possible until we 
possess an entirely new version, where no word-crystal is unscrupulously 
and language ceases to be the monopoly of a few privileged individuals.

For the interpretation of the older texts it is of great value where 
they are concerned with the fixed, formal statutes of the church. 
In these cases, where they pass rather in the form of the Gathas, the Pahlavi translator becomes a defective and 
unreliable interpreter. The Parsee priest, Neryosangh, subsequently 
translated a portion of the Pahlavi version into Sanskrit.

The MSS. of the Avesta are, comparatively speaking, of recent 
date. The oldest is the Pahlavi Vispered in Copenhagen, dated 
1528. Next come the four MSS. of the Herbad Mihirapán Kai 
Khosro of Anquetil (1322 and 1324), two Vendidasi with the 
Avesta in London and Copenhagen, and two Yasnás with Pahlavi in 
Copenhagen and formerly in Bombay (now Oxford). Generally speaking; 
The MSS. fail off in quality and carefulness in proportion to their 
age. The older MSS. have a very precise and word-crystal 
concerning the texts of those proceeding from Kimran and Yazd in Persia, mostly 
dating from the 17th and 18th centuries.

The Copernican attention to the Avesta was 
Hyde of Oxford, in his Historia Religiosa 
Veternar Persarum 
orumque Magorum (1700), which, however, 
failed to awake any 
hunting in the sacred writings of the Parsees. The merit 
seems to be this book has ever since been entitled 
by the fruit of whose prolonged stay in India (1755-1761) 
the Pahlavi, the Avesta translation; a 
and his acquaintance with the Parsee priests was a 
(very certain) defective of the Zend-Avesta. 
and the foundation of a scientifique the exegesis was laid by Burnouf. The interpretation of the 
composition of the Zoroastrian 
only from the fact that Spiegel's translation, by an excessive reaction. 
Avesta is a monotonous book. The Yasna and 
many Yashts in great part consist of formulae which are as 
poor in contents as they are rich in verbiage.

the Church, and the sole literary monument of ancient 
the Avesta occupies a prominent position in the literature of the 
the future will doubtless be more just with regard 
the importance of the book for the history of religion in general 
and of the Zoroastrian faith, and the sole literary monument of ancient Iran—
the Avesta occupies a prominent position in the literature of the 
world. At the present day its significance is definitely 
understood.

ENRICHMENT:—Zend-Avesta, ed. by N. L. Westergaard (Copenhagen 
1852-54, 2 vols., complete; F. Spiegel, Avesta (Vienna, 1853-58), only 
Vendidad, Vaspered and Yasna, but with the Pahlavi translation; 
G. Geldner (Stuttgart, 1886-90), Translations.—Anquetil Duper-
Darmesteter, 3 vols. (Paris, 1892-93) (Annales du Musée Guimet)—a most important work.

LITERATURE.—Anquetil Duperon (see above); Haug, Essays on the 
language and literature of the Zend-Avesta, by E. W. West (London, 1878); De Harlez, Introduction à l'étude de l'Avesta (Paris, 1881); Max Duncker, Geschichte des Altertums, vols. I & II (Stuttgart, 1841); J. Darmesteter, in the Introduction to Zend-Avesta (see above); Pahlavi, Avesta-Literatur in the Grundriss 
der iranischen Philologie, by Geiger and Kuhn (Strassburg, 
1860), vol. 1; E. W. West, Contents of the Names, Soc., 37 (Oxford, 1892).
ZENGG—ZENO OF ELEA

ZENGG (Hungarian, Zeng; Croatian, Senj; Italian, Segno), a royal free town of Hungary, in the county of Lika-Krbava, Croatia-Slavonia, 34 m. S.E. of Fiume, on the Adriatic Sea. Pop. (1900) 3182. Zengg lies at the entrance to a long cleft among the Velbit Mountains, down which the bora, or N.E. wind, sweeps with such violence as often to render the harbour unsafe, although the Austrian Lloyd steamers call regularly. Apart from the cathedral of its Roman Catholic bishop, a gymnasion, and some ancient fortifications, the town contains little of interest. It carries on a small trade in tobacco, fish and hemp. An elevated road of Veglia faces the town and the port of San Giorgio lies 5 m. S.

The captnacy of Zengg was established, in the 15th century, by King Matthias Corvinus of Hungary, as a check upon the Turks; and subsequently, until 1617, the town became famous as the stronghold of the Uskoks.

ZENITH (from the Arabic), the point directly overhead; its direction is defined by that of the plumb-line.

ZENJAN, or Zanjan, a town of Persia, capital of the Khamseh province, about 205 m. N.W. of Teheran, on the high road thence to Tabriz, has an elevation of 4,373 ft. It has an area of about 25,000 and post and telegraph offices, and was one of the original strongholds of the Bábí sectarians, who held it against a large Persian force from May 1590 to the end of the year, when most of them were massacred. It has extensive gardens, well watered by the Zanjanee river, which flows south of it. The well-stocked bazaar supplies the neighbouring districts.

ZENO, East Roman emperor from 474 to 491, was an Isaurian of noble birth, and originally bore the name of Trascasilua, which he exchanged for that of Zeno on his marriage with Ariadne, daughter of Leo I., in 468. Of his early life nothing is known; after his marriage (which was designed by Leo to secure the Isaurian support against his ambitious minister Aspar) he became patrician and commander of the imperial guard and of the armies in the East. While on a campaign in Thrace he narrowly escaped assassination; on his return to the capital he avenged himself by compassing the murder of Aspar, who had instigated the attempt. In 474 Leo I. died after appointing as his successor Leo the son of Zeno and Ariadne; Zeno, however, with the help of his mother-in-law Verina, succeeded in getting himself crowned also, and on the death of Leo the son of the year, the year of the death of the year, became sole emperor. In the following year, in consequence of a revolt fomented by Verina in favour of her brother Basiliscus, and the antipathy to his Isaurian soldiers and administrators, he was compelled to take refuge in Isauria, where, after sustaining a defeat, he was compelled to shut himself up in a fortress. The growing misgovernment and unpopularity of Basiliscus ultimately enabled Zeno to re-enter Constantinople unopposed (476); his rival was banished to Phrygia, where he soon afterwards died. The remainder of Zeno's reign was disturbed by numerous other less formidable revolts. Since 472 the aggressions of the two Ostrogoth leaders Theodoric had been a constant source of danger. Though Zeno at times contrived to play them off against each other, they in turn were able to profit by his dynastic rivalries, and it was only by offering them pay and high command that he kept them from attacking Constantinople itself. In 487 he induced Theodoric, son of Theodemir, to invade Italy and establish his new kingdom. Zeno is described as a lax and indolent ruler, but he seems to have husbanded the resources of the empire so as to leave it appropriately stronger at his death than it was at his accession. In ecclesiastical history the name of Zeno is associated with the Hecaton or instrument of union, promulgated by him and signed by all the Eastern bishops, with the design of terminating the Monophysite controversy.

ZENO OF ELEA, son of Teleutagoras, is supposed to have been born towards the beginning of the 5th century B.C. The pupil and the friend of Parmenides, he sought to recommend his master's doctrine of the existence of the One by contro-venting the popular belief in the existence of the Many. In virtue of this method of indirect argumentation he is regarded as the inventor of "dialectic," that is to say, disputation having for its end not victory but the discovery or the transmission of truth. He is said to have been concerned in a plot against a tyrant, and on its detection to have borne with exemplary constancy the tortures to which he was subjected; but authorities differ both as to the name and the residence of the tyrant and as to the circumstances and the issue of the enterprise.

In Plato's Parmenides, Socrates, "then very young," meets Zeno, "a man of about forty, tall and personable," and engages him in philosophical discussion. But it may be doubted whether such a meeting was chronologically possible. Plato's account of Zeno's teaching (Parmenides, 128 seq.) is, however, presumably as accurate as it is precise. In reply to those who thought that Parmenides's theory of the existence of the One involved inconsistencies and absurdities, Zeno tried to show that the assumption of the existence of the Many, that is to say, a plurality of things in time and space, carried with it the impossibility of an infinite multitude of individual entities. In early youth he collected his arguments in a book, which, according to Plato, was put into circulation without his knowledge.

Of the paradoxes used by Zeno to discredit the belief in plurality and motion, eight survive in the writings of Aristotle and Simplicius. They are commonly stated as follows.1 (1) If the Existend is Many, it must be at one infinitely small and infinitely great— thereby impossible, illusory; because, the parts of any whole, because indivisible and therefore without magnitude; infinitely great, because, that any part having magnitude may be separate from any other part, the intervention of a third part having magnitude is necessary, and that this third part may be separate from the other two the intervention of other parts having magnitude is necessary, and so on ad infinitum. (2) In like manner the Many is infinite, the argument runs, and so are the numbers, because there are as many things as there are, neither more nor less; numerically infinite, because, that any two things may be separate, the intervention of a third thing is necessary, and so on ad infinitum. (3) If all that is in is in space, space itself must be infinite, and so ad infinitum. (4) If a bushel of corn turned out upon the floor makes a noise, each grain and each part of each grain must make a noise likewise; but, in fact, it is not so. (5) Before a body in motion can reach a given point, it must traverse the half of the distance; before it can traverse the half of the distance, it must first traverse the quarter; and so on ad infinitum. (6) Hence, it is impossible to traverse a distance, and so ad infinitum. (7) If Achilles meets Balaam, and so ad infinitum. (8) Achilles can never come up with the tortoise; for, while Achilles traverses the distance from his starting-point to the starting-point of the tortoise, the tortoise advances a certain distance, and while Achilles has traversed this distance the tortoise makes a further advance, and so ad infinitum. Consequently, Achilles may run ad infinitum without overtaking the tortoise. This paradox is virtually identical with (5), the only difference being that, whereas in (5) there is one body, in (6) there are two bodies, moving towards a limit. The "infinity of the premise is an infinity of subdivisions of a distance which is finite; the conclusion is an infinity of distances. Thus Zeno again confounds a finite distance infinitely divided with an infinite distance. If the tortoise has a start of 100 ft. Achilles, on the other hand, says that what happened between Achilles and the tortoise is an infinite number of spaces—100 ft., 100 ft., &c.—and the tortoise must traverse an infinite number of spaces—100 ft., 10 ft., &c.—before they reach the point, distant from their starting-points 1111 ft. and 1111 ft., respectively, at which the tortoise is overtaken. In a word, 1000+10+10+&c., in (6) and 111111+&c., in (5) are convergent series, and 111111 and 1 are the limits to which they respectively approximate.] (7) So long as anything is infinite, it has the same magnitude at all points of the infinite, it being thus in the rest at every moment of its flight, and therefore also during the whole of its flight. (8) Two bodies moving with equal speed traverse equal spatial paths equal in extent; bodies moving with equal speed in opposite directions, the one passes the other in half the time in which it passes it when at rest. These propositions appeared to Zeno to be irreconcilable. In short, the paradoxes are myths, in philosophy, a myth is a story of the results of criticism or reflection. They are fatal inconsistencies, whence he inferred that Parmenides was justified in distinguishing the mutable movable Many from the

1 See Zeller, Die Philosophie d. Griechen, i. 591 seq.; Grundris, 54.
immutably immovable One, which alone is really existent. In
other words, Zeno re-affirmed the dogma, "The Ent is, the Non-ent
is not."

If tradition has not misrepresented these paradoxes of time, space
and motion, there is in Zeno’s reasoning an element of fallacy. It
is indeed difficult to understand how so acute a thinker should
confound that which is infinitely divisible with that which is infinitely
great; but the latter idea should have been suggested to him and
magnitude, as in (3); that he should neglect the imperfection of
the organs of sense, as in (4); that he should deny the reality of
motion, as in (7); and that he should ignore the relativity of speech
and space, as in (8). In many years it has been thought that
these conventional statements of the paradoxes, and in particular of
those which are more definitely mathematical, namely (5), (6),
(7), (8), do less justice to Zeno’s acumen. Thus, several
philosophers—Tannery, Russell—have studied as dilemmas advanced, with some measure of success, in refuta-
tion of specific doctrines attributed to the Pythagoreans. ’One
of the most notable victims of posterity’s lack of judgment’
says Bertrand Russell, “is the Eleatic Zeno. Having invented
four arguments all immeasurably subtle and profound, the gross-
ess of subsequent philosophers pronounced him to be a more
ingenious juggler, and his arguments to be one and all sophisms.
After two thousand years of continual refutation, these sophisms
were reinstated, and made the foundation of a mathematical
renaissance, by a German professor, who probably never dreamed of any
correlation with the former argument and of banishing all infinitesimals, has at last shown that we live in an
unchanging world, and that the arrow at every moment of its
flight is at rest. The connexion of these paradoxes given by Messrs. Noel and Russell,” says G. H. Hardy,
“may be briefly stated as follows: The notion of time, which
seems at first sight to enter into (5) and (6), should be
eliminated. The same is true of (7) and (8). In that
theorizing temporally, but logically, subsequent to the part, and that there
therefore is an infinite regress in the notion of a whole which is
infinitely divisible—a view which at any rate demands a serious
repetition. The kernel of the latter lies in the perfectly valid
proof which it affords that the tortoise passes through as many
positions as Achilles—a view which embodies an accepted doctrine
of modern mathematics. The paradox of the arrow (7) and (8)
Mr Russell, is a plain statement of a very elementary fact: the
arrow is at rest at every moment of its flight: Zeno’s only mistake
was in inferring (if he did infer) that it was therefore at the same
point at all times. Finally, the last paradox another,
may be interpreted as a valid refutation of the doctrine that space
and time are not infinitely divisible. How far this interpretation
of Zeno is historically justifiable, may be doubtful. But one may
well believe that there was in his mind at any rate a foreshadowing
of some of the ideas by which modern mathematicians have finally
laid to rest the traditional difficulties connected with infinity and
continuity.”

Great as was the importance of these paradoxes of plurality and
motion in stimulating speculation about space and time, their direct influence upon Greek thought was less considerable
than that of another paradox—strangely neglected by historians
of philosophy—the paradox of predication. We learn from
Plato (Parmenides, i, 127 D) that “the first hypothesis of the first
argument” of Zeno’s book above mentioned ran as follows:
“if existences are many, they must be both like and unlike
[unlike, inasmuch as they are not one and the same, and like,
inasmuch as they agree in not being one and the same, Proclus,
On the Parmenides, ii. 143]. But this is impossible for unlike
things cannot be like, nor like things unlike. Therefore
existences are not many.” That is to say, not perceiving that
the same thing may be at once like and unlike in different
relations, Zeno regarded the attribution to the same thing
likeness and unlike as a violation of what was afterwards
known as the principle of contradiction; and, finding that
plurality entailed these attributions, he inferred its unreality.
Now, when without qualification he affirmed that the unlike
thing cannot be like, nor the like thing unlike, he was on the
horizon of his thought to be the doctrine of the modern
century later by the Cynics, that no predication which is not implicit
is legitimate. He was not indeed aware how deeply he had
committed himself; otherwise he would have observed that his
argument, if valid against the Many, of the vulgar, was valid
also against the One of Parmenides, with its plurality of attributes,
as well as that, in the absence of a theory of predication,
it was useless to speculate about knowledge and being. But
others were not slow to draw the obvious conclusions; and it
may be conjectured that Gorgias’s sceptical development of
the Zonian logic contributed, not less than Protagoras’s
development of the Ionic physics, to the diversion of
the intellectual energies of Greece from the pursuit of truth
to the pursuit of culture.

For three-quarters of a century, then, philosophy was at
a standstill; and, when in the second decade of the 4th century
the pursuit of truth was resumed, it was plain that Zeno’s
paradox of predication must be disposed of before the problems
which had occupied the earlier thinkers—the problem of know-
ledge and the problem of being—could be so much as attempted.
Accordingly, in the seventh book of the Republic, where Plato
reared his Sokrat, he had stretched himself to the limit of his
attention of studious youth primarily, if not exclusively, to
the concurrence of inconsistent attributes; and in the Phaedo,
102 B—103 A, taking as an instance the tallness and the short-
ness simultaneously discoverable in Simmias, he offers his own
theory of the immanent idea as the solution of the paradox.
Simmias, he says, has in him the ideas of tall and short.
Again, when it presently appeared that the theory of the
immanent idea was inconsistent with itself, and moreover
inapplicable to explain predication except where the subject
was identical with its predicate, Zeno’s, the Eleatic, theory
of Zeno difficulty continued to demand and to receive Plato’s
best attention. Thus, in the Parmenides, with the paradox of
likeness and unlikeness for his text, he inquires how far the
current theories of being (his own included) are capable of
providing, not only for knowledge, but also for predication,
and in the concluding sentence he suggests that, as likeness
and unlikeness, greatness and smallness, &c., are relations, the
initial paradox is no longer paradoxical; while in the Sophist,
Zeno’s doctrine having been shown to be fatal to reason,
thought, speech and utterance, the mutual konsew of êpó
which are not ares and épiaro is elaborately demonstrated.
It would seem then that, not to Antisthenes only, but to Plato
also, Zeno’s paradox of predication was a substantial difficulty;
and we shall be disposed to give Zeno credit accordingly for
his perception of its importance.

In all probability Zeno did not observe that in his contro-
versial defence of Eleaticism he was interpreting Parmenides’s
 teaching anew. But so it was. For, while Parmenides had
recognized, together with the One, which is, and is the object
of knowledge, a Many, which is not, and therefore is not known,
problems, but nevertheless the object of logical specification
was definitely and unambiguously: "that which is not of the non-
ent, absolute nullity. Thus, just as Empedocles developed Parmenides’s theory of
the Many to the neglect of his theory of the One, so Zeno
developed the theory of the One to the neglect of the theory
of the Many. With the severance of these two members Eleaticism
proper, the Eleaticism of Parmenides, ceased to exist.

The first effect of Zeno’s teaching was to complete the
discomfiture of philosophy. For the paradox of predication,
which he had used to disprove the existence of plurality, was
virtually a denial of all speech and all thought, and thus led
to a more comprehensive scepticism than that which sprang
from the contemporary theories of sensation. Nevertheless,
he left an enduring mark upon Greek speculation, inasmuch as he
not only recognized the need of a logic, and grappled, how-
ever unsuccessfully, with the problem of the nature of logical
thinking, but also by the invention of dialectic provided a new
and powerful instrument against the time when the One and
the Many should be reunited in the philosophy of Plato.

Zeno of Elea
ZENO OF SIDON—ZENODOTUS

Russell, Principles of Mathematics (Cambridge, 1903), pp. 345-354. For histories of the bank of philosophy and other works upon Eleaticism see Parmenides (H. J. A.)

ZENO OF SIDON, Epicurean philosopher of the first century B.C., and contemporary of Cicero. In the De Natura Deorum (i. 34), Cicero states that he was contemptuous of other philosophers and even called Socrates "the Attic Buffoon." Diogenes Laëritius and Cicero both speak of him with respect and describe him as an elevated and polished thinker. He held that happiness includes not merely present enjoyment and prosperity, but also a reasonable expectation of their continuance. His views were made the subject of a special treatise by Posidonius.

ZENO OF TARSUS, Stoic philosopher and pupil of Chrysippus, belonged to the period of the Middle Stoic. He appears to have accepted all the Stoic doctrines except that he denied the final configuration of the universe (see Stoics).

ZENOBIA (Gr. Ζενόβια), queen of Palmyra, one of the heroines of antiquity. Her native name was Septimia Bathshabal, a name also borne by one of her generals, Septimius Zabbiā. This remarkable woman, famed for her beauty, her masculine energy and unusual powers of mind, was said to be the consort of Odainatti (see Οδανατιος) in his proud position as Dux Orientis; during his lifetime she actively seconded his policy, and after his death in A.D. 266 she not only succeeded to his position but determined to surpass it and make Palmyra mistress of the Roman Empire in the East. Wahab-allath or Athanodorus (as the name was Graecized), her son by Odainath, being still a boy, she took the reins of government into her own hands. Under her general-in-chief Zabdi, the Palmyrenes occupied Egypt in A.D. 270, not without a struggle, under the pretext of restoring it to Rome; and Wahab-allath governed Egypt in the reign of Claudius as joint ruler with the title of βασιλεύς (king), while Zenobia herself was styled βασιλευσσα (queen). In Asia Minor Palmyrene garrisons were established as far west as Ancyra in Galatia and Chaledon opposite Byzantium, and Zenobia still professed to be acting in the interests of the Roman rule. In his coins struck at Alexandria in A.D. 270 Wahab-allath is named along with Aurelian, but the title of Augustus is given only to the latter; a Greek inscription from Byblus, however, mentions Aurelian (or his predecessor Claudius) and Zenobia as Σεβαστος and Σεβαστη (i.e. Augustus and Augusta, C.I.C. 4503 b). When Aurelian became emperor in 270 he quickly realized that the policy of the Palmyrene queen was endangering the unity of the empire. It was not long before all disguises were thrown off; in Egypt Wahab-allath began to issue coins without the head of Aurelian and bearing the imperial title, and Zenobia’s coins bear the same. The assumption marked the rejection of all allegiance to Rome. Aurelian instantly took measures; Egypt was recovered for the Empire by Probus (close of 270), and the emperor himself prepared a great expedition into Asia Minor and Syria. Towards the end of 271 he marched through Asia Minor and, overthrowing the Palmyrene garrisons in Chaledon, Ancyra and Tyana, he reached Antioch, where the main Palmyrene army under Zabda and Zabbiā, with Zenobia herself, attempted to oppose his way. The attempt, however, proved unsuccessful, and after suffering considerable losses the Palmyrenes retired in the direction of Emesa (now Homs), whence the road lay open to their native city. The queen refused to yield to Aurelian’s demand for surrender and drew up her army at Emesa for the battle which was to decide her fate. In the end she was defeated, and there was nothing for it but to fall back upon Palmyra across the desert. Thither Aurelian followed her in spite of the difficulties of transport, and laid siege to the well-fortified and provisioned city. At the critical moment the queen’s courage seems to have failed her; she and her son fled from the city to seek help from the Persian king; they were captured on the bank of the Euphrates, and the Palmyrenes, losing heart at this disaster, capitulated (A.D. 272). Aurelian seized the wealth of the city but spared the inhabitants; to Zenobia he granted life; while her officers and advisers, among whom was the celebrated scholar Longinus, were put to death. Zenobia figured in the conqueror’s splendid triumph at Rome, and by the most probable account accepted her fall with dignity and closed her days at Tibur, where she lived with her sons the life of a Roman matron. A few months after the fall of Zenobia, Palmyra revolted again; Aurelian unexpectedly returned, destroyed the city, and this time showed no mercy to the population (spring, 273).

Among the traditions relating to Zenobia it may be mentioned that of her discussions with the Archbishop Paul of Samosata on matters of religion. It is probable that she treated the Jews in Palmyra with favour; she is referred to in the Talmud, as protecting Jewish rabbis (Talm. Jer. Ter. viii. 46 b).

The well-known account of Zenobia by Gibbon (Decline and Fall, i. pp. 302-312 Baye’s edition) is based upon the imperial biographers (Histoires Augustae) and cannot be regarded as strictly historical in detail. An obscure and distorted tradition of Zenobia as an Arab queen survived in the Arabic story of Zabb, daughter of Amr b. Zabir, whose name is associated with Tadmor and with Wahab-allath Zabbai, the queen of Palmyra, and with the name of Zenobia of which Procopius speaks as founded on the famous queen. See C. de Perceval, Essai sur l’histoire des Arabes, ii. 28 f., 197 f.; Tabari, i. 757 f. See further Palmyra. (G. A. C. *)

ZENOBUS, a Greek lexicographer, who taught rhetoric at Rome during the reign of Hadrian (A.D. 117-138). He was the author of a collection of proverbs in three books, still extant in an abridged form, compiled, according to Suidas, from Didymus of Alexandria and "The Sarrhaean" (Lucillus of Tarra in Crete). Zenobius is also said to have been the author of a Greek translation of Sallust and of a birthday poem (γενεθλιακα) on Hadrian.

Editions by T. Gaslaf (1836) and E. L. Leutsch-F. W. Schneidewin (1839), and in B. E. Miller, Mélanges de littérature grecque (1866); and also W. Christ, Griechische Literaturgeschichte (1869).

ZENODOCHIUM (Gr. ξενοδοχιας, ξενος, stranger, guest, δεχομαι, to receive), the name given by the Greeks to a building erected for the reception of strangers.

ZENODOTUS, Greek grammarian and critic, pupil of Philetas (q.v.) of Cos, was a native of Ephesus. He lived during the reigns of the first two Ptolemies, and was at the height of his fame about 292 B.C. It was the influence of the king that induced him to leave the library at Alexandria and the first critical editor (katalektos) of Homer. His colleagues in the librarianship were Alexander of Aetolica and Lycophrion of Chalcis, to whom were allotted the tragic and comic writers respectively, Homer and other epic poets being assigned to Zenodotus. Although he has been reproached with arbitrariness and an insufficient knowledge of Greek, in his recension he undoubtedly laid a sound foundation for future criticism. Having collated the different MSS. in the library, he expunged or obelized doubtful verses, translated or altered lines, and introduced new readings. He divided the Homeric poems into books (with capitals for the Iliad, and small letters for the Odyssey), and possibly was the author of the calculation of the days of the Iliad in the Tabula Iliaca. He does not appear to have written any regular commentary on Homer, but his Homeric γλωσσα (lists of unusual words) probably formed the source of the explanations of Homer attributed by the grammarians to Zenodotus. He also lectured upon Hesiod, Aenacreon and Pinard, if he did not publish editions of them. He is further called an epic poet by Isocrates, and three epigrams in the Greek Anthology are assigned to him.

There appear to have been at least two other grammarians of the same name: (1) Zenodotus of Alexandria, surnamed

1 See the Palmyrene inscriptions given in Vogüé, Syrie centrale, Nos. 28, 29 = Cooke, North-Semitic Inscriptions, Nos. 120, 131. Zabbiā, an abbreviation of some such form as Zabdi-lā = dayry of God, was a common Palmyrene name; it occurs in the Old Testament, Ezr. x. 26; Neh. iii. 20.

2 Whether Shīrūr or his son Hormuzd is not certain: Shīrūr’s death is variously placed in 269 and 272.
ZENATHE—ZEPHANIAH 973

ó by ðσταν; (2) Zenodotus of Millus, the disciple of Crates, who like his master attacked Aristarchus.

ZENATHE, a market town of Hungary, in the county of Bács-Bodrog, 133 m. S.E. of Budapest by rail. Pop. (1900) 25,582. It is situated on the right bank of the river Thiess, and is historically known for the decisive victory won in its vicinity by Prince Eugene of Savoy over the Turks on the 11th of September 1701.

ZEOLITES, a family of minerals consisting of hydrated silicates of alumina with alkalies or alkaline earths or both. The water they contain is readily lost, and before the blowpipe it is expelled with intumescence; hence the name zeolite, from the Greek ζεόλιν (to boil) and άλιθος (a stone), given by A. Cronstedt in 1758. In some other characters, as well as in their origin and mode of occurrence, they have points in common. Several species have been distinguished, of which the more important are: Apophyllite (p. 73) and pectoite (see Pyroxene). These are also sometimes included.

Heulandite Group
Heulandite H. CaAl₂Si₃O₈ + 3H₂O
Brewsterite H. (Sr, Ba, Ca)₂Al₂Si₃O₈ + 3H₂O
Epistilbite H. CaAl₂Si₃O₈ + 3H₂O
Welselite (Ba, Ca, K)₂Al₂Si₃O₈ + 3H₂O
Philippinite H. Ca₂Al₂Si₃O₈ + 3H₂O

Stilbite Group
H. CaAl₂Si₃O₈ + 3H₂O
Cäsitellite H. Ca₂Al₂Si₃O₈ + 3H₂O
Gismondite H. Ca₂Al₂Si₃O₈ + 3H₂O
Laumontite H. Ca₂Al₂Si₃O₈ + 3H₂O

Chabazite Group
Chabazite (Ca, Na)₂Al₂Si₃O₈ + 3H₂O, etc.
Gmelinite (Na, Ca)₂Al₂Si₃O₈ + 3H₂O
Levyvite NaAl₂Si₃O₈ + 3H₂O
Analcite NaAl₂Si₃O₈ + 3H₂O
Natrolite Na₂Al₂Si₃O₈ + 3H₂O
Mesolite (Na, Ca)₂Al₂Si₃O₈ + 3H₂O
Scolecite Ca₂Al₃Si₃O₈ + 3H₂O
Edingtonite BaAl₂Si₃O₈ + 3H₂O
Thomsomite (Na, Ca)₂Al₂Si₃O₈ + 2H₂O

Some of the chemical formulae given above are only approximate, since in some species the composition varies between certain limits and can be best expressed by the isomorphous mixing of different molecules (see, for example, Chabazite). They are all readily decomposed by hydrochloric acid, usually with the separation of gelatinous silica. By the action of various reagents several substitution products have been prepared artificially: thus, crystallized products, in which the alkalis or alkaline earths are replaced by ammonium or silver, &c., have been obtained.

The zeolites are often beautifully crystallized, and belong to several crystal-systems. The crystals usually show evidences of twinning, and when examined in polarized light they frequently exhibit optical anomalies and a complex structure. The hardness (H. 3½-3) and specific gravity (2-0-2-4) are comparatively low, and so are the indices of refraction and the double refraction.

The water of zeolites presents many points of interest. Laumontite loses water on exposure to air; when a crystal is soon crumbly to powder unless they are kept in a moist atmosphere. All the zeolites lose a portion of their "water of crystallization" in dry air (over sulphuric acid), and a considerable portion at a temperature of 100°C., increasing in amount to about 20% of the actual amount lost depending not only on the temperature, but also on the tension of aqueous vapour in the surrounding atmosphere. In some species the remaining water is expelled only at a red heat, and is therefore to be regarded as "water of constitution." With the progressive loss of water there is a progressive change in the optical characters of the crystals. When a partially dehydrated and opaque crystal is exposed to moist air the water is reabsorbed, the crystal becoming again transparent and regaining its original optical characters. Not only may water be reabsorbed, but such substances as ammonia, hydrogen sulphide and alcohol may be absorbed in definite amounts and with an evolution of heat. The water of zeolites may therefore be partly driven off and reabsorbed or replaced by other substances without destroying the crystalline structure; in the main the results thus seem to differ from the water of crystallization of most other hydrated salts.

Zeolites are minerals of secondary origin and in most cases have resulted from the decomposition of the felspars of basic igneous rocks; more commonly they are associated with that of the felspars with the addition of water. Nepheline and sodalite are often altered to zeolites. They usually occur as crystals lining the amygdaloidal and other cavities of basalt, melaphyre, &c. Under the microscope they are associated with agate, calcite and some other minerals. Less frequently they occur in cavities in granite and gneiss, and in metalliferous veins (e.g., in auriferous quartz veins). They are important as industrial raw materials (e.g. analcite) of igneous rocks. Several species have been observed in the Roman masonry at the hot springs of Bourbonnes-Bains in France: and phillipite has been dredged from the Mediterranean deep sea.

See Analcite, Chabazite, Harmotome, Heulandite, Natrolite, Philiblite, Scolecite, Stilbite. (L. J. S.)

ZEOPHANIAH, the ninth of the minor prophets in the Bible. The name (Yahveh) "hides" or "treasures"; there is a similar Phoenician compound of Baal) is borne by various individuals, in Jer. xxix. 25 (cf. liii. 24); Zech. vi. 10, 14; 1 Chron. vi. 36, of among the Jews of the period of the Babylonian captivity (in the 6th century B.C.). The prophet's ancestry is traced to the West (cf. Jer. xxxiii. 14) to his great-grandfather Hezekiah, who may, in spite of 2 Kings xx. 18, xxii. 1, be the well-known king of Judah (c. 720-690). This would agree fairly with the title (i. 1) which makes the prophet a contemporary of King Josiah (c. 637), and this in turn appears to agree (a) with the internal conditions (i. 4-6; cf. 2 Kings xxiii. 4, 5. 12) which, it is held, are evidently earlier than Josiah's reforms (620); (b) with the denunciation of the royal household, but not of the (young) king himself (i. 8, iii. 3); (c) with the apparent allusion in ch. i. 1 to the invasion of the Scythians (perhaps c. 560) and (d) with the anticipated downfall of Assyria and Nineveh (li. 13, 607 B.C.). Zephaniah's prophecies are characterized by the denunciation of Judah and Jerusalem and the promise of a peaceful future, and these are interwoven with the idea of a world-wide judgment resulting in the sovereignty of a universally recognized Yahweh. The theme in its main outlines is a popular one in biblical prophecy, but when these 53 verses are carefully examined and compared with prophetic thought elsewhere, several difficult problems arise, an adequate solution of which cannot as yet be given.

The name (i. 1) is a "prognostication" or divining of the entire destruction of every living thing (2-3), the fate of Judah and Jerusalem is heralded (4-6). The name of Baal (so LXX.; remnant implies a date after Josiah's reforms) and of the idolatrous priests will be cut off together in better times. (condemned later than 620 in Jer. xix. 13, c. xlv. 15-19) and swear by the Ammonite god Milcom (or perhaps by their Moloch) for the persistence of his grim cult (cf. Jer. v. 6). Silence is enjoined at the appearance of Yahweh (i. 15, 17), Zech. xxii. 21; and there follows a fine description of "the day of Yahweh" (v. 7-18). The invertebrate popular belief in the manifestation of the warring deity on behalf of his people (e.g. Isa. xxxiv. 8, liii. 4; Jer. xlvii. 10-13; Obad. 15; Ezek. xxx. 3) is treated (6) ethically, as a day of judgment upon sin and pride (Amos v. 18; Isa. xii. 21-22) and (6) apocalyptically, is bound up with ideas of a universal doom. Punishment will fall upon an oppressive court, upon those who wear foreign apparel and who "leap over the threshold" (v. 9, cf. 1 Sam. v. 5, a Palesine custom)—a protest against heathen intercourse, for which cf. Ezek. xvi. 5, and Costume, Oriental. The blow falls first on the north side of Jerusalem (v. 10 seq., the merchant quarter (?), cf. Zech. xiv. 21); the city will be ransacked and the indifferent or apathetic, who thought that Yahweh could do neither good nor evil (so of the idols, Isa. xlii. 23; Jer. x. 15) will be ruined. With v. 13 contrast the promises Isa. lvii. 21, "That day is a day of wrath" (v. 15) with celebral signs (cf. Amos v. 18, 20, viii. 9; Isa. xiii. 10; Joel ii. 1, 13, 15) and warn distress, with which shall not be compared (v. 18, cf. Hb. x. 29; Ezek. xxi. 28; Matthew Babylon is more generally Ezek. vii. 10). Thus Yahweh's jealousy fired by the dishonour shown towards him in Judah will make an end of all the phenomena of destruction (v. 18, cf. r. 2 seq., and see Isa. x. 23, where a remnant is promised).

1 For "day" (i.e. of battle) cf. the Arab usage, W. R. Smith, Prophec. of Israel, p. 398. The victorious and divine kings of Egypt in the XIXth and XXth Dynasties are likened to Baal in his "hour" (J. H. Breasted, Hist. Doc. Eg., iii. §§ 312, 326, iv. § 106).

2 The Vulgate Dies trae dies illa, whence the striking hymn by Thomas of Celano (c. 1250).
ZEPHANIAH

Chap. ii. opens probably "Get you shame, and be ye ashamed, O nation unabashed, before ye become as that passeth away (cf. Isa. ix. 14); for this is a solemn call to repentance (cf. Amos v. 6, 15; Jer. iv. 14, &c.) is joined to the appeal to "the humble ones of the earth" (v. 3, cf. iii. 12; Isa. xi. 4, Ps. lxxxvi. 9) to seek righteousness and humility, peradventure (cf. Ps. lxxxvi. 9) they may be saved from the day of Yahweh's wrath (cf. "for" the cities of the Philistines shall be destroyed (v. 4, cf. on i. 9 above), and an oracle of woe is uttered against Edom (cf. on ii. 5 seq.)." Against this "remnant of the house of Judah" is promised the maritime coast (v. 7, read by the sea for thereupon), and this is enhanced by the tidings of the return of the captivity. This thought is developed further in chap. iii. 13 seq. (cf. Isa. lixiv. 13 seq.), and especially Ezek. xxvii. 29 sq.; Ezek. xxxv., 12 "the reproach of Moab and the revilings of the Ammonites," and the Lord of Hosts, the God of Israel, swears by his life that both shall be destroyed for their hostility towards the remnant of God's people and their nation (v. 8-10). After turning aside to Yahweh's supremacy (v. 11, seq. 9) the chapter continues with a strong and vague doxology (cf. also "upon" the book (Ethiopic) main by my sword (cf. Isa. lxvi. 16), and a more detailed prophecy upon Assyria and Nineveh. The exulting and boastful city (cf. Babylon, Isa. xlviii. 10, with xv. 5 seq.) shall be a haunt of wild animals (cf. Babylon, Isa. li. seq., and more especially Edom (cf. xxxiv. 11-13), and is pictured as shortly to be made desolate (v. 15, with the last words cf. Jerusalem, Jer. xix. 8, Edom, xlix. 17).

In chap. iii. there are again changing situations. The defiant, proud, and confident people are contrasted with the humble and lowly, failing to regard the warnings. Her secular and religious leaders are denounced, and stress is laid, not upon foreign cults, but upon the rampant treachery and apostasy of the people themselves (v. 1 seq. and especially ii. 25-28). Yahweh in the midst of her is "righteous" (cf. Neh. ix. 33, and especially the "Deutero-Isaiah," xl sq.), but although the nations round about have been cut off and destroyed, Jerusalem itself has not been washed clean from the guilt of its escape; destruction, has been persistently corrupt (v. 1-7; cf. ii. 30 and often). Therefore, wait ye for me, saith Yahweh, for the day when I arise as a valour (so read in v. 8, cf. Mic. iv. 1; Mal. iv. 5). But there is another sudden transition—in that day Yahweh will assemble all nations and kingdoms to pour out upon them his anger (v. 8). This judgment upon the world will be followed by a universal conversion, as of old (cf. ii. 14, and more especially xvii. 1, 7; some reference to a return of dispersed Jew may be suspected in the now corrupt text). In that day "all the nations of the earth shall be gathered together against Jerusalem" and Yahweh will "fight against those who rise up against her" (v. 9). "The remnant of Israel," also, shall dwell in peace and piety (v. 13; cf. the corrupt people who are to be "refined," Jer. iii. 9). Next, a noteworthy jubilant note is struck when the daughter of Zion is "bidden to exult (v. 14, cf. Isa. lix. 10 seq.); for the valour of the enemy is clearly as Yahweh, the mighty deliverer, is in her midst as "king of Israel" (Isa. xxiv. 3, xlv. 6), he will take joy in her (cf. Isa. ii. 15, lxv. 19), and shall not more see evil. Israel herself (where we shall have, as it seems, an anticipation of what is to happen from the sacred festivals, who were a cause of "reproach" (cf. Ezek. xxxvii. 15; Isa. liv. 4; Neh. i. 3) he will "deal with all oppressors (and the) oppressor shall become a spoil (cf. Ezek. xxviii. 16). She shall become a praise and a name (cf. Jer. iii. 9.) when Yahweh brings back the captives before your eyes" (i.e. in your generation).

It is a natural assumption that prophecies have a practical end and refer to existing or impending conditions. But although one single leading motive runs through the book of Zephaniah there are abrupt transitions which do not concern mere subjective considerations of logical or smooth thought, but material and organic changes representing different groups of ideas. The instruments of Yahweh's anger (ch. i.) are not so real or prominent on the political horizon as, for example, in Isaiah, Jeremiah or Habakkuk. The true date of the Scythian inroad and its results for Judah and Philistia are less important when it is observed that the doom upon Philistia, the vengeance upon Moab and Ammon and the promises for Judah (ch. ii.) belong to a large group of prophecies against central and external religious and social conditions, (cf. also Hosea, vii. 1 seq.) who are depicted for their contempt, hostility and intrusion. These prophecies

1 The idea of "righteousness" (δικαιοσύνη), or, more accurately, appears to have implied the mutual bonds uniting the community and its deity, see Journ. Theol. Stud., 1908, p. 632 n. 1; Expositor, Aug. 1910, p. 120. Material familiar to contemporary thought is naturally used (see especially H. Gressmann, Ursprung d. israel.-jud. Eschatologie; J. M. P. Smith, Biblical World, 1910, pp. 223 seq.).

2 The prophecy of the "remnant," and, as in iii. 12, are viewed as a small pious community which, as we find in the Psalms (see Nowack's Comm.),

3 The "humble" (cf. "to be humble) can scarcely be identified with the "remnant," and, as in iii. 12, are viewed as a small pious community which, as we find in the Psalms (see Nowack's Comm.),

4 See further W. R. Smith, art. "Zephaniah," Encyc. Brit., 9th ed., who points out that "in the scheme of Isaiah it is made clear that the power of the Sufferer who shall possess the nations cannot fail to be recognized as Yahweh's work."

are in large measure associated traditionally with the fall of Jerusalem, and to such a calamity, and not to the inroad of the Scythers, the references to the "remnant" and the "captivity" can only refer. The anticipation of future events is of course conceivable in itself, but the promises (in ch. i.) presuppose events other and later than those with which the Scythers were connected. On the other hand, it is entirely intelligible that a prophecy relating to Scythers should have been re-shaped to apply to later conditions, and on this view it is explicable why the indefinite political convulsions should be adjusted to the exile and why the gloom should be relieved by the promise of a territory extending from the Mediterranean to the Syrian desert (ii. 7, 9). After a period of punishment (cf. Lamentations) Yahweh's jealousy against the semi-heathen Judah has become a jealousy for his people, and we appear to move in the thought of Haggai and Zechariah, where the remnant are contrasted with Yahweh's work and the dispersed exiles are to be brought back (cf. Zech. i. 14-17, viii. 2-7). But in ch. iii. other circles of thought are manifest. Israel's enemies have been destroyed, her own God Yahweh has proved his loyalty and has fulfilled his promises, but the city remains polluted (v. 1-7, cf. Isa. liii. seq.; Malachi). Once more doom is threatened, and once more we pass over into a later stage where Yahweh has vindicated his supremacy and Zion is glorified. Instead of the realities of history we have the apocalyptic feature of the gathering of the nations (v. 8); the thought may be illustrated from Zech. xii. 1-12, where Jerusalem is attacked by the world's hostile forces, and in the visions of the Apocalypse where the city is actually captured and half the people are removed into captivity (cf. Zeph. iii. 11 purging, 15 removal of the enemy, 18-20 return of the captivity). The goal is the vindication of Israel and of Israel's God, and the establishment of universal monotheism (ii. 11, iii. 9 seq.). The foe which threatened Judah has become the chastiser of Assyria and Ethiopia (ii.) and the prelude to the golden age (iii., cf. Ezek. xxxviii seq.). No longer does Yahweh contend for recognition with Baal and the "host of heaven" (i. 4-6); the convulsions of history are Yahweh's work for the instruction and amendment of Israel (iii. 6 seq.); the heathen gods prove helpless (ii. 11), but in what manner the conviction of Yahweh's greatness is brought home is not stated.

If Jer. iv. 5-6, 30 originally referred to the Scythers, it has been revised to refer to the Chaldeans; also in Ezek. xxxviii seq. the northern foe has been associated with the great world-judgment. The replacing of the sequel of Amos (q.v.) by one which presupposes a later historical background, the addendum to the prophecy against Moab (Isa. xvi. 13 seq.), the pessimistic glosses in Isa. xlviii., the variations in the Hebrew and Greek translation of "my people", the absolute judgment of prophecy (vi. 10), the judgment and promise, exemplify certain literary processes which illustrate the present form of Zephaniah. In Isaiah and Zechariah, notably, older and later groups of prophecies are preserved, whereas here the new preludes and new sequels suggest that the original nucleus has passed through the hands of writers in touch with those vicissitudes of thought which can be studied more completely elsewhere. It is not to be supposed that the elimination of all later passages and traces of revision will give us Zephaniah's prophecies in their original form. The text as we have it is the result of several stages of development; if 4-6 or iii. 1-4 do not compose a date before Josiah's reforms. The doom of Cushi is still in the future in Ezek. xxx. 4; and if the impending fall of Nineveh (iii. 13) implies an early date, yet it is found in writings which have later additions (Nachum), or which are essentially later (Jonah, cf. Tobit xiv. 4 [LXX], 8, 10, 15); cf. also the use of Assyria for Babylon (Ezra vii. 22) or Syria (Zech. x. 10). Historical references in prophecies are
not always decisive (Ezek. xxxii., for example, looks upon Edom and Sidon as dead), and while the continued revision of the book allows the presumption that the tradition ascribing its invention to the time of Josiah may be authentic, it is doubtful how much of the original nucleus can be safely recognized. These are problems which concern not only the criticism of biblical, prophetic, and historical writings as a whole, but also the annals and vicissitudes of the period over which they extend (see Jews; Palestine: History).

According to late tradition Zephaniah, like Habakkuk, was of the tribe of Simeon (cf. Micah of Mareshah and Obadiah of Beth-haccerem, see Cheyne, Ency. Bib., col. 3455). The apocryphal prophecy of Zeph (Clement of Alex., Stromata, v. 11, 777) in Gesch. Völk. Isr., iii., 271 seq.) merely illustrates the tendency to utilize older traditions. Lippin in Bibl. Studien (1910), and the commentaries on (or all portions of) the Minor Prophets by A. B. Davidson (Camb. Bible, 1896); G. A. Smith (1898); W. Nowack (1900); K. Marti (1905; especially valuable): Driver (Cent. Bib., 1906); Von Hoornacker (1908). (S. A. C.)

**ZEPHYRUS, ST.** bishop of Rome from about 198 to 217, succeeded Victor I. He is described as a man of little intelligence or strength of character, and the somewhat important controversies on doctrine and discipline that marked his pontificate are more appropriately associated with the names of Hippolytus and of Callixtus, his principal adviser and afterwards his successor.

**ZEUS,** in Greek mythology, the west wind (whence the English "zephyr," a light breeze), brother of Boreas, the north wind, and son of the Titan Astraus and Eos, the dawn. He was the husband of Chloris, the goddess of flowers, by whom he had a son, Cupid, the god of fruit (Ovid, Fasti, v. 197); by the harpy Podarge he was also the father of Xanthus and Ballus, the horses of Achilles. Being spurred by Hyacinthus (q.v.), he caused his death by accident at the hands of Apollo. He was identified by the Romans with Favonius, and Chloris with Flora.

**ZERBST,** a town of Germany, in the duchy of Anhalt, situated on the Nuthe, 11 m. N.W. of Dessau and 27 m. S.E. of Magdeburg by the railway Dessau-Leipzig. Pop. (1900) 17,095. It is still surrounded in part by old walls and bastions, while other portions of the whither fortifications have been converted into pleasant promenades. It contains five churches, one of which (St Nicholas), built in 1446-88, is a good example of the late Gothic style as developed in Saxony, with its spacious proportions, groined vaulting, and bare simple pillars. The town hall dates from about 1480, but it was disfigured by additions in the beginning of the 17th century. It contains the magnificent ceiling, among the few that remain of the Luther Bible illustrated by Lucas Cranach the younger. The palace (1681-1750) has been used as a depository of archives since 1872. There are several quaint old houses, with high gables, in the market-place, in the middle of which stand a Roman column, about of 1445, and a bronze figure known as the Bultjerunger (butter-girl), of uncertain origin and meaning, but now regarded as the palladium of the town. The old Franciscan monastery, with fine cloisters, founded in 1230, contains the gymnasium; a Cistercian nunnery of 1241 has been converted into barracks; and the Augustinian monastery of 1390 has been a hospital since 1525. Gold and silver articles, silk, plush, cloth, leather, soap, starch, chemicals and carriages are among the chief manufactures. Iron-founding is carried on; and several breweries are engaged in the preparation of Zerbst bitter beer, which enjoys considerable repute.

Zerbst is an ancient town, mentioned in 940. In 1307 it came into the possession of the Anhalt family, and from 1603 till 1793 was the capital of the collateral branch of Anhalt-Zerbst. In 1793 it passed to Anhalt-Dessau.

**ZEUTHEN, MARIANNE.** poet and theophatic writer; village at the head of the Visp valley and at the foot of the Matterhorn of the Valais, Switzerland. It is 224 m. by rail from Visp in the Rhône valley, and there is also a railway from Zermatt past the Riffel inns to the very top of the Gornergart (10,289 ft.). The village is 5315 ft. above the sea, and in 1900 had 741 permanent inhabitants (all Romanists save 9, and all but 17 German-speaking), resident in 73 houses. Formerly Zermatt was called "Pra- borge," and this name is mentioned in the Swiss census of 1888. Its originally Romance population seems to have been "Toutounised" in the course of the 19th century, the name "Matt" (now written "Zermatt," i.e. the village on the meadows) first occurring at the very end of that century. Zermatt was long known to botanists and geologists only, and has an interesting though very local history. De Saussure in 1780 was one of the first tourists to visit it. But it was not till the arrival of M. Alexandre Seiler in 1854 that its fame as one of the chief tourist resorts in the Alps was laid, for tourists abound only there where there are good inns. When M. Seiler died in 1859 he was proprietor of most of the great hotels in and around Zermatt. The Matterhorn, which crowds over the village from which it takes its name, was not conquered till 1865 by Mr. E. Whymper and two guides then alone surviving the terrible accident in which their four comrades perished. The easy glacial pass of the St Théodule (10,890 ft.) leads S. in six hours from the village to the Val Tournanche, a tributary glen of the valley of Aosta.

**ZERO,** the figure 0 in the Arabic notation for numbers, nought, cipher. The Arabic name for the figure was sifr, which meant literally an empty thing. The old Latin writers on arithmetic translated or transaliterated the Arabic word as nullus, and this is its Latin name (zero, sifr) borrowed by F. Sera, whence it came late into English. The Spanish form cifra, more closely resembling the original Arabic, gave O. Fr. cifer, mod. chiffre, also used in the sense of monogram, and English "cipher" which is thus a doublet. In physics, the term is applied to a point with which phenomena are quantitatively compared, especially to a point of a graduated instrument between a positive and negative or ascending and descending scale, as in the scales of temperature.

**ZEULENRODA,** a town of Germany, in the principality of Reuss-the-Elter, situated on a high plateau in a well-wooded and hilly country, 33 1/2 m. from Halle by the railway to Werdau. Pop. (1900) 9419. The town contains a handsome town hall, several churches and schools, and carries on an active industry in cotton and woollen stocking manufacture. Zeulenroda is mentioned as a village as early as 1390, and it obtained municipal rights in 1438. Since 1500 it has belonged to the Greiz branch of the Reuss line of princes.

**ZEUS,** the Greek counterpart of the Roman god, Jupiter (q.v.). In the recorded periods of Hellenic history, Zeus was accepted as the chief god of the pantheon of the Greeks; in religious progress of the human race, from lower to higher ideals can be well illustrated by the study of his ritual and personality. His name is formed from a root dír, meaning "bright," which appears in other Aryan languages as a formative part of divine names, such as the Sanskrit Dvīs, "sky"; Latin Divis, Jovis, Diespiter, divus; Old English Tūs; Norse Tyr. The conclusion that has been frequently drawn from these facts, that all the Indo-Germanic stocks before their dispersal worshipped a personal High God, the Sky-Father, has been now seen to be hazardous. Nevertheless, it remains probable that Zeus had already been conceived as a personal and pre-eminent god by the ancestors of the leading Hellenic tribes before they entered the peninsula which became their historic home. In the first place, his pre-eminence is obviously pre-Homerian; for Homer was no preacher or innovator in religion, but gives us some at least of the primary facts of the contemporary religious beliefs prevailing about 1000 b.c.; and he attests for us the supremacy of Zeus as a belief which was unquestioned by the average Hellene of the time; and appreciating how slow was the process of religious change in the earlier period, we shall believe that the god had won this position long before the Homeric age. In the next place, we cannot trace the origin of his worship.
back to any special stock or particular locality; we cannot
find a single community that did not possess his worship or
that preserved any legend that suggests a late date for its
introduction. Doubtless, it has very ancient and close asso-
ciations with Thessaly; for most of the leading tribes must
have entered Hellas by this route, and remembered the moun-
tain Olympus that dominates this region as the earliest home
of his cult, and took with them to their most distant settlements
the memory of his deeds. Also the name Zeus, which is used
in Thessaly, like the Achaean Aeacids, may have regarded
him as specially their ancestor. But to maintain therefore
that he originated in Thessaly as the special deity of a single
tribe, who were able to impose him upon the whole of Hellas,
is against the analogies offered by the study of the special
cults of Greek polytheism. But if we assume that he was the
aboriginal Hellenic High God, we must be quite ready to admit
that the separate communities were always liable to cherish
other divinities with a more ardent and closer devotion, whether
divinities that they brought with them or divinities that they
found powerfully established in the conquered lands, Athena
or Hera, for instance, in Attica or Argolis, or Poseidon in
the Minyan settlements. This in fact is a frequent fate of a “High
God” in polytheistic systems; he is vaguely praised and reverenced,
but lower divine powers are nearer to the people's love or fear.

The Cretan legend of his birth and origin, which gave rise to
the Cretan cult of Zeus Кηρυγαγειας, “Zeus born in Crete,”
may appear evidence against the theory just set forth. But it is
not likely that any birth-legend belongs to the earliest stratum
of the Zeus-religion. The Aryan Hellenes found in many of
the conquered lands the predominant cult of a mother-goddess,
to whom they gradually had to affiliate their own High God;
and in Crete they found her cult associated with the figure of
a male divinity who was believed to be born and to die at certain
periods; probably he was an early form of Dionysus, but owing
to his prominence in the island the Hellenic settlers may have
called him Zeus; and this would explain the markedly
Dionysiac character of the later Zeus-religion in Crete.

We can now consider the question how the god was imagined
in the popular belief of the earliest and later periods. Homer
is our earliest literary witness; and the portrait that he presents
of Zeus is too well known to need minute description. To
appreciate it, we must distinguish the lower mythologic aspect
of him, in which he appears as an amorous and capricious deity
lacking often in dignity and real power, and the higher religious
aspect, in which he is conceived as the All-Father, the Father
of Gods and men in a spiritual or moral sense, as a God
omnipotent in heaven and earth, the sea and the realms below,
as a God of righteousness and justice and mercy, who regards
the sanctity of the oath and bears the voice of the suppliant
and sinner, and in whom the pious and the lowly trust. In
the fact the later Greek religion did not advance much above
the high-water mark of the Homeric, although the poets and
philosophers deepened certain of its noble traits. But Homer
we now know to be a relatively late witness in this matter.
How much of his sketch is really primitive, and what can we
learn or guess concerning the millennium that preceded him?
His God is pronouncedly individual and personal, and probably
Zeus had reached this stage of character at the dawn of Hellenic
history. Yet traces of a pre-delitian and animistic period sur-
vived here and there; for instance, the pre-Hellenic cult of
the thunder itself called Zeus (Zeus Кηρυγαγειας) in a Mantinian inscrip-
tion, and the stone near Gythium in Laconia on which Orestes
sat and was cured of his madness, evidently a thunder-stone,
was named itself Zeus Кηρυγαγειας, which must be interpreted as
“Zeus that fell from heaven”; we here observe that the personal
God does not yet seem to have emerged from the divine
thing or divine phenomenon. Yet the Arcadians, like the
other Greeks, had probably long before Homer risen above
this stage of thought; for Greek religion was so strongly
conservative that it preserved side by side the deposits of differ-
ent ages of thought surended perhaps by thousands of years.

Again the Homeric Zeus is fully anthropomorphic; but in
many domains of Greek religion we discover the traces of therio-
morphism, when the deity was regarded as often incarnate
in the form of an animal or the animal might itself be worshiped
in its own right. We seem to find it latent in the Arcadian
worship of Zeus Δαίας and the legend of King Lycaon. The
story of that king, who gave a shape of the wild goat to
him into a wolf for his sins; and the later Arcadian ritual
in honour of this God betrays a hint of lynanthropy; some one
who partook of the sacrifice or who swam across a certain lake
was supposed to be transformed into a wolf for a certain time.4
Robertson Smith5 was the first to propose that we have here
the traces of an ancient totemistic sacrifice of a wolf-clan, who
offered the “theanthropic” animal “the man-wolf” to the
wolf-God. The totemistic theory in its application to Greek
religion cannot be here discussed; but we may note that there
is a hint in the story that the wold was offered to Zeus and
that the name Δαίας could not originally have designated the
“wolf”-God: for from the stem λυκο- we should get the
adjective λυκος, not Δαίας; the latter is better derived from a
word such as λυκω-, “light,” and may allude to the God of the
clear sky; in fact the wolf, which was a necessary animal
in the ritual and legend of Apollo Δαίας, may have strayed
casually into association with Zeus Δαίας, attracted by a
false etymology. Another ritual, fascinating for the glimpse
it affords of very old-world thought, is that of the Dipolia,
the yearly sacrifice to Zeus Polies on the Acropolis at Athens.6
In this ox was slaughtered with ceremonies unique in Greece;
the priest who slew him fled and remained in exile for a period,
and the axe that was used was tried, condemned and flung
into the sea; the hide of the slain ox was stuffed with hay,
and this effigy of the ox was yoked to the plough and feigned
to be alive. Again Robertson Smith saw here the “thean-
thropic” animal, the Ox-God-man, eaten sacramentally by an
ox-tribe, and so sacred that his death is a murder that must
be atoned for in other ways and by a feigned resurrection. We
recognize indeed the sacramental meal and the sanctity of the
ox; but the animal may have acquired this sanctity tempo-
rarily through contact with the altar; we need not suppose
an ox-clan—the priest was merely βουτός “the herdman”7
nor assume the permanent sanctity of the ox, nor the belief
that the deity was permanently incarnate in the ox: the main
part of the ceremony can be explained as cattle-magic intended
to appease the rest of the oxen or to prevent them suffering
sympathetically through the death of one. We may indeed
with Mr Andrew Lang explain the many myths of the bestial
transformations of Zeus on the theory that the God was the
tribal ancestor and assumed the shape of the animal-living
in order to engender the tribal patriarchy;8 but on the actual
cults of Zeus theriomorphism has left less trace than on those
of many other Hellenic deities. The animal offered to him
can become temporarily sacred; and its skin would have
magic properties: this explains his use of the aegis, the goat-
skin, as a battle-carm; but of a Goat-Zeus, a Ram-Zeus, or a
Wolf-Zeus, there is no real trace.

The peculiar characteristic of his earliest ritual was the
human sacrifice; besides the legend of King Lycaon, we find
it in the story of the house of Athamas and in the worship of
Zeus Aσιδαρός of Thessaly,9 and other examples similarly recorded.
The cruel rite had ceased in the Arcadian worship before Pliny
wrote, but seems to have continued in Cyprus till the reign of
Hadrian. It was found in the worship of many other divinities
of Hellas in early times, and no single explanation can be
given that would apply to them all. A hypothesis favoured by
Dr Frazer, that the victim is usually a divine man, a priest-king

incarnating the God, may be well applied to the Athamanthid sacrifice and to that of King Lycaon; for he derives his name from the divinity himself, and according to one version he offers his own child; and the Lycaonid legend presents one almost unique feature, which is only found elsewhere in legendary Dionysiac sacrifice, the human flesh is eaten, and the sacrifice is a cannibalistic-sacrament, of which the old Mexican religion offers conspicuous example. Yet it is in this religion of Zeus that we see most clearly the achievement of progressive morality; Zeus himself punishes and abolishes the savage practice; the story related by Plutarch,1 how a kid was armed and disposed of by Helen for Helen when she was led to the altar to be offered, is a remarkably close parallel to the biblical legend of Abraham's sacrifice of Isaac.

We can now consider the special attributes of the anthropomorphic God. His character and power as a deity of the sky, who ruled the phenomena of the air, so clearly expressed in Homer, explains the greater part of his cult and cult-titles. More personal than Ouranos and Helios—with whom he has only slight associations—he was worshipped and invoked as the deity of the bright day (Adeon and Aetaos, Aeta), who sends the rain, the wind and dew ('Omurows, Naios, Tires, Orios, Etmowos, Ekmioi), and such a primitive adjective as aterpeta, applied to things “that fall from heaven,” attests the primeval significance of the name of Zeus. But the thunder was his most striking manifestation, and no doubt he was primarily a thunder-God, Keraivos, KeravnofOdos, 'Astrapanos. These cult-titles had originally the force of magic invocation, and much of his ritual was weather-magic: the priest of Zeus Awaivos, in time of drought, was wont to ascend Mount Lyceum and dip an oak-bough in a sacred fountain, and by this sympathetic means produce moisture. A god of this character would naturally be worshipped on the mountain-tops, and that these were very frequently consecrated to him is shown by the large number of appellatives derived from the names of mountains. But probably in his earliest Hellenic period the power of Zeus in the natural world was not limited to the sky. A deity who sent the fertilizing rains would come to be regarded as a god of vegetation, who descended into the earth and whose power worked in the life that wells forth from the earth in plant and tree. Also the close specific associations of the heavens and the earth, and the thunder and the rain, which Zeus has so recently been exposed.2 Homer calls the God of the lower world Zeos Karakhivos,3 and the title of Zeus Xbivos which was known to Hesiod, occurred in the worship of Corinth, fourth century bc, and there is reason to believe that Euboules of Eleusis and Trophoun of Lebedaeia are fabled forms of the nether Zeus; in the Phrygian religion of Zeus, which no doubt contains primitive Aryan elements, we find the Thunder-God associated also with the nether powers.4

A glimpse into a very old stratum of Hellenic religion is afforded us by the records of Dodona. A Dodonian liturgy has been preserved which, though framed in the form of an invocation and a dogma, has the force of a spell-prayer—"Zeus was and is and will be, oh great Zeus: earth gives forth fruits, therefore call on Mother Earth."5 Zeus the Sky-God is seen here allied to the Earth-Goddess, of whom his feminine counterpart, Dione, may have been the personal form. And it is at Dodona that his association with the oak is of the closest. His prophet-priests the Seloi "with unwashed feet, coughing on the ground,"6 lived about the sacred oak, which may be regarded as the primeval shrine of the Aryan God, and interpreted its oracular voice, which spoke in the rustling of its leaves or the cooing of its doves. Achilles hails the Dodonian God as Πελανις, either in the sense of "Thessalian" or primitive;7 and Zeus, we may believe, long remained at Dodona such as he was when the Hellenic tribes first brought him down from the Balkans, a high God supreme in heaven and in earth.

We may also believe that in the earliest stages of worship he had already acquired a moral and a social character. The Homeric view of him as the All-Father is a high spiritual concept, but one of which many savage religions of our own time are capable. The family, the tribe, the city, the simpler and more complex organisms of the Hellenic polity, were specially under his care and direction. In spite of the popular stories of his amours and infidelities, he is the patron-God of the monogamic marriage, and his union with Hera remained the divine type of human wedlock.8 "Reverence Zeus, the Father-God: "all fathers are sacred to Zeus, the Father-God, and all brothers to Zeus the God of the family": these phrases of Aristophanes and Epicetetus9 express the ideas that engendered his titles Parwos, Γαμηδος, Τελειος, Όψινος. In the Eumenides of Aeschylus10 the Erinyes are reproached in that by aiding Clytemnestra, who slew her husband, "they are dishonouring and bringing to naught the pledges of Zeus and Hera, the marriage-goddess"; and these were the divinities to whom sacrifice was offered after the wedding,11 and it may be that some kind of mimetic representation of the "Holy Marriage," the Ιερος γαμος, of Zeus and Hera formed a part of the Attic nuptial ceremonies.12 The "Holy Marriage" was celebrated in many parts of Greece, and certain details of the ritual suggest that it was of great antiquity: here and there it may have had the significance of vegetation-magic,13 like the marriage of the Lord and Lady of May; but generally it seems to have been only regarded as a divine counterpart to the human ceremony. Society may have at one time been matrilineal in the communities that became the historic Hellenes; but of this there is no trace in the worship of Zeus and Hera.14

In fact, the whole of the family morality in Hellas centred in Zeus, whose altar in the courtyard was the bond of the kinsmen; and sins against the family, such as unnatural vice and the exposure of children, are sometimes spoken of as offences against the High God.15 He was also the tutelary deity of the larger organization of the phratría; and the altar of Zeus Φάραος was the meeting-point of the phrateres, when they were assembled to consider and settle the intimacy of the new applicants for admission into their circle.16

His religion also came to assist the development of certain legal ideas, for instance, the rights of private or family property in land; he guarded the allotments as Ζεως Κλαρος,17 and the Greek commandment "thou shalt not remove thy neighbour's landmark" was maintained by Zeus Ορος, the god of boundaries, a more personal power than the Latin Jupiter Terminus.18

His highest political functions were summed up in the title Iheros, a cult-name of legendary antiquity in Athens, and frequent in the Hellenic world.19

His consort in his political life was not Hera, but his daughter Athena Polias. He sat in her judgment court τη πελανία where cases of involuntary homicide were tried.20 With her he shared the chapel in the Council-Hall of Athens dedicated to them under the titles of Βουλαίω and Βουλαία, "the inspirers of counsel," by which they were worshipped in many parts of

ZEUXIS

Greece. The political assembly and the law-court were consecrated to Zeus 'Agamemnor, and being the eternal source of justice he might be invoked as Δικαιόνος "The Just." As the god who brought the people under one government he might be worshipped as Πάρνιασος; as the deity of the whole of Hellas, 'Ελλάντωος, a title that belonged originally to Aegina and to the prehistoric tribe of the Aeacidae, and had once the narrower application to the "Thessalian Hellenes," but acquired the Pan-Hellenic sense, in fact expanded into the form Πανελλάντωος, perhaps about the time of the Persian wars, when thanksgiving or victory took the form of dedications and sacrifice to Zeus the Liberator. Finally, in the formulae adopted for the public oath, where many deities were invoked, the name of Zeus was the masterword.

There is reason for thinking that this political character of Zeus belongs to the earliest period of his religion, and it remained as long as that religion lasted. Yet in one respect Apollo was more dominant in the political life; for Apollo possessed the more powerful oracle of Delphi. Zeus spoke directly to his people at Dodona only, and with authority only in ancient times; for owing to historical circumstances and the trend of events a new position was forced upon it. It remains to consider briefly certain moral aspects of his cult. The morality attaching to the oath, so deeply rooted in the conscience of primitive peoples, was expressed in the cult of Zeus Ορκος, the God who punished perjury. The whole history of Greek legal and moral conceptions attaching to the guilt of homicide is studied in relation to the cult-appealatives of Zeus. The Greek consciousness of the sin of murder, only dimly awakened in the Homeric period, and only sensitive at first when a kinsman or a suppliant was slain, gradually expanded till the sanctity of all human life becomes recognized by the higher morality of the people: and the names of Ζεύς Μιλχιως, the bread deity, of the ghost-world whom the sinner must make "placable," of Ζεύς Ιδάκως and Προσταρατως, to whom the conscience-stricken outcast may turn for mercy and pardon, play a guiding-part in this momentous evolution.

Even this summary reveals the deep indebtedness of early Greek civilization to this cult, which engendered ideas of importance for the higher religious thought of the race, and which might have developed into a monothestic religion, had a prophet-philosopher arisen powerful enough to combat the polytheistic proclivities of Hellas. Yet the figure of Zeus had almost faded from the religious world of Hellas some time before the end of paganism; and Lucian makes him complain that even the Egyptian Anubis is more popular than he, and that men think they have done the outworn God sufficient honour if they sacrifice to him once in five years at Olympia. The history of religions supplies us with many examples of the High God losing his hold on the people's consciousness and love. In the case of this cult the cause may well have been a certain coldness, a lack of enthusiasm and mystic ardour, in the service. These stimulants were offered rather by Demeter and Dionysus, later by Cybele, Isis and Mithras.

ZEUXIS, a Greek painter, who flourished about 430-390 B.C., and described himself as a native of Heraclea, meaning probably the town on the Black Sea. He was, according to one

In ancient records we are told that Zeuxis, following the initiative of Apollodoros, had introduced into the art of painting a method of representing his figures in light and shadow, as opposed to the older method of outline, with large flat masses of colour for draperies, and other details, such as had been practised by Polygnotus and others of the great fresco painters. The new method led to smaller compositions, and 44 years after his death and single figure was it more easy for the painter to demonstrate the combined effect of the various means by which he obtained perfect roundness of form. The effect would appear strongly realistic, as compared with the older method, and to this was probably due the origin of such stories as the contest in which Zeuxis painted a bunch of grapes so like reality that birds flew towards it, while Parrhasius painted a curtain which even Zeuxis mistook for real. It is perhaps a variation of this story when we are told (Pliny) that Zeuxis also painted a boy holding grapes towards which birds flew, the artist remarking that if the grapes had been as well painted as the grapes the birds would have kept at a distance. But, if the method of Zeuxis led him to real roundness of form, to natural colouring, and to pictures consisting of single figures or nearly so, it was likely to lead him also to search for striking attitudes or motives, which by the obviousness of their meaning should emulate the plain intelligibility of the larger compositions of older times. Lucian, in his Zeuxis, speaks of him as carrying this search to a novel and strange degree, as illustrated in the group of a female Centaur with her young. When the picture was exhibited, the sculptor admired its novelty and, overcome by the skill of the painter, to the vexation of Zeuxis. The pictures of Hercules strangling the serpents to the astonishment of his father and mother (7), Penelope (10), and Menelaus Weeping (11) are quoted as instances in which strong motives naturally presented themselves to him. But, in spite of the tendency towards realism inherent in the new method of Zeuxis, he is said to have retained the ideality which had characterized his predecessors. Of all his known works it would be expected that this quality would have appeared best in his famous picture of Helena, for this reason, that we cannot conceive any striking or effective incident for him in her career. In addition to this, however, Quintilian states (Inst. Orat. xii. 10, 4) that in respect of robustness of types Zeuxis had followed Homer, while there is the fact that he had inscribed two verses of the Iliad (iii 176 seq.) under his figure of Helena. As models for the picture he was allowed the presence of five of the most beautiful maidens of Croton at his own request, in order that he might be able to "transfer the truth of life to a mute image." Cicero (De Invent. ii. 1, 4) assumed that Zeuxis had found distributed among these five the various elements he wished to use, and to make up a figure of ideal beauty. It should not, however, be understood that the painter had made up his figure by the process of combining the good points of various models, but rather that he found among those models the points that answered to the ideal Helena in his own mind, and that he merely required the models to guide and correct himself by during the process of transferring his ideal to form and colour. This picture also is said to have been exhibited publicly, with the result that Zeuxis made much profit out of it. By this and other means,
ZHELESNOVODSK—ZIEM

979

we are told, he became so rich as rather to give away his pictures than to sell them. He presented his Alcmena to the Agrigentines, his Pan to King Archelaus of Macedonia, whose palace he is also said to have decorated with paintings. According to Pliny (N.H. xxxv. 62), he made an ostentatious display of his wealth at Olympia in having his name woven in letters of gold on his dress. Under his picture of an athlete (12) he wrote that "It is easier to revile than to rival" (μισθοντες τοις μεγαλουσ η μισθοφόρα). A contemporary, Isocrates (De Furtium. 28), remarks that no one would say that Zeuxis and Parrhasius had the same profession as those persons who paint pinokia, or tablets of terra-cotta. We possess many examples of the vase-painting of the period circa 400 B.C., and it is noticeable on them that there is great freedom and facility in drawing the human form, besides great carelessness. In the absence of fresco paintings of that date we have only these vases to fall back upon. Yet, with their limited resources of colour and perspective, they in a measure show the influence of Zeuxis, while, as would be expected, they retain perhaps more of the simplicity of older times.

ZHELESNOVODSK, a health resort of Russian Caucasia, in the province of Terek, lying at an altitude of 1853 ft. on the S. slope of the Zhelesnaya Gora (2805 ft.), 10 m. by rail N.N.W. from Pyatigorsk. It possesses chalybeate springs of temperature 56°—60° Fahr.; the buildings over the springs were erected in 1863. The season lasts from early in June to the middle of September.

ZHITOMIR, or ZHITOMIR, a town of western Russia, capital of the government of Volhynia, on the Teteriv river, 85 m. W.S.W. (1900) 52,290, more than one-third Jews. It is the see of an archbishop of the Orthodox Greek Church and of a Roman Catholic bishop. Two printing offices in Zhitomir issue nearly one-half of all the Hebrew books printed in Russia. The Jewish merchants carry on a considerable export trade in agricultural produce, and in timber and wooden wares from the forests to the north. Kid-gloves, tobacco, dyestuffs and spirits are manufactured.

Zhitomir is a very old city, tradition tracing its foundation as far back as the times of the Scandinavian adventurers, Askold and Dir (9th century). The annals, however, mention it chiefly in connexion with the invasions of the Tartars, who plundered it in the 13th, 14th and 17th centuries (1660), or in connexion with destructive conflagrations. It fell under Lithuanian rule in 1326, and during the 13th century was one of the chief cities of the kingdom. Later it became part of Poland, and when the Cossacks rose under their chieftain, Bogdan Chmielnicki (1648), they sacked the town. It was annexed to Russia along with the rest of the Ukraine in 1778.

ZHOB, a valley and river in the N.E. of Baluchistan. The Zhob is a large valley running from the hills near Ziarat first eastward and then northward parallel to the Indus frontier, till it meets the Gomal river at Khajuri Kach. It thus becomes a strategic line of great importance, as being the shortest route between the North-West Frontier Province and Quetta, and dominates all the Pathan tribes of Baluchistan by cutting between them and Afghanistan. Up to the year 1884 it was practically unknown to Europeans, but the Zhob Valley Expedition of that year opened it up, and in 1886 the Zhob Valley and Gomal Pass were taken under the control of the British Government. The Zhob Valley was the scene of punitive British expeditions in 1884 and 1890. In 1890 Zhob was formed into a district or political agency, with its headquarters at Fort Sandeman: pop. (1901) 3552. As reconstituted in 1903, the district has an area of 926 sq. m.; pop. (1901) 60,718, mostly Pathans of the Kakar tribe.

See Sir T. H. Holdich's Indian Borderland (1901); Bruce's Forward Policy (1900); McFall's With the Zhob Field Force (1895); and Zhob District Gazetteer (Bombay, 1907).

ZIARAT ("a Mahomedan shrine"), the summer residence of the chief commissioner of Baluchistan, and sanatorium for the European troops at Quetta: 8830 ft. above the sea and 33 m. by cart-road from the railway. There is a very good supply of fine sand-dunes, and the hills around are well-wooded and picturesque.

ZICHY (of Zich and Vásonyék), the name of a noble Magyar family, conspicuous in Hungarian history from the latter part of the 13th century onwards. Its first authentic ancestor bore the name of Zayk, and this was the surname of the family until it came into possession of Zich in the 15th century. It first came into great prominence in the 16th century, being given county rank in 1579 in the person of the imperial general Ferdinand, who married a daughter of Count Odon (d. 1605). His descendants divided into two branches: those of Zichy-Palota and Zichy-Karhlov. The Palota line, divided again into three: that of Nagy-Láng, that of Adony and Szent-Miklós, and that of Palota, which died out in the male line in 1874. The line of Zichy-Karhlov (since 1811 Zichy-Ferraris) split into four branches: that of Védri, that of Vészony, and those of Daruvár and Csicó, now extinct.

COUNT KÁROLY ZICHY (1753—1826) was Austrian war minister in 1800 and minister of the interior in 1813—1814; his son, Count Ferenc Zichy (1783—1862) was the Austrian field-marshal condemned to ten years’ imprisonment for surrendering the town to the insurgents in 1848 (he was pardoned in 1851). Count ODÖN [EDMUND] ZICHY (1800—1848), administrator of the county of Veszprém, was hanged on the 3oth of September 1848 by order of a Hungarian court-martial, presided over by Görgő, for acting as Jellachich’s emissary to the imperial general Roth. COUNT FERENC ZICHY (1811—1900) was secretary of state for commerce in the Széchenyi ministry of 1848, but retired on the outbreak of the revolution, joined the imperial side, and acted as imperial commissionaire; from 1874 to 1880 he was Austrian ambassador at Constantinople. Count ODÖN ZICHY (1811—1894) was remarkable for his great activity in promoting art and industry in Austria-Hungary; he founded the Oriental Museum in Vienna. His son, Count Eugen Zichy (b. 1837), inherited his father’s notable collections, and followed him in his economic activities; he three times visited the Caucasus and Central Asia to investigate the original seat of the Magyars, publishing as the result Voyages au Caucase (2 vols., Budapest, 1897) and Dritte asiatische Forschungsreise (6 vols., in Magyar and German; Budapest and Leipzig, 1900—1905). COUNT FERDINAND ZICHY (b. 1839), vice-president of the Hungarian stadtholdership under the Mailath régime, was condemned in 1863 under the press laws to the loss of his titles and to imprisonment. In 1867 he was elected to the Hungarian parliament, at first joining the party of Déák, and subsequently becoming one of the founders and leaders of the Catholic People’s Party (see HUNGARY, History). His second son, Count Aladár Zichy (b. 1864), also a member of the Catholic People’s Party, was made minister of the royal household in the Wéckerle cabinet of 1906. COUNT JáSOS ZICHY (b. 1868), also from 1896 to 1906 a member of the Catholic People’s Party in the Lower House, and after 1906 attached to Andrassy’s Constitutional Party, was of importance as the confidant of the heir to the throne, the Archduke Francis Ferdinand. COUNT GÉZA ZICHY (b. 1849), nephew of the Count Ferenc mentioned above, studied under Liszt and became a professional pianist; in 1891 he became intimate of the Hungarian national opera-house, a member of the Hungarian Upper House and head of the Conservatoire at Budapest. COUNT MIHÁLY ZICHY (b. 1859), one of the most conspicuous Hungarian painters, was appointed court painter at St. Peters-Burg and accompanied the Russian monarch on various journeys. The National Gallery at Budapest possesses some of his paintings, notably that of “Queen Elizabeth before the coffin of Francis Déák;” but he is best known for his illustrations of the works of the great Magyar writers (Petőfy, Arany, &c.).

ZIEM, FÉLIX FRANÇOIS GEORGE PHILIBERT (1821— ), French painter, was born at Beaune (Côte d’Or) in 1821. Having studied at the art school of Dijon, where he carried off the grand prix for architecture, he went to Rome in 1839 and there continued his studies. The years from 1845 to 1849
were spent in travel in the south of France, Italy and the East, where he found the glowing sunlight and the rich colour peculiarly suited to his temperament. His reputation is, however, not based so much on his orientalist canvases as on his pictures of Venice, which are generally characterized by the intensity of the sunny glow on the red sails and golden-yellow buildings under a deep blue sky. Many of his Venetian pictures are purely imaginative, and their appeal is entirely due to their qualities of colour, his architectural drawing being frequently faulty and careless. After "Sunrise at Stamboul," which Théodore Gautier called "the finest picture of modern times," he received the Legion of Honour in 1857, and was made an officer in 1878. The majority of his paintings have gone to American private collections, but two of his pictures, "The Doge's Palace in Venice" (1852), and a marine-painting, are at the Luxembourg Museum, and a "View of Quai St Jean, Marseilles" at the Marseilles Gallery, whilst many others are to be found in the leading private collections of modern pictures in France, England and Germany. In collaboration with Luc de Vos he illustrated The Death of Paganini.

See Félix Ziem, by L. Roger-Milès (Librairie de l'Art, Paris).

ZIERIKSEE, a town in the province of Zeeland, Holland, on the south side of the island of Schouwen. Pop. 6800. It is a very old town, and formerly flourished exceedingly on account of its trade and fishing, and important salt-making industry, and now is the chief market centre and port in the island. Among the principal buildings are the town-hall (15th century); the Great Church, which was rebuilt after a fire in 1852, but retains the lofty tower (1454) belonging to the earlier building; the Little Church, the prison and the exchange. The chief public square occupies the site of a residence of the counts of Zeeland dating from 1048.

ZIETEN, HANS JOACHIM VON (1600-1786), Prussian general-field-marshal, began his military career as a volunteer in an infantry regiment. He retired after ten years' service, but soon afterwards became a lieutenant of dragoons. Being involved in some trade transactions of his squadron-commander, he was cashiered, but by some means managed to obtain reinstatement, and was posted to a hussar corps, then a new arm. At that time light cavalry work was well known only to the Austrians, and in 1735 Rittmeister von Zieten made the Rhine campaign under the Austrian general Baronay. In 1741, when just promoted lieutenant-colonel, Zieten met his old teacher in battle and defeated him at the action of Rothschloss. The chivalrous Austrian sent him a complimentary letter a few days later, and Winterfeld (who was in command at Rothschloss) reported upon his conduct so favourably that Zieten was at once marked out by Frederick the Great for command. Within the year he was colonel of the newly formed Hussar regiment, and henceforward his promotion was rapid. In the "Moravian Foray" of the following year Zieten and his hussars penetrated almost to Vienna, and in the retreat to Silesia he was constantly employed with the rearguard. Still more distinguished was his part in the Second Silesian War. In the short peace, the hussars, like the rest of the Prussian cavalry, had undergone a complete reformation; to iron discipline they had added the dash and skirrelshing qualities of the best irregulars, and the hussars were considered the best of their arm in Europe. Zieten fought the brilliant action of Moldau Tein almost on the day he received his commission as major-general. In the next campaign he led the famous Zietenrilt round the enemy's lines with the object of delivering the king's order to a distant detachment. At Hohenfriedberg-Streigau and at Katholisch-Hennersdorf the hussars covered themselves with glory. Hennerstorf and Kesselsdorf ended the second war, but the Prussian army did not rest on its laurels, and their training during the ten years' peace was careful and unceasing. When the Seven Years' War broke out in 1756 Zieten was made inspector-general. At Reichenberg and at Prag he held important commands, and at the disastrous battle of Kolin (18th June 1757) his left wing of cavalry was the only victorious corps of troops. At Leuthen, the most brilliant battle of the 18th century, Zieten's cavalry began the fighting and completed the rout of the Austrians. He continued, during the whole of the war, to be one of Frederick's most trusted generals. Almost the only error in his career of battles was his misdirection of the frontal attack at Torgau, but he redeemed the mistake by his desperate assault on the Sipititz heights, which eventually decided the day. At the peace, General Zieten went into retirement, the hero among the army and the people. He died in 1786. Six years later Frederick's suc- cessor erected a column to his memory on the Wilhelmsplatz in Berlin.

ZIMBABWE, a Bantu name, probably derived from the two words zimba ("houses") and mabgi ("stones"), given to certain ruins in South-East Africa. Its use is not confined to Southern Rhodesia and should not properly be restricted to any one particular site. For, as the medieval Portuguese stated, it is merely a generic term for the capital of any considerable chief, and it has been applied even by them to several distinct places. From about 1550 onwards the Zimbabwe generally referred to by Portuguese writers was at a spot a little north of the Afur district, not far from the Zambezi. There is some reason, however, to suppose that before this the capital of the Monomo-tapa was situated much farther south, and it may plausibly be identified with the most extensive ruins as yet known, viz. those near Victoria (Mashonaland) to which popular usage has now attached the name of Zimbabwe.

These ruins were discovered by Adam Renders in 1868 and explored by Karl Mauch in 1871. They became well known to English readers from J. T. Bent's account of the Ruined Cities of Mashonaland, but the popularity of that work disseminated a romance concerning their age and origin which was only dispelled when scientific investigations undertaken in 1903 showed it to be wholly without historical warrant. Even before this it had been clear to archaeologists and ethnologists that there was no evidence to support the popular theory that Zimbabwe had been built in very ancient days by some Oriental people. Swan's measurements, which had misled Bent into accepting a chronology based on a supposed orientation of the "temple," had been shown to be inexact. There was no authentic instance of any inscription having been found there or elsewhere in Rhodesia. Numerous objects had been discovered in the course of excavations, but not one of them could be recognized as more than a few centuries old, while those that were not demonstrably foreign imports were of African type.

The explorations conducted in 1905 added positive evidence. For it was proved that the medieval objects were found in such positions as to be necessarily contemporaneous with the foundation of the buildings, and that there was no super-position of periods of any date whatsoever. Finally from a comparative study of several ruins it was established that the plan and construction of Zimbabwe are by no means unique, and that this site only differs from others in Rhodesia in respect of the great dimensions and the massiveness of its individual buildings. It may confidently be dated to a period not earlier than the 14th or 15th century A.D., and attributed to the same Bantu people the remains of whose stone-fenced kraals are found at so many places between the Limpopo and the Zambezi.

There are three distinct though connected groups of ruins at Zimbabwe, which are commonly known as the "Elliptical Temple," the "Acropolis" and the "Valley Ruins." The most famous is the first, which is doubtless misnamed, since it is not a temple and its contour is too unsymmetrical to be described properly as elliptical. It is an irregular enclosure over 800 ft. in diameter, a maximum height of 18 ft. and a maximum breadth of 220 ft., surrounded by a dry-built wall of extraordinary massiveness. This wall is in places over 30 ft. high and 14 ft. wide, but is very erratic in outline and
variable in thickness. The most carefully executed part is on the south and south-east, where the wall is decorated by a row of granite monoliths beneath which runs a double line of chevron ornament. The interior has been much destroyed by the ravages of gold-seekers and amateur excavators. Enough, however, remains to show that the scheme was a combination of such a stone *kradl* as that at Nanatali with the plan of a fort like those found about Iinyanga. The only unique feature is the occurrence of a large and a small conical tower at the southern end, which Bent and others considered to be representatives of the human phallus. Their form, however, is not sufficiently characteristic to allow this hypothesis. Moreover, it has been noted that the nearest approximation to phallic worship is found amongst the most typical of African peoples, viz. the Ewe-speaking natives of the West Coast. The floor of the enclosure is constituted as in the other Zimbabwe buildings by a thick bed of cement which extends even outside the main wall. This cement mass is heightened at many places so as to make platforms and supports for huts. Groups of these dwellings are enclosed by subsidiary stone walls so as to form distinct units within the larger precinct.

The term "kraal" is in some ways more remarkable than the *great kraal* which has just been described. It is a hill rising 200 to 300 ft. above the valley, fortified with the minutest care and with extraordinary ingenuity. The principles of construction, the use of stone and cement are the same as in the "elliptical" *kradl*; there is no definite plan, the shape and arrangement of the enclosures being determined solely by the natural features of the ground. Between this and the "elliptical" *kradl* are the "Valley Ruins," consisting of smaller buildings which may have been the dwellings of those traders who bartered the gold brought in from distant mines. Zimbabwe was probably the distributing centre for the gold traffic carried on in the middle ages between subjects of the Monomotapa and the Mahommedans of the coast.

See D. Randall-MacIver, Mediaeval Rhodesia (London, 1906); *Journal of Anthr. Inst., vol. xxxv.; Geog. Journal* (1906); Mauch's report in *Austral* (1872) is now only of bibliographical interest, while Bent's *Ruinized Cities of Mashomaland* (1892) and R. N. Hall's *Great Zimbabwe* (1905) are chiefly valuable for their illustrations.

ZIMMERMANN, JOHANN GEORG, RITTER von (1728–1795), Swiss philosophical writer and physician, was born at Brugg, in the canton of Aargau, on the 8th of December 1728. He studied at Göttingen, where he took the degree of doctor of medicine, and was afterwards appointed by the Dutch East India Company, *De irritabilitate* (1751). After travelling in Holland and France, he practised as a physician in his native place, and here he wrote *Über die Einsamkeit* (1756, emended and enlarged, 1784–85) and *Vom Nationalstode* (1758). These books made a great impression in Germany, and were translated into almost every European language. They are now only of historical interest. In Zimmermann's character there was a strange combination of sentimentalism, melancholy and enthusiasm; and it was by the free and eccentric expression of these qualities that he excited the interest of his contemporaries. Another book by him, written at Brugg, *Von der Erfahrung in der Arzneiwissenschaft* (1764), also attracted much attention. In 1768 he settled at Hanover as private physician of George III, with the title of Hofrat. Catherine II. invited him to the court of St. Petersburg, but this invitation he declined. He attended Frederick the Great during that monarch's last illness, and afterwards issued various books about him, of which the chief were *Über Frederich den Grossen und meine Unterredung mit ihm kurz vor seinem Tode* (1788) and *Fragmente über Friedrich den Grossen* (1790). These writings display extraordinary personal vanity, and convey a wholly false impression of Frederick's character. Zimmermann died at Hanover on the 7th of October 1798.

See A. Rengger, Zimmermann's Briefe an einige seiner Freunde in der Schweiz (1830); E. Bodemann, Johann Georg Zimmermann, sein Leben und bisher ungedruckte Briefe an ihn (Hann., 1878); and R. Ischer, Johann Georg Zimmermann's Leben und Werke (Bern, 1903).

**ZINC**, a metallic chemical element; its symbol is Zn, and atomic weight 65.37 (O = 16). Zinc as a component of brass (CuZn3, Cu2Zn3) had currency in metallurgy long before it became known as an industrial metal. From the 18th century the brass as the "metal of the Mosynoed," which is produced as a bright and light-coloured CuZn3, not by addition of tin, but by fusing up with an earth. Pliny explicitly speaks of a mineral *kaluba* or *cadmia* as serving for the conversion of copper into aurichalcum, and says further that the deposit of (zinc oxide) formed in the brass furnaces could be used instead of the mineral. The same process was used for centuries after Pliny, but its rationale was not understood. Stahl, as late as 1702, quoted the formation of brass as a case of the union of a metal with an oxide, and brought out a metallic compound; but he subsequently adopted the view propounded by Kunckel in 1717, that "cadmium" is a metallic calx, and that it dyes the copper yellow by giving its metal up to it.

The word zinc (in the form *sinken*) was first used by Paracelsus, who regarded it as a bastard or semi-metal; but the word was subsequently used for both the metal and its ores. Moreover, zinc and bismuth were confused, and the word *spalter* (the modern spelter) was indiscriminately given to both these metals. In 1597 Libavius described a "peculiar kind of tin" which was prepared in India, and of which a friend had given him a quantity. From his account it is quite clear that that metal was zinc, but he did not recognize it as the metal of calamine. It is not known to whom the discovery of isolated zinc is due; but we do know that the art of zinc-smelting was practised in England from about 1730. The first continental zinc-works were erected at Liège in 1807.

**Occurrence.**–Zinc does not occur free in nature, but in combination it is widely diffused. The chief ore is zinc blende, or sphalerite (see BLEND), which generally contains, in addition to zinc sulphide, small amounts of the sulphides of iron, silver and cadmium. It may also be accompanied by pyrites, galena, arsenites and antimonides, quartz, calcite, dolomite, &c. It is widely distributed, and is particularly abundant in Germany (the Harz, Silesia), Austria-Hungary, Belgium, the United States and in England (Cumberland, Derbyshire, Cornwall, North Wales). Second in importance is the carbonate, calamine (*q.v.*) or zinc spar, which at one time was the principal ore; it almost invariably contains the carbonates of cadmium, iron, manganese, magnesium and calcium, and may be contaminated with clay, oxides of iron, galena and calcite; "white calamine" owes its colour to much clay; "red calamine" to admixed iron and manganese oxides. Calamine chiefly occurs in England and in the United States. Of less importance is the silicate, ZnSiO$_3$·H$_2$O, named electric calamine or hemi-morphite; this occurs in quantity in Altenburg near Aix-la-Chapelle, Sardinia, Spain and the United States (New Jersey, Pennsylvania, Missouri, Wisconsin). Other zinc minerals are willemite (*q.v.*), Zn$_2$SiO$_4$, hydrozincite or zinc bloom, ZnCO$_3$·Zn(OH)$_2$, zincite (*q.v.*) or red zinc ore, ZnO, and franklinite, 3(Fe,Zn)$_2$·(Fe,Mn)$_3$.O$_6$.

**Production.**–Until about 1833 the supply of zinc was almost entirely obtained from Germany, but in this year Russia began to contribute about 2000 tons annually to the 6000 to 7000 derived from Germany. Belgium entered in 1837 with an output of about 2000 tons; England in 1855 with 3000; and the United States in 1875 with 2000 tons. The productions of Germany, the United States and Belgium are now annually and fairly regularly increased; the rise has been most rapid in the United States, where the Zn mine is in the middle of a flourishing mining district.
ZINC

States. England, France, Spain and Austria have been fairly constant producers. Germany produced 155,799 tons in 1900, and 188,208 in 1905; Belgium, 120,000 in 1900 and 143,165 in 1905; the United States, 111,000 in 1900 and 183,014 in 1905. The world's supply was 445,438 tons in 1900, and 654,367 in 1905.

Metallurgy

The principles underlying the extraction of zinc may be summarized as: (1) the ore is first converted into zinc oxide; (2) the oxide is distilled with carbon and the distillate of metallic zinc condensed. Oxide of zinc, like most heavy metallic oxides, is easily reduced when the metallic state is approached, reduces charcoal; pure red zinc ore may be treated directly; and the same might be done with pure calamine of any kind, because the carbon dioxide of the zinc carbonate goes off below redness and the zinc oxide does not. The only requisite for success is then to prevent the reducing action of the charcoal. Zinc blende, however, being zinc sulphide, is not directly reducible by charcoal; but it is easy to convert it into oxide by roasting; the sulphur goes off as sulphur dioxide whilst the zinc remains in the (insoluble) form of 

In practice, however, we never have to deal with pure zinc minerals, but with complex mixtures, which must first of all be subjected to mechanical operations, to remove at least of the gangue, and if possible also of the heavy metallic impurities (see Ore-Dressing).

As ores of zinc are usually shipped before smelting from widely separated sources, Spain, Sweden, Italy, Germany, and the Rocky Mountains of North America—it is important that they be separated from their mixtures at the mines. The difficulty in separating zinc blende from iron pyrites is well known, and the simple block of ore has never been designed with this end in view. The Wetherill system of magnetic concentration has been remarkably successful in separating these two substances and concentrates as well-known and by no means completely

The magnetic concentrates contain enough zinc to be well adapted to the manufacture of zinc oxide. Magnetic concentration is also applied in the removal of an excess of iron from partially roasted blende, which is magnetic, and the reduction is very much in the way of separation when, as in many complex ores, carbonates of iron, calcium and magnesium replace the isomorphic zinc carbonate, when some iron sulphide containing less sulphur than pyrites replaces zinc sulphide, and when gold and silver are contained in the zinc ore itself. Hence in exceptional circumstances it is possible to utilize a large class of widely distributed ores, carrying from 10 to 35 per cent. of zinc, in which the zinc alone, estimated at 2d. a pound, is worth from about £2 to £7 per ton of ore. The ores of the Joplin district, in the Ozark uplift in the Mississippi Valley, are remarkable in that they are specially adapted to the Wetherill system and are probably not average over 10 per cent. of zinc, but the dressed zinc ore as sold ranges from 45 to 62 per cent. of zinc. This region now supplies a large part of the ore required by the smelters of Illinois, Missouri and Kansas.

The ore, even if it is not blende, must be roasted or calcined in order to remove all volatile components as completely as possible, because it will be difficult to remove them in proper proportion of the zinc vapour during the distillation. If the zinc is present as blende, this operation offers considerable difficulties, because the zinc sulphide passes into zinc oxide as the first instance into sulde, which demands a high temperature for its conversion into oxide. Another point to be considered in this connexion is the mass of sulphur dioxide evolved, being destructive of vegetable life, are an intolerable nuisance to the neighbourhood in which the operations take place. For the desulphurization of zinc blende where it is not intended to collect and save the sulphur there are many mechanical kilns, generally called "sulphur vents," heayed with a horizontal passage in which these may be made, to do good work on moderately clean ores which do not melt at the temperature of desulphurization. But the problem of saving the sulphur is yearly becoming more important. In roasting a ton of rich blende containing 60 per cent. of zinc enough sulphur is liberated to produce one ton of strong sulphuric acid, and unless this is collected not only are poisonous gases evolved, but the whole mass of waste is laden with 

sulphuric acid is to be collected, it is important to keep the fuel gas from admixture with the sulphur gases, and kilns for this purpose require some modification. If hot air is introduced into the retort, then the sulphur, that evolves with the zinc and the sulphur is sufficient to keep up a part of the reaction; but for the complete expulsion of the sulphur an externally-fired metal of zinc is required. This must be provided in a sheltered furnace, where the distillate is collected in a ladle held under the outlet end of the pipe. For manufacturing purposes a furnace similar to that used for the making of glass was employed to heat a circular row of crucibles in which zinc was smelted in a shell of the furnace. This system, however, has long been abandoned.

The modern processes may be primarily divided into two groups according to the method of distillation employed, viz., one in which the zinc is collected in a ladle held under the outlet end of the pipe. For manufacturing purposes a furnace similar to that used for the making of glass was employed to heat a circular row of crucibles in which zinc was smelted in a shell of the furnace. Various combinations and modifications of these two types of furnace have given rise to distinctive names, and as each system has its advantages and disadvantages local conditions determine which is the better.

In the Belgian process the reduction and distillation are carried out in cylindrical or elliptical retorts of fire-clay, from 3½ to 4 in. long, 9 in. in diameter, and 10 in. in internal diameter. Some forty or six more retorts, arranged in parallel horizontal rows, are heated in one furnace. The furnaces are square and open in front, to allow the outlet ends of the retorts to project; they are grouped in three or four layers, each layer being divided into vertical sections. Each retort is provided with two adapters, namely, a conical pipe of fire-clay, about 15 in. long, which fits into the retort end, and a conical tube of sheet iron, which fits over the flues of the kiln and plays the same part as the chimney in a smelting furnace. The gases pass through the flues of the kiln and the chimney. In the Belgian process the zinc is roasted in the retort, heated as before, to a white heat, and then allowed to cool. The retorts, after having been heated to redness, are inserted in corresponding sets. The charge of the retorts consists of a mixture of 1100 lb. of roasted calamine and 750 lb. of dry powdered coal per furnace. A newly started furnace, however, is used for a time with smaller charges. Supposing the last of these preliminary distillations to have been completed, the residues left in the retorts are removed, the charge of the retorts is renewed, and the zinc is roasted as before. The retorts of the second and third charges are of cylindrical shape, and are adapted to the specially made retorts of the Wetherill system.

For the charging and discharging of the retorts there are cylindrical openings in the side of the kiln, equipped with iron doors, and the zinc which is to be distilled is introduced through these doors. The zinc passes through the flues of the kiln, and the residue is removed through the chimney. The retorts are heated to a temperature of about 1500°, the zinc is distilled, and the furnace is cooled down, after which the zinc is collected in a ladle held under the outlet end of the pipe. For manufacturing purposes a furnace similar to that used for the making of glass was employed to heat a circular row of crucibles in which zinc was smelted in a shell of the furnace. Various combinations and modifications of these two types of furnace have given rise to distinctive names, and as each system has its advantages and disadvantages local conditions determine which is the better.

ZINC

Three modes of gas-firing are to be noticed, each of which is adapted to special local conditions. (a) The gas is made from the fuel in a detached fireplace and conducted while hot into the combustion chamber of the furnace, and the air for complete combustion is admitted to the furnace by means of a sloping belt containing the fuel. (b) Both the producer gas and the air are heated before they enter the combustion chamber, as in the Siemens system of regenerative firing. (c) Natural gas is piped to the furnace, where it meets air under pressure and is burned in an open combustion chamber. Further details of the primary advantages of gas-firing are that less fuel is required, that there is better control of the heat in the furnace, and that larger and more accessible furnaces can be built. In Silesia the introduction of gas-firing is now in progress.

In the United States, Belgian furnaces of type (a) are built to contain 864 retorts; of type (b), to contain 300 to 400 retorts; and of type (c), preferably with the air heated. The furnace simplifies manual labour. On a direct-fired furnace at least one man, the bricklayer, must be an expert in all the operations involved; but with a gas furnace a division of labour is possible. One man who understands the use of gaseous fuel can regulate the heat of a thousand or more retorts. The men who charge and empty the retorts, those who draw and cast the metal, and those who keep the furnace in repair, need not know anything about the making or using of gas, and the men who make the gas need not know anything about a zinc furnace. Again, in direct-fired furnaces there are commonly seven or eight rows of retorts, one above another. At random it is possible for an upper row to overhang a lower one, and it is the job of a helper to watch the man who is engaged upon a table, where he is exposed to the full heat of the furnace and requires a helper to wait upon him. With gas-firing the retorts can be arranged in four horizontal rows, all within reach of a man on a crane, but also separated so that, in any case in which gas-making makes possible mechanical appliances may be substituted for manual labour in many operations, such as removing and replacing battens, melting out, casting into moulds, drawing and casting the metal, charging and emptying the retorts, and removing the residues and products.

Refining.—The specific effects of different impurities on the physical and chemical propensities of zinc and the uses to which it is put, have been described by Ashcroft. Fortunately, however, the small amounts of any of them that are likely to be found in commercial zinc are not for most purposes very deleterious. It is generally recognized that the purest ores produce the purest metal. Chemical analysis based on selected ores, and brands, when they mean anything, usually mean that the metal is made from certain ores. Chemical control of the metal purchased is not nearly as common as it should be, and the refining of zinc is at best an imperfect operation. To obtain the metal chemically pure a specially prepared pure oxide or salt of zinc is distilled. A redistilled zinc, from an ordinarily pure commercial zinc, is often called chemically pure, but redistillation is seldom practiced except for the recovery of zinc from galvanizer’s dross and from the skimmings and bottoms of the melting furnaces of zinc rolling mills. The only other method of refining zinc is by electric electrolysis. Impure zinc, which has been reduced by hydrogen to zinc or impure zinc, is allowed to stand at about the temperature of the melting-point of the metal for forty-eight or more hours, whereupon it becomes nearly perfect. When zinc is melted, the impurities rise to the top, the heavier metals such as lead and iron settling towards the bottom. This method is rarely practiced except by the rollers of zinc. A certain amount of refined zinc can be obtained from the molten metal of the electric furnace by distilling off the zinc vapor in the bottom of the bath in a subsequent slow remelting, and it is sometimes possible to eliminate a zinciferous lead which collects in the sump of the furnace. Owing to the fact that at temperatures between its melting and boiling point zinc has a strong affinity for iron, it is often contaminated by the scraper while being drawn from the crucible, as is shown by the fact that the scraper wears away rapidly. As each retort in a furnace is in all essentials a separate crucible, and as the metal from only a few of them goes into a single ingot, there can be no uniformity either in the ingots made from various furnaces or in the ingots themselves from several furnaces treating the same ore. Some brassfounders break from a single ingot the quantity of zinc required to produce an amount of brass they wish to compound in one crucible, but when perfect uniformity is desired the importance of remelting the zinc on a large scale cannot be too strongly emphasized.

Electrolytic Separation of Zinc.—The deposition of pure zinc is brought about by the use of a more or less strong solution, solution, or a low current-density, was used, and that hydrogen was usually evolved simultaneously; sound deposits resulted from the use of a compound of zinc and hydrogen, and from strongly and strong solutions. The cause of the spongy deposit is variously explained, some (Siemens and Halske) ascribing it to the existence of a compound of zinc and hydrogen, and others, among whom are W. Borchers, trace it to the presence of oxide, produced, for example, either by the use of a solution containing a trace of basic salt of zinc (to prevent which the bath should be kept just—almost—imperceptibly—acid), or by the presence of a more electro-negative element, or by the absence of a more electro-positive element, of the zinc. Many processes have been patented, the ore being acted upon by the solution, and the resulting solution treated, by either chemical or electrolytic means, for the production of the refining of zinc. The process of zinc is then electrolysed. E. A. Ashcroft patented a process of dealing with complex ores of the well-known Broken Hill type, containing sulphides of silver, copper, and zinc. The ores were smelted in a reverberatory furnace. The metallic products of zinc, silver, and copper were then recovered by the system, which was worked on a practical scale. A full account of the process (Trans. Inst. Min. and Met., 1898, vol. vi. p. 282) has been published by the inventor, describing the practical trial at the Cockle Creek Works. When the ore was roasted, and leached with sulphuric acid (with or without ferric sulphate); the solution was purified and then electrolysed for zinc with lead anodes and with a current-density of 5 amperes per sq. ft. at 275 volts when diaphragms were used, or 2.5 volts when they were dispensed with, or with 10 amperes per sq. ft. at 3 or 2.5 volts respectively, the electrolyte containing 1.2 lb. of zinc in the form of sulphate, and 1 oz. of sulphuric acid, per gallon. The current efficiency was said at 83 per cent. Canvas diaphragms were used to prevent the acid formed by electrolysis at the anode from mixing with the cathode liquor, and so hindering deposition. C. Hoepfner has patented a new zinc electrolysis process. He used a zinc anode, and a rotating cathode is used in a chloride solution, a porous portion separating the tank into anode and cathode compartments, and to which the generated hydrogen is evolved at the anode being recovered. Hoepfner’s processes have been put in practice in Germany. Halske’s process, with an electrolyte containing alkaline sulphate and zinc sulphate, has been used in Germany. Another process involves the use of zinc dust as anode, and iron plate as cathode, in the mine country. Siemens and Halske have proposed the addition of oxidizing agents such as free halogens, to prevent the formation of zinc hydride, to which they attribute the formation of zinc carbonate and zinc chloride. Borchers, after many experiments, in Borchers’ process the chlorine is heated partly by external iron, partly by the heat generated owing to the use of a current-density of 90 to 100 amperes per sq. ft.

Properties

Zinc is a bluish-white metal, showing a high lustre when freshly fractured. It fuses at 415° C. and under ordinary atmosphere boils at 1040° C. its vapour density shows that it is monatomic. The molten metal on cooling deposits crystals belonging to the hexagonal system, and freezes into a compact crystal line solid, which may be brittle or ductile according to circumstances. If zinc be cast into a mould at a red heat, the ingot produced is laminar and brittle; if cast at just the freezing-point, a metal of a tenacious character is obtained. Zinc is used externally to prevent the ordinary temperature. According to some authorities, pure zinc always yields ductile ingots. Commercial "spelter" always breaks at the grain, while zinc produced in any other way is likely to be rolled out into even a very thin sheet. Such a sheet, if once produced, remains flexible when cold. At about 200° C, the metal becomes so brittle that it can be pounded in a mortar. The specific gravity of zinc is not to be expected to stand perfect comparison according to Karsten, that of pure ingot is 6.915, and rises to 7.191 after rolling. The coefficient of linear expansion is 0.002505 for 100° from 0° upwards (Fizeau). The specific heat is 0.3955 (Regnault). Compact zinc is bluish white; it does not tarnish much in the air. It is fairly soft, and clogs the file. If zinc be heated to near its boiling-point, it catches fire and burns with a brilliant light into its powdery white oxide, which forms a red in the air (lana philosophica, "philosopher's wool"). Boiling water attacks it appreciably, but slightly, with evolution of hydrogen and formation of the hydroxide, Zn(OH)₂. A rod of perfectly pure zinc need be exposed in water for many months before it is attacked that there is no visible evolution of gas; but, if a piece of platinum, copper or other more electro-positive metal be brought into contact with the zinc, it dissolves readily with evolution of hydrogen, and formation of zinc chloride. The ordinary metal dissolves at once, the more readily the less pure it is. Cold dilute nitric acid dissolves zinc as nitrate, with evolution of nitrous fumes and oxygen. Lead nitrate, NO₃, is not reduced, but is not oxidized. NO, is produced besides or instead of nitrous. Zinc is also soluble in soda and potash solutions, but not in ammonia.

Applications.—Zinc is largely used for "galvanizing" iron, sheets of copper, and other Zinc is corrosion, and is being oxidized, in galvanizing. Silver is attacked, and then removed, so that a coat of zinc remains on the iron, which is thereby protected from atmospheric corrosion. It is also a constituent of the typical high-voltage materials, such as stannic acid, nicotine, toluene, are examples. In technologic chemistry it is used as a reducing agent, e.g., in the production of aniline from benzene, but the use of iron is generally preferable in view of the cheapness of this metal.
ZINCITE

**ZINC**

Zinc forms only one oxide, ZnO, from which, by dehydration, a yellowish white powder is obtained. One of the marks of a good product is its being well marked; one distinction is that zinc is less basigean. Zinc is capable of isomorphous replacing many of the bivalent metals—magnesium, manganese, iron, nickel, cobalt and cadmium.

Zinc is a compound of oxygen and zinc, and is obtained in the following manner: by two processes—directly from the ore mixed with coal by volatilization on a grate, as in the Wetherill oxide process, and by oxidizing the vapour given off from the slag of the zinc furnace. The oxide thus obtained is black, and the latter method has generally a better colour, a finer texture, and a greater covering power. It is also manufactured by the latter process from the metallic zinc liquefied out of galvanizer’s dust. It is dried in the ordinary furnace, which is a heated stove, and when set on fire, as on cooling becomes white. This at least is true of the oxide produced from the metal by combustion; that produced from the carbonate by burning, or by yellow rouge, retains a yellow shade permanently. By heating the latter in a current of air, hemorphous pyramids belonging to the hexagonal system; and by heating the chloride in a current of steam as hexagonal prismas. It is insoluble in water; it dissolves readily in all aqueous solutions of alkalis, with formation of salts. It also dissolves in aqueous acetic alkalies, including ammonia, forming “zincates” (e.g., Zn(OH)₂).

Zinc oxide is used in the arts as a white pigment (zinc white); it has a high refractive index and the density of the compound, and offers the advantages of being non-poisonous and of not becoming discoloured in sulphuretted hydrogen. It is used also in medicine.

Zinc chloride is precipitated by the continuous addition of a solution of any zinc salt to a caustic potash. The alkali must be free from carbonate and an excess of it must be avoided, otherwise the hydrate redissolves. It is a white powder, and is insoluble in water, but to acids and alkalis it behaves like the oxide, but dissolves more readily.

**Zinc chloride, ZnCl₂**, is produced by heating the metal in dry chlorine gas, when it distils over as a white translucent mass, fusing at 250° and being at about 400°. Its vapour-density at 300° corresponds to ZnCl₂. It is extremely hygroscopic and is used in synthetic organic chemistry as a condensing agent. It dissolves in an equal volume of water, or in an equal volume of cold water, forming a syrupy solution. A solution of zinc chloride is easily produced from the metal and hydrochloric acid; it cannot be evaporated to dryness without considerable decomposition of the hydrated salt into a mixture of hydrochloric and hydrochloric acids, forming a solution of 

$$\text{ZnCl}_2 + \text{H}_2\text{O} \rightarrow \text{ZnCl}_2 \cdot \text{H}_2\text{O}. $$

A concentrated solution of zinc chloride converts starch, cellulose and a great many other bodies into soluble compounds; hence the application of the fused salt as a caustic in surgery and the impossibility of filtering a strong ZnCl₂ solution through paper (see CELLULOSE). At a boiling heat, zinc chloride dissolves in any proportion of water, and highly concentrated solutions, of course, boil at high temperatures; hence they afford a convenient medium for the maintenance of high temperatures.

Zinc chloride solution readily dissolves the oxide with the formation of oxychlorides, some of which are used as pigments, cements and masticating agents. One of the products of the action of zinc chloride has the property of dissolving silk, and hence is employed for removing this fibre from wool.

**Zinc sulphide, ZnS**, occurs in nature as the blende (q.v.), and is artificially obtained as a white precipitate by boiling obtained by mixing hydrogen into a neutral solution of a zinc salt. It dissolves in mineral acids, but is insoluble in acetic acid.

**Zinc sulphate, ZnSO₄·H₂O**, or white vitriol, is prepared by dissolving the metal in dilute sulphuric acid. If care be taken to keep the zinc in excess, the solution will be free from all foreign metals except iron and perhaps manganese. Both are easily removed by recrystallization from the mother liquors, and if perfectly freed from ferric and manganic salt, and then digesting the liquid with a washed precipitate of basic carbonate, produced from a small portion of the solution by means of sodium carbonate. The iron and manganese are precipitated as precipitates, and are filtered off. The filtrate is acidified with a little sulphuric acid and evaporated to crystallization. The salt crystallizes out on cooling with 7 molecules of water, forming a yellow orthorhombic plate, being small and thin. They are peculiar in their form. According to Poggiale, 100 parts of water dissolve respectively of (H₂O) salt, 115.2 parts at 0°, and 653.6 parts at 100°. At 100° C. the crystal lost 6 molecules of water, or 40.15 per cent., and if the remaining salt goes off at 250°, a temperature which lies close to that at which the salt begins to decompose. The anhydrous salt, when exposed to a red heat, breaks up into oxide, sulphur dioxide and oxygen. An example of the use of this salt is the formation of an emetic when the temperature is low. In the arts it is employed in the preparation of varnishes, and as a mordant for the production of colours on calico.

A green pigment known as Rösswitz’s green is prepared by mixing 100 parts of zinc vitriol with 2·5 parts of cobalt nitrate and heating the mixture to redness, to produce a compound of the two oxides.

Zinc sulphate, like magnesium sulphate, unites with the sulphates of many metals and of ammonium into crystalline double salts, ZnSO₄·R₂SO₄·6H₂O, isomorphous with one another and the magnesium salts.

**Zinc carbonate, ZnCO₃**, occurs in nature as the mineral calamine (q.v.), and has never been prepared artificially, basic carbonate 

$$\text{ZnCO}_3 \cdot \text{xZn(OH)}_2,$$ 

where x is variable, being obtained by precipitating a solution of the carbonate with zinc carbonate. To produce a product free from CaO, there must be an excess of alkali and the zinc salt must be poured into the hot solution of the carbonate. The precipitate, even after exhausting washing with hot water, still contains a trace of alkali; but from the oxide, precipitated from it in the cold, can be washed away. The basic carbonate is used as a pigment.

Of zinc phosphates we notice the minerals hopeite, Zn₃(PO₄)₂·4H₂O, and anykite, Zn₆(PO₄)₃(OH)₂·H₂O.

**Analysis.** From neutral solutions of its salts zinc is precipitated by sulphuretted hydrogen as sulphide, ZnS—a white precipitate, soluble, but by no means readily, in dilute mineral acids, but insoluble in hydrochloric acid. In the case of the acerate the precipitation is quite complete; from a sulphate or chloride solution the greater part of the metal goes into the precipitate; in the presence of a sufficient quantity of HCl the metal remains dissolved; sulphide of ammonium precipitates the metal completely, even in the presence of ammonium salts and free ammonia. The precipitate, when heated, passes into oxide, which is yellow in the heat and white after cooling; and thus zinc chloride solution, on igniting and re-heating, it exhibits a green colour after cooling.

Zinc may be qualitatively estimated by precipitating as basic carbonate, which is dried and ignited to zinc oxide. It may also be determined as basic carbonate, Zn₂(CO₃)₂, which is weighed on a filter tared at 100°. Volumetric methods have also been devised.

**Pharmacology and Therapeutics of Zinc Compounds**

Zinc chloride is a powerful caustic, and is prepared with plaster of Paris in the form of sticks for destroying warts, &c. Its use for this purpose at the present day is, however, very rare, the knife or galvanocautery being preferred in most cases. The salt is a positive tritant poison when taken internally. Its treatment is to wash out the stomach or give such an emetic as apomorphine, and, when the stomach has been emptied, to administer sickness powders. Such a salt as may be left on the hands in handling zinc dust or zinc salts, of used in medicine, are of value as containing this metal. Certain others are referred to in relation with the important radiance contained in the salt. Those treated here are the sulphate, oxide, carbonate, oleate and acetate. All these salts are mild astringents when applied externally, as they coagulate the albumen of the tissues and of any discharge which may be present. In virtue of their property they are also mild haemostatics, tending to coagulate the blood and thereby to arrest haemorrhage.

Lotito Rubra, the familiar “Red Lotus,” a solution of zinc sulphate, is widely used in many catarrhal inflammations, as of the ear, and is an important remedy for catarrhal inflammations.

These salts have been extensively employed internally, and indeed they are still largely employed in the treatment of the more severe and difficult cases of nervous disease. The sulphate is a very potent emetic in cases of poisoning, acting rapidly and without much nausea or depression. For these reasons it may also be given with advantage to children suffering from acute bronchitis or acute laryngitis.

**ZINCITE**, a mineral consisting of zinc oxide (ZnO), crystallizing in the hemimorphic-hemidrical class of the rhombohedral system. Distinct crystals are of rare occurrence; they have the form of a hexagonal pyramid terminated at one end only by a basal plane. There is a perfect cleavage parallel to the basal plane, and usually the mineral is found as platy foliated masses. The blood-red colour and the orange-yellow streak are characteristic features. The hardness is 4½, and the specific gravity is 4.5. Some manganese is usually present, replacing zinc. It is found in the zinc mines at Sterling Hill and Franklin Furnace in Sussex county, New Jersey, where it is associated with franklinite and willemite in crystalline limestone, and is mined as an ore of zinc. Artificial crystals of a white or yellowish colour are not infrequently formed by sublimation in zinc furnaces.
ZINDER, a town on the northern margin of the central Sudan. Zinder is a great emporium of the trade across the Sahara between the Hausa states of the south and the Tuareg countries and Tripoli in the north. Its ruler was formerly subordinate to Bornu, but with the decline of that kingdom shook off the yoke of the sultan, and on the conquest of that country by Rabah (q.v.) seems to have maintained his independence. The country of which Zinder is the capital is known as Damergu. It is semi-fertile, and supports considerable numbers of horses and sheep, besides troops of camels. By the Anglo-French agreement of June 1898 it was included in the French sphere, having already been the object of a French protectorate in 1882. By the armistice of 1920 Zinder was placed under the rule of France, and was reconstructed in 1897, but the town was occupied in July 1909, after a slight resistance, by Lieutenant Pallier of the reconstructed Voulet-Chanoine mission (see SENEGAL, country). A French post (named Fort Cazemajou) was built outside the town on a mound of huge granite blocks. Zinder was the first point in the Sudan reached by F. Foureau after his great journey across the Sahara via Air in 1899. Subsequently Commandant Gadel, from his headquarters at Zinder, mapped and pacified the surrounding region. Some of the huts of the nomads (camel-corps) which occupied the oasis of Air and Bilma in 1906. Zinder is a large and fine town surrounded with high earthen walls, very thick at the base and pierced with seven gates. Its houses, in part built of clay, in part of straw, are interspersed with trees. There is an important colony of Tuareg merchants, who occupy the suburb of Zengu, and who deal in a variety of wares, from cotton, silks, spices, ostrich feathers, &c., to French scent bottles. Salt is a great article of merchandise. A busy market is held outside one of the gates. Administratively Damergu is dependent on the French colony of Upper Senegal and Niger.

ZINGERLE, IGNAZ VICENZ (1825–1892), Austrian poet and scholar, was born, the son of the Roman Catholic theologian and orientalist, Pius Zingerle (1801–1881), at Meran on the 6th of June 1825. He began his studies at Trient, and entered for a while the Benedictine monastery at Marienberg. Abandoning the clerical profession, he returned to Innsbruck, where, in 1848, he became teacher in the gymnasium, and in 1859 professor of German language and literature at the university. He died at Innsbruck on the 17th of September 1892.

Zingerle is known as an author by his Zeitgedichte (Innsbruck, 1848); Von den Alpen (1850); Die Miihlerin, a village tale (1853); Der Bauer von Longval (1874); and Erzahlungen aus dem Burggrafenamt (1885). His ethnographical writings and literary studies, dealing especially with the Tirol, have, however, rendered him more famous. Among them may be mentioned his editions of König Laurin (1850), of the legend, Von den heyligen drei Königen (1855); Sagen von Tirol (1850, 2nd ed. 1861); Tirol. Natur, Geschichte und Sage im Spiegel deutscher Dichtung (1851); Die Personen- und Taufnamen Tirols (1853); Süden, Brüche und Meinungen der Tiroler-Volks (2nd ed. 1871); Das deutsche Landbuch und das Gesprächenbuch im Mittelalter (2nd ed. 1873); Schilderzieher im Tirol (1877, new series, 1888). With E. Inama-Sternegg, he edited Tirolische Weiszüisser (5 vols., 1875–1891).

ZINNIA, in botany, a genus of the natural order Compositae, containing about a dozen species of half-hardy annual or perennial herbs or undershrubs, natives of the southern United States and Mexico. The numerous single and double garden forms are mostly derived from Zinnia elegans, and grow about a ft. high, producing flowers of various colours, the double ones being about the size of asters, and very handsome. The colours include white, yellow, orange, scarlet, crimson and purple. Zinnias do best in a rich, deep loamy soil, in a sunny position. They should be sown on a gentle hothot at the end of March or in April and planted out early in June.

ZINZENDORF, NICOLAUS LUDWIG, COUNT OF ZINZENDORF AND POTTENDORF (1700–1750), German religious and social reformer, was born on the 26th of May 1700 at Dresden. His ancestors belonged to Lower Austria, but had taken the Protestant side in the Reformation struggle, and settled near Nuemberg. Both his parents belonged to the Pietist circle and the lad had Philipp Jakob Spener for his godfather. His father died six weeks after he was born. His mother married again when he was four years old, and he was educated under the charge of his pious and gifted grandmother, Catherine von Gersdorf, who did much to shape his character. His school days were spent at Halle amidst Pietist surroundings, and in 1716 he went to the university of Wittenberg, to study law and fit himself for a diplomatic career. Three years later he was appointed private secretariat to the German ambassador at Paris, where, he married the daughter of a German merchant, who made him the personal acquaintance of men distinguished for practical goodness and belonging to a variety of churches. On his return he visited the branches of his family settled at Oeberberg and at Castell. During a lengthened visit at Castell he fell in love with his cousin Theodora; but the widowed countess, her mother, objected to the marriage, and the lady afterwards became the wife of Count Henry of Reuss. Zinzendorf seems to have considered this disappointment to be a call to betake himself to some special work for God. He had made a reputation as a landowner and diplomatist, the latter by tract and book distribution and by practical benevolence. He might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence might have been a successful diplomatist, but by tract and book distribution and by practical benevolence.
satisfy the authorities that his religious community could be brought under the conditions of the peace of Augsburg; he had to quiet the suspicions of the Lutheran clergy; and, hardest of all, he had to rule in some fashion men made fanatical by persecution, who, in spite of his unwaried labours for them, on more than one occasion, it is said, combined, in his own house to denounce him as the Beast of the Apocalypse, with Rothe as the False Prophet. Patience had at last its perfect work, and gradually Zinzendorf was able to make his home into something like a militia Christi, based not on monastic but on family life. He was able to establish a common order of worship in 1727, and soon afterwards a common organization, which has been described in the article Moravian Brethren. Zinzendorf took the deepest interest in the wonderful missionary enterprises of the Brethren, and saw with delight the spread of this Protestant family order in Germany, Denmark, Russia and England. He travelled widely in its interests, visiting America in 1741–42 and spending a long time in London in 1750. Missionary work had by this time been settled in the West Indies (1732), in Greenland (1733), amongst the North American Indians (1735); and before Zinzendorf's death the Brethren had sent from Herrnhut missionary colonies to Livonia and the northern shores of the Baltic, to the slaves of North Carolina, to Surinam, to the Negro slaves in several parts of South America, to Trancanore in the East Indies, to the Copts in Egypt and to the west coast of South Africa. The community in Herrnhut, from which almost all these colonies had been sent out, had no money of its own, and its expenses had been almost exclusively furnished by Zinzendorf. His frequent journeys from home made it almost impossible for him to live on it; he was compelled from time to time to raise money by loans, and about 1750 was almost reduced to bankruptcy. This led to the establishment of a financial board among the Brethren, on a plan furnished by a lawyer, John Frederick Köber, which worked well. In 1752 Zinzendorf lost his only son, Christian Renatus, whom he had hoped to make his successor; and four years later he lost his wife Erdmude, who had been his counsellor and confidante in all his work. Zinzendorf remained a widower for one year, and then (June 1757) contracted a second marriage with Anna Nitschmann, on the ground that a man in his official position ought to be married. Three years later, overcome with his labours, he fell ill and died (on the 9th of May 1760), leaving John de Wattlewille, who had married his eldest daughter Benigna, to take his place at the head of the community.

Zinzendorf had a naturally alert and active mind, and an enthusiastic temperament that made his life one of ceaseless planning and executing. Like Luther, he was often carried away by strong and vehement feelings, and he was easily upset both by sorrow and joy. He was an eager seeker after truth, and could not understand men who at all costs kept to the opinions they had once formed; yet he had an exceptional talent for talking on religious subjects even with those who differed from him. Few men have been more solicitous for the happiness and comfort of others, in little things. His activity and varied gifts sometimes landed him in oddities and contradictions that not infrequently looked like equivocation and dissimulation, and the courtly training of his youth made him susceptible about his authority even when no one disputed it. He was a natural orator, and though his dress was simple his personal appearance gave an impression of distinction and weight. His projects were of a grander kind, and in 1736 he was even banished from Saxony, but in 1749 the government rescinded the decree and begged him to establish within its jurisdiction more settlements like that at Herrnhut.

He wrote a large number of hymns, of which the best known are: 'Jesus, Thy blood and righteousness,' and 'Jesus, still lead on.' A selection of his Sermons was published by G. Clemens in 10 vols., his Diary (1716–1719) by G. Reichel and J. Th. Müller (Herrnhut, 1800), and his Hymns, ec., by H. Bauer and G. Burkhardt (Leipzig, 1800).

**ZION, or Zion (Heb. גָּפֶּ֣ר, perhaps from גָּפֶּ֣י to be dry, גָּפֶּ֣י to set up, or גָּפֶּ֣י to protect); Arabic analogies favour the meaning 'hump,' 'summit of a ridge,' and so ['citadel'], the name of the Jebusite stronghold at Jerusalem captured by David (2 Sam. v.). Zion (which is synonymous with the Ophel) is properly the southern part of the eastern hill on the top of which was built the temple, so that the name came to be given to the whole hill (2 Kings xix. 31, Isaiah xxiv. 23 and throughout 1 Maccabees), to all Jerusalem (Isaiah i. 27, c. iv. and even to the nation or its spiritual nucleus. Thus the people of Jerusalem are spoken of as the 'daughter of Zion' (Isaiah i. 8), the name being often personified and idealized, especially in Isaiah ii., and in the Psalm, e.g. Ps. lxxxvii. 5, "Every one calls Zion his mother."

See G. A. Smith, Jerusalem (London, 1898).

**ZIONISM.** One of the most interesting results of the anti-Semitic agitation (see Anti-Semitism) has been a strong revival of the national spirit among the Jews in a political form. To this movement the name Zionism has been given. In the same way that anti-Semitism differs from the Jew-hatred of the early and middle ages, Zionism differs from previous manifestations of the Jewish national spirit. It was originally advocated as an experiment, without the object of permanent political proposals, and has remained almost harshly modern. None the less it is the lineal heir of the attachment to Zion which led the Babylonian exiles under Zerubbabel to rebuild the Temple, and which flamed up in the heroic struggle of the Maccabees against Antiochus Epiphanes. Without this national spirit it could, indeed, never have assumed its present formidable proportions. The idea that it is a set-back of Jewish history, in the sense that it is an unnatural galvanization of hopes long since abandoned for a spiritual and cosmopolitan conception of the mission of Israel, is a controversial fiction. The consciousness of a spiritual mission exists side by side with the national idea. The great bulk of the Jewish people have throughout their history remained faithful to the dream of a restoration of their national life in Judaea. Its manifestations have suffered temporary modifications under the influence of changing political conditions, and the intensity with which it has been held by individual Jews has varied according to their social circumstances, but in the main the idea has been passionately clung to.

The contention of some modern rabbis that the national idea is Messianic, and hence that its realization should be left to the Divine initiative (e.g. Chief Rabbi Adler, Jewish Chronicle, 25th November 1898), is based on a false analogy between the politics of the Jews and those of other oppressed nationalities. As all Hebrew politics were theocratic, the national hope was necessarily Messianic. It was not on that account less practical or less disposed to express itself in an active political form. The Messianic dreams of the Prophets, which form the framework of the Jewish liturgy to this day, were essentially political-national. They contemplated the redemption of Israel, the gathering of the people in Palestine, the restoration of the Jewish state, the rebuilding of the Temple, and the establishment of the Davidic throne in Jerusalem with a prince of the House of David. How little the dispersed Jews regarded this essentially political programme as a mere religious ideal is shown by their attitude towards the pseudo-Messiahs who endeavoured to fulfil it. Bar Cochba (A.D. 117–138) lived at a period when a Jewish national uprising might well have been exclusively political, for the dissolution of the kingdom was

---

1. Christians of the 4th century removed the name to the S.W. hill, and this tradition has persisted until modern times, when archaeological and topographical evidence has re-identified Zion with the S. hill.
scarcely half a century old, and Palestine still had a large Jewish population. None the less Bar Cochba based his right to lead the Jewish revolt on Messianic claims, and throughout the Roman Empire the Jews responded with enthusiasm to his call. Three centuries later Moses of Crete attempted to repeat Bar Cochba's experiment, with the same results. In the 8th century, when the Jews of the West were sufficiently remote from the days of their political independence to have developed an exclusively spiritual conception of their national identity, the Messianic claims of a Syrian Jew named Serene shook the whole of Jewry, and even among the Jews of Spain, Abba played the part of the Saviour in the hands of Providence. It was the same with another pseudo-Messiah named Abu-Isa Obadiah, who unfurled the national banner in Persia some thirty years later.

During the middle ages, though the racial character of the Jews was being transformed by their Ghetto seclusion, the national yearning suffered no relaxation. If it expressed itself exclusively in literature, it was not on that account undergoing a process of idealization. (Cf. Abraham's Jewish Life in the Middle Ages, pp. 24-25.) The truth is that it could not have expressed itself differently. There could have been no abandonment of national hopes in a practical sense, unless the prospect of entering the national life of the peoples among whom they dwelt had presented itself as an alternative. Of this there was not the remotest sign. The absence of militant Zionism during this period is to be accounted for partly by the want of conspicuous pseudo-Messiahs, and partly by the terror of persecution. Unlike the modern Greeks, the medieval Jews could expect no sympathy from their neighbours in an agitation for the recovery of their country. One may imagine what the Crusaders would have thought of an international Jewish conspiracy to recapture Jerusalem. In the 15th century the aversion from political action, even had it been possible, must have been strengthened by the fact that the Grand Signor was the only friend Jews had in the world. The national spirit of the medieval Jews is sufficiently reflected in their liturgy, and especially in the works of the poet, Jehuda Halevi. It is impossible to read his beautiful Ziamide without feeling that had he lived another twenty years he would have gladly played towards the pseudo-Messiah David Alroy (circa 1160) that part that Abraham Bar Kochba played.

The strength of the national feeling was practically tested in the 16th century, when a Jewish impostor, David Reuben (circa 1530), and his disciple, Solomon Molcho (1501-1532), came forward as would-be liberators of their people. Throughout Spain, Italy and Turkey they were received with enthusiasm by the bulk of their brethren. In the following century the influence of the Christian Millenarians gave a fresh impulse to the national idea. Owing to the frenzy of persecution and the apocalyptic teachings of the Chilists, it now appeared in a more mystical form, but a practical bias was not wanting. Menasseh ben Israel (1604-1657) co-operated with English Millenarians to procure the resettlement of the Jews in England as a preliminary to their national return to Palestine, and he regarded his marriage with a scion of the Davidec family of Aharbanel as justifying the hope that the new Messiah might be found among his offspring. The increasing dispersion of the Marranos or crypto-Jews of Spain and Portugal through the Inquisition, and the persecution of the Jews in Poland, deepened the Jewish sense of homelessness the while the Millenarians encouraged their Zionist dreams. The Hebraic and Judeophobe tendencies of the Puritan revolution in England still further stirred the prevailing unrest, and some Jewish rabbis are said to have visited England in order to ascertain by genealogical investigations whether a Davidec descent could be ascribed to Oliver Cromwell. It only wanted a leader to produce a national movement on a formidable scale. In 1666 this leader presented himself at Smyrna, in the person of a Jew named Sabbatai Zevi (1626-1676), who proclaimed himself the Messiah. The news spread like wildfire, and despite the opposition of some of the leading rabbis, the Jews everywhere prepared for the journey to Palestine. Not alone was this the case with the poor Jews of Lithuania and Germany, but also with well-to-do communities like those of Venice, Leghorn and Avignon, and with the great Jewish merchants and bankers of Hamburg, Amsterdam and London. Throughout Europe the nationalist excitement was intense. Even the downfall and apostasy of Sabbatai were powerless to stop it. Among the wealthier Jews it partially subsided, but the great bulk of the people refused for a whole century to be disillusioned. A Messianic frenzy seized upon them. Encouraged on the one hand by Christian Millenarians as the work of Messiah, Ogier Faust and Johannes Speeck, pandered to by Sabbatai himself in his capacity of Messiah, and on the other hand by such Gentiles as Menachem of Eisenstadt, Jacob Querido, Judah Chassid, Nehemiah Chayon and Jacob Franks, and maddened by fresh oppressions, they became fanaticized to the verge of demoralization.

The reaction arrived in 1778 in the shape of the Mendelssohbian movement. The growth of religious toleration, the attempted emancipation of the English Jews in 1753, and the same Judeophilism of men like Lessing and Dohm, showed that at length the dawn of the only possible alternative to nationalism was at hand. Moses Mendelssohn (1729-1786) sought to present his brethren to the new liberal and rationalistic lands in which they dwelt, by emphasizing the spiritual side of Judaism and the necessity of Occidental culture. His efforts were successful. The narrow nationalist spirit everywhere yielded before the hope or the progress of local political emancipation. In 1866 the Jewish Sanhedrin convened by Napoleon virtually repudiated the nationalist tradition. The new Judaism, however, had not entirely destroyed it. It had only reconstructed it on a wider and more sober foundation. Mendelssohbian culture, by promoting the study of Jewish history, gave a fresh impulse to the racial consciousness of the Jews. The older nationalism had been founded on traditions so remote as to be almost mythical; the new race consciousness was fed by a glorious martyr history, which ran side by side with the histories of the newly adopted nationalities of the Jews, and was not unworthy of the companionship. From this race consciousness came a fresh interest in the Holy Land. It was an ideal rather than a politico-nationalist interest—a desire to preserve and cherish the great monument of the departed national glories. It took the practical form of projects for improving the circumstances of the Jews in the lands in which they dwelt, and for reviving something of the old social condition of Judea by the establishment of agricultural colonies. In this work Sir Moses Montefiore, the Rothschild family, and the Alliance Israélite Universelle were conspicuous. More or less passively, however, the older nationalism still lived on—especially in lands where Jews were persecuted—and it became strengthened by the revived race consciousness and the new interest in the Holy Land. Christian Millenarians also helped to keep it alive. Lord Ashley, afterwards Lord Shaftesbury, Colonel Gawler, Mr Walter Cresson, the United States consul at Jerusalem, Mr James Finn, the British consul, Mr Laurence Oliphant and many others organized and supported schemes for the benefit of the Jews of the Holy Land on avowedly Restoration grounds. Another vivifying element was the reopening of the Eastern Question and the championship of oppressed nationalities in the East by the Western Powers. In English political writers were found to urge the re-establishment of a Jewish state under British protection as a means of assuring the overland route to India (Hollingsworth, Jews in Palestine, 1852). Lord Palmerston was not unaffected by this idea (Finn, Zion, Times, vol. i. pp. 150-152), and both Lord Beaconsfield and Lord Salisbury supported Mr Laurence Oliphant in his negotiations with the Porte for a concession which was to pave the way to an autonomous Jewish state in the Holy Land. In 1854 a London Jew attempted to float a company "for the purpose of enabling the descendants of Israel to obtain and cultivate the Land of Promise" (Hebrew Observer, 12th April). In 1876 the publication of George Eliot's Daniel Deronda gave to the Jewish nationalist spirit the strongest stimulus it had experienced since the appearance of Sabbatai Zevi.
It was not, however, until the spread of anti-Semitic doctrines through Europe made men doubt whether the Mendelssohnian denationalization of Judaism possessed the elements of permanency that the Jewish national spirit reasserted itself in a practical form. As long as the anti-Semites were merely polemical, the nationalists were mute, but when in Russia their agitation took the form of massacres and spoliation, followed by legislation of medical harassment, the nationalist remonstrated, and acted for itself. In 1882 several pamphlets were published by Jews in Russia, advocating the restoration of the Jewish state. They found a powerful echo in the United States, where a young Jewish poetess, Miss Emma Lazarus, passionately championed the Zionist cause in verse not unworthy of Jehuda Halevi. But the movement did not limit itself to literature. A society, "Chovevi Zion," was formed with the object of so extending and methodizing the establishment of agricultural colonies in Palestine as to make the eventual acquisition of the country by the Jews possible. From the beginning it was a great direct appeal to their "tengu"; as they were illiterate, it was established all over the world. At the same time two other great schemes for rescuing the Jewish people from oppression were brought before the public. Neither was Zionist, but both served to encourage the Zionist cause. One was due to the initiative of Mr. Cazalet, a financier who was interested in the Euphrates Valley Railway project. With the assistance of Mr. Laurence Oliphant he proposed that the concession from the Porte should include a band of territory two miles wide on each side of the railway, on which Jewish refugees from Russia should be settled. Unfortunately the scheme failed. The other was the "Herzl's Colonial Scheme" from Hirsch, Mauricé de (see HIRSCH, MAURICE DE). This was neither political nor Zionist, but it was supported by a good many members of the "Chovevi Zion," among them Colonel Goldsmit, on the ground that it might result in the training of a large class of Jewish yeomen who might be invaluable in the ultimate settlement of Palestine. (Interview in Daily Graphic, 10th March 1892.)

None of these projects, however, proved sufficiently inspiring to attract the great mass of Jewish nationalists. The Chovevi Zion was too timid and prosaic; the Hirsch scheme did not do anything to impress the masses; but Herzl's scheme was strikingly change manifested itself. A new Zionist leader arose in the person of a Viennese journalist and playwright, Dr. Theodore Herzl (1860-1904). The electoral successes of the anti-Semites in Vienna and Lower Austria in 1895 had impressed him with the belief that the Jews were unassimilable in Europe, and that the time was not far distant when they would be once more submitted to civil and political disabilities. The Hirsch scheme did not, in his view, provide a remedy, as it only transplanted the Jews from one uncongenial environment to another. He came to the conclusion that the only solution of the problem was the segregation of the Jews under autonomous political conditions. His first scheme was not essentially Zionist. He merely called for a new exodus, and was ready to accept any grant of land in any part of the world that would secure to the Jews some form of self-government. The idea was not new. In 1566 Don Joseph Nasi had proposed an autonomous settlement of Jews at Tiberias, and had obtained a grant of the city from the Sultan for the purpose. In 1652 the Dutch West India Company in Curacao, in 1654 Oliver Cromwell in Surinam, and in 1659 the French West India Company at Cayenne had attempted similar enterprises. Marshal de Saxe in 1749 had projected the establishment of a Jewish kingdom in South America, of which he should be sovereign; and in 1825 Major M. M. Noah purchased Grand Island, in the river Niagara, with a view to founding upon it a Jewish state. All these projects were failures. Dr. Herzl was not slow to perceive that without an impulse of real enthusiasm his scheme would share the fate of these predecessors. He accordingly resolved to identify it with the nationalist idea. His plan was set forth in a pamphlet, entitled The Jewish State, which was published in German, French and English in the spring of 1896. It explained in detail how the new exodus was to be organized and how the state was to be managed. It was to be a tribute-paying state under the suzerainty of the Sultan. It was to be settled by a chartered company and governed by an aristocratic republic, tolerant of all religious differences. The Holy Places were to be extinguitorialized. The pamphlet produced a profound sensation. Dr. Herzl was joined by a number of distinguished Jewish literary men, among whom were Dr. Max Nordau and Mr. Israel Zangwill, and promises of support and sympathy reached him from all quarters of the world. The haute finance and the higher rabbinates, however, stood aloof.

The most encouraging feature in Dr. Herzl's scheme was that the Sultan of Turkey appeared favourable to it. The motive of his sympathy has not hitherto been made known. The Armenian massacres had inflamed the whole of Europe against him, and for a time the Ottoman Empire was in very serious peril. Dr. Herzl's scheme provided him, as he imagined, with a means of securing powerful friends. Through a secret emissary, the Chevalier de Newinsky, whom he sent to London in May 1896, he offered to present the Jews a charter in Palestine provided they used their influence in the press and otherwise to solve the Armenian question on lines which he laid down. The English Jews declined these proposals, and refused to treat in any way with the persecutor of the Armenians. When, in the following July, Dr. Herzl himself came to London, the Maccabeean Society, though ignorant of the negotiations with the Sultan, declined to support the scheme. None the less, it secured a large amount of popular support throughout Europe, and in 1910 Zionism had a following of over 300,000 Jews, divided into a thousand electoral districts. The English membership of the movement was about 30,000. Between 1897 and 1910 the Zionist organization held nine international congresses. At the first, which met at Basel, a political programme was adopted on the following terms:

"Zionism aims at establishing for the Jewish people a publicly and legally assured home in Palestine. For the attainment of this purpose the Congress considers the following means serviceable: (1) The promotion of Jewish immigration to Palestine. (2) The promotion of the Jewish in Palestine. (3) The federation of all Jews into local or general groups, according to the laws of the various countries. (4) The strengthening of the Jewish feeling and consciousness. (5) The appointment of the representatives of the states for the attainment of those governmental grants which are necessary to the achievement of the Zionist purpose."

Subsequent congresses founded various institutions for the promotion of this programme, notably a People's Bank known as the Colonial Trust, which is the financial instrument of political Zionism, a National Fund for the purchase of land in Palestine and a Palestine Commission with subsidiary societies for the study and improvement of the social and economic condition of the Jews in the Holy Land. For the purposes of these bodies about £400,000 was collected in small sums and invested. Very little practical work of any abiding value, however, was accomplished, and on the political side the career of Zionism had up to the end of 1910 proved a failure.

In May 1901 and August 1902 Dr. Herzl had audiences of the Sultan Abdul Hamid, and was received with great distinction, but the negotiations led to nothing. Despairing of obtaining an immediate charter for Palestine, he turned to the British government with a view to securing a grant of territory on an autonomous basis in the vicinity of the Holy Land, which would provisionally afford a refuge and a political training-ground for persecuted Jews. His overtures met with a sympathetic reception, especially from Mr. Chamberlain, then Colonial Secretary, and Earl Percy, who was Under-Secretary for Foreign Affairs (October 1902). At first a site for the proposed settlement was suggested in the Sinai peninsula, but owing to the waterless character of the country the project had to be abandoned. Then Mr. Chamberlain, who in the interval had paid a visit to Africa, suggested the salubrious and uninhabited highlands of the East Africa Protectorate, and in 1903 the British government formally offered Dr. Herzl the Ras Gishiu plateau, 6,000 sq. m. in area. No such opportunity for creating a Jewish self-governing community had presented itself since
the Dispersion, and for a moment it seemed as if Zionism were really entering the field of practical politics. Unhappily it only led to bitter controversies, which nearly wrecked the whole movement. The British offer was submitted to the Sixth Congress, which assembled at Basel in August 1903. It was received with consternation and an explosion of wrath by the ultra-nationalist, who interpreted it as an abandonment of the Palestine idea. By his personal influence Dr Herzl succeeded in obtaining the appointment of a commission to examine the proposed territory, but its composition was largely nationalist, and in the following year the Congress gladly availed itself of certain critical passages in the report to reject the whole scheme.

Meanwhile Zionism had suffered an irreparable blow by the death of Dr Herzl (1904). He was succeeded by Mr David Wolffsohn, a banker of Cologne, but there was in truth nobody who in ability and personal dignity and magnetism could take his place. The movement was further shaken by the dissensions which followed the rejection of the East African project. Mr Israel Zangwill led an influential minority which combined with certain non-Zionist elements to found a rival organization under the title of the TTO (Terra Territorial Organisatie), with a view to taking over the East African offer or to establish an autonomous place of refuge elsewhere. Thus freed from all moderating elements the Zionists hardened into an exclusively Palestinian body, and under the auspices of Mr Wolffsohn fresh negotiations were opened with the Porte. These, however, were rendered finally hopeless by the Turkish revolution, which postulated a united Ottoman nationality, and resolutely set its face against any extension of the racial and religious autonomies under which the integrity of the Empire had already severely suffered.

During 1905-1910 the Jewish national idea, for all practical purposes, was in a state of suspended animation. The recovery of the Holy Land appeared more distant than ever, while even the establishment of an independent or autonomous Jewish state elsewhere, for which the ITO was labouring, had encountered unexpected difficulties. On the rejection of the British offer by the Zionists Mr Zangwill approached the Colonial Office, but he was too late, as the reserve on the Nasi Gishiu plateau had already been officially withdrawn. The ITO then turned its attention to Cyrenaica, and an expedition to examine the country was sent out (1908), but it was not found suitable. A project for combining all the Jewish organizations in an effort to secure an adequate foothold in Mesopotamia in connection with the scheme for the irrigation of that region was subsequently proposed by Mr Zangwill, but up to January 1911 it had not been found practicable. The ITO, however, did valuable work by organizing an Emigration Regulation Department for deflecting the stream of Jewish emigration from the overcrowded Jewry of New York to the Southern states of the American Union, where there is greater scope for employment under wholesome conditions. For this purpose a fund was formed, to which Mr Jacob Schiff contributed £100,000 and Messrs Rothschild £20,000.

Although the Zionist organization was numerically strong—indeed, the strongest popular movement Jewish history had ever known—its experience from 1897 to 1910 rendered it very doubtful whether its nationalist aspirations could, humanly speaking, ever be fulfilled. From Turkey, either absolutist or democratic, it appeared hopeless to expect any willing relaxation of the Ottoman hold on Palestine, while in the event of a disintegration of the Empire it was questionable whether Christendom—and especially the Roman and Greek Churches—would permit the Holy Land to pass to the Jews, even though the Holy Places were exterminialized. Should these obstacles be overcome, still more formidable difficulties would await the Jewish state. The chief of these is the religious question. The state would have to be orthodox or secular. If it were orthodox it would desire to revive the whole Levitical polity, and in these circumstances it would either pass away through internal chaos or would so offend the modern political spirit that it would be soon extinguished from outside. If it were secular it would not be a Jewish state. The great bulk of its supporters would refuse to live in it, and it would ultimately be abandoned to an outlawed population consisting of Hebrew Christians and Christian Millennials.

Modern Zionism is vitiated by its erroneous premises. It is based on the idea that anti-Semitism is unconquerable, and thus the whole movement is artificial. Under the influence of religious toleration and the naturalization laws, nationalities are daily losing more of their racial character. The coming nationality will be essentially a matter of education and economics, and this will not exclude the Jews as such. With the passing away of anti-Semitism, Jewish nationalism will disappear. If the Jewish people disappear with it, it will only be because either their religious mission in the world has been accomplished or they have proved themselves unworthy of it.

LITERATURE.—A Zionist bibliography has been published by the Federation of American Zionists. Besides the works already cited in the body of this article, see on the early nationalist movement Greenstein, Geschichte der Juden, under the heads of the various pseudo-Messiahs and their adherents. Jewish agricultural colonies will be found discussed very fully in The Jewish Encyclopedia, vol. 1, pp. 240-242. For early Zionist projects see Publications of the American Jewish Historical Society, No. 8, pp. 75-118; Laurence Oliphant, Land of Gilead; Mr Oliphant, Life of Laurence Oliphant, pp. 168 et seq. The Zionist movement since 1895 is fully recorded in its official organ, Die Welt (Vienna). For proceedings of the Congresses see the Official Protocols published for each year by the society "Erez Israel" of Vienna; also Herzl, Der Basler Congress (Vienna, 1897). On the movement generally, see Herzl's Zionistische Schriften, edited by Dr Leon Kellner: Ten Years of Zionism (Cologne, 1907); Nordau, Zionism, its History and its Aims (London, 1905); J. de Haas, Zionism, Jewish Needs and Jewish Ideals; also articles by I. Zangwill in Cosmopolis (October 1897), Contemporary Review (October 1899) and Forimbus Review (April 1910); Dr Gaster in Asiatic Quarterly Review (October 1907); H. Bentwich in Nineteenth Century (October 1897), and Forimbus Review (December 1898); Reich in Nineteenth Century (August 1897); Lucien Wolf in Jewish Quarterly Review (October 1904: "The Zionist Peril"). On the ITO see pamphlets and leaflets published by the Jewish Territorial Organization; also the Report of the Commission on Cyrenaica (London, 1905). (L. W.)

ZIRCON, a mineral composed of zirconium silicate, sometimes used as a gem-stone. It is believed that the name comes from the Arabic zarqun, and is essentially the same as "jargon", the name formerly used. The mineral crystallizes in the tetragonal system, generally in combinations of square prisms and square pyramids, as in figs. 1 and 2. Zircon is isomorphous with cassiterite and rutile, and like them may occur in geniculated twins. There is no distinct cleavage, and the mineral breaks with a conchoidal fracture. The hardness is about 7.5. It is notable that the specific gravity is very wide range, extending from a little below 4 to rather more than 4.7, and being thus greater than that of any other gem-stone. Rarely colourless, zircon is usually brown or red, sometimes orange, yellow or green, and occasionally parti-coloured or zoned. Whilst common zircon is opaque, the gem-varieties are transparent. The dichroism of coloured zirconos is always feeble; the double refraction usually strong and of positive sign; and the optical properties of some zircons suggest a biaxial mineral. It was pointed out long ago by Sir A. H. Church that many transparent zircons afford a spectrum

![Fig. 1](image1)

![Fig. 2](image2)
marked by certain absorption-bands, a property perhaps due to the presence of uranium. The effect of heat on zircon is remarkable. Most coloured zircons, exposed to a high temperature, either change or lose their colour, but this loss is attended by a gain in brilliancy. The "Matura diamonds" of Ceylon are zircons which have been thus artificially decolorized. Certain zircons when heated in a crucible and ground in a glass mortar may lose their colour, others may emit an orange glow when ground on a copper wheel fed with diamond-dust. Even exposure to sunlight will sometimes modify the colour and lustre of a zircon. Some zircons suffer contraction when heated, so that the specific gravity becomes raised; but the behaviour of zircons in this respect shows such anomalies that S. Stevanov has been led to suggest the existence of three classes of zircon. One group has a specific gravity of 4-0 and another of 4-7, both remaining unchanged in density when heated. L. J. Spencer, who has studied some remarkable crystals from Ceylon, describes the former as zircon, and the latter as zircon. A third class has specific gravity between 4-0 and 4-7, and increases in density on heating. These stones consist, according to Spencer, of an intergrowth of α-zircon or β-zircon, with a third unstable modification which he designates as γ-zircon.

Whilst zircon is usually regarded as a zirconium silicate, ZrSiO₄, it is sometimes placed with the oxides as consisting of ZrO₂SiO₃. A small proportion of ferric oxide seems to be always present, and to this the colour of zircon, according to G. Spezia, may be due. Traditionally so many minerals have been called zircons that it was at one time proposed to call the species polycrasite from the Greek πολυς (many) and κρασις (mixture). Zircon is used as a source of zirconia in various preparations, for incandescent gas mantles, &c. It was in this mineral that zirconia was originally discovered by M. H. Klaproth in 1789.

Zircon fit for use as a gem-stone is often known as "noble" or "precious zircon." The red and orange stones are termed hyacinth (g.) and jaclin, whilst those of other colours, as also the colourless transparent zircons, are called jargoon (g.). The lustrousness of the most precious zircons is a most unusual property, and they have been known to change to a dark brown when held near a fire. Zircon is readily attacked by water at a dull heated point and quenched in water to render it brittle, and then reduced to a fine powder, which is fused with three to four parts of acid potassium fluoride in a platinum crucible. When the mass is quite fusing, the liquid is poured out and is boiled, and then again fused; the porcelain-like melt is powdered, boiled with water, and acidified with hydrofluoric acid, and the residual potassium fluorosilicate is converted into potassium silicate. The remaining zirconium fluoride, K₂ZrF₆, is purified by crystallization from hot water. The double fluoride is decomposed with hot concentrated sulphuric acid; the mixed sulphate is dissolved in water; the anhydrous fluoride is precipitated, being difficult to wash, is (after a preliminary washing) re-dissolved in hydrochloric acid and re-precipitated with ammonia. Zirconium hydroxide, Zr(OH)₄, as thus obtained, is quite appreciably soluble in water and easily in mineral acids, with formation of zirconium salts, e.g. ZrCl₄. But, if the hydroxide is precipitated in the heat, it demands concentrated acids for its solution. The anhydrous fluoride is readily attacked by water at a dull heated point, gives the anhydride with vivid incandescence. Zirconia can be obtained crystalline, in a form isomorphous with cassiterite and rutile, by fusing the amorphous modification with borax, and dissolving out the borate, then treating the hydrated zirconium fluoride. The anhydrous oxide is with difficulty soluble even in hydrofluoric acid; but a mixture of two parts of concentrated sulphuric acid and one of water dissolves it on continued heating as the sulphate, ZrSO₄. Zirconia, when heated to whiteness, remains fusible, and radiates a fine white light, which suggested its utilization for making incandescent gas mantles; and, in the form of disks, as a substitute for the lime-cylinders ordinarily used in the manufacture of metal dust. Zirconia, being insoluble in all organic acids, unites not only with acids but also with basic oxides. For instance, if it be fused with sodium carbonate, sodium zirconate, Na₂ZrO₄, is formed. If the carbonate be in excess, the salt Na₂ZrO₄·Na₂CO₃ (which was formerly called zirkon) is obtained, in which crystals in hexagonal plates. When heated in a loosely covered crucible with magnesia the nitride ZrN₄ is formed. Zirconium hydroxide, Zr(OH)₄, is supposed to be formed when zirconia is heated with magnesium in an atmosphere of hydrogen. Zirconium fluoride, ZrF₄, is obtained as glittering monoclinic plates (with 3H₂O) by heating zirconia with acid ammonium fluoride. It forms double salts, namely zircono-fluorides, which are isomorphous with the stannni- and titanii-fluorides. Zirconium chloride, ZrCl₄, is prepared as a white sublimate by igniting a mixture of zirconia and charcoal in a current of chlorine. It has the exact vapour-density corresponding to the formula. It dissolves in water with evolution of heat; on evaporation a basic salt, ZrOCl₂·8H₂O, separates out in the slightest acid but remains almost unaffected when converted similarly to the chloride. Water gives the oxobromide ZrOBr₂. Zirconium iodide, ZrI₄, was obtained as a yellow, microcrystalline solid on acting with hydroiodic acid on heated zirconium (Wedekind, Berlin, 1904, 37, p. 1135). It fuses with water; with water it gives ZrO₂H₂O·H₂O; and with alcohol ethyl iodide and zirconium hydroxide are formed. The iodide combines with liquid ammonia to form ZrI₄·8NH₃, and with ethylamine to give Zr(OC₂H₅)₄. Zirconium combines with sulphur to form a sulphide, and with carbon to form several carbides. The sulphate, Zr(SO₄)₂, is a white mass obtained by dissolving the oxide or hydroxide in sulphuric acid, evaporating the solution and drying the mass. In water it forms a series of double sulphates, Ruer (Zeit, anorg. Chem., 1904, 42, p. 87) regards it as a dibasic acid, Zr₂SO₄·2H₂O, and that the crystalline sulphate is Zr₂SO₄·5H₂O. The type Zr₂(SO₄)₂·5H₂O, where M = K, Rb, Cs, and n = 8 for K, 15 for Rb, and 11 for Cs (Rosenheim and Frank, Berlin, 1905, 38, p. 812). The atomic weight was determined by Mangac to be 107-93; Bailey (Proc. Roy. Soc., 1890, 45, p. 74) deduced the value 89-95.
ZIRKEL, FERDINAND (1838– ), German geologist and petrographer, was born at Bonn on the 20th of May 1838. He was educated in his native town, and graduated Ph.D. at the university in 1861. In early years he was engaged in teaching geology and mineralogy in Vienna. He became professor of geology in 1865 in the university of Lemberg, in 1868 at Kiel, and in 1870 professor of mineralogy and geology in the university of Leipzig.

His numerous papers and essays include Geologische Skizze von der Westhste Schollands (1871); Die Struktur der Varolite (1875); Microscopical Petrography. Monograph of U.S. Geological Survey of 40th Par., vol. vi., 1876; Limnuris aus der Vallee de Lepont (1879); Über den Zittern (1880). His separate works include Lehrbuch der Petrographie (1886; 2nd ed. 1893, 1894); Die mikroskopische Beschaffenheit der Mineralien und Geoleine (1873).

ZITHER (Ger. Zither, Schlachtsieber, Streichsieber; Ital. cithara), a name applied in modern Germany to the ancient cithara (q.v.), to the cittern (q.v.), and to an instrument which is a kind of psaltery, consisting of a shallow sound-chest with ribs having the outline of a flattened jug (termed in German Flaschenform, bottle-shaped). In the centre of the sound-board is a rose sound-hole, and the finger-board, with frets lies along the straight side of the zither in front of the performer. The number of the strings varies, but 36, 38 and 42 are the most usual. Over the finger-board are four or five strings known as violin, on which the melody is played. These five melody strings are stopped with the thumb and fingers of the left hand and plucked with the thumb of the right hand, which usually has a thumb ring with plectrum. Nos. 1 and 2 are steel strings; No. 3 of brass, and 4 and 5 of spun wire; the bass is played with the fingers of the right hand, and in order to facilitate the fingering the strings are tuned in fourths and fifths.

Most of the other strings from the 6th are of gut. All the strings lie horizontally across the sound-board, being fastened in the usual manner to hitch and wrest pins. The zither is placed on the table in front of the performer, who holds his right arm so that the wrist rests on the side of the zither parallel with the hitch pins, the thumb being over the finger-board.

The foregoing remarks apply to the discant and concert zither; the elegiæ or bass zither is of similar construction but larger, and is a transposing instrument, having the same notation as the former. The real sounds being a fourth lower. These zithers are the favourite instruments of the peasants in the Swiss and Bavarian highlands, and are sometimes seen in the concert halls of north and western Germany. The discant or a bowed zither, has a body of heart- or pear-shape similar to that of the cittern, but without the long neck of the latter. The finger-board covers the whole of the sound-board with the exception of a few inches at the tapering end, which is finished off with a raised nut or bridge, the bow being applied in the centre of this gap. The bowed zither has little feet and is placed on a table when being played. There are four strings corresponding to those of the violin or viola, but the tone is nasal and glassy.

The spelling of the word with a "Z" had already become usual in the early 17th century, for, although the instrument described above did not then exist, Zither was the name by which the cittern was known in Germany, and Michael Praetorius, writing in 1618, spells it both with "C" and "Z."

ZITTEL, KARL ALFRED VON (1839-1904), German palaeontologist, was born at Balinghen in Baden on the 25th of September 1839. He was educated at Heidelberg, Paris and Vienna. For a short period he served on the Geological Survey of Austria, and as assistant in the mineralogical museum at Vienna. In 1863 he became teacher of geology and mineralogy in the polytechnic at Carlshue, and three years later he succeeded Oppel as professor of palaeontology in the university of Munich, with the charge of the state collection of fossils. In 1880 he was appointed to the geological professorship, and eventually to the directorship of the national history museum of Munich. His earlier work comprised a monograph on the Cretaceous bivalve mollusca of Gosau (1863-66); and an essay on the Tithonian stage (1870), regarded as equivalent to the Purbeck and Wealden formations. In 1873-74 he accompanied the Rohils expedition to the Libyan desert, the primary results of which were published in Über den geologischen Bau der libyschen Wüste (1880), and further details in the Palaeonotographica, where he published the palaeontological researches. From 1869 until the close of his life he was chief editor of the Palaeonotographica (founded in 1826 by W. Dunker and H. von Meyer). In 1876 he commenced the publication of his great work, Handbuch der Palaeontologie, which was completed in 1893 in five volumes, the fifth volume on palaeobotany being prepared by W. P. Schimper and A. Schenk. To make his work as trustworthy as possible Dr Zittel made special studies of each great group, commencing with the fossil sponges, on which he published a monograph (1877-79). In 1891 he issued a summary of his work entitled Grundzüge der Palaeontologie (ed. 2, part 1, Invertebrata, revised by Dr Zittel in 1903; the American edition of 1900 by C. R. Eastman is so revised, sometimes in opposition to Zittel's views, as to be practically an independent work). He was author of Aus der Urzeit (1873, ed. 2, 1875); and Die Sahara (1883). In 1890 he published Geschichte der Geologie und Palaeontologie bis Ende des 10. Jahrhunderts, a monumental history of the progress of geological science (Eng. trans., Mrs Maria M. Ogilvie-Gordon, 1901). Dr Zittel was from 1869 president of the Royal Bavarian Academy of Sciences, and in 1894 he was awarded the Wollaston medal by the Geological Society of London. He died on the 5th of January 1904.

Obituary with portrait and bibliography, by Dr F. L. Kitchin. Geol. Mag. (February 1904).
ZIZKA, JOHN (c. 1376-1424), Bohemian general and Hussite leader, was born at Trocnov in Bohemia, of a family which belonged to the gentry. He took part in the civil wars in Bohemia in the reign of Wenceslaus IV., during which he lost one eye in a skirmish. He was from his youth connected with the continued and his campaigns against the enemy. Zizka's name first became prominent when the Hussite movement began. When in 1419 a Hussite procession was stoned at Prague from the town hall, Zizka headed those who threw the town councillors from its windows. When a temporary armistice was concluded between the partisans of King Sigismund and the citizens of Prague, Zizka marched to Pilsen (Pilsen) with his followers, but soon left that city, and, after defeating at Sudomer the partisans of Sigismund, arrived at Tabor, the newly founded stronghold of the advanced Hussites. Zizka's success in the first standard of the new militant community and became one of the four captains of the people (hejmané) who were at its head. Meanwhile Sigismund, king of the Germans and king of Hungary, invaded Bohemia, claiming the crown as the heir of his brother Wenceslaus. Menaced by Sigismund, the citizens of Prague entreated the Taborites for assistance. Led by Zizka and their other captains, the Taborites set out to take part in the defence of the capital. At Prague Zizka and his men took up a strong position on the hill then known as the Vitkov, on the spot where Zizka, a suburb of Prague, stands. The next morning the enemy, driven back by the siege, at the city began, and on the 14th of July the army of Sigismund made a general attack. A strong German force assaulted the position on the Vitkov which secured the Hussite communications with the open country. Mainly through the heroism of Zizka, the attack was repulsed, and the forces of Sigismund abandoned the siege. Shortly afterwards (August 22, 1420) the Taborites left Prague and returned to Tabor. Zizka was now engaged in constant warfare with the partisans of Sigismund, particularly with the powerful Romanist, Ulrich of Rosenberg. By this struggle, in which Zizka was invariably successful, the Hussites obtained possession of the greatest part of Bohemia, which Sigismund now left for a time. It was proposed to elect a Polish prince to the throne; but meanwhile the estates of Bohemia and Moravia, who met at Časlav on the 1st of June 1421, decided to appoint a provisional government, consisting of twenty members chosen from all the political and religious parties of the country, Zizka, who took part in the deliberations at Časlav, being elected as one of the two representatives of Tabor. He summarily suppressed some disturbances on the part of a fanatical sect called the Adamites. He continued the campaigns against Sigismund, and the heretics of Sigismund; and having captured a small castle near Litoměřice (Leitmeritz) he retained possession of it—the only reward for his great services that he ever received or claimed. According to the Hussite custom he gave the biblical name of "Challice" to this new possession, and henceforth adopted the signature of "Zizka of the Chalice." Later, in 1421, he was severely wounded while besieging the castle of Rábi, and lost the use of his remaining eye. Though now totally blind, he continued to command the armies of Tabor. At the end of 1420, Sigismund of Poland, and later Prince of Prussia, entered Bohemia, obtained possession of the important town of Kutna Hora (Kuttenberg). Zizka, who was at the head of the united armies of Tabor and Prague, at first retreated to Kolín; but after having received reinforcements he attacked and defeated Sigismund's army at the village of Nebovid between Kolín and Kutna Hora (January 6, 1422). Sigismund lost 25,000 men and only escaped himself by rapid flight. Sigismund's forces made a last stand at Německý Brod (Deutschbrod) on the 10th of January, but the city was stormed by the Bohemians, and, contrary to Zizka's orders, its defenders were put to the sword. Early in 1423 internal dissensions among the Hussites led to civil war. Zizka, as leader of the Taborites, defeated the men of Prague and the Utraquist nobles at Hörlic on the 27th of April; but shortly afterwards the news that a new crusade against Bohemia was being prepared, induced the Hussites to conclude an armistice at Konopist on the 24th of June 1423. As soon, however, as the so-called crusaders had dispersed without even attempting to enter Bohemia, the internal dissensions broke out afresh. During his temporary rule over Bohemia Prince Sigismund Kuba of Poland had appointed as the stolnik of the Kingdom of Bohemia, Count of Borek of Milešinek, who belonged to the moderate Hussite, the so-called Utraquist, party. After the departure of the Polish prince the city of Králové Hradec, in which the democratic party now obtained the upper hand, refused to recognize Borek as its ruler, and called Zizka to its aid. He acceded to the demand and defeated the Utraquists under Borek at the farm of Strachov, near the city of Králové Hradec (August 4, 1423). Zizka now attempted to invade Hungary, which was under the rule of his old enemy King Sigismund. Though this Hungarian campaign was unsuccessful owing to the great superiority of the Hungarians, it ranks among the greatest military exploits of Zizka, on account of the skill he displayed in retreat. In 1424, civil war having again broken out in Bohemia, Zizka decisively defeated the Pragians and Utraquists nobles at Skalice on the 6th of January, and at Malesov on the 7th of June. In September he marched on Prague, but on the 14th of that month peace was concluded between the Hussite parties through the influence of John of Rokycan, afterwards Utraquist archbishop of Prague. It was agreed that the now reunited Hussites should attack Moravia, which was held by Sigismund's partisans, and that Zizka should be the leader in this campaign. But he died of the plague at Přibyslav (October 11, 1424) before reaching the Moravian frontier.

See Count Lützow, Bohemia: an Historical Sketch (London, 1896); Louis Leger, Jean Zizka in "Nouvelles études Slaves, deuxième série" (Paris, 1886), the best account of Zizka's career for those unacquainted with the Bohemian language; Tomek, Jan Zizka, and Dějiny Mezi Prahy; Palacky, History of Bohemia. Zizka is the hero of a novel by George Sand, of a German epic by Meissner, and of a Bohemian tragedy by Alois Jirasek.

ZLATOUST, a town of Russia, in the government of Ufa, close to the river Ufa, in a picturesque valley of the middle Ural, 1925 ft. above sea level, 199 m. by rail E.N.E. of the town of Ufa. Pop. 20,973. The town has a first-class meteorological and magnetic observatory, a cathedral and a museum; it is the seat of the mining administration for the Zlatoust district, and has a brisk trade in agricultural produce and manufactured wares.

ZNAIM (Czech Znojmo), a town of Austria, in Moravia, 50 m. S.W. of Brunn by rail. Pop. (1900) 16,261, mostly German. This town contains a famous Romanesque church. The site of the former fortifications is occupied by a promenade. The Ráuturm is a relic of the old castle of the margraves of Moravia; the round castle-chapel, known as the heathen temple (Heiden-Tempel), in the Romanesque style of the 12th century, was at one time considered the most ancient building in Moravia. The Gothic church of St Nicholas was built about 1348 by the emperor Charles IV.; the town house, with a Gothic tower, 250 ft. high, dates from about 1440. The ancient and once powerful Premonstratensian abbey of Bruck, east of the town, is now a ruin and is surrounded by a modern village.

The present town of Znaim was founded in 1226 by Ottcar I. of Bohemia on the site of Znojmo, the ancient capital of the tributary margraves of Moravia, which had been destroyed in 1145. Znaim is best known for history for the armistice concluded here in 1809 after the battle of Wagram between Napoleon I. and the archduke Charles. In 1866 the Prussians occupied the town from July 13th till September 3rd. The novelist Karl Postl (1793-1854), who wrote under the pseudonym of Charles Sealsfield, was born at Poppitz, 23 m. S.W. of Znaim. Palacky, the Austrian and Sudanese governor, came of the Gembaj section of the Jaalin, and was a member of a family which claims descent from the Korish tribe through Abbas, uncle of Mahomet. He became prominent as the most energetic and intelligent of the Arab ivory and slave traders who about 1860 established themselves
on the White Nile and in the Bahr-el-Ghazal. Nominally a subject of Egypt, he raised an army of several thousand well-armed blacks and became a dangerous rival to the Egyptian authorities. ‘At the height of his power Zobeir was visited (1871) by George Schweinfurth, was arrested him “surrounded with a court which was little less than princely in its details” (Heart of Africa, vol. ii., chap. xv.). In 1869 an expedition sent from Khartoum into the Bahr-el-Ghazal was attacked by Zobeir and completely defeated, its commander being slain. Zobeir represented that he was blameless in this matter, received a “pardon,” and was himself appointed governor of the Bahr-el-Ghazal, where he was practically independent. In 1873 he attacked the sultan of Darfur, and the khedive Ismail gave him the rank of bey and sent troops to co-operate. After he had conquered Darfur (1874), Zobeir was asked by the authorities, the more substantial reward of being made governor-general of the new province, and went to Cairo in the spring of 1876 to press his title. He was now in the power of the Egyptian authorities, who prevented his return, though he was allowed to go to Constantinople at the outbreak of the Russo-Turkish War. In 1878, however, his son Suleiman, having got possession of the Bahr-el-Ghazal, and acting on instructions from his father, defied the authority of General Gordon, the new governor-general of the Sudan. Gordon sent Romolo Gessi against Suleiman, who was subdued after an arduous campaign. During the campaign Zobeir offered, if he were allowed to return to the Sudan, to restore order and to pay a revenue of £25,000 a year to the khedive. Gordon declined this help, and subsequently, for his instigation of the revolt, Zobeir was condemned to death, but the trial was a farce, the sentence was remitted, and he remained at Cairo, now in high favour with the khedivial court. In March 1884, Gordon, who had been sent to Khartoum to effect, if possible, the relief of the Egyptian garrisons in the Sudan, astonished Europe by requesting that Zobeir, whose son he had overthrown and whose trade he had ruined, should succeed him as his successor. Zobeir, described by Sir Reginald Wingate, who knew him well, as “a quiet, far-seeing, thoughtful man of iron—" a born ruler of men” (Mahdisim and the Egyptian Sudan, book v.), might have been able to stem the mahdist movement. But to reinstate the notorious slave-dealer was regarded in London as too perilous an expedient, even in the extreme circumstances then existing, although Colonel Stewart (Gordon’s companion in Khartoum), Sir Evelyn Baring and Nubar Pasha in Cairo, and Queen Victoria and Mr Gladstone, all favoured such a course. During the campaign Gordon was, by order of the British government for treasonable correspondence with the mahdi and other enemies of Egypt, and was interned at Gibraltar. In August 1887 he was allowed to return to Cairo, and after the reconquest of the Sudan was permitted (1890) to settle in his native country. He established himself on his estates at Geili, some 30 m. N. of Khartoum.

See Gordon, Charles George, and the authorities there cited.

Zodiac (δ ϊώδος κόσμος, from ϊώδος, “a little animal”), in astronomy and astrology, an imaginary zone of the heavens within which lie the paths of the sun, moon and principal planets. It is bounded by two circles equidistant from the ecliptic, about eighteen degrees apart; and it is divided into twelve signs, and marked by twelve constellations. These twelve constellations, with the symbols of the signs which correspond to them, are as follows:

- **Aries**, the Ram
- **Taurus**, the Bull
- **Gemini**, the Twins
- **Cancer**, the Crab
- **Leo**, the Lion
- **Virgo**, the Virgin
- **Libra**, the Balance
- **Scorpio**, the Scorpion
- **Sagittarius**, the Archer
- **Capricornus**, the Goat
- **Aquarius**, the Water-carrier
- **Pisces**, the Fishes

1 Gordon and Zobeir met in Cairo on the 25th and 26th of January (see Egypt No. 12 of 1884) and Gordon from that time onward asked for Zobeir’s help. It was not, however, until the 10th of March that his wish was made public, in a telegram from Khartoum published in The Times.

The signs—the Greek δεκακατμούρα—are geometrical divisions thirty degrees in extent, counted from the spring equinox in the direction of the sun’s progress through them. The whole series accordingly shifts westward through the effect of precession by about the results of several thousand years. At the moment of crossing the equator towards the north the sun is said to be at the first point of Aries; some thirty days later it enters Taurus, and so on through Gemini, Cancer, Leo, Virgo, Libra, Scorpio, Sagittarius, Capricornus, Aquarius and Pisces. The zodiacal bearings the same names coincided approximately in position, when Hipparchus observed them at Rhodes, with the divisions they designate. The discrepancy now, however, amounts to the entire breadth of a sign, the sun’s path in Aries lying among the stars of Pisces, in Taurus among those of Orion.

 Assyria and Babylonia.—The twelvefold division of the zodiac was evidently suggested by the occurrence of twelve full moons in successive parts of it in the course of each year. This approximate relation was first systematically developed by the early inhabitants of Mesopotamia, and formed the starting-point for all their divisions of time. As the year separated, as it were of itself, into twelve months, so the day was divided into twelve “double hours,” and the great cosmical period of 43,200 years into twelve “sars.” Each sar, month and hour was represented at once visibly and symbolically by a twelfth part of the “furrow” drawn by the single Bull across the heavens. The idea of tracing the sun’s path among the stars was, when it occurred to Chaldaean astronomers, an original and, relatively to their means, a recondite one. We owe it to its realization by them the constitution and nomenclature of the twelve signs of the zodiac. Assyrian cylinder inscriptions indicate for the familiar series of our text-books an antiquity of some four thousand years. Ages before Assur-bani-pal reigned at Nineveh the eighth month (Marchesvan) was known as “the month of the star of the Scorpion,” the tenth (Tebet) belonged to the “star of the Goat,” the twelfth (Adar) to the “star of the Fish of Ea.”1 The motive underlying the choice of symbols is in a few cases obvious, but in most remains conjectural. The attributes of the deities appointed to preside over the months and signs were to some extent influential. Two of them, indeed, took direct possession of their respective portions of the sky. The zodiacal Virgo is held to represent the Assyrian Venus, Ishtar, the ruling divinity of the sixth month, and Sagittarius the archer-god Nergal, to whom the ninth month was dedicated. But no uniform system of selection was pursued. The rather picturesque and symbolic items, adopted at various epochs, and under the influence of varying currents of ideas, became amalgamated in the final series.

This, there is reason to believe, was the upshot of a prehistoric reform. So far as positive records go, Aries was always the first sign. But the arrangement is, on the face of it, a comparatively modern one. None of the brighter stars of the constellation could be said even roughly to mark the equinox much before 1800 B.C.; during a long stretch of previous time the leading position belonged to the stars of Taurus. Numerous indications accordingly point to the invading primitive zodiac. Setting aside as doubtful evidence derived from interpretations of cuneiform inscriptions, we meet, in connexion with Mithraic and Mithlistic legends, reminiscences of a zodiac and religious calendar in which the Bull led the way.4 Virgil’s

Candidus auratis aperit cum cornibus annum Taurus

perpetuates the tradition. And the Pieiades continued, within historical memory, to be the first asterism of the lunar zodiac.

1 Lenormant, Origines de l’Histoire, l. 236.

2 The possibility should not, however, be overlooked that the “stars of the months” were determined by their heliacal risings (see Bosanquet and Sayce on Babylonian astronomy, in Monthly Notices Roy. Astr. Soc. xl. 117). This would give a further extension back of the civil years, during which the equinox might have occurred in the month of the Ram.

In the Chaldaean signs fragments of several distinct strata of thought appear to be embedded. From one point of view they shadow out the great epic of the destinies of the human race; again, the universal solar myth claims a share in them; hence traditions were sought into eft post factum connexions with them; or they served to commemorate simple meteorological and astronomical facts.

The first Babylonian month Nisan, dedicated to Anu and Bel, was that of "sacrifice"; and its association with the Ram as the chief primitive object of sacrifice is thus intelligible. According to an alternative explanation, the heavenly Ram, placed as leader in front of the flock of the stars, merely embodied a spontaneous figure of the popular imagination. An antique persuasion, that the grand cycle of creation opened under the first sign, has been transmitted to modern cognizance by Dante (Inf. i. 38). The human race, on the other hand, was supposed to have come into being under Taurus. The solar interpretation of the sign goes back to the far-off time when the year began with Taurus, and the sun was conceived of as a bull entering upon the great furrow of heaven as he ploughed his way among the stars. In the third month and sign the building of the first city and the fratricidal brothers—the Romulus and Remus of Roman legend—were brought to mind. The appropriate symbol was at first indifferently a pile of bricks or two male children, always on early monuments placed feet to feet. The retrograde movement of a crab typified, by an easy association of ideas, the retreat of the sun from his fairest northern excursion, and Cancer was constituted the sign of the summer solstice. The Lion, as the symbol of fire, represented the culmination of the solar heat. In the sixth month, the descent of Ishtar to Hades in search of her lost husband Tammuz was celebrated, and the sign of the Virgin had thus a purely mythological significance.

The history of the seventh sign is somewhat complicated. The earlier Greek writers—Eudoxus, Eratosthenes, Hipparchus—knew of only eleven zodiacal symbols, but made one do double duty, extending the Scorpion across the seventh and eighth divisions. The Balance, obviously indicating the equality of day and night, is first mentioned as the sign of the autumnal equinox by Geminus and Varro, and obtained, through Sosigenes of Alexandria, official recognition in the Julian calendar. Nevertheless, Virgil (Georg. i. 32) regarded the space it presided over as so much waste land, providentially occupied by the "Claws" of the Scorpion, but readily available for the apotheosis of Augustus. Libra was not of Greek invention. Ptolemy, who himself chiefly used the "Claws" (Xyphοδ), speaks of it as a distinctively Chaldaean sign; and it occurs as an extrazodiacal asterism in the Chinese sphere. An ancient Chinese law, moreover, prescribed the regularization of weights and measures at the spring equinox. No representation of the seventh sign has yet been discovered on any Euphratean monument; but it is noticeable that the eighth is frequently doubled, and it is difficult to avoid seeing in the pair of zodiacal scorpions carved on Assyrian cylinders the prototype of the Greek scorpion and claws. Both Libra and the sign it eventually superseded thus owned a Chaldaean birthplace. The struggle of rival systems of nomenclature, from which our zodiacal series resulted, is plainly visible in their alternations; and the claims of the competing signs were long sought to be conciliated by representing the Balance as held between the claws of the Scorpion.

The definitive decline of the sun's power after the autumnal sign was typified by placing a Scorpion as the symbol of darkness in the eighth sign. Sagittarius, figured later as a Centaur, stood for the Babylonian Mars. Capricornus, the sign of the winter solstice, is pleasingly connected with the capricorn head of the young solar god in Oriental legend, as was which of Zeus and Amalthis is a variant. The fish-tailed Goat of the zodiac presents a close analogy with the Mexican calendar sign Cipactli, a kind of marine monster resembling a narwhal. Aquarius is a still more exclusively meteorological sign than Leo. The eleventh month was known in Euphratean regions as that of "want and rain." The deluge was traditionally associated with it. It was represented in zodiacal symbolism by the god Ramman, crowned with a tiara and pouring water from a vase, or more generally by the vase and water without the god. The resumption of agricultural labours after the deluge was commemorated in the twelfth month, and a mystical association of the fishes, which were its sign, with the life after death is evident in a monument of Assyrian origin described by Clermont-Ganneau, showing a corpse guarded by a pair of fish-gods. The doubling of the sign of Pisces still recalls, according to Sayce, the arrangement of the Babylonian calendar, in which a year of 360 days was supplemented once in six years by a thirteenth month, a second Adar. To the double month corresponded the double sign of the Fishes.

Cyclical Meaning of the Succession of Signs.—The cyclical meaning of the succession of zodiacal signs, though now obscured by interpolations and substitutions, was probably once clear and entire. It is curiously reflected in the adventures of the Babylonian Hercules, the solar hero Gilgamesh (see Gilgamesh, Epic 09). They were recorded in the comparatively late surviving version of the 7th century B.C., on twelve tablets, with an obvious design of correlation with the twelve divisions of the sun's annual course. Gilgamesh's conquest of the divine bull (the sacred ox), placed under the sign of Leo, is the victory of light over darkness, represented in plastic art by the group of a lion killing a bull, which is the form ordinarily given to the sign Leo on Ninevite cylinders. The wooing of Ishtar by the hero of the epic falls under Virgo, and his encounter with two scorpion men, guardians of the rising and the setting sun, under Scorpio. The eleventh tablet narrates the deluge; the twelfth associates the apotheosis of Ebabni with the zodiacal emblems of the resurrection.

In the four middle constellations of the zodiac little regard was paid to similar configurations. The Chaldaeans chose three stars in each sign to be the 'councillor gods' of the planets. These were called by the Greeks 'decans,' because ten degrees of the ecliptic and ten days of the year were presided over by each. The college of the decans was conceived as moving, by their annual risings and settings, in an 'eternal circuit' between the infernal and supernal regions. Modern asterisms first appear in the Phaenomena of Eudoxus about 370 B.C. But Eudoxus, there is reason to believe, consulted, not the heavens, but a celestial globe of an anterior origin, with which the signs were forced into unnatural agreement. The representation thus handed down (in the verses of Aratus) has been thought to tally best with the state of the sky about 2000 B.C., and the mention of a polar star, for which Eudoxus was rebuked by Hipparchus, seems, as W. T. Lynn pointed out, to refer to the time when a Draconis
stood near the pole. The data afforded by Eudoxus, however, are far too vague to serve as the basis of any chronological conclusion.

Egyptian Zodiacal Signs.—The Egyptians adopted from the Greeks, with considerable modifications of its attendant symbolism, the twelve-fold division of the zodiac. Aries became the Fleece; two Sprouting Plants, typifying equality or resemblance, stood for Gemini; Cancer was re-named Scarabaeus; Leo was converted, from the axe-like configuration of its chief stars, into the Knife: Libra into the Mountain of the Sun, a reminiscence, apparently, of the Euphratean association of the seventh month with a "holy mound," designating the biblical tower of Babel. A Serpent was the Egyptian equivalent of Scorpio; the Arrow only of Sagittarius was retained; Capricornus became "Life," or a Mirror as an image of life; Aquarius survived as Water; Taurus, Virgo and Pisces remained unchanged.1 The motive of some of the substitutions was to avoid the confusion which must have ensued from the duplication of previously existing native asterisms; thus, the Egyptian and Greek Lions were composed of totally different stars. Abstractions in other cases replaced concrete objects, with the general result of effacing the distinctive character of the Greek zodiac as a "circle of living things."

Spread of Greek System.—Early Zoroastrian writings, though immersed with star-worship, show no traces of an attempt to organize the heavenly array. In the Bundahish, however (4th century), the twelve "Akhkârs," designated by the same names as our signs, lead the army of Ormâzid, while the seven "Awakhtârs" or planets (including a meteor and a comet) fight for Ahriman. The knowledge of the solar zodiac thus turned to account for dualistic purposes was undoubtedly derived from the Greeks. By them, too, it was introduced into Hindustan. Aryabhata, about the beginning of the Christian era, reckoned by the same signs as Hipparchus. They were translated into Chaldaean, borrowed by Bactrian missionaries to China, but remained in abeyance until the Jesuit reform of Chinese astronomy in the 17th century.

Chinese Zodiacal Signs.—The native Chinese zodiacal system was of unexampled complexity. Besides divisions into twenty-eight and twenty-four parts, it included two distinct duodenary series. The 13th or "stations" were referred by E. C. Biot to the date 1111 B.C. Measured from the winter solstice of that epoch, they corresponded, in conformity with the Chinese method of observation by intervals of what we now call right ascension, to equal parts of the celestial equator.2 Projected upon the ecliptic, these were considerably unequal, and the tse accordingly differed essentially from the Chaldaean and Greek signs. Their use was chiefly astrological, and their highly figurative names—"Great Splendour," "Immensely Void," "Fire of the Phoenix," &c.—had reference to no particular stars. They became virtually merged in the European series, stamped with official recognition over two centuries ago. The twenty-four tiâi or demi-1se were probably invented to mark the course of weather changes throughout the year. Their appellations are purely meteorological.

The characteristic Chinese mode of dividing the "yellow road" of the sun was, however, by the twelve "cyclical animals"—Rat, Ox, Tiger, Hare, Dragon or Crocodile, Serpent, Horse, Sheep, Monkey, Hen, Dog, Pig. The opening sign corresponds to our Aquarius, and it is remarkable that the rat is, in the far East, frequently used as an ideograph for "water." But here the agreement ceases. For the Chinese series has the strange peculiarity of proceeding in a retrograde direction or against the course of the sun. Thus the second sign (of the Ox) occupies the position of Capricorn in the third that of Sagittarius, and so on. The explanation of this seeming anomaly is to be found in the primitive designation of the "animals" to the purposes of an "horary zodiac." Their succession, established to mark the hours of day and night, was not unnaturally associated with the diurnal revolution of the sphere from east to west.3 They are unquestionably of native origin. Tradition ascribes their invention to Tajao, minister of the emperor Han-Hwang, who reigned c. 206 B.C., and it can scarcely be placed later than the 7th century B.C.4

The Chinese circle of the "animals" obtained early a wide diffusion. It was adopted by Tatars, Turks and Mongols, in Tibet and Tong-king, Japan and Korea. It is denominated by Humboldt5 the "zodiac of hunters and shepherds," and he adds that the presence in it of a tiger gives it an exclusively Asiatic character. It appears never to have been designed for astronomical employment. From the first it served to characterize the divisions of time. The nomenclature not only of the hours of the day and of their minutest intervals was supplied by it but of the months of the year, of the years in the Oriental sixty-year cycle, and of the days in the "little cycle" of twelve days. Nor has it yet fallen into desuetude. Years of "the Rat," "of the Tiger," "of the Pig," still figure in the almanacs of Central Asia, Cochín China and Japan.

Aztec Zodiacal Signs.—A large detachment of the "cyclical animals" even found its way to the New World. Seven of the twenty days constituting the Aztec month bore names from those of the Chinese horary signs. The Hare, Rabbit; Monkey, Dog and Serpent reappeared without change for the Tiger, Crocodile and Hen, unknown in America. The Ocelot, Lizard and Eagle were substituted as analogues.6 The Aztec calendar dated from the 7th century; but the zodiacal tradition embodied by it was doubtless much more ancient. Of the zodiac in its true sense of a partitioned belt of the sphere there was no aboriginal knowledge on the American continent. Mexican acquaintance with the signs related only to their secondary function as days (so to speak) with which to stamp recurring intervals of time.

Lunar Zodiac.—The sidereal revolution of the moon laid down only the course of the sky, its sidereal revolution those of the lunar zodiac. The first was a circle of "full moons"; the second marked the diurnal stages of the lunar progress round the sky, from and back again to any selected star. The moon was the earliest "measurer" both of time and space; but its services can scarcely have been rendered available until stellar "milestones" were established at suitable points along its path. Such were the Hindu nakshatras, a word originally signifying stars in general, but appropriated to designate certain small stellar groups marking the divisions of the lunar track. They exhibit in an exaggerated form the irregularities of distribution visible in our zodiacal constellations, and present the further anomaly of being frequently reckoned as twenty-eight in number, while the ecliptic arcs they characterize are invariably twenty-seven. Now, since the moon revolves round the earth in 27 1/2 days, hesitation between the two full numbers might easily arise; yet the real explanation of the difficulty appears to be different. The superfluous asterism, named Abhijli, included the bright star a Lyrae, under whose influence the gods had vanquished the Asuras. Its invocation with the other nakshatras, remoteness from the ecliptic notwithstanding, was thus due (according to Max Müller's plausible conjecture)7 to its being regarded as of especially good omen. Acquaintance with foreign systems of twenty-eight lunar divisions tended doubtless to fix its position, which remained, nevertheless, always equivocal.8 Alternately admitted into or rejected from the series, it was finally, some six or seven centuries ago, eliminated by the effects of precession in reversing the order of culmination of its limiting stars.

The notion of a twofold division of the zodiac was deeply rooted in Hindu tradition. The number and the name were in early times almost synonymous. Thus a nakshatra-mula

denoted a necklace of twenty-seven pearls; and the fundamental equality of the parts was figured in an ancient legend, by the compulsion laid upon King Soma (the Moon) to share his time impartially between all his wives, the twenty-seven daughters of Prajapati. Everything points to a native origin for the system of nakshatras. Some were named after exclusively Vedic deities; they formed the basis of the sacrificial calendar of the Brahmins; the old Indian names of the months were derived from them; their existence was pre-supposed in the entire structure of Hindu ritual and science. They do not, however, obtain full recognition in Sanskrit literature until the Brāhmaṇa period (7th or 8th century B.C.). The Rig-Veda contains only one allusion to them, where it is said that 'Soma is placed in the nakshatras'; and this is in a part including later interpolations.

Positive proof of the high antiquity of the Hindu lunar zodiac is nevertheless afforded by the undoubted fact that the primitive series opened with Krittikā (the Pleiades) as the sign of the vernal equinox. The arrangement would have been correct about 3500 B.C.; it would scarcely have been possible after 1800 B.C. We find nowhere else a well-authenticated zodiacal sequence corresponding to so early a date. The reform by which Krittikā, now relegated to the third place, was superseded as the head of the series by Agni or Vivasvan, is believed to have been made during the influence somewhere near the beginning of the Christian era. For purposes of ritual, however, the Pleiades, with Agni or "Fire" as their presiding deity, continued to be the first sign. Hindu astronomy received its first definite organization in the 6th century, with results embodied in the Śāryu-Siddhānta. Here the "signs" and the "constellations" of the lunar zodiac form two essentially distinct systems. The ecliptic is divided into twenty-seven equal parts, called bhogas or arcs, of 80° each. But the nakshatras are twenty-eight, and are represented by as many "junction stars" (yogātārā), carefully determined by their co-ordinates and co-planarity. The sphere of the moon and planetas into the nakshatras (the ascertainment of which was of great astrological importance) were fixed by means of their conjunctions with the yogātārā. These, however, soon ceased to be observed, and already in the 11th century, al-Biruni could meet with no Hindu astronomer capable of pointing out to him the complete series. Their successful identification by Colebrooke in 1807 had a purely archaeological interest. The modern nakshatras are twenty-seven equal ecliptical divisions, the origin of which may be that of the signs of the zodiac with the vernal equinox of the sun, and the bḥogas of the Śāryu-Siddhānta. The mean place of the moon in them, published in all Hindu almanacs, is found to serve unexceptionably the ends of astral vaticination.

The system upon which it is founded is of great antiquity. Belief in the power of the nakshatras evidently inspired the invocations of them in the Akhaṇa-Veda. In the Brāhmaṇa period they were distinguished as "deva" and "yama," the fourteen lucky asterisms being probably associated with the waxing, the fourteen unlucky with the waning moon. A special nakshatra was appropriated to every occurrence of life. One was propitious to marriage, another to entrance upon school-life, a third to the first ploughing, a fourth to laying the foundation of a house. Festivals for the dead were appointed to be held under those that included but one star. Propitiatory abstinences were recommended when the natal asterism was menaced by unfavourable planetary conjunctions. The various members of the body were parcellled out among the nakshatras, and a system of food was prescribed as a wholesome accompaniment of the moon's revolution among them.⁴

The nomenclature of the Hindu signs of the zodiac, save as regards a few standard asterisms, such as Āvini and Krittikā, was far from uniform. Considerable discrepancies occur in the lists given by different authorities.⁵ Hence it is not surprising to meet in their evidence of foreign communications. Reminiscences of the Greek signs of Gemini, Leo, Libra, Sagittarius, Capricornus and Pisces are obviously prevalent in the Hindu Two Faces, Lion's Tail, Beam of a Balance, Arrow, Gazelle's Head (figured as a marine nondescript) and Fish. The correspondence does not, however, extend to the stars; and some coincidences adverted to by Humboldt between the nakshatras and the zodiacal animals of Central Asia are of the same nominal character.⁶ Mexican loans are more remarkable. They were apparently a second-hand adoption, and the Hindu zodiacal calendar includes nakshatra titles borrowed, not only through the medium of the Tatar zodiac, but likewise straight from the Indian scheme, apart from any known intervention. The "three footprints of Vishnu," for example, unmistakably gave its name to the Mexican day Olín, signifying the "track of the sun"; and both series further contain a "flint weapon," a "stick," and a "house." Several houses and couches were ranged along the Hindu zodiac with the naive idea of providing resting-places for the wandering moon.

Relative Antiquity of Hindu, Chinese, and Arabian Systems.— Relationship of a more intimate kind connects the Hindu lunar mansions with those of the Arabs and Chinese. The resemblance between the three systems is indeed so close that it has been assumed, almost as axiomatic, that they must have been framed from a single model. It appears nevertheless to have become tolerably clear that the nakshatras were both native to India, and the siu to China, but that the mánḍāsī were mainly of Indian derivation. The assertion, paradoxical at first sight, that the twenty-eight "hostelries" of the Chinese sphere had nothing to do with the moon's daily motion, seems to convey the sense of an actual fact. The division of the heavens into the four "elements" was well established; the Arab, described by the quaternary partition of the heavens, fundamental in Chinese astronomy. It was considered by Biot to have been originally twenty-four, but to have been enlarged to twenty-eight about 1100 B.C., by the addition of determinants for the solstices and equinoxes of that period. The essential difference, however, between the nakshatras and the siu is that the latter were equatorial, not ecliptical, divisions. They were measured by the meridian-passages of the limiting stars, and varied in amplitude from 8° 42′ to 30° 24′. The use of the nakshatras, however, continued, some idea of the moon was as points of reference for the movements of sun, moon and planets. They served, in fact, and still serve (though with astrological ends in view), the precise purpose of "fundamental stars" in European astronomy. All that is certainly known about the antiquity of the siu is that they were well established in the 3rd century B.C. Their initial point at the autumnal equinox marked by Kio (Spica Virginis) suits a still later date; and there is no valid evidence that the modern series resulted from the rectification of an older superannuated arrangement, analogous to the Krittikā sequence of nakshatras. The Hindu zodiacal constellations belong then to an earlier epoch than the Chinese "stations," such as they have been transmitted to our acquaintance. Yet not only were the latter an independent invention, but it is almost demonstrable that the nakshatras, in their more recent organization, were, as far as possible, assimilated to them. The whole system of junction stars was doubtless an imitation of the siu; the choice of them by the Hindu astronomers of the 6th century A.D. was plainly instigated by a consideration of the Chinese list, compiled with a widely different motive. The order in which the signs were arranged varied from one authority to another; the reason can generally be assigned for the change. Eight junction stars lie quite close to seven others are actually identical with, Chinese determinants; and many of these coincidences

are between insignificant and, for the purposes of ecliptical division, inconveniently situated objects.

**Arabian Mansions of the Moon.**—The small stellar groups characterizing the Arab "mansions of the moon" (mandal al-bakandār) were more equably distributed than either the Hindu or Chinese series. They presented, nevertheless, striking resemblance to the latter. Twenty-four out of twenty-eight were forward, at least in perspective, of the Chinese stars. That the Arab was essentially a copy of the Hindu lunar zodiac can scarcely admit of doubt. They were divided on the same principle; each opened at the spring equinox; the first Arab sign Sharaštān was strictly equivalent to the Hindu Avinī; and eighteen constellations in each were virtually coincident. The model of the sieu was, however, also regarded. Eighteen Chinese determinants were included in the Arab asterisms, and of these five or six were not nakšatra stars; consequently, they must have been taken directly from the Chinese series. Nor were the Greek signs without effect in determining the names of the mandālis, the late appearance of which, in a complete form, removes all difficulty in accounting for the various foreign influences brought to bear upon them. They were first enumerated by Alfarāhī early in the 9th century, when the Arabs were in astronomy the avowed disciples of the Hindus. But, although they then received perhaps their earliest quasi-scientific organization, the mansions of the moon had ages previously figured in the popular lore of the Bedouin. A set of twenty-eight names associated their heliacal risings with the changes of the seasons. The vernal and autumnal settings were of meteorological and astrological import: in the Koran (x. 5) they are regarded as indispensable for the reckoning of time. Yet even this intimate penetration into the modes of thought of the desert may be explained by prehistoric Indian communication. The alternative view, advocated by Weber, that the lunar zodiac was primitively Chaldean, rests on a very shadowy foundation. It is true that a word radically identical with mandālīl occurs twice in the Bible, under the form man̂sūl and mazāloth (2 Kings xxiii. 5; Job xxviii. 32); but the heavenly halting-places which it seems to designate may be solar rather than lunar. Euphratean exploration has so far brought to light no traces of eclipsal partition by the moon's diurnal motion, unless, indeed, zodiacal associations be claimed for a set of twenty-eight deprecatory formulae against evil spirits inscribed on a Ninevite tablet. 1

The safest general conclusions regarding this disputed subject appear to be that the sieu, distinctively and unvaryingly Chinese, cannot properly be described as divisions of a lunar zodiac, that the nakshatras, though of purely Indian origin, became modified by the successive invasion of Greek and Chinese rectifications and supposed improvements; while the monāsas constituted a frankly eclectic system, in which elements from all quarters were combined. It was adopted by Turks, Tatars and Persians, and forms part of the astronomical paraphernalia of the Bundākīsh. The sieu, on the other hand, were early naturalized in Japan.

**Astrological Systems.**—The refined system of astrological prediction based upon the solar zodiac was invented in Chaldaea, obtained a second home and added elaborations in Egypt, and spread irresistibly from thence. To the beginning of the Christian era. For genealogically purposes the signs were divided into six solar and six lunar, the former counted outward from Leo, the "house" of the twelve, and from the moon's domicile in Cancer. Each planet had two houses—solar and a lunar—distributed according to the order of their revolutions. Thus Mercury, as the planet nearest the sun, obtained Virgo, the sign adjacent to Leo, with the corresponding lunar house in Gemini; Venus (Libra) (solar) and Taurus (lunar); and so for the rest. A ram frequently stamped on coins of Antiochus, with head reversed towards the moon, was supposed to be the "house" of the moon, and was abroad. Mars was so connected to be the lunar house of Mars. With the respective and relative positions in the zodiac of the sun, moon and planets, the character of their action on human destiny varied indefinitely. The influence of the signs, though secondary, was hence overmastering: Julian called them "the guiding stars," and to the gods corresponded. Cities and kingdoms were allotted to several patronage on a system fully expounded by Manilius:

* Hos erit in fines orbis pontusque notandus, Quiem Deus in partes per singula dividit astra, At sua cura sancta regna per orbem, Et propias gentes atque urbes addidit alatas.*

In quibus exercent praestantia sidera vires.*

Syria was assigned to Aris, and Syriac coins frequently bear the effigy of a ram; Scythia and Arabia fell to Taurus, India to Gemini, and Aquarius was allotted. In the bodhisattva, claimed the favour of Libra, Zeugma that of Capricorn; Leo protected Miletus, Sagittarius Singara. The "power of the signs" was similarly distributed among the parts of the human body:—

* Et quanquam communis eat tutela per omne Corpus, et in proprium divisio artibus exit: Namque ariis capit, taurus cervicibus haecest; Brachia sub geminis cenistant, pectora cancro.*

Warning were uttered against surgical treatment of a member through whose sign the moon happened to be passing: and the sign of Leo was a dispensable branch of the healing art in the Middle Ages. Some curious municipalities of the suppliant have survived in rings and amulets, engraved with the various signs, and worn as a kind of astral defensive armour. Many such, the signs of Cancer and Libra, and have been engraved by Thanes. Individuals, too, adopted zodiacal emblems. Capricornus was impressed upon the coins of Augustus, Libra on those of Pythodorus, queen of Pontus; a sultan of Iconium displayed Leo his "homing emblem" for sovereignity; Stephen of Edessa chose the protection of Sagittarius.

**Egyptian Astrology.**—In Egypt celestial influences were considered emanating almost entirely from the thirty-six "decans" of the signs. They were called the "sieve of the whole circle of the zodiac"; each ten-day period of the Egyptian year was consecrated to the decanal god whose celestial rote at that epoch determined the ceremonial order of the religious cycle, and disease was cured by invoking the zodiacal regent of the part affected. As early as the 14th century B.C. a complete list of the decans was placed among the hieroglyphs adorning the tomb of Seti I. Among the figures an Egyptian was wont to portray, and characterize every Egyptian astronomical monument. Both the famous zodiaces of Dendera display their symbols, unmistakably identified by Lenormant. The origin of these representations was established by the detection upon them of the cartouches of Tiberius and Nero. As the date of inception of the circular zodiac in Egypt is 46 B.C., has, however, been suggested with high probability, from (among other indications) the position of the signs of the emblem of the planet Jupiter. Its design was most likely to serve as a sort of *hora coeli* at the time of the birth of Caesar. The companion rectangular zodiac still in situ on the walls of the temple of Dendera at Aris, the body was corresponding with that of the Egyptian, and was esteemed by the ancient authorities, the date 29 A.D. It forthwith, there is reason to believe, the natal scheme, not of the emperor Tiberius, as had been conjectured by Leuth, but of the building it served to decorate. The Egyptian signs of the months have been generally obvious upon both these monuments, which have thrown useful light upon the calendar system and method of stellar grouping of the ancient Egyptians.

**Planispheres.**—An Egyptian-Greek planisphere, first described by Bianchini, resembles in its general plan the circular zodiac of Dendera. The decans are ranged upon the outermost of its five concentric zones; the planets and the glreek zodiac in duplicate occupy the next three; while the inner circle is unaccountably reserved for the Chinese cyclical animals. The relic was dug up upon the Avila in 1705, and is now in the Louvre. It dates from the 2nd or 3rd century A.D. The Tatar zodiacs are frequently found engraved on Chinese mirrors in polished bronze or steel of the 7th century, and figured on the "plateau of the twelve hours" 1

in the treasury of the emperors of the Tang dynasty.1 Probably the most ancient zodiacal representation in existence is a fragment of an early Chinese painted zodiacal planisphere, inscribed with the names of the twelve months and their governing signs. Two only now remain.2

A zodiacal altar, the "astrological altar of Gabies" in the Louvre, illustrates the apportionment of the signs among the inmates of the Roman Pantheon;3 and they occur as a classical reminiscence in the mosaics of San Miniato and the baptistery at Florence, the bamboos of Lucca, and the crypt of San Savino.4 Zodiacal symbolism became conspicuous in medieval art. Nearly all the French cathedrals of the 12th and 13th centuries exhibit on their exterior surfaces the signs of the zodiac, in each month and sign its corresponding labour. The zodiac of Notre Dame of Paris, opening with Aquarius, is a noted instance.5 A similar series, in which sculptured figures of Christ and the Apostles are associated with their zodiacal signs, is to be seen in perfect preservation on the chief doorway of the abbey church at Vezelay. The cathedrals of Amiens, Sens and Rheims are decorated in the same way. In Italy the signs and works survive fragmentarily in the baptistery at Parma, completely on the porch of the cathedral of Cremona and on the west doorway of St Mark's at Venice. They are less common in England; but St Margaret's, York, and the church in Oxfordshire offer good specimens of the zodiac at Merton College, Oxford. Libra is represented by a judge in his robes and Pisces by the dolphin of Fitzjames, warden of the college, 1482–1507.6 The great rose-windows of the Early Gothic period were often enriched with zodiacal signs; and some frescoes in the cathedral of Cologne contain the signs, each with an attendant angel, just as they were depicted on the vault of the church at Mount Athos. Giotto's zodiac at Padua was remarkable (in its union with the signs of the months), and the arrangement of the signs so as to be struck in turns, during the corresponding months, by the sun's rays.7 The "zodiac of labours" was replaced in French cathedrals at earliest by a separate altar, in which hunting, hawking, fishing and dancing were substituted for hoeing, planting, reaping and ploughing.8

It is curious to find the same sequence of symbols employed for the same decorative purposes in India as in Europe. A perfect set of signs was copied in 1764 from a pagoda at Verdapatnath near Cape Comorin, and one equally complete existed at the same period in the clustering of a temple near Madurah.9

The hieroglyphs representing the signs of the zodiac in astronomical works are found in manuscripts of about the 10th century, but in carvings not until the 15th or 16th.10 Their origin is unknown; but they, and the figures of them, have antique associations. The hieroglyph of Leo, for instance, occurs among the symbols of the Mithraic worship.11

See also the article ASTRONOMY, and the separate articles on the constellations. The whole subject of the history of the zodiac is very obscure. See generally Franz Boll, Sphaera (Leipzig, 1903); also the bibliographies to Astrology and Babylonian and Assyrian Religion. (A. M. C.)

ZODIACAL LIGHT, a faint illumination of the sky, surrounding the sun and elongated in the direction of the ecliptic on each side of the sun. It is lenticular in form, brightest near the sun, and shaded off imperceptibly gradations, generally becoming invisible at a distance of 90° from the sun. It will be noticed, however, that it is never observed in the same zodiac; hence its designation. Its breadth varies with the time and place of observation, depending upon the position of the ecliptic with respect to the horizon. In the tropics, where the ecliptic is nearly perpendicular to the horizon, it may be seen after the end of twilight on every clear evening; and before twilight on every clear morning, unless blotted out by moonlight. It then presents a nearly vertical wedge-shaped form, the base of which extends 15° or 20° on each side of the point at which the ecliptic intersects the horizon. The point of the wedge is quite indefinite, the extremely diffuse light gradually fading into invisibility at a height which may range from 50° to 70° or even more, according to the keenness of the observer's eyesight. The breadth of the wedge is not so great as to make any exact statement of the extent of the light can be made. The brightness is at its maximum along its central line, called the axis of the light. Along this axis the brightness continually increases as the sun is approached. Owing to the softness of the outline, it is not possible to fix the position of the axis with precision; but, so far as observations have been made, it is found that it lies near the ecliptic, though deviating from it by a quite sensible amount.

Having this position, the conditions of visibility will be best when the ecliptic, and therefore the axis of light, are nearly perpendicular to the horizon, and, as the angle between the ecliptic and horizon becomes acute, will deteriorate, slowly at first, more and more rapidly afterwards, owing to the increasing effect of atmospheric absorption. This effect is enhanced by the light being brighter as we approach the sun. More and more of the brighter regions of the light will then be near the horizon the more acute the angle. The result is that the light can only be distinctly seen when the angle with the horizon is less than 45°, unless in a region where the atmosphere is unusually free from all turbidity. From the statement of the conditions it will be seen that the tropical zones is the most favourable for the observation, and that the most favourable hour of the day at which the light can be seen must always be the earliest after sunset and the last before sunrise. Practically this is when twilight is first ended in the evening, and about to begin in the morning. At these hours the angle of the ecliptic with the horizon varies with the season. At the close of evening twilight the angle is greatest about three weeks before the vernal equinox. The months of February and March are therefore best for the evening observations in the northern hemisphere, but the light can generally be seen from January until April. Similar favourable conditions prevail in the morning from September to November. It is clear that the light proceeds from a region surrounding the sun, and lenticular in form, the axis of the lens being nearly perpendicular to the ecliptic, while the circumference extends at least to the orbit of the earth. If it did not extend so far as this it could not be seen as frequently as it is at a distance of 90° from the sun. The accompanying figure shows the form of the outline, as it would appear to an observer on an outer planet were the light of the sun cut off. The hypothesis which best accounts for the variable nature of the phenomenon is that reflected from an extremely tenuous cloud of particles having the form and extent described, and becoming more and more tenuous as the earth's orbit is approached until, immediately outside the orbit, it fades into complete invisibility. The fact that the light widens out toward the sun leads to the inference that it entirely surrounds the sun. It is therefore of interest to test this inference by observations at midnight in such a latitude that the distance of the sun below the horizon is no more than necessary to preclude the possibility of twilight. Such an opportunity is offered when the sun is near the summer solstice, in latitudes not differing much from 50° north. A transparent atmosphere and clear horizon are necessary, conditions which can best be secured on a mountain top. The visibility of a light corresponding to the inference was shown by Simon Newcomb, by observations at the top of the Brienz Rothorn, in 1905. Previously to this, E. E. Barnard had observed the same phenomenon at Chicago. The only source of doubt as to the validity of the conclusion that this is really the zodiacal light arises from the possibility that, after the close of the ordinarily recognized twilight, there may be a faint illumination arising from the reflection of light by the very rare upper atmosphere, shown by the phenomena of meteors to extend some hundred miles or more above the earth's surface. The problem of

The actual symbols of the signs are referred to above (see Journal of the Asiatic Society of Bengal, vol. 50 (1884), 171, No. 20, and plate 17, No. 6); it occurs there with an Assyrian winged bull. But there is nothing to prove that it there, or elsewhere, means Taurus; it is found, in the same early period, with a lion as well as with a bull —on coins, seals, &c.
ZODIACAL LIGHT

separating a possible effect produced in this way from the zodiacal light proper may seem to offer some difficulty. But the few observations made show that, after ordinary twilight has ended in the evening, the northern base of the zodiacal light extends more and more toward the north as the hours pass until, towards midnight, it merges into the light of the sky described by the two observers mentioned. Yet more conclusive are the observations of Maxwell Hall at Jamaica, who reached conclusions identical with those of Barnard and Newcomb, from observations of the base of the light at the close of twilight, which he estimated at 5° in the line of the sun.

These observations show that the outline on that portion of the light commonly seen in the morning or evening is concave instead of convex, as it would be were the cloud strictly lenticular. The actual outline of the cloud is that of which a section through the sun is shown in the figure. Since the tenuous edge of the lens extends beyond the earth's orbit it follows that there must be some zodiacal light, whether it can be seen or not, passing entirely across the sky, along or near the ecliptic. Observations of this zodiacal band are therefore of great interest. It has been seen to stretch across the sky at midnight by several observers, especially Barnard, to whom it appears 3° to 4° wide. He found it to be best seen during the months of October, November and May.

Intimately connected with this band and with the zodiacal light is the Gegenschein, or counter-glow, a faint illumination of the sky in the region opposite the sun, which may generally be seen by a trained eye when all the conditions are favourable. Unfavourable conditions are moonlight, nearness to the Milky Way, and elevation of the light above the horizon (and therefore a depression of the sun below the horizon) of less than 20°, and the presence in the region of any bright planet. The Milky Way renders the object invisible during the months of June, July, December and January. Its light is so faint and diffuse that it is impossible to assign dimensions to it, except to say it covers a region of several degrees in extent. Barnard, the most successful observer, assigns diameters of 5° or even 10° or more. From what has been said of its position it is evident that the zodiacal band, when seen across the sky, must include it. It may therefore be regarded as an intensification of this band, possibly produced by the increased intensity of the light when reflected nearly back toward the sun, and therefore toward the earth. From the description given of the zodiacal band and the Gegenschein, it is clear that these objects should be best seen at the highest elevation, especially within the tropics. But the only well-authenticated observations we have of this kind show anomalies which have never been cleared up. This is especially the case with those of Chaplain George Jones, who spent eight months at Quito, Peru, at an elevation of more than 9000 ft., for the express purpose of observing the phenomenon in question. He saw the zodiacal band at midnight as a complete arch spanning the sky, agreeing in this point with the observations of Barnard. One anomaly of his observations is his description of the arch as sometimes so bright to the transparency of the atmosphere. Barnard reports it as sometimes best seen when the sky is slightly milky, while during the observations already mentioned from the Rothorn the Gegenschein was scarcely, if at all, visible, though the conditions were exceptionally favourable. It has even been said that observers at great elevations have failed to see the zodiacal light; but it is scarcely credible that this failure could arise from any other cause than not knowing what it was or where to look for it. Moreover, it has been well seen by Hanks from the observatory on the summit of Mont Blanc.

In studying the causes of the phenomenon we must clearly distinguish between the apparent light from the earth, and the real form of the lenticular-shaped cloud. The former refers to the earth, which is continually changing the point of view of the observer as he is carried around the sun, while the latter relates to the invisible position of the matter which reflects the light. First in importance is the question of the position of the principal plane, passing through the sun, and containing the circumferential regions of the cloud. This plane must be near, but not coincident with, that of the ecliptic. It has therefore a node and a certain inclination to the ecliptic. The determination of these elements requires that, at some point within the tropics where the atmospheric maximum, observations of the position of the axis of the light among the stars should be made from time to time through an entire year. In view of the simplicity of the necessary appliances, and of the small amount of labour that would be required, we find a singular paucity of such observations. The most elaborate attempt in the required direction was made by the American chaplain, George Jones, during a voyage of the "Mississippi" in the Pacific Ocean, in 1875-5. Owing to the varying latitude of the ship, and the fact that the observer attempted to draw curves of equal brilliancy instead of the central line, the required conclusions cannot be drawn with certainty from these observations. More recently Maxwell Hall in Jamaica made a satisfactory determination during the months from January to March, July and October, and carefully discussed his results. But the observations do not extend continuously throughout the year, and do not include a sufficient length of the central line on each evening to enable us to distinguish certainly the heliocentric latitude of the central line, as distinct from its apparent geocentric position. Yet his observations are of the first importance as showing the smallness of the deviation of the central line from the ecliptic. When smoothed out, the result is that the maximum latitude is less than 3°, which seems to preclude the coincidence of the central plane of the light with that of the sun's equator. Hall also reaches the interesting conclusion that the plane in question seems to lie near the invariable plane of the solar system, a result which might be expected if the light proceeded from a swarm of independent meteoric particles moving around the sun. Chaplain Jones concluded, from his observations at Quito, that the central line of the arch made an angle of 3° 26' with the ecliptic, the ascending node being in Taurus, near longitude 63°. This is about 40° from the ascending node of the invariable plane, so that there is a well-marked deviation of his results from those of Hall.

Yet more divergent are the conclusions of Francis J. Bayliss, R.N.R., who made many observations while on voyages through the Pacific Ocean between Australia and the west coast of North America. He places the ascending node at the vernal equinox, and assigns an inclination of 4°. He found that as the observer moved to the north or south the axis of the light appeared to be displaced in the direction of the motion, which is the opposite of the effect due to parallax, but in the same sense as the effect of the greater atmospheric absorption of the light on the side nearest the horizon. He also describes the moon as adding to the zodiacal light during her first and last quarters, a result so difficult to explain that it needs confirmation. It is noteworthy that he could see the zodiacal band across the entire sky during the whole of every very clear moonless night in tropical regions.

If we accept the general conclusion already drawn as to the
form and boundary of the region from which the light emanates, the next question is that of the matter sending it forth. The most plausible view is that we have to do with sunlight reflected from meteoric particles moving round the sun within the region of the lens. The polariscopes and the spectroscope are the only instruments by the aid of which the nature of the matter can be inferred. The evidence afforded by these instruments is not, however, altogether consistent. At Upsala, in March, at the same time as the zodiacal line (W.L. 5567), and concluded that in the zodiacal light there was the same material as is found in the aura and in the solar corona, and probably through all space. Upsala, however, is a place where the auroral spectrum can often be observed in the sky, even when no aura is visible, and it has generally been believed that what Ångström really saw was an auroral and not a zodiacal spectrum.

Professor A. W. Wright, of New Haven, also made careful observations leading to the conclusion that the spectrum differs from sunlight only in intensity. Some evidence has also been found by the same observer of polarization, showing that a considerable portion of the light must be reflected sunlight. The observations of Maxwell Hall also embraced some made with the spectroscope. He was unable to see any marked deviation of the spectrum from that of the sun; but it does not appear that either he or any other of the observers distinctly saw the dark lines of the solar spectrum. Direct proof that we have to do with reflected sunlight is therefore still incomplete.

The question whether the Gegensechein can be accounted for by the reflection of light from the same matter as the zodiacal band is still unsettled. Taking the general consensus of the observations it would seem that its light must be so much brighter than that of the band as to imply the action of some different cause. In this connexion may be mentioned the ingenious suggestion of S. Arrhenius, that the phenomenon is due to corpuscles sent off by the earth and repelled by the sun in the same way that they are sent off from a comet and form its tail. In other words, the light may be an exceptionally tenuous cometary tail to the earth, visible only because seen through its very great length. The view that no cause intervenes additional to that producing the zodiacal band is strengthened, though not proved, by a theorem due to F. R. Moulton of Chicago. He shows that, supposing the cloud of particles to move around the sun in nearly circular orbits immediately outside the earth, the perturbations by the earth in the motion of the particles will result in their retardation in that part of the orbit nearest the earth, and therefore in their always being more numerous in a given space, that is to say, in the region of the orbit nearest the earth, and that this may account for some intensification of the light, to which may be added the intensification produced by the vertical reflection of the sunlight.

A new interest was given to the subject by the investigations of H. H. Seeliger, published in 1906, who showed that the observed excess of motion of the peripheral part of Mercury may be accounted for by the action of that portion of the matter reflecting the zodiacal light which lies nearest to the sun. Plausible though his result is, the subject still requires investigation. It seems not unlikely that the true explanation may be that instead of the reflecting matter being composed of solid particles it is an exceedingly tenuous gaseous envelope surrounding the sun and revolving on an axis the mean position of which is between that of the sun's equator and that of the apsidal line of the solar system.

Bibliography

ZOFFANY—ZOISITE

ZOFFANY, JOHANN (1733-1810), British painter, whose father was architect to the prince of Thurn and Taxis, was born in Frankfort-on-Main. He ran away from home at the age of thirteen and went to Rome, where he studied art for nearly twelve years. In 1756 he left for England, and after undergoing some hardship he was brought into favour at court, and in 1772 was included among the foundation members of the Royal Academy. He went to Florence in 1772 with an introduction from George III. to the grand duke of Tuscany, and did not return until 1779. During this second stay in Italy he met with much success, and was commanded by the empress Maria Theresa to paint a picture of the royal family of Tuscany; this work he executed so much to the satisfaction of the empress that in 1778 he was created a baron of the Austrian empire. He went next to India, where he lived from 1783 to 1790, to which period belong some of his best-known paintings: but the last twenty years of his life were spent in England. He died in 1810 and was buried in Kew churchyard. His portrait group of dramatic celebrities are, perhaps, the most highly esteemed of his many productions; they have considerable technical merit and show much shrewd insight into character. Several of the best are in the Garrick Club, London.

ZOILOS (c. 300-330 B.C.), Greek grammarian of Amphipolis in Macedonia. According to Vitruvius (vii., pref.) he lived during the age of Ptolemy Philadelphus (285-247 B.C.), by whom he was produced in his youth. He did not write against his own time, but left a collection of papers on the substrata of many of his fellowmen. He was held in high esteem by Posterius, who draws the portrait character. Zoilos was chiefly distinguished for the acerbity of his attacks on Homer (which gained him the name of Homeromastix, "scurril of Homer"), chiefly directed against the fabulous element in the Hymric poems. Zoilos also wrote against Isocrates and Plato, who had attacked the style of Lysias of which he approved. The name Zoilos came to be generally used of a spiteful and malignant critic.

See U. Friedländer, De Zoiolo aitique Homer Obitractatiorurn (Königsberg, 1869); J. E. Sandys, History of Classical Scholarship (2nd ed. 1890).

ZOISITE, a rock-forming mineral, consisting of basic calcium and aluminium silicate, Ca_2Al_2Si_3O_10(OH)_4, crystallizing in the orthorhombic system. It is closely related to epidote (both in the angles of the crystals and in chemical composition): a zoisite containing some iron replacing aluminium may be identical in composition with an epidote ("clinozoisite") poor in iron. The crystals are prismatic in habit and are deeply furrowed parallel to their length; terminal planes are rare; there is a perfect cleavage parallel to the brachy-pinacoid. Columnar and compact masses are more common. The hardness is 5½ and the specific gravity 3.25-3.37. The colour is often grey; a rose-red variety, known as "thulite," occurs with a white veining. A variety known as "Thulite of Sweden" has been used to a limited extent as an ornamental stone. According to differences in the optical characters, two kinds of zoisite have been distinguished. Zoisite is a product of dynamometamorphism, and occurs as a constituent of some crystalline
schists, such as amphibolite and eclogite. It was first observed by Baron Zois (after whom it was named) in the eclogite of Sau-Alpe in Carinthia; other localities are the Ducktown copper mines in Tennessee, where it occurs embedded in chalcopyrite; Loch Garve in Ross-shire, &c. The "sau-
surite" of the Alps and elsewhere, which has resulted from the alteration of the plagioclase feldspar of gabбро, consists largely of zoisite with epidote.

ZOLA, ÉMILE ÉDOUARD CHARLES ANTOINE (1840-1902), French novelist, was born in Paris on the 2nd of April 1840, his father being an engineer, part Italian and part Greek, and his mother a Frenchwoman. The father seems to have been an energetic, visionary man, who, dying while his only son was a little lad, left to his family no better provision than a lawsuit against the municipality of the town of Aix. It was at Aix, which figures as Plassans in so many of his novels, that the boy received the first part of his education. Thence he proceeded, in 1858, to Paris, where, as at later Marseilles, he failed to obtain his bachelor's degree. Then came a few years of terrible poverty; but at the beginning of 1862 he obtained a clerkship, at the modest salary of a pound a week, in the house of Hachette the publisher. Meanwhile he was writing apace, but nothing of particular merit. His first book, Contes à Nînon, appeared on the 24th of October 1864, and attracted some attention, and in January 1866 he determined to abandon clerking and take to literature. Vigorous and aggressive as a critic, his articles on literature and art in Villemessant's paper L'Événem-
ment created a good deal of interest. So did the gruesome but powerful novel, Germinal (1885). Meanwhile, Zola, his characteristic energy, Zola was projecting something more im-
portant: the creation of a world of his own, like that of Balzac's

Comédie Humaine—the history of a family in its various rami-
fications during the Second Empire. The history of this family, the Rougon-Macquart, was to be told in a series of novels con-
taining a scientific study of heredity—science was always Zola's
ignis fatuus—and a picture of French life and society. The
first novel of the series, La Fortune des Rougon, appeared in
book form at the end of 1871. It was followed by La Curée
(1874), La Ventre de Paris (1874), La Conquête de Plassans
(1875), La Fante de l'Abbé Mouret (1875), Son Excellence Eugène
Rougon (1876)—all books unquestionably of immense ability,
and in a measure successful, but not great popular successes.
Then came L'Assommoir (1878), the epic of drink, and the
author's fortune was made. Edition followed edition. He
became the most discussed, the most read, the most bought
novelist in France—the sale of L'Assommoir being even exceeded
by that of Nana (1880) and La Débâcle (1892). From

La Fortune des Rougon to the Docteur Pascal (1893) there are some twenty novels in the Rougon-Macquart series, the second half of which includes the powerful novels Germinal (1885) and
La Terre (1888). In 1888 Zola departed from his usual vein in
the idyllic story of Le Rêve. Zola also wrote a series of three
romances on cities, Lourdes, Rome, Paris (1894-98), novels on the "gospels" of population (Fécondité) and work (Travail), a
volume of plays, and several volumes of criticism, and other
things. These books are based on study and observation; the
novels are crowded with characters. The whole is a gigantic
opus, the fruit of immense labour, of an admirable tenacity—
so many pages written, morning after morning, without inter-
mission for years. He prided himself on his motto, Nulla dies sine linea.

Zola was the apostle of the "realistic" or "naturalistic"
school; but he was in truth not a "naturalist" at all, in so
far as "naturalism" is to be regarded as a record of fact. He
was an idealist, but while other idealists idealize the nobler
elements in human nature, so has he, for the most part—the
later books, however, show improvement—idealized the elements
that are bestial. He saw man's lust, greed, gluttony, as in a
vision, magnified, overwhelming, portentous. And what he
saw he presented with tremendous power. His style may lack
the classic qualities of French prose—lightness, delicacy,
sparkle; it certainly has not Daudet's colour and felicity of
touch. The first impression it produces may be one of heaviness,
and the later "gospels" on population and work are distinctly ponderous. But for rendering the gloomy horror of the sub-
jects in which he most delights—detail on detail being accumu-
lated till the result is overwhelming—Zola has no superior.
Some of his descriptions of crowds in movement have never
been surpassed.

Zola played a very important part in the Dreyfus affair,
which convulsed French politics and social life at the end of the
19th century. At an early stage he came to the conclusion that
Dreyfus was the innocent victim of a nefarious conspiracy, and
on the 13th of January 1898, with his usual intrepidity, he
published in the Aurore newspaper, in the form of a letter begin-
ing with the words J'accuse, a terrible denunciation of all those
who had had a hand in hounding down that unfortunate officer.
Zola's object was a prosecution for libel, and a judicial inquiry
into the whole affaire, and at the trial, which took place in Paris
in February, a fierce flood of light was thrown on the case.
All this and much more Zola's career put forth all their power, and Zola was condemned. He appealed. On the 2nd of April the Cour de Cassation quashed the proceedings. A second trial took place at
Versailles, on the 18th of July, and without waiting the result
Zola, by the advice of his counsel and friends, and for reasons
of legal strategy, abruptly left France and took refuge in
England. Here he remained in hiding, writing Fécondité, till
the 4th of June 1899, when, immediately on hearing that there
was to be a revision of the first Dreyfus trial, he returned to
Paris. Whatever may be thought of the affaire itself, there
is no question of Zola's superb courage and disinterested-
ness.

On the morning of the 29th of September 1902 Zola
was found dead in the bedroom of his Paris house, having been
accidentally asphyxiated by the fumes from a defective flue.
He received a public funeral, at which Captain Dreyfus was
present. Anatole France delivered an impassioned oration at
the grave. At the time of his death Zola had just completed a
novel, Vérité, dealing with the incidents of the Dreyfus trial.
A sequel, Justice, had been planned, but not executed. After
a life of constant struggle and an obloquy which never relaxed,
the death of the close of Zola's career was the signal for an
extraordinary burst of eulogy. The verdict of posterity will
probably be kinder than the first, and less unmeasured than
the second. Zola's literary position would have more than
qualified him for the French Academy. He was several times
a candidate in vain.

(F. T. M.)

See Émile Zola, Novelist and Reformer (1904), giving a full account
of his life and work, by E. A. Vizetelly, who translated and edited
many of his works in English; also Émile Zola, Novis, A Life of
Zola, by Aubert and W. F. Bruce, and the two volumes, Zola, The Roman Novels, English
translation by C. H. S. Smith, 1904., where he was an ardent
partisan of the chancellor Zamoyski, and supported the can-
didature of Stephen Báthory, under whose banner he learned
the art of war in the Muscovite campaigns. On the death of
Stephen, Zolkiewski vigorously supported the policy of Zamoyski,
and took an active part in the battle of Buczyna, when the
Austrian archduke Maximilian was defeated by the Polish
chancellor. Shortly afterwards Zolkiewski was made castellan
of Lemberg and acting commander-in-chief. On the accession
of Sigismund III. he retired from court and divided his time
between improving his estates, where he built towns and for-
tresses, and disciplining the Cossacks, with whom he enjoyed
great influence. In 1601-2 he served with distinction in the
Livonian war against the Swedes, whom he defeated at Reval.
During the insurrection of Nicholas Zebrzydowski he led the
army which routed the rebels at Guzow in 1607, though pro-
testing against the necessity of shedding "his brothers' blood." For his services he received the palatinate of Klev. He was op-
posed to the expedition sent to place the false Demetrius on the throne of Muscovy; but nevertheless accompanied the king. In the spring of 1618, he was with a band of men against Moscow. On his way thither he defeated and captured
Tsar Vasily Shuiski at the battle of Klushino (July 14, 1610), and
two months later entered the Russian capital in triumph. His tactful and conciliatory diplomacy speedily won over the
boyars, whom he persuaded to offer the Muscovite crown to the
Polish crown prince, Vladislaus. For a moment it seemed
possible that the Vasai family might occupy the throne of Ivan
the Terrible; but Sigismund III. would not consent to the re-
ception of his son into the Greek Church, and refused to ratify
the terms made with the boyars. Zolkiewski then returned to
the Polish camp and assisted in the reduction of Smolensk,
but Moscow in the meantime drove out the Polish garrison and
proclaimed a native dynasty under Michael Romanov. When
Zolkiewski presented his captives, Tsar Vasily and his family,
to the Polish diet, he received an ovation and was rewarded with the
dignity of hetman wielki (commander-in-chief). For the next
few years he defended the Ukraine against the Tatars and
Cossacks, and in 1617 was involved in a war with the Porte
owing to the unauthorized interference of the Polish nobles
in the affaires of Wallachia and Moldavia. Unable to defeat
the sturdy supple劲uates of the Porte, Zolkiewski, in con-
clusion with him an advantageous treaty at Jaruda (27th of
August 1618), by the terms of which he pledged himself to
curb the Cossacks and at the same time renounced all the claims
of Poland to the Danubian principalities. Thus he saved the
one army of Poland to guard her southern frontier from ap-
parently inevitable destruction. On his return he was fiercely
assailed by the diet for not risking everything in a pitched
battle, but Zolkiewski defended himself with an eloquence which
silenced his most venomous opponents. The peace of Jaruda was
then confirmed, and the king conferred upon Zolkiewski
the grand-chancellorship, an honour he had neither desired
nor expected. Fresh attacks were presently made against him
for failing, it was alleged, to prevent the Tatar incursions.
So deeply wounded was the hero by these calumnies that when
in 1619 he was sent against the Turks he publicly declared that
he would never return alive unless victorious. He was as good
as his word. Surrounded near the Dniester by countless hosts
of Turks, Tatars and Janissaries, he retreated through the
Steppes, fighting night and day without food or water, towards
Cecora. By the time he reached it, he saw clearly that his
emperor was impossible, and deliberately determined to die where
he stood. Disguising himself so that his dead body might not be
recognized, he turned upon the pursuers and was slain after
a desperate resistance (6th of October 1620). His head was
cut off, exhibited in the Turkish camp and then sent to Con-
stantinople as a present to the sultan, from whom it was subse-
quently ransomed at a great price. Zolkiewski is one of the
most heroic figures in Polish history. An accomplished general,
а skilful diplomatist, and a patriot who not only loved his
country above all things, but never feared to tell his countrymen
the truth as he conceived it in all private and public virtues. As a
writer he made his name by an important history of his Muscovite
campaigns.

See Stanislaw Gabryd Kozlowski, Life of Stanislaus Zolkiewski (Pol.) (Cracow, 1904). (R. N. B.)

ZÖLLNER, JOHANN KARL FRIEDRICH (1834-1882),
German astronomer and physicist, was born at Berlin on the
8th of November 1834. From 1872 he held the chair of astro-
physics at Leipzig University. He wrote numerous papers
on photometry and spectrum analysis in Poggendorff's Annalen
and Berichte der k. sächsischen Gesellschaft der Wissenschaften,
two works on celestial photometry (Grundzüge einer allgemeinen
Photometrie des Himmels, Berlin, 1861, 4to, and Photometrische
Untersuchungen, Leipzig, 1865, 8vo), and a curious book, Ueber
die Natur der Cometen (Leipzig, 1872, 3rd ed. 1883). He died
at Leipzig on the 25th of April 1882.

ZÖLLVEREIN (Germ. Zoll, toll, customs, and Verein, union),
a term used generally for a certain form of Customs Union, but
specially for the system among the German states which was in
existence between 1819 and 1871 (see Tariff, and Germany:
History). ZÖLMER, a town in Hungary, capital of the county of Bács
Bodrog, 146 m. S. of Budapest by rail. Pop. (1900) 29,936,
two-thirds Servians. It is situated in a fertile plain near the
Franz Josef canal, which connects the Danube and the Theiss,
and is the centre of the corn and cattle trade of an extensive
area.

ZONARAS, JOANNE (John), Byzantine chronicler and theo-
logian, flourished at Constantinople in the 12th century. Under
Alexius I. Comnenus he held the office of commander of the
bodyguard and private secretary to the emperor, but in the
succeeding reign he retired to Hagia Glykeria (one of the Princes'
Islands), where he spent the rest of his life in writing books.
His most important work, Euprouk Iotopouk (compendium
of history), in eighteen books, extends from the creation of
the world to the death of Alexius (1118). The earlier part is largely
drawn from Josephus; for Roman history he chiefly followed
Dio Cassius, whose first twenty books are not otherwise known
to us. His history was continued by Nicetas Acominatus. Various
ecclesiastical works have been attributed to Zonaras—com-
ments upon the Gospels and the authors and the poems of Gregory of Nazianzus;
lives of Saints; and a work on Prognostics and there is no reason to doubt their genuineness. The lexicon,
however, which has been handed down under his name (ed.
J. A. H. Tittmann 1808) is probably the work of a certain
Antonius Monachus (Stein's Herodotus, ii. 479 f.).

cxxvii.; the Chronicle by M. Pinder and T. Bütter-Wobst in
the Bonn Corpus Scriptorum Hist. Byz. (1841-97) and by L. Dink-
dorf in the Teubner series (1868-76); see bibliography in C. Rump-
bacher, Geschichte der byzantinischen Literatur (2nd ed. 1897).

ZONE (Gr. ζώνη, a girdle, from zowelw, to gird), a term
for a belt or girdle, now used chiefly in the transferred sense
of a demarcated area. Thus the earth's surface is divided, for
classification of climates, into five climatic zones: the two
temperate and the two frigid zones and the tropical or torrid
zone. (See Climate and Climatology.)

ZOOLOGICAL DISTRIBUTION (also known as Zoogeography),
the science dealing, in the first place, with the distribution of
living animals on the surface of the globe (both land and water),
considered secondly with that of their forerunners (both in time
and in space). The science is thus a side-branch of zoology,1 in-
timately connected on the one hand with geography and on the
other with geology. It is a comparatively modern science,
which dates, at all events in its present form, from the second
half of the 19th century.

Different parts of the land-surface of the globe are inhabited
by different kinds of animals, or, in other words, by different
faunas. These differences, in many cases at any rate, are not
due to differences of temperature or of climate; and they do
not unreservedly follow on the one hand from the conditions on
the other. The warm-blooded land-animals of Japan are, for example, very
much more closely related to those of the British Isles than is
the corresponding fauna of Africa to that of Madagascar.
Again, on the hypothesis of the evolution of one species from another,
in the case of land-animals unprovided with the means
of flight such resemblances and differences between the faunas
of different parts of the world depend in a great degree on the
presence or absence of facilities for free communication by
land between the areas in question. Prima facie, therefore,
it is natural to suppose that the fauna of an island will differ
more from that of the adjacent continent than will those of
different parts of that continent from one another.

To a great extent this is the case; and if the present con-
tinents and islands had always been in statu quo, the proposition

1 For the distribution of plants, see PLANTS: Distribution.
would, for the most part at any rate, be universally true. Geology has, however, taught us that many parts of what are now continents formed at earlier periods of the earth's history portions of the ocean-bed, while what are now islands have in some instances been connected with the adjacent mainlands, or even with land-masses the sites of which are now occupied by the open sea.

We can hope, therefore, to understand and explain the present distribution of terrestrial animal life only by taking into account what geology teaches us as to past changes in the configuration of the land-masses of the globe, accompanied by investigations into the past history of animals themselves, as revealed by their fossil remains.

Although to understand the reason of many facts in the present distribution of animals—as, for example, why tapirs are confined to the Malay countries and South America—it is essential to study fossil faunas, yet it has been found possible from the consideration of existing faunas alone to map out the land-surface of the globe into a number of zoological "regions," or provinces, more or less independent of the ordinary geographical boundaries, and severally characterized by a greater or smaller degree of distinctness in the matter of their faunas. One of the pioneers in this line of research was Dr P. L. Sclater, who in a paper on the geographical distribution of birds, published in the Journal of the Linnean Society of London for 1858, was enabled to define and name six of such zoological regions; these being mainly based on the distribution of the perching or passerine birds. Two years later Dr A. Russel Wallace, in the same journal, discussed in some detail the problems presented by the distribution of animals in the Malay Archipelago and Australasia. This preliminary essay was followed in 1876 by the appearance of the latter author's Geographical Distribution of Animals, an epoch-making work, which may be said to have first put the study of the distribution of animals generally on a thoroughly firm and scientific basis. With some slight modifications, the names proposed for the six zoological regions by Dr Sclater were adopted by Dr Wallace. Certain changes in regard to the limits and number of the zoological regions adopted by Sclater and Wallace have been proposed; but the original scheme forms the basis of all the later modifications, and these eminent naturalists are entitled to be regarded as the fathers of the study of distributional zoology. T. H. Huxley was also one of those who did much to advance the science in its early days, while among those who have proposed more or less important modifications of the original scheme special mention may be made of Dr W. T. Blanford, Dr A. H. Selby, Prof. P. Matschie and Prof. Max Weber.

The zoological regions proposed by Dr Sclater were based mainly on the distribution of the perching birds; but in the writings of Dr Wallace and of later authors mammals were very largely taken into consideration, and in later schemes there has been a similarly extensive use of the evidence afforded by mammalian distribution. That different groups of animals do not agree with another in the matter of geographical distribution will be evident when we reflect that in many instances there are very great differences in the relative ages of such groups, or, at all events, in the dates of their dispersal, or "radiation," on the surface of the earth. The radiation and distribution of reptiles, for example, greatly antedated that of either birds or mammals. Consequently, the zoological regions indicated by the present geographical distribution of the former group are very different from those suggested by the distribution of the two latter. If zoological regions are based on the evidence of the existing distribution of animals, groups with a relatively late radiation are clearly to be preferred to those the dispersal of which was earlier. Mammals and birds, therefore, are of greater value from this point of view than reptiles; while the absence of the power of flight in the great bulk of the class renders the evidence afforded by mammals superior to that derived from birds. The marked general agreement between the geographical distribution of birds on the one hand and of mammals on the other is, however, a fact of the greatest importance in regard to the value of the zoological regions established on their evidence. Further testimony in the same direction is afforded by the distribution of certain other groups, more especially spiders (Arachnida); and it is also noteworthy that the distribution of the three main divisions of the human race accords to a certain extent with the boundaries of some of the zoological regions based on the distribution of the lower animals.

With regard to the theory of the polar origin of life and the gradual dispersal of animals from the arctic regions, it may be briefly stated that the presumed series of radiations of life southward from the northern pole can have nothing to do with the present geographical distribution of animals, since we have abundant evidence that mammals have been spread over the whole of the warmer parts of the globe since, at any rate, the commencement of the Tertiary period, while the radiation of reptiles commenced at a much earlier epoch.

As regards barriers to the free dispersal of nonvolant terrestrial animals these may be grouped under two main heads, namely, climatic and geographical, of which the second is by far the more important. At the present day a certain number of animals are fitted to live respectively only in hot and in cold climates. The man-like apes and elephants among mammals, and trogons and parrots among birds, are, for example, now exclusively dwellers in tropical or subtropical climates; whereas the polar bear, the musk-ox and ptarmigan are equally characteristic of the arctic zone. To a great extent this must be regarded as a comparatively modern adaptive feature, since many of these arctic and tropical animals belong to groups the distribution of which, either in the past or the present, is more or less independent of climate. Elephants, for instance, formerly inhabited Siberia at a time when the climate, although probably less cold than at present, was certainly not tropical; while the polar bear is a specialized member of a group some of the representatives of which are denizens of the tropics.

It is true, indeed, that within the limits of the different zoological regions temperature-control has had an important influence on the distribution of animals, and has resulted in certain cases in the formation of life-zones, as in North America. As remarked, however, by H. A. Fillsby and J. H. Ferriss in connexion with the distribution of land-molluscs, the life-zones of the United States as mapped by Dr C. H. Merriam emphasize the secondary and not the primary facts of distribution. The laws of temperature-control do not define trans-continental zones of primary import zoologically. These zones are secondary divisions of vertical life-areas of which the molluscs may be evolved in large part independently. And what is true of molluscs will hold good in the case of several other groups.

There is also the phenomenon of vertical temperature-control. On this subject Dr A. R. Wallace has written (Encyc. Brit., 9th ed., art. "Distribution"): "As we ascend lofty mountains, the forms of life change in a manner somewhat analogous to the changes observed in passing from a warm to a cold country. This change is different from that observable in animals than in plants; and it is so unequal in its action, and can so frequently be traced to mere change of climate and deficiency of food, that it must rank as a phenomenon of secondary importance. Vertical distribution among animals will be found in most cases to affect species rather than generic or family groups, and to involve in each case a mass of local details. . . . The same remarks apply to the bathymetrical zones of marine life. Many groups are confined to tidal, or shallow, or deeper waters; but these differences of habit are hardly geographical, but involved in each case a mass of local details. Temperature-control is therefore mainly a factor which has acted independently in the different zoological regions of the globe, and as such demands little or no further mention in a general sketch of the present nature.

The same remark will apply in the case of the influence of humidity on distribution, and also as regards "station." To illustrate the latter we may take the instances of the European squirrel and the chamois, the former of which is found only in wooded districts and is entirely absent from the open plains, while the chamois is normally found on the mountains, in the Pyrenees, Alps, Apennines and the Carpathians. The distributional area of both may, however, be regarded as including Europe generally, so that these local restrictions of range have nothing to do with the wider problems of distribution.

Very different is the case with regard to geographical barriers to the free dispersal of terrestrial animals. It should be observed, however, that even these act with different degrees of intensity in the case of different groups. From the fact that the great majority of them are oviparous, reptiles, whose powers of dispersal in the adult state are generally as restricted as those of mammals, have an advantage over the latter in that their eggs may be carried long distances on floating timber down rivers and thence across the ocean, or may even be occasionally transported by birds. The eggs of batrachians, like those of fresh-water fishes, will in some cases at any rate withstand being frozen, and hence conceivably may be transported by floating ice. Adult insects may be carried in the same manner as the eggs of reptiles. After all, however, such unusual means of transport are probably of no great importance; and it seems most likely that the varying features in the geographical distribution of animals and plants may be traced to the differences in the dates of radiation, or dispersal of those groups, than to varying degrees of facility for overcoming natural geographical barriers to dispersal.

The greatest barriers of all are formed by the ocean and the larger rivers; and from the former factor it follows that zoological regions coincide to a considerable extent—although by no means altogether—with the main geographical (as distinct from political) divisions of the earth's surface. In these, mammals and other nonvolant terrestrial animals are debarked from crossing anything more than comparatively narrow channels of the sea, while even these and the larger rivers form a more or less effectual barrier to the dispersal of the great majority of the species. Hence it results that oceanic islands are usually devoid of such forms of life; while it may be laid down, as a general rule, that the existence of nearly allied types of terrestrial animals in countries now separated by stretches of sea implies a former land-connexion between them. There are, however, in many cases great difficulties in determining the nature of such connexions, largely owing to the fact that we are still in the dark as to whether the dispersal of many groups of animals has taken place down the lines of the present continents from north to south or equatorially by means of belts of land long since swallowed up by the ocean. In this connexion it may be remarked, as tending against the old idea of the radiation of all the modern groups of terrestrial animals from the north towards the south, that there is decisive evidence to prove the existence during the Tertiary period (so far at least as mammals are concerned) of certain great centres of development, and in some instances, at all events, also of radiation, in the southern hemisphere; one of these developmental centres is found in Africa a second in South America, and a third in Australia.

To the general law that straits and arms of the sea form an effectual barrier to the dispersal of the larger land-animals, and more especially mammals, certain exceptions may be pleaded. Jaguars have, for instance, been known to cross the Rio de la Plata, while tigers constantly swim from island to island in the delta of the Ganges and probably also in the Malay Archipelago, and a polar bear has been observed swimming twenty miles away from land in Bering Sea. Deer, certain antelopes, pigs and elephants are also good swimmers; hippopotamuses and crocodiles—especially the latter—can cross channels of considerable width. The great tropical and subtropical rivers also carry down masses of floating soil or large trees upon which mammals and reptiles are borne, and although in many or most instances such are swept out to sea and their occupants drowned, in other instances they may be stranded upon the opposite bank or shore where their living freight can effect a landing. Such instances, however, cannot be very frequent, and they cannot affect widely spread forms. It is a matter of common observation, supposing a mammal to have reached a new land, unless it happened to be a pregnant female, or unless another individual of the opposite sex be similarly stranded, it would eventually die without progeny. Even in the case of a pregnant female, there is no certainty that the offspring, if but one, would be a male; and even supposing this to be the case, the progeny might perish from the attacks of other animals or from inbreeding. On the whole, it may be said, that instances of such methods of dispersal must be relatively few and can affect only countries not very widely separated. The most important case that can be cited is the occurrence of a pig and an extinct hippopotamus in Madagascar, which probably reached that island by swimming from Africa. As a rule, a strait like that separating Ceylon from India may be considered an effectual barrier to the dispersal of large land-animals.

Although the Rio de la Plata has effectively prevented the amphibious carpincho from reaching Argentina, deserts form even more impassable barriers than large rivers, the Sahara having prevented the North African fauna from reaching the heart of that continent. High and continuous mountain chains, such as the Andes and Himalaya, are likewise the most effectual in restricting the range of animals; this being more especially the case when, like the Himalaya, their trend is equatorial instead of, as in the case of the Rocky Mountains and the Andes, from north to south in the direction of the main continental extension. Forests also present great obstacles to animal migration, although this is to a great extent of a local nature and comes, in fact, under the category of "station." Indeed, there appears to be no instance of the separation of one zoological region from another by forest alone.

Lastly it should be mentioned that ice may serve as a factor in the dispersal of animals by acting as a bridge between different land-areas; and at some period this means of communication may have aided in the great migrations of animals that have taken place between the Old and the New World by way of what is now Bering Sea.

I. Terrestrial Distribution

The zoological regions recognized by Dr A. R. Wallace in 1876, which are in the main identical with those proposed by Dr P. L. Sclater in 1858, are chiefly based on the distribution of birds and mammals, and are as follows:

1. Palearctic, which includes Europe to the Azores and Iceland, temperate Asia from the high Himalaya and west of the Indus, with Japan, and China from Ningpo to the north of the watershed
of the Yang-tse-kiang; also North Africa and Arabia, to about 
the line of the tropic of Cancer.
2. Nearctic, comprising Africa south of the tropic of Cancer, 
and as well as the southern part of Arabia, with Madagascar and the 
adjacent islands.
3. Oriental, or Indo-Malay, comprising India and Ceylon, the 
Indo-Chinese countries and southern China, and the Malay Archi-
pelago as far as the Philippines, Borneo and Java.
4. Australian, composed of the remainder of the Malay Archi-
pelago, Australia, New Zealand and all the tropical islands of the 
Pacific, including those of the Marianas and the Low Archipelago.
5. Neotropical, which comprises South America and the adjacent 
islands, the West Indies or Antilles, and Central America and Mexico.
6. Neartic, consisting of temperate and arctic North America, 
and Greenland.

"These six regions," remarks Dr Wallace, "although all of 
primary importance from their extent, and well marked 
by their total assemblage of animal forms, vary greatly in their 
zooological richness, their degree of isolation, and their relation-
ship to each other. The Australian region is the most peculiar and 
the most isolated, but it is comparatively small and poor 
in the higher animals. The Neotropical region comes next in 
peculiarity and isolation, but it is extensive and excessively 
rich in all forms of life. The Ethiopian and Oriental regions are 
also very rich, but they have much in common. The Palaearctic 
and Nearctic regions being wholly temperate are less 
rich, and they too have many resemblances to each other; but 
while the Neartic region has many groups in common with the 
Neotropical, the Palaearctic is closely connected with the Oriental 
regions.

In Dr Sclater's original scheme the first four of the above regions 
were bracketed together under the designation of Palaega, 
and the fifth and sixth, or those belonging to the New World, 
as Neogaea. T. H. Huxley, in a paper on the distribution of 
game-birds, published in the Proceedings of the Zoological 
Society of London for 1868, instead of dividing the world into 
an eastern and a western division, adopted a northern and a 
southern division, calling the former Arctogaea, and the latter 
(which included Australasia and the Neotropical region of Mears 
Sclater and Wallace, but not the Ethiopian region) Neogaea.

In 1874 Dr Sclater, taking mammals as well as birds into 
consideration, adopted Huxley's Arctogaea as the major northern 
division to include the Nearctic, Palaearctic, Oriental and 
Ethiopian regions; and instead of Huxley's Neogaea recognized 
three primary divisions, namely, Dendrogaea for the Neotropical 
region, Antarctogaea for the Australian region (in a somewhat 
restricted sense), and Ornithogaea for New Zealand and Poly-
nasia.

The tendency of these amendments on the original scheme of a 
division into six regions was to recognize three primary 
subdivisions of higher rank than such "regions." This 
view was adopted in 1890 by Dr W. T. Blanford, who proposed to 
designate these three major divisions of the earth's land 
surface respectively the Australian, the South American and 
the Arctogaea regions. A weak point in this scheme is that 
since the term "region" is likewise applied to the subdivisions 
of Arctogaea, there is a danger of confusion between the primary 
and secondary divisions. An amendment proposed anony-
mously ¹ in 1893 was to substitute the names Notogaea, 
Neogaea and Arctogaea for the three primary divisions of 
Dr. Blanford. Yet another emendation, suggested by R. 
Lydekker ² and subsequently adopted by Prof. H. F. Osborn,³ 
was to designate these three primary divisions as "realms," 
and to reserve the name "region" for their subdivisions.

Emendations on the original scheme also included modific-
ations in the limits of the regions themselves. In 1878, for 
instance, Dr A. H. Heilprin ⁴ (in accordance with a suggestion of

peculiar avian families include the birds-of-paradise (Paradisaeidae), the honeyeaters (Meliphagidae), the passerines (Passeriformes), the hawks and owls (Strigiformes), the penguins (Spheniscidae) and the flightless birds (Casuariidae). All these families are represented in New Zealand, although the former are not abundant. The peculiarities of the region are also marked by the absence of certain widely spread family groups, such as the babblers (Megalaimidae), the bower-builders (Ptilonorhynchidae) and the honeyeaters (Meliphagidae). The peculiarities of the region are also marked by the absence of certain widely spread family groups, such as the babblers (Megalaimidae), the bower-builders (Ptilonorhynchidae) and the honeyeaters (Meliphagidae). The peculiarities of the region are also marked by the absence of certain widely spread family groups, such as the babblers (Megalaimidae), the bower-builders (Ptilonorhynchidae) and the honeyeaters (Meliphagidae). The peculiarities of the region are also marked by the absence of certain widely spread family groups, such as the babblers (Megalaimidae), the bower-builders (Ptilonorhynchidae) and the honeyeaters (Meliphagidae). The peculiarities of the region are also marked by the absence of certain widely spread family groups, such as the babblers (Megalaimidae), the bower-builders (Ptilonorhynchidae) and the honeyeaters (Meliphagidae).
in favour of a land-connection between Neogaea and Notogaea cannot be attributed to it by Mr. W. J. Sinclair.

The typical Edentata (sloths, ant-eaters and armadillos) are at the present day practically confined to Neogaea where they have existed from the date of the Santa Cruz beds of Patagonia; and probably much longer. Whether they have ever penetrated into Texas; and in the Pleistocene epoch several representatives of the extinct ground-sloths (Megatheriidae) and a ground-sloth (Mammuthus) from South America are known. The group is, however, essentially Neogaeic. Among the monkeys of the Cebidae, or American monkeys, and their relatives the Hapalidae, or marmosets, are likewise peculiar to Neogaea, where they date from the time of the Santa Cruz beds. The primates, as a matter of fact, are by no means restricted; the lemurs (Lemuridae), are likewise peculiar to this realm, and are doubtless also endemic. With the exception of a few shrew-mice, which have extended to Neogaea from the north, continental Neogaea seems to have presented day devoted to the specialists, however, a very noteworthy fact is that one peculiar family (Solenodontidae) of the order, apparently nearly allied to the Malagasy Centetidae (tenrecs), occurs in the West Indies, while the extinct Neororycia, believed to be near akin to the African golden moles (Chrysolophoridae), is found in the Santa Cruz beds. Rodents of more or less peculiar types are highly characteristic of Neogaea and for the most part date from the Santa Cruz epoch. Among these the Caviidae, Chinchillidae and Octodontidae are peculiar to this realm, while the Capromyidae are common to the Ethiopian region of Arctogaean, being not uncommon in the latter.

Ungulates are in the main very poorly represented in Neogaea and include only the llama group (guanaco, &c.), tapirs, and certain small or medium-sized deer related to North American types. Members of the deer family are however, comparatively few in number, the peculiar genera of horses now extinct (such as Hippiodromus) and mastodonts, were comparatively recent intruders into the realm from the north. On the other hand, Neogaea at the date of the deposition of the Santa Cruz beds was more than one-third occupied by the proboscideans (Perissodactyla), a group of ungulates, such as the Toxodontia and Litopterna, some of the representatives of which (Toxodon and Macrochoerus) flourished during the Pliocene epoch.

Of the Carnivora, the cievet group (Viveridae) is absent, and the representatives of the dog tribe (Canidae), bears (Ursidae), of which there is only a single existing representative, cats (Felidae), and the raccoons (Procyonidae) are found in the latter region. The latter group, however, have spread into several regions of the northern hemisphere. Among the large-fanged carnivores, the Viverridae, which are like the Viverridae, the big-billed toucans (Rhamphastidae), puff-birds (Bucconidae), jacamars (Galbulidae), motmots (Eumomota), and the screech owls (Insololata), are in the main peculiar to this realm, although some of the last-named family wander to the northward in summer. The condors (Cathartidae), form a highly characteristicNeogaeic family; while the dog-like carnivores (Canidae) and ferrets (Mustelidae) are far more abundant in the southern continents, especially as their earliest known representative is African.

Among the reptiles, the tortoises, with the exception of representatives of the terrestrial genus Testudo, all belong to the Pleistocene, and include several peculiar generic types such as Chelys (matamata) and one, Podocnemis, common to Madagascar. To the occurrence in the Pleistocene of almost the entire Neogaeic reptilia (a group whose fossil remains can only be known from the Pleistocene of Queensland, has been already mentioned. A number of snakes of the boa group (Boinae) occur in the realm, to which the genus Eunectes (anacondas) is restricted; but Boy itself, like Podocnemis among the tortoises, is common to Neogaea and Madagascar. The blind burrowing-snakes of the family Glaucophiidae occur throughout the warmer parts of the realm, and are also found in Africa and south-western Asia. The caimans or South American alligators (Caiman) are exclusively Neogaeic; the iguanas (Iguanidae) are mainly peculiar to the realm, although a few individuals have reached the Northern United States. The two outlying genera in Madagascar and a third in Fiji. The teju (Tejuide) are wholly Neogaeic. The Xantusiidae are exclusively Neogaeic, as are the spiny-tailed lizards (Teiidae). The Agamidae, which are practically restricted to Neogaea and Africa. On the other hand, Lacertidae, Varanidae and Agamidae are absent. Tailed amphibians are unknown south of central Central America; but the region is the home of several peculiar types of tortoises (Geochelone and Ornithocheilus) belonging to an otherwise Ethiopian section, and the majority of the family Cistugnathidae, as exemplified by the horned toad (Phrynoderus) and the Arabian cistugnat (Cistugnatophryne), the remainder of the group being Australian.

Freshwater fishes are very abundant in Neogaea, where they are represented by a number of peculiar generic and certain family types; some of the members have developed the remarkable habit of feeding upon the floating fruits abundant in the rivers of the tropical forest-districts.

The electric eels (Gymnotidae) are peculiar to the waters of Neogaea, as are certain other groups, such as the armoured catfishes (Loricariaidae), while true cat-fishes (Siluridae) are extremely abundant. Perhaps, however, the most remarkable feature of the freshwater fish fauna of Neogaea is the absence of a large group (Chondrostomi). Among the lung-fishes the family Lepidosirenidae is, for example, restricted to the two areas, with one genus in each, as is also the family Characinidae. Much the same may be said of the Cichlidae. There is, however, a general tendency for the more specialized groups, such as the flightless aquatic birds, to be absent. Whether the southern fringe of the Palaearctic sub-region and a considerable portion of the Oriental region.

From the first edition of the History of Neogaea, Professor Carl Eigenfin, writing in the Popular Science Monthly for June 1906, observes that "in the earliest Tertiary epoch the South American continent occupied the same area that it does at present; it was a land-mass, between Africa and South America, possibly in contact with Guiana and some point in tropical Africa. This land-mass, which was inhabited, among other things, by fishes remaining from the family Lepidosirenidae (lung-fishes), sank beneath the surface of the ocean, forcing the fauna in two directions, towards Africa and towards South America, exterminating all types not moved to the east or to the west. From these two rudiments have developed the present diverse fauna of Africa and South America, each reinforced by intrusions from the ocean and neighbouring regions of the northern land-mass, and by species from the southern land border. . . . The connexion between Africa and South America existed before the origin of present genera, and even before the origin of some of the present families and sub-families, some time about the early Tertiary. But the connexions of South America and Australia, with neither of these, afford any exchange between Africa and South America since that time."

This connexion between Neogaea and Africa was doubtless a continuous one for the greater part of the time that these areas have been in existence. An allusion has been already made; freshwater fishes being probably a group of earlier radiation than mammals. Perhaps the distribution of the repilin genera common to Neogaea and Madagascar may be explained in the same manner, although tortoises apparently identical with Podocnemis occur in the Eocene of Europe (as well as in that of Africa and India). So that this group may have radiated into the north. Whether the evidence of the Cistugnathidae among the amphibians and of the extinct Mitaarion among the ichthyopods is also evidence of the persistence of the Jurassic connexion between Neogaea and Notogaea till a considerably later epoch must, for the present, be left unascertained. As the evidence of the occurrence of lizards of Madagascar, that is, in Notogaea, is, however, not in favour of such a connexion, the Lacertidae and Agamidae being confined to the Old World, inclusive of Africa but exclusive of Madagascar, while the cosmopolitan Cistugnathidae, so abundant in Neogaea, are extremely scarce in Neogaea.

Reverting to the mammalian fauna, its evidence, combined with that of geology, indicates that during the greater portion of the Tertiary period South America was isolated from North America, and inhabited by its autochthonous fauna of monkeys, marsupots, sloths, ground-sloths, ant-eaters, armadillos, glyptodonts, toxodonts, sloths, saurians (turtles), and rodents, marsupials and creodonts, as well as Varanoids, toads, and some of the other birds now peculiar to the area. This state of things continued till the close of the Tertiary, and was therefore the connexion established with North America by way of the isthmus of Darien. By means of this new land-bridge a certain proportion of the autochthonous fauna of Neogaea was enabled
to effect an entrance into North America, as is exemplified by the occurrence there of ground-sloths and glyptodonts. Simultaneously a large immigration of northern forms took place into Neogaea; this is in all probability a resolved fact, and includes the migrations of such animals as the mammoths and mastodons, and probably also of certain groups of Marsupials. In the former part of the Tertiary period there was, it seems, a large portion of the autochthonous fauna. This it may be well to notice that the evidence for the inhabitation of Neogaea during a large portion of the autochthonous period is supplied by forms which have extended only on that supplied by mammals. C. H. Gilbert and E. C. Starks, for instance, in a work on the fishes of the two sides of the isthmus of Darien, wrote as follows:—"The ichthyological evidence is overwhelming and leaves no existence of any connection between the two oceans, which must have become closed at a period sufficiently remote from the present to have permitted the species of the two regions to become the very large majority of the forms involved." All evidence concurs in showing that at the time of that connexion at some time prior to the Pleistocene, probably in the early Miocene. This it will be observed, agrees almost precisely with the conclusion drawn from the fossil mammalian faunas of North and South America, which indicate that land-communication between those two continents was interrupted during a considerable portion of the Tertiary epoch, and only re-established (or [1] established for the first time) either towards the close of the Miocene or the early part of the Pliocene epoch.

The South American mammalian fauna, as we now know it, is that of an extinct autochthonous element and of a large foreign infusion from the north. As the result of the latter, there is no difficulty; but some degree of obscurity still prevails as to the source of the autochthonous fauna. According to the hypothesis of a tropic boundary, it must be supposed that the fresh-water fishes the early Tertiary Atlantic "Hellenis" may have been in contact with the Guiana on the one side and tropical Africa on the other. Such a connexion did really exist in Tertiary times is the conclusion reached by Dr C. W. Andrews, as the result of his studies of the Tertiary vertebrate fauna of the Fayum district of Egypt, as expressed in the following passage:—"Once established, the idea of a Tertiary connexion between South America and Africa is undoubted; (2) in the Cretaceous period the sea encroached southwards over this land, forming what is now the South Atlantic. How far this depression extended southwards, and in what is now the northern part of South America, the Cretaceous period is not clear, but it appears certain that the final separation of the two continents did not take place till Eocene times, and that there may have been a chain of islands between the northern part of Africa and Brazil which persisted even till the Miocene.

By this route, as was suggested considerably earlier by Prof. W. B. Scott and subsequently by the present writer, Neogaea may have received a considerable portion of its autochthonous mammal fauna. Further reference to this point is made later; but it may be added that the evidence of the land-faunas is supplemented by that of the shallow-water marine faunas on the two sides of the Atlantic, strikingly similar.

In an address to the British Association at the meeting in 1905 in South Africa Mr G. A. Bouleenger expressed himself, however, as not subscribing to the evidence of a Tertiary connexion between Africa and South America. It is understood he observed, "that the hypothesis of a Tertiary land-communication in the Eocene has much in its favour, and when this is coupled with the evidence of islands in the North Atlantic, it is possible that the Cichlidae will have disappeared. In the meanwhile, we must not construct bridges without being sure of our points of attachment." In this connexion it may be mentioned that those who explain the distribution of certain forms of life by the present existence of land-connexion between the southern continents by way of "Antarctica," have attached some importance to the existence of fishes of the genus Galaxias in the freshwaters of New Zealand, Australia, South America and the Cape. This evidence has been shattered by Mr Bouleenger's description (in memoir of the fishes of the Congo) of a marine representative of the genus commencing in the Northern Ocean.

For the zoological subregions of Neogaea the reader must refer, as in the case of most of the other regions, to special works on zoological distribution.

Artocaea. The region comprises the whole of the land-surface of the globe (with the exception of Antarctica) it is almost impossible to give any general diagnosis even of its mammal fauna, as a number of present day monotremes are wholly wanting, while marsupials are represented only by one or two species of opossums (Didelphes) in North America and by cuscuses (Phalanger) in the Australo-Melanesia subregion. Subsequent writers will be able to treat a number of late wanderers from Neogaea into North America, absent from this realm at the present time and during the Pleistocene; the alleged occurrence of a ground-sloth in the Pleistocene of Madagascar being probably due to a misinterpretation. On the other hand, this region, and more especially its eastern half, is the great home of the ungulate mammals. Indeed rhinoceroses may be almost considered the typical representatives of this mammalian family, and it is probable that in former times they have ranged over the whole area, except Madagascar, and are quite unknown elsewhere. The modern land Carnivora are likewise an essentially Neogaeo-Malagasy region, in the comparatively recent period; and the realm may be said to have been the birthplace of most of the higher groups of placental mammals. The tortoises of the family Testudinidae, Pan, and the geckos, are all exclusively of this range.

,

region.

Apart from the widespread Trionychoidea

(of

which there are

two genera peculiar to the

region), the Ethiopian fresh-water
Pelotortoises belong to the section Pleurodira; the two
genera
medusa and Sternothaerus being common to Africa and Madagascar,

and unknown elsewhere. The Amphisbaenidae are common to
Neogaea and Ethiopia, to the exclusion of Madagascar; but the
Gerrnosauridae and Zonuridae, on the other hand, are restricted to
the present region and Madagascar, which also form the headquarters of chameleons. In contrast to the latter community is
the absence in Madagascar of Agamidae and Varanidae, which are
common in Ethiopia. The absence of slow-worms and their kindred
(Anguidae) is a marked negative feature of the present region.
As regards batrachians, the region has no salamanders or other

forms, but, in common with India, possesses caecilians
(Apoda); while it shares the group of tongueless toads (Aglossa)
with Neogaea, its peculiar family being the Xenopodidae, in contradistinction to the South American Pipidae. The Pelobatidae are
absent, and true toads are few, but frogs are abundant.
Among fishes, Africa south of the Sahara possesses a number of
tailed

With Neogaea it shares the possession of the
peculiar types.
typical lung^-fishes (Lepidosirenidae), while it is the habitat of the
species of bichir (Polypterus) and Caiamoichthys, the sole survivors
of the ancient group of fringe-finned ganoids (Crossopterygii).
The other families peculiar to Ethiopia are the Mormyridae (proboscis-fishes), Pantodontidae, and Phractolaemidae the two latter
represented only by a single species each. The Notopteridae,
;

being
Ophiocephalidae, Anabantidae, Osphromenidae and Mastacembelidae are common to Ethiopia and the Oriental region. In addition
to the Lepidosirenidae, the Characinidae are peculiar to this region
and Neogaea. The Cichlidae occur in Madagascar, Ethiopia, the
Oriental region and Neogaea; and the Osteoglossidae are common
to the last three of these regions, as well as Australia, while the
Nandidae are Ethiopian, Oriental and Neotropical.
On the
whole, the affinities of the fish-fauna of Ethiopia are nearest to
that of the Oriental region, and, secondly, to that of South
America.
Although invertebrates do not come within the scope of the

present article,

it

may be mentioned

1009
that Ethiopia

is

remarkable

for the total absence of fresh-water cray-fishes.
As regards its past history, Ethiopian Africa was in connexion
with India during the Triassic and Jurassic periods, the two areas
"
Gondwanaland," which doubtless constituted
collectively forming
a portion of the equatorial land-belt referred to as existing during
the epochs in question. Gondwanaland was the home of a large
section of the anomodont reptiles from which mammals have
sprung; and it is quite probable that the evolution of the latter
Between the Trias
group took place within the present area.
and the Eocene little or nothing is known of the vertebrate palae1
ontology of Ethiopia; and in Egypt there is also a long gap
between the lower Miocene and certain Pliocene beds in the Vvadi
Natrun. The Tertiary deposits of southern Europe and northern

India indicate, however, that Ethiopian Africa was m"free communication with these countries during the upper Miocene and Pliocene
epochs. There occur, for instance, either in south-eastern Asia or
southern Europe, or both, during the_ latter period numerous genera of
antelopes now restricted to Ethiopia, as well as giraffes, okapi-like
ruminants (Palaeotragus), elephants and rhinoceroses of an African
type, probably zebras, hippopotamuses, baboons, chimpanzees and
ostriches. Owing to imperfect knowledge of Pliocene Africa, it is
impossible to say whether these types were first developed in
Ethiopia or to the north-east, and consequently whether or not
Professor Huxley was right in his theory that the modern higher
mammalian fauna of Ethiopia came from the north. It has, however, been suggested that while the Bovidae are an autochthonous
Ethiopian group, the Cervidae originated in either the Holarctic
or the Oriental region; a theory which if confirmed will materially
aid in explaining the absence of the latter group from Ethiopia.
It is
supported to some extent by the fact that we are acquainted
with primitive ancestral deer in the European
while the
Tertiary,
ancestors of the Bovidae are at present unknown. Whatever be
the truth on this point, it is manifest that whether the middle
Tertiary Bovidae migrated from Ethiopia to Asia or in the opposite
direction, there must have been some cause which barred the
entrance by the same route into the latter area of all members
of the deer-tribe (as well as bears).
It should be added that
although the ancestral Proboscidea were Ethiopian, the passage
from the mastodons into the true elephants
appears to have taken
place in Asia; a circumstance which would imply the Asiatic
of
the
African
origin
elephant.
The evidence in favour of the continuation of the Mesozoic landbetween
bridge
Ethiopia and Neogaea has been discussed under
the heading of the latter area.
If the arguments in favour of
suoh a connexion are valid, it is to the old mammal fauna of
Ethiopia that we must probably look for the progenitors of the
Santa Cruz fauna of Patagonia. Very noteworthy is the alleged
occurrence of remains of primitive armadillos in the Oligocene beds
of southern Europe in association with those of
pangolins and
aard-varks; since, if these fossils be rightly determined, there at
once arises the probability of Africa having been the original home
of the entire Edentate order.
In the case of an island lying so close to the African continent
as does Madagascar the natural expectation would be that its
fauna should be intimately related to that of the former. ..
As a matter of fact in the case of mammals and birds,
j"^
at any rate
is much more distinct from the
Ethiopian
^it
fauna than is the latter from the fauna of either the Oriental or
the Holarctic region. The
evidence^ from the above-mentioned
groups in favour of recognizing a distinct Malagasy region is in
fact positively overwhelming, while it is also
in some
supported
degree by the distribution of groups other than those named. In
place of the Ethiopian assemblage of apes, monkeys, baboons,
galagos and pottos, Madagascar (together with the Comoro islands)
possesses an absolutely unique fauna of lemurs, constituting the
as now understood, is confined to this
family Lemuridae, which,
island, where it is represented by the three subfamily-groups of
sifakas (Indrisinae), true lemurs (Lemurinae), and aye-ayes (Chiromyinae). All these animals agree with one another in the characters of the tympanic region of the skull; thereby differing from
the African and Oriental Prosimiae, but agreeing with the European
Oligocene Adapts,^ which must apparently be regarded as the ancestral form.
This is a striking confirmation of the theory advanced
many years ago by Huxley that Madagascar received its lemuroid
fauna from Europe at a very early date, since which time, at any
rate, it has been isolated from Africa.
Some of the Pleistocene
Malagasy lemurs were much larger than any of the living forms,
The Carnivora are reprerivalling in this respect a chimpanzee.
sented only by a small number of species, mostly referable to
peculiar genera, of Viverridae, among which the fossa (CryploIn the ungulates there are only two extinct
procta) is the largest.
species of hippopotamus and a living bush-pig, the ancestors of all
three of which probably crossed the Mozambique channel
by swimming; and Edentata are equally conspicuous by their absence.
Insectivora, on the other hand, are represented by the tenrecs
(Centetidae), with numerous generic types, whose nearest relatives
1
The fossils of the Uitenhage beds, now generally classed as
Jurassic, consist chiefly of invertebrates and plants.


appear to be the west Indian polliwogs. The bats are likewise
differentiated from the mainland, a notable feature being the occurrence of flying-foxes of the Asiatic and Australian genus Pteropus. Of the countless rodents of Africa, all are wanting; while the only members of that group inhabiting the island are certain rat-like animals collectively constituting the family Nesocidae.

The birds are scarcely less remarkable than the mammals, such conspicuous orders as the Ardeidae, the Tinamidae, the Psophophagidae, and the Podocnemidae is remarkable. The former, the American bird family of the birds of prey, is represented in the Seychelles by an Endemic species, Pogoniulus semitorquatus. Whether the predilection for the sea is due to a peculiarity of the Caspian region; or to the fact that the Punjab differs so remarkably in its fauna from the rest of India that it cannot be included in the Oriental region, and must be assigned to the Mediterran-

Euryceros, is, a third subregion, the Malayan, includes southern Tenasserim, the Malay Peninsula, and the Malay Archipelago exclusive of Celebes. In the map in the present article the last-named island is included among Borneo and Sumatra, which are divided from it by a water line. A third subregion, the Ethiopian, is a great region of extension, which, occurring through the Solitaire islands, to an Austro-Malay transitional region. Wallace drew the main line dividing the Oriental from the Australian region between the two islands; while the street through Bali and Lombok is in the direction of "Walter's line." On the contrary, it passes east of Timor and through the Banda and Molucca seas, separating Sula from Buru, and is entirely different from "Walter's line," Dr. A. Pelseneer has proposed the name of "Walter's line." It is this "Weber's line" which marks the real division between the Arctogaean and the Notogaean faunas, although it has been taken by some as the line to make Celebes the centre of an intermediate transi-

The Oriental region agrees with the Ethiopian in being inhabited by elephants, rhinoceroses, buffaloes, several large representatives of the Cervidae (amphibious deer), boas and vipers, etc., and by many species of bats. The pigeons, doves, and pelicans are, however, all limited to the Oriental region. It may be added that Madagascar differs from Ethiopia in possessing one fresh-water cray-fish, the representative of a genus by itself.

The radical distinctness of the Malagasy fauna is thus demonstrated from all sides. That the island has been separated from Ethiopia during the greater portion of the Tertiary period is self-evident. The interpretation of its relationships with other regions is, however, a subject of controversy. The African and Madagascar faunas are widely separated in the Eocene, as well as in the Pliocene. The spider-tortoise (Pyxis) is a peculiar cryptodiran Malagasy genus. In the matters of batrachian the Malagasy region lacks both coelacians (Apoda) and toad-like toads (Anura), while it has in greater variety the Asiatic and African genera, among them the Oriental genus Rhacophorus. Of fishes, the peculiar Ethiopian types are absent from the present region, although the community of the Cichlidae to Neogaea and the Ethiopian region. It may be added that Madagascar differs from Ethiopia in possessing one freshwater cray-fish, the representative of a genus by itself.

In the opinion of Captain F. Hutton 4 the landshells of the genus Endodina, which ranges all the way from Polynesia, New Zealand, eastern Australia, New Guinea and the Philippines, with an outlier in Ceylon, afford the best evidence in favour of a Polynesian continent, the Singalese pointing to the conclusion that this group of molluscs originally came from the north. The molluscian evidence will not, however, explain the South American connexion.

Zoological evidence of the latter connexion, by way of Antarctica, is afforded by the earthworms of the family Acanthodrilidae, which are unknown north of the equator, although their occurrence in Madagascar may point to a northern origin. Additional evidence of a connexion with Patagonia is afforded by the occurrence in the Tertiary strata of South America and New Zealand of a number of shallow-water marine invertebrates. Further, the occurrence of these forms in older strata in South America than in New Zealand suggests that the migration took place from the Eocene to the latter era.

The relatively small and wholly tropical or subtropical Oriental region is also characterized by its distinct aspects, of which an abstract appeared in the Proceedings of the Royal Society of London for 1900 (vol. lvii. p. 484), Dr Blanford came
to the conclusion that the Punjab differs so remarkably in its fauna from the rest of India that it cannot be included in the Oriental region, and must be assigned to the Mediterra-

One member of this group has recently been described from the Shan States.
zoological distribution

terrestrial | halves of the holarctic region (or in some instances of portions of the adjacent transitional zones to the southward) the following may be mentioned: elk (Alces), reindeer (Rangifer), wapiti (Cervus elaphus), mountain hare (Lepus timidus and its relatives), ptarmigan (Lagopus), beavers (Castor), marmots (Arctomys), chipmunks (Tamias), squirrels (Spermophilus, or Citellus), jumping-mice (Zapus), field-mice, or voles (Microtus, or Arvicola), lemurs (Lemmus and Dicrostonyx), redshanks (Tringa totanus), and several others. Among these may be added, as more exclusively arctic forms, the polar bear (Ursus maritimus), and the arctic fox (Canis lagopus). There are, however, many genera which are restricted to the holarctic region. Among reptiles, the pond-tortoises of the genus Emys, if we include their Pleistocene range, are an essentially holarctic (and mediterranean-Sonoran) group. In regard to fishes, the entire area is characterized by the abundance of sturgeons (Acipenseridae), carp (Cyprinidae), pike (Esoxidae), and the salmon group (Salmonidae), coupled with the scarcity of cat-fishes (Siluridae).

Further testimony in favour of the unity of the holarctic region is afforded by the presence on the two sides of the pacific (and in most cases nowhere else) of true alligators (Alligator), giant eels (Conger), and the false alligators (Gavialis, proper), with the latter group of unknown distribution in the far eastern region of the holarctic. Again, it is highly probable that Père David's deer of Central Asia, alone representing the genus Elaphurus, is akin to the fork-antlered deer (Cervus elaphus) of Europe and Asia Minor, but no further instances might be quoted. Finally, the distribution of earth-worms affords the strongest confirmation of the view that the two halves of the holarctic region form but a single zoological province, with the mediterranean and Sonoran zones as transitional appendages.

In briefly reviewing some of the chief faunistic areas of the palearctic, as distinct from the holarctic, it will be convenient to include some of the groups and species inhabiting the transitional mediterranean zone, much of which is in reality only a portion of the palearctic subregion. Of this transitional mediterranean zone, the first characteristic feature is that of a number of wild sheep, such as Ovis musimon, gmelini, ammon, poli, etc., which have representatives on the other side of bering strait, as well as wild goats, like Capra hircus-cervus, C. ibex, and C. sibirica, belonging to an exclusively old world genus, the saiga antelope (Saiga) and the chamois (Rupicapra) may also be regarded as palearctic (in the sense of old world) types; as are also wild horses (Equus caballus-przewalskii), and the kiang (E. hemionus) and onager (E. hemippus), the latter being commonly termed wild ass, although widely different from the african animals properly so-called. There are also many peculiar types of birds, including the many peculiar varieties of passerines. Père David's deer (Elaphurus), the roe-deer (Capreolus), and the musk-deer (Moschus); while the chinese water-deer (Hydropotes) is one of the characteristic forms from the mediterranean zone. As regards reptiles (and amphibians) and mammals, a few may be quoted. Among the carnivora, reference may be made to the raccoon-dog (Nyctereutes), the panda (Ailurus), and the wild dog (Canis), as well as the vonderhorstian dogs (Canis orientalis) and the weasels (Mustela), or long-tailed weasel (Mustela frenata), with its relative the short-tailed weasel (Mustela nivalis). Among the insectivora, reference may be made to the water-shrew (Neomys or Cossutus) is exclusively palearctic, as is the allied Diplomastodon, while the desmans (Myogale), although a palearctic type, are solely old world types. Among the rodents, reference may be made to the Old world family of the dormice (Gliiridae or Myoxidae), of which the genera glis and muscardinus are restricted to the area; as are the hamsters (Cricetus) and siberian hamsters (Phodopus), and the marmots (Marmota). Among the birds, the thrushes, warblers, jays, magpies, buntings, sparrows, and (in the eastern part of the mediterranean zone) pheasants, pratincoles,

1 The American of form is often separated as Neotrichus, but this does not affect the relationship of the two areas.
ZOOLOGICAL DISTRIBUTION

TERRESTRIAL

coursers (Glareolidae), and bustards (Otididae), of which there are numerous genera confined to the area. The two families last named are characteristic of the Nearctic region, the first (represented by the bearded tit), being solely Old World, are of themselves sufficient to distinguish the Palearctic from the Nearctic fauna.

Of the remaining subregion-to-the restoration of the Palearctic—underlies the subregion, in its restricted sense, being characterized by the poverty of its fauna, several of the widely spread families of the Old World, such as the Varanidae and Agamidae, stopping short of its southern limits. In other families, such as the Ctenodactylidae, represented in this and the Mediterranean region (as in the northern hemisphere generally), the genera Salamandra and Chialosoma, as well as the frogs and toads of the genera Alytes and Pelobates, being entirely absent. Only a small number of species of reptiles, however, is found in the Palearctic and are rare in the Nearctic subregion. The ophidian (Python) is a native of the Mediterranean rather than the Palearctic.
independent region, is best ranked (on Prof. Max Weber's scheme) as a transitional zone between the Nearctic subregion of the Holarctic region of Arctogaea, on the one hand, and Neogaea on the other. Its fauna is essentially a mixture of the two, and hence may be considered as largely derived from them, and not (as is often supposed) as being based on the pocket-gophers (Geomysidae) and kangaroo-rats (Heteromyidae), some of the genera of which are peculiar to this area. Among the more striking features of the bird fauna of the more southerly parts is the fact that the region is characterized by a large number of tropical species, and by a number of birds which are otherwise confined to the Orient. The latter, for instance, include the tucan (Ramphastos) and the toucan (Asio), which are confined to the south-eastern parts of the continent.

Perhaps the most important aspect of the bird fauna of the region is the fact that it is characterized by a large number of tropical species, and by a number of birds which are otherwise confined to the Orient. The latter, for instance, include the tucan (Ramphastos) and the toucan (Asio), which are confined to the south-eastern parts of the continent.

The latter, for instance, include the tucan (Ramphastos) and the toucan (Asio), which are confined to the south-eastern parts of the continent.
For the distribution of invertebrate animals generally, the reader may be referred to the articles dealing with the various groups of that assemblage. An exception must, however, be made with regard to the spiders, known as the Mygalomorphae (which includes the trap-door spiders) on account of the remarkable general similarity presented by its distribution to that of mammals. According to Mr. R. I. Pocock the distribution of the Mygalomorphae is the same as that of the Myomorphae (excluding the Vespidae). The world is divided into the following zoological regions:—

1. The Holarctic, including Europe north of the southern mountain-chains, North Asia, and North America north of about the 50th parallel of latitude.
3. The Sonoran, comprising the United States of America south of about the 45th parallel and the plateau of Mexico.
4. The Ethiopian, embracing Africa south of the Sahara, the South Arabian and Madagascar.
5. The Antarctic, comprising all regions of the earth south of the 60th parallel of latitude.
6. The Australian, constituting all regions of the earth south of the 20th parallel of latitude.
7. The Ethiopian, comprising all regions of the earth south of the 20th parallel of latitude.

These spiders furnish, moreover, strong evidence in favour of a former union between Africa and South America, and of a connection between the Australo-American and Australian continents on the one hand and the Australian and south-western regions of South America on the other. As regards the first regions, and with regard to the last, the distribution of these spiders accords with remarkable closeness to that of mammals, if we except the more intimate connexion indicated between the faunas of Ethiopian Africa and Madagascar.

Dr. Ortmann adds in a later paragraph, "the chief aim of z&oelig;no-geographical study consists—as in any other branch of biology—in the demonstration of its geological development."}

II. MARINE DISTRIBUTION

That the fauna of the ocean, apart from the influence of temperature, would be much more uniform, and therefore less susceptible of being divided into zoological provinces, or regions, will be apparent from a glance at the map of the world on Mercator's projection, in which the fact that the three great oceans—the Pacific, the Atlantic, and the Indian—are in free communication with one another in the southern hemisphere is clearly brought out. There is, however, more than this; for there is evidence that during the early part of the Tertiary period the Pacific and the Atlantic were not separated by the isthmus of Darien; while there is a probability that the Mediterranean was at one time in communication with the Red Sea, and that other connexions of a like nature have existed.

In addition to this general community of the marine fauna of the world, there is the further important fact that such faunas may be divided into three main, and for the most part perfectly distinct, groups: namely, the littoral, or shallow water, fauna, the abyssal, or deep-sea, fauna, and the pelagic, or surface, fauna. Of these three the first alone is really susceptible of division into more or less ill-defined zoological regions, the other two being practically uniform in character. Moreover, these three faunas are for the most part perfectly well defined; the pelagic being very sharply separated from the abyssal, although there may in certain instances be a tendency for the littoral to merge locally into the abyssal. As regards the sharp demarcation between the pelagic and the abyssal faunas, an idea it was formerly current that whales, which are essentially pelagic animals, when "sounding," descended to abyssal depths in the ocean. A moment's reflection will show the absurdity of such a supposition; for no surface-dwelling animal could possibly support the enormous pressure existing at great depths, in the body-cavities of animals so situated. The abyssal fauna is afforded by the fact that when fishes are brought to the surface from great depths their bodies are practically broken to pieces by the removal of the normal pressure, while their scales start from the skin and the eyes from their sockets. The absolute darkness prevailing at great depths would be another bar to pelagic animals descending to the ocean abysses. We may accordingly regard the pelagic and the abyssal faunas as perfectly distinct and widely separated from one another; as widely separated in the case of some species as are beings living in three-dimensional space from these (if such there be) in two-dimensional space.

Modern research shows that invertebrates, and probably also fishes, live at the greatest depths that have yet been reached by the dredge, and the inference from this is that they occur everywhere. The general results of the various expeditions have led to the belief that the fauna of the ocean depths is much the same all the world over, and that identical species occur at points sundered as widely as possible from each other. The more than double the ocean floor, however, has been well remarked, with the same uniformity in the matter of temperature, food, station and general conditions of life, contains, in fact, no effective barriers to the almost indefinite dispersal of species.

The foregoing general considerations with regard to the deep-sea fauna were arrived at after working out the material and evidence obtained during the cruise of H.M.S. "Challenger."—(1) Animals, belonging to the orders that have been described from abyssal depths, are not so abundant as at moderate depths; but since representatives of all classes of marine invertebrates are met with at all depths, this poverty probably depends more upon certain causes affecting the composition of the bottom deposits, and the degree to which the bottom-water is provided with chemical substances necessary for animals, rather than upon conditions immediately associated with depth. (2) There is reason to believe that the fauna of "blue water" is chiefly restricted to two belts; one at or near the surface, and the other near the bottom, the intervening zone being more or less completely devoid of inhabitants. (3) The surface-water, particularly the cold bottom-water, is rich to the bottom, which, however, in the case of the greatest depths may be completely dissolved in descensus. (4) Although all the chief groups of invertebrates are represented in the abyssal fauna, their relative proportions are very unequal; molluscs, including cephalopods, would, as a rule, scarce, while echinoderms and sponges predominate. (5) Depths below 500 fathoms are inhabited by a practically uniform fauna, the genera being usually represented by allied forms in widely sundered areas. (6) The abyssal fauna, so far as invertebrates are concerned, is of an archaic type as compared with shallow-water fauna. (7) The most characteristic and archaic abyssal types seem to be most abundant and to attain their maximum dimensions in the southern ocean. (8) In general character the abyssal fauna approximates to that of shallower water in polar latitudes, doubtless owing to the fact that the conditions of temperature and the distribution of marine animal life mainly depends, are nearly the same.

In consequence to the abundance of sponges in the deep-sea fauna, it may be mentioned that the calcareous group is absent, and that among the siliceous section, the Hexactinellidae, of which the Venus flower-basket (Euplectella) and glass-robe sponge (Hyalonema) are familiar representatives, are exceedingly abundant; the conditions of temperature being likewise of great geological antiquity. Corals are scarce and belong for the most part to the Turbinolidae. Echinoderms are represented by all the existing classes, but the stone-ossuaries (Cupulidae) and the family Aplacidae, which attained its maximum development during the Jurassic epoch; and somewhat similar relationships are exhibited by certain of the Cephalopoda. The Ophiuridae are also notably rich in the general development of the sea-cucumber group (Holothuroidea), and likewise the bizarre forms assumed by some of its abyssal representatives. Molluscs, however, are poorly represented, and it is not improbable that of the cephalopod cuttle-fishes (Cephalopoda) Bivalves of the genera Leda and Arca have, however, been obtained from a depth of 16,000 ft. Lamp-shells (Brachiopoda) are likewise scarce.

Considerable difficulty exists in determining from what depths fishes are dredged. Although many species display various structural peculiarities, such as a huge head, or an attenuated ribbon-like body, while special phosphorescent organs are very generally present, each species has developed as a result of an isolated and sectional group by itself, but are drawn from a number of families, certain members of which have adapted themselves to an abyssal existence. A preponderance of representatives of the families Macruridae, Ophidionidae and Scopelidae is, however, noticeable.

Whether light or temperature is the prepotent agency in regulating the limits of distribution of deep-sea forms is a question long before it was first noted that reef-building corals, which require an average temperature of from 70° to 75° F. and one which never falls below 68°, are never found below a depth of 20 fathoms (120 feet) and where an average temperature of from 70° to 77° obtains to depths of between 80 and 100 fathoms. It is further remarkable that well-characterized deep-sea faunas are locally met with in comparatively shallow waters. One instance is that of the pelagic Clio, which was

Changed

ocean, fathoms.

The number 155 of the Clio, a derivate of the old Mesozoic Mediterranean, the south-polar fauna of the old Pacific fauna. The first developed along the shores of the northern continents, while the second had its original home on the shores of the Antarctic continent. We know that there is a strange element among the littoral fauna of the southern extremities of the continents, differing entirely from the arctic fauna, and wholly different from the tropical and the south-polar. The above consideration give us the threefold origin of the present deep-sea fauna:—(1) An ancient Mesozoic (or pre-Tertiary) constituent, derived from a transformed part of the old warm-water fauna of the deep sea, adapted to the changed climatic conditions. It is clearly autochthonous. (2) A more modern, immigrant, Tertiary constituent, which came from the north-polar littoral waters, and immigrated into the deep sea together with the cool water (or after it had passed). This element goes back to an old pre-Tertiary stock that lived in the warm littoral waters of the old Tethys (Mediterranean Sea), but as a cold-water fauna, it is not older than Tertiary. (3) A Tertiary element, corresponding to the second one, but belonging to the south pole, which is finally to be traced back to the warm waters of the old Pacific Ocean of pre-Tertiary times.

American region; so that the eastern and western shores of the Atlantic appear decidedly more distinct than the eastern and western coasts of America. The extensive Oriental region is by far the richest.

From the distribution of the species (not genera) of barnacles, or cirripeds, which are an aberrant group of Crustacea, Darwin considered the main divisions of the zoological regions, viz.-(1) The North Atlantic, comprising North America and Europe down to N. lat. 30°; (2) The West American, from Bering Strait to Tierra del Fuego; (3) The Malayan, from India to New Guinea, and (4) The Australian, comprising Australia and New Zealand: the Malayan and Australian regions being the richest in cirripeds.

One of the earliest students of the geographical distribution of marine animals was Dr S. P. Woodward, who, in his Manual of the Mollusca, proposed a scheme of zoö-geographical regions. He adopted three main divisions for the warmer parts of the ocean; namely, the Atlantic, the Indo-Pacific and the West American; and these Wallace was inclined to regard as the only valid marine molluscan regions. The Indo-Pacific region extends from the Red Sea and the east coast of Africa to the eastern Pacific islands, and corresponds to Prof. Dana's Oriental region for Crustacea, many species ranging over nearly the whole area. The Atlantic region unites the fauna of the east coast of America with that of West Africa and South Europe, but has considerable affinity with that of West America, many genera being common to both areas. Several genera appear restricted to the north temperate zone, which in Wallace's opinion should perhaps form a distinct region. Numerous genera are confined to the Indo-Pacific region. The Atlantic coasts have few peculiar genera of importance, while the west coast of America has hardly any, the difference of its fauna from that of the Atlantic on the one side and the Indo-Pacific on the other being chiefly specific. It is stated that while there is not a single species common to the east and west coasts of tropical South America, the corresponding coasts of North America have a large number in common, while others are so closely representative as to be almost identical.

Inclusive of an Arctic province of somewhat doubtful value, Dr Woodward's three main regions were divided into 18 subregions; but, according to a somewhat modified later scheme, these may be arranged in four main groups, as follows:-

**Fish Regions.**—From the distribution of shore-haunting fishes, Dr A. C. L. G. Günther 1 suggested the following marine zoological regions, the characteristic family and generic types of which we are prevented by limitations of space from discussing:-

I. Arctic Ocean.
II. Northern Temperate Zone.
   A. Temperate N. Atlantic.
   1. British district.
   2. Mediterranean district.
   3. N. American district.
   B. Temperate N. Pacific.
   1. Kamchatkan district.
   2. Japanese district.
   3. Californian district.
III. Equatorial Zone.
   A. Tropical Atlantic.
   B. Tropical Indo-Pacific.
   C. Pacific Coast of Tropical America.
   1. Central American district.
   2. Galapagos district.
   3. Peruvian district.
IV. Southern Temperate Zone.
   1. Cape of Good Hope district.
   2. South American district.
   3. Chilean district.
   4. Patagonian district.
V. Antarctic Ocean.

**Mammal Regions.**—The last scheme of marine zoological regions necessary to mention is one proposed by Dr P. and W. L. Scater 2 on the distributional evidence afforded by seals, sea-cows and cetaceans. According to this, we have the following six regions, viz.:-

(i) Articatiticia (North Atlantic), characterized by the presence of seals of the subfamily Phocaee, with the genera Halichoerus peculiar to it, and Phoca common to it and No. iv.; the absence of sea-cows; and (it is stated) by the bottle-nosed whales (Hydrodocent) being peculiar to this area.
(ii) Mesatitelia (Mid Atlantic), the sole habitat of the monk-seal (Monachus) and the manit (Phalina).
(iii) Philolititelia (Indian Ocean), characterized by the presence of dugongs and the absence of seals.
(iv) Arctitelia (North Pacific), agreeing with No. i. in the possession of Phoca but distinguished by also having sea-bears and sea- lions (Otaridae): formerly the habitat of the northern sea-cow (Rhybia), and now of the grey whale (Rabicinaetex).
(v) Mesitielia (Mid Pacific), without Phoca or sea-cows, but with the elephant-seal (Macrorhinus), from the south, and also Otaridae.
(vi) Notolititelia (Southern Ocean), with four peculiar genera of seals (Phocaee), numerous sea-bears and sea- lions, and two peculiar genera of cetaceans, the pigma-whale (Noebula) and Arno's beaked-whale (Baradus).

To explain the absence of sea-bears and sea- lions from the North Atlantic, and likewise the existence of manit on both Atlantic coasts, the authors of this scheme call in the aid of a land-connexion between Africa and South America, which presented a barrier to the migration of the northern species of seals; and the consequent ceiling of dispersal to the latter. As the Otaridae are at present unknown previous to the Miocene, such an explanation, if valid, requires the persistence of the ancient land-bridge across the Atlantic to a much later date than is commonly supposed.

III. DISTRIBUTION IN TIME

The subject of the distribution of animals in time, i.e. the relative dates of their first appearance on the earth, and in the case of extinct forms the length of their sojourn there, can be treated but briefly; reference being restricted to the larger groups, and not even all of these being mentioned. The dates of appearance and disappearance of the various groups are only relative, for although many more or less vague attempts have been made to determine the age of the earth, there is no possibility of indicating in years the length of time occupied by the deposition of any one stratum or series of strata. All that can be attempted is to say that one stratum (and consequently the remains of animals that may be entombed in it) is older or younger, as the case may be, than another. For the sequence and names of the various strata, or time-periods of the geological record, see GEOLOGY. An important factor in regard to the past history of animals is the imperfection of the geological record. Recent discoveries have rendered this imperfection much less marked than was formerly the case. There is, however, an important story which we have, for instance, no definite information as to where and when the transformation from reptiles into mammals took place.

It may nevertheless be emphatically affirmed that the geological, or rather the palaeontological, record indicates a gradual progression in the status of animals from the lowest to the highest fossiliferous strata. That is to say, the earlier animals were creatures of comparatively low grade (although certain representatives of such groups may have attained a relatively high degree of specialization), and that as we ascend the geological ladder higher and higher types of animals make their appearance, till the series culminates in man himself—the crowning effort of creation, in the modern evolutionary signification of that term. It is not, indeed, to be supposed that the higher groups made their appearance exactly according to their relative grades or (what we regard as such); all that can be affirmed is that in the main the higher forms have made their appearance later than the lower. The record is thus almost exactly what it might be expected to be on the theory of evolution; while it also accords fairly well if regarded with sufficient breadth of view—with the Biblical notion of creation.

A brief survey of the time-distribution of the leading groups of animals may now be undertaken, commencing with the highest and concluding with the lowest groups.

---

1 See Study of Fishes (London, 1880).
2 The Geography of Mammals (London, 1890).
As the highest of all vertebrates, it is natural to expect that mammals should be one of the latest groups of that assembly to make their appearance; and this as a matter of fact they are, although it is by no means improbable that birds are to be found in the earlier deposits of the Cambrian period. As a matter of fact, however, that the approximately contemporaneous Trilobites, represented by Protocimex; the former, appears to be in great degree intermediate between reptiles and mammals, it is by no means improbable that none of these Mesozoic periods, in so far as the existing records are referable to the Marapaplia, Insectivora, and, not improbably, that the former also (Stegocephalia). After the lowest Eocene (when the Puerco fauna represented an inferior and apparently non-progressive type) mammals became abundant; and during that epoch most if not all of the existing orders made their appearance.

Birds.

There is little doubt that they are really due to almost mammalian reptiles. The class Aves, so far as we know, is therefore first represented by the long-tailed Archaeopteryx of the upper Jurassic, which represents a sub-class (or order) by the lower Eocene. The later birds also appear during the Cretaceous period, and have been developed ever since. Both Europe and North America, but all these appear referable to existing ordinal (or subordinal) groups. By the lower Eocene, when teeth appear to have been entirely lost, most or all of the existing orders were developed; and these orders continue in existence, which date the majority at all events have steadily increased.

In contradistinction to both the preceding classes, reptiles, which date from the Permian are a varying group, at all events so far as both terrestrial and marine forms are concerned. The Permian reptiles were small or medium-sized creatures, few in number, and of generalized character. Among the orders of which it is represented by Protosaurus is the Rhynchocephalia, of which the sole survivor is the New Zealand tuatara (Sphenodon). The Mesozoic period, from the Trias to the Cretaceous, is true 'age of reptiles.' The Trias has been developed by the reptiles. The Triassic forms are the case of the marine groups very generally of small size, and apparently among the preponderating groups of the Jurassic and Cretaceous, the Dinosaurs, as demonstrated by their footprints in the sandstone of the Connecticut valley, were represented by species of huge size even in the Trias. The other extinct orders whose distribution was approximately coeval with the Mesozoic period were the Ichthyosaurs (Ichthyopterygii), the Plesiosaurus (Sauropterygia), and the Pterodactyls (Ornithosauria). The Chelonia and Crocodilia (if we include the Platypterygia) date from the Trias, but are also dominant forms at the present day, the mammal-like Anomodontia (Theromorpha), which ranged from South Africa to India and Russia, were solely Triassic. The Sphenodon, Archosauria, and some of the extant Cretaceous Pythons (Mocassusare, etc.), did not come into being till the upper Jurassic, or lower Cretaceous, and constitute the great bulk of the existing members of the class.

The Myriapoda (centipedes and millipedes) are of comparatively little importance as fossils. The class dates from the Devonian, and is abundant in the Coal-measures; the Palaeozoic forms for the most part being Palaeobolithina of the French upper Silurian. From the Devonian about a dozen forms are known, belonging to several groups; and from the Coal-measures extensive insectoid remains are known. The two supreme groups of the distinctive features by which the modern groups are characterized, the majority of them showing the cockroach group.

The Mollusca, of which the great bulk are marine and the majority of the above water species are the class, of which the great bulk are marine and the majority of the classes are molluscs. The order representing the molluscs is that which is known as the Gastropoda, including the snails, slugs, and clams. The order Bivalvia (bivalved molluscs) is represented by the bivalved molluscs, and includes such familiar forms as the cockroach (Fusus) and gastropods showing a relatively poor development. The bivalved molluscs are represented by such as the Cockroach, the Bivalves and gastropods have shown a steady increase to the present day, and are now the dominant forms.

Insects date from the Ordovician grahorites-slates of Sweden, and are known in the upper Silurian only. The most abundant of the class are the Trilobites, the next best being Palaeolabidina of the French upper Silurian. From the Devonian about a dozen forms are known, belonging to several groups; and from the Coal-measures extensive insectoid remains are known. The two supreme groups of the distinctive features by which the modern groups are characterized, the majority of them showing the cockroach group.
ZOLOGICAL GARDENS

ZOLOGICAL GARDENS, sometimes called ZOOLOGICAL PARKS, institutions in which wild animals are kept in captivity. Their primary object is to gratify the pleasure most persons take in viewing at close range the curious and beautiful living products of nature, but they serve also as means of instruction in natural history, providing material for museums and for investigations in comparative anatomy and pathology, while they may have a commercial value as pleasure resorts, or as show grounds for the display of animals that have been imported or that are for sale.

According to Captain Stanley Flower, director of the Zoological Gardens at Giza, Cairo, Egypt, the ancient Egyptians kept various species of wild animals in captivity, but the first Zoological Garden of which there is definite knowledge was founded in China by the first emperor of the Chou dynasty, who reigned about 1400 B.C. This was called the "Intelligence Park," and appears to have had a scientific and educational object. The ancient Greeks and Romans kept in captivity large numbers of such animals as leopards, lions, bears, elephants, antelopes, rhinoceroses, and ostriches, and in the general as well as in the public entertainment, these animals were displayed. The garden of Sennacherib at Nineveh was a zoological garden, and it is said that the elephants brought in by Pharaoh Necho, king of Egypt, were kept in the garden of Alexandria, which is the first zoological garden known to history.

ZOOGDIAL GARDENS

1019

and Montezuma II, emperor of Mexico in the beginning of the 16th century, maintained large collections of animals in the gardens of his capital.

Most of the modern zoological gardens date from comparatively recent years, and there are a larger number stocked with a finer collection of animals, more suitably housed, than at any past time in the history of the world. According to a reference list compiled by Captain Stanley Flower, there were 202 actually existing public gardens or parks containing collections of wild animals in 1910, while there are a considerable number of private collections. It is possible to refer here only to a few of the more important.

Africa.—The Zoological Gardens at Giza, Cairo, are a government institution administered by the Public Works Department. The grounds are beautifully laid out and the collection is particularly rich in African animals, to which the climate is well adapted. The Khartoum Zoological Gardens are free to the public and are under the control of the municipality, but the collection of animals is under the Game Preservation Department. The Transvaal Zoological Gardens at Pretoria are a government institution, and are associated with the Museum.

America, North.—The Zoological Park at Bronx Borough, New York City, opened in 1896, is one of the largest in the world. It is controlled by the Borough of the City of New York, and is financed largely out of municipal funds, and is open free to the public five days a week. The Park occupies nearly 300 acres, of great natural beauty, and is laid out in a park-like form by the most eminent landscape gardener. It contains many fine buildings, designed on the most modern lines, but its special feature is a series of spacious enclosures, whose beauty is such that they are not only a source of great enjoyment to the visitor, but also as a national reserve, and has already been an important factor in the preservation of the American bison.

The National Zoological Park at Washington, D.C., was founded by Congress in 1888 for the advancement of science and the instruction and recreation of the people. The site was purchased by the United States government, and all the expenses come from national funds, the management being vested in the Smithsonian Institution. The Park consists of an area of 265 acres of undulating and wooded tracts of natural woods and rocks, traversed by a gorge cut by Rock Creek, a tributary of the Potomac. The river and gorge extend into the country far beyond the Park, and the animals that have been introduced, there are many wild creatures that retain their native freedom, such as musk rats in the creek, grey squirrels, crested cardinals and turkey buzzards. The varied natural conditions form an almost ideal site for a collection of animals; great care and skill have been expended on the designing and construction of the houses, the collection receives many accessions from various government departments, including the foreign consul service, and it usually exhibits every year an additional animal. The Zoological Gardens in Fairmount Park, Philadelphia, resemble the gardens of the Zoological Society of London, of which they are a direct offshoot. The Zoological Society of Philadelphia, founded in 1859, and is supported partly by subscriptions of members, partly by gate-money and partly by an allowance from the city of Philadelphia. They consist of a fine collection, in which the most interesting feature is the careful and scientific method of feeding the animals, and the increasing scientific and commercial enterprise of the nation have combined to make the collections rich and interesting. The great Gardens at Berlin were founded in 1844, and belong to a private company, but one much to the interest and benefit of the Royal House. The collection is extremely good, the houses are well constructed and sumptuously decorated, and the general management is conducted on the most aesthetic scientific lines. The Zoological Gardens at Munich were founded in 1860 and are partly supported by the government and partly by private societies and partly by the municipalities. The collections are not specially rich in the very interesting and peculiar native fauna, but devote themselves preponderantly to imported animals.

Europe.—There are a large number of zoological gardens in Europe, but those of real importance are not numerous. The Imperial Menagerie of the palace of Schönbrunn, Vienna, was founded about 1752. The public are admitted free to the greater part of the gardens, but the gardens and collection are the property of and are supported by the emperor of Austria. The collection is very large and well kept; the gardens and menagerie of the Royal Zoological Society of Antwerp were founded in 1843, and have been maintained at a very high level. The collection is not usually very rich in species, but it can be kept as a long-caged and well arranged collection of breeding of large animals such as hippopotamuses, lions and antelopes, and a very large business is done in domesticated birds, wild animals and caged birds. The Zoological Gardens, held in the Gardens, chiefly surplus stock from various zoological gardens, are famous. The revenue is derived partly from subscriptions, partly from gate-money, from the fine concert-hall and refreshment pavilion. The Zoological Gardens of the Zoological Society of London in Regent’s Park, founded in 1828, extend to about only 35 acres, but the collection, if species and rare animals be considered rather than the number of individuals, has always been the finest in existence. The Society is not assisted by the state or the municipality, but derives its revenue from the subscriptions of Fellows, gate-money, Garden receipts and so forth. In India there is a large and excellent collection of mammals. The larger and better known Jardin d’Acclimatation in the Bois de Boulogne is owned and conducted by a private company. It was founded in 1858 and is beautifully situated and well laid out. In addition to the usual annual financial support, the good management is a commercial value. In recent years it has been somewhat neglected and presents no features of special interest, but efforts are being made to revitalize its prosperity. Germany contained in 1910 nineteen zoological gardens, but in process of formation. In most cases they are associated with concert-halls and open-air restaurants, which account for much of their annual profit. Among the animals are generally a small collection of wild animals, and the increasing scientific and commercial enterprise of the nation have combined to make the collections rich and interesting. The great Gardens at Berlin were founded in 1844, and belong to a private company, but one much to the interest and benefit of the Royal House. The collection is extremely good, the houses are well constructed and sumptuously decorated, and the general management is conducted on the most aesthetic scientific lines. The Zoological Gardens at Munich were founded in 1860 and are partly supported by the government and partly by private societies and partly by the municipalities. The collections are not specially rich in the very interesting and peculiar native fauna, but devote themselves preponderantly to imported animals.
spectacular point of view, and very suitable where most of the animals are young and in process of training. The chief gardens in Europe are those of London, at Kew, and in the Zoological Society, "Artis Magistra." In addition to the menagerie, founded in 1838, and since then remaining one of the chief collections of the world, the Society owns a fine aquarium, and supports a museum and library. The Zoological Gardens, which however, are not a part of the biological collections of other European countries are of little importance.

Certain general remarks may be made on the efficient management of the zoological gardens.

Finance.—Disbursements for rent, rates and taxes naturally vary according to the special conditions; in a large number of cases public land is provided free of cost, and in a smaller number of cases, with such of the public useful functions, are relieved of the ordinary burden of taxation. In London, rent, rates and taxes have all to be paid, precisely as if the gardens were a profit-distributing private institution, the annual expendi- ture, therefore, is extremely large, but fortunately the average of all the gardens is such as to show that in London a collection such as that in London can be adequately maintained. The cost of new buildings varies too much to make any individual figures useful.

The zoological gardens are owned by private companies and derive their income entirely from gate-money, menagerie sales, rent of refreshment rooms, concert-halls and other auxiliary public attractions. The gardens being desirous of being obtainable to the majority of the members of the company. In other cases the gardens are assisted by public authorities, in return for which a certain number of free days are given. In other cases again, as in the case of London, the income is derived partly from the subscriptions of the members, and receive privileges as to admission, and partly from gate-money and menagerie receipts, all the income being expended on the maintenance of the institution and on scientific purposes.

The expense of maintaining a zoo will depend with some extent on the object of the institution. The species and varieties of mammals and birds that have a commercial value as farmyard stock or as pets, are for the most part easy to keep, are attractive to the public and may be a source of profit. Some of the smaller gardens in Europe, and perhaps a majority of those in other parts of the world, pay much attention to this side, but the more important collections, and those only, which are possible limited to natural species and wild animals. In theory every wild species has its place in a zoological collection, but the actual choice is limited by so many practical considerations that the better-known collections are remarkably alike. Birds are the most important, and the leading collections devote a good deal of attention to reptiles and batrachians; fishes and aquatic invertebrata are most often to be found, whilst species of land invertebrata are seldom to be seen and at most of a few moths and butterflies, spiders, scorpiuses and centipedes, molluses and crustaceans. Within these limits, the first choice falls on large and well-known creatures which every one can recognize and desires to see. The large Carnivora, lions, tigers, jaguars and leopards are the first favourites; then follow monkeys, then the large ungulates, elephants, rhinoceroses and hippopotamuses, camels and giraffes, deer and antelopes and equine animals, whilst birds are appreciated chiefly for plumage and song. Animals vary very greatly in visibility (see LONGEVITY), and practical experience has shown that animals of the genus bear a very strong resemblance to those reasons that appear to be psychological as well as physically quick to succumb. Many animals of great zoological interest, from their nocturnal habits, or natural disposition, display themselves so seldom as to be almost lost to view. It is usual to reserve the better localities of the public, whilst closely allied species are not distinguished except by trained observers. If the object of a collection is simply to provide a handy and popular exhibition, it is neither difficult nor very costly to get together and to maintain. But if the object be, as in the case of the greater zoological institutions, to get together as many species as possible, and to exhibit animals that have been obtained, the possible range is enormous and the cost very great.

Sources of Animals.—A certain number of wild animals are born in captivity and from time to time the possession of a successful stock is a condition of the survival of zoological gardens. In London it was able to supply many Continental gardens with giraffes, and Dublin and Antwerp have had great successes with lions, whilst antelopes, sheep and cattle, or tigers and equine animals are always to be found breeding in one collection or another. Such stocks, however, usually fail in time, partly from close inter-breeding, partly from the ordinary chances of mortality, and partly from the cumulative effects of strange conditions. Fresh-caught wild animals have to be fed for a considerable time, and the majority of cases the conditions of success are that the wild creatures should be obtained as young as possible, kept in their native climate, and have to be fed, not on what they can find in their wild state, but on what they can be given at their ultimate destinations. The percentage of failure is greatest when fresh-caught adults are hurred to Europe or America. Individuals, moreover, vary greatly in their capacity to reproduce, and experience shows that it is less costly and more practical if the selection be made in their natural homes. The most promising sources of new species for zoological gardens are the young creatures which have been partly tamed by hunters, traders, natives or travelers, and which have been acquired by travellers. Many of these find their way to the great shipping-ports, where there have grown up establishments that to species of animals. Special expeditions are arranged to procure numbers of particular birds or mammals, but these are extremely costly and the mortality is usually high.

Area and Site. The areas occupied vary from about 300 acres (New York) to about 8 acres (Bristol, England). In the larger gardens, however, the greater part of the space is engaged by a few extensive enclosures for herds of herbivorous animals, and where no attempt is made to associate the function of a game reserve with that of a menagerie a smaller area is quite satisfactory. From the point of view of public convenience, too, a large space is fattiguing and makes it more difficult to see the animals, whilst if the colonel of many menageries is the idea of proportion of the advantages. The older gardens have followed too closely the idea of small cages, designed to guard an animal securely rather than to display it in a fitting environment, but if designed and arranged to be too small or too large and is less small than in a relatively large enclosure. With regard to situation, the ideal would be to have the collection placed in the open country, but in centres of population. But as menageries are supported for the public and in most cases by the state, it is a matter of practical, and if the soil, drainage and exposure are reasonably good, experience shows that a thriving collection may be maintained in an indoor arrangement. The ideal would be to have the open space immediately in front and to have the animals rapidly become contaminated, and the ideal condition would be to have an impermeable fencing covering the whole area, and supplied with suitable layers of sand, sawdust, peat-moss or other absorbent substances which can be changed at frequent intervals. The buildings should be constructed on the most modern hospital lines, with smooth walls and rounded corners, so that complete removal of faecal matter is possible. Buildings should be clean and dry, and the floors well drained. Animals should be fed abundantly, however, that even the best designed and best cared for buildings rapidly become contaminated, and it is probable that in the majority of cases the so-called waterprooaff are erroneous in principle, and should be replaced by light and cheap structures not intended to last longer than a few years. In most temperate climates, artificial heating is necessary, at least occasional, and in tropical and warm temperate zones, artificial cooling is extremely good and the collection may be maintained in those cases in considerable comfort. In cold-blooded animals, such as reptiles and batrachians, thrive best in an equable temperature, and, especially in the case of snakes, frequently can be induced to feed only when their temperature has been raised to a certain point. But the vast majority of birds and mammals not only can endure a large range of temperature, but thrive best when they are subjected to it. Protection from violent draught and shelter from extremes of heat and cold are necessary, but in most cases the choice is left to the animals themselves, and the most successful arrangements consist of free exposure to the climate, the result of which is also applicable to the wintering of living beings are subject to epidemics, and in an ideal menagerie special precautions should be taken. New arrivals should be quarantined until it is certain that they are in a satisfactory condition of health. All animals should have their cages and their cages and enclosures disinfected, whilst as a matter of routine the enclosure in which any animal has died should be swept and fumigated with carbolic, after post-mortem examination, which should be made in every case, appropriate measures of disinfection employed.

Feeding.—The food must be as varied as possible, and special attention should be paid to the quality of the food, and to the supply. It is important that no more should be supplied at a time than is necessary, as most animals rapidly foul their food, and except in a few special cases, wild animals are peculiarly liable to disease. If possible, the animals should be fed as near the natural diet as can be from experience, and from watching individual cases; frequency varies within very wide limits, from reptiles which at most may feed once a week and fast for long periods, to the smaller insectivorous birds which require to be fed every two or three
hours, and which in the winter dark of northern latitudes must be lighted up once or twice in the night to have the opportunity of feeding. Knowledge of the habits of animals and experience are the best guides to the nature of food to be supplied, but the keeper should be warned that the objects of their charges and to judge from these of the extent to which any particular substances are being digested. The feeding of carnivores is on the whole the most easy; the chief pitfall being the extreme liability of all except the larger forms to suffer digestive disturbances from food that is not quite fresh. The more powerful creatures in a state of nature are accustomed to kill a prey too large to be devoured at once, and to return to it again and again, long after it has putrid; the smaller forms, for the most part, devour nothing but small creatures immediately after they have been captured and killed, and consequently in an absolutely fresh condition. The chief advantages in the carnivorous or ravenous habits of creatures is that their constitutions are not adapted to the richness of cultivated fruits and cereals, and, in captivity, may suffer mechanically from the want of bulk in their food supply, or if they eat a quantity sufficient in bulk, it contains an excess of nutritive material. A minor problem in menageries is injudicious feeding by visitors. Many authorities attempt to restrain visitors from feeding the animals in their charge, but a restriction, even if practicable, is not all gain, for animals in captivity are less inclined to moe, and are more intelligent and tame, if they become accustomed to regard visitors as pleasant sources of tit-bit.

ZOOLOGICAL NOMENCLATURE, the system by which it is attempted to designate, exactly and conveniently, the animals which exist now or are known to have existed. It is, in fact, the grammar of classification, and has the advantage that it is applicable and useful as a method of names of the same genera or species, without regard to country to country, but even amongst civilized peoples, and still more amongst uncivilized persons and the lower races, the animals denoted by popular names are a very small part of existing forms, whilst the connotation of the names is vague and varying. Linnaeus was the first to adopt a precise system, which he explained and applied in 1731 in his Philosophia botanica, and later extended to animals in the tenth edition of his Systema naturae (1758). The foundation of the system was the application of a binomial nomenclature to species (see Srrtces). Each species was designated by a binomial name, consisting of the Latin name of the genus to which it belonged, and the second the appellation peculiar to the species. There are many different cat-like animals, such as the common cat, lion, tiger and so forth, more obviously related to one another than they are to dog-like or hyena-like carnivores. The assemblage of cats constitute the genus Felis, the wild cat being one species, Felis catus, the lion another, Felis leo, the tiger yet another, Felis tigris, and so forth. The various genera were grouped into families, the family taking its designation from the leading genus, as, for instance, the family Felidae for the cats. Families were grouped into orders, the Carnivora, in the order Carnivora, and the orders in Classes. There is still little uniformity in the designation of the assemblages higher than families, and less agreement as to the degree or measure of separation to be indicated by the use of the designations employed. For the system adopted in the present work, see Zoology.

Linnaeus named very many species and genera, but the number known continues to increase at a prodigious rate, while precision of description has far surpassed his conceptions, with the result that his rules have long ceased to meet the needs of modern science. In 1842 the English ornithologist, H. E. Strickland, assisted by a committee of which Charles Darwin was a member, elaborated rules which became known as the Strickland Code, and were adopted in 1845 by the American Society of Geologists and Naturalists, and in 1846 by the British Association for the Advancement of Science. In 1881, the International Congress of Geology, meeting at Bologna, constructed a code differing in many respects from that of Strickland, and well applicable to fossil forms. In 1831 the Zoological Society of France agreed on new rules, based on those of Strickland, but formulated by a committee of which Maurice Chaperse and R. Blanchard were leading members. In 1885 the American Ornithologists' Union, urged by the needs of the great advance in ornithology in America, adopted rules which were still further modified from the Strickland Code. In 1894 the Zoological Society of Germany framed another set of rules drawn up by J. V. Carus, L. Doderlein and K. Mbius. In 1896 the English entomologist Lord Walsingham devised another modification of the Strickland Code, which became known as the Hymenoptera Code, due to its application to Hymenoptera. The existence of so many conflicting authorities caused much confusion and an impractical condition of nomenclature in which many distinguished and active systematists elaborated practices individual to themselves. When the International Congress of Zoology held its first meeting in Paris in 1889, one of the chief objects submitted to it was the necessity of framing rules which should be uniform in their application to the whole animal kingdom and which might receive international sanction. The discussion was carried over to the second meeting of the congress at Madrid in 1895, at which the code proposed by R. Blanchard was accepted. Further modifications were made, partly to reconcile it with the German Code, and a permanent commission was appointed to consider fresh points that might arise. In 1905 there was published, with the sanction of the Congress, in French, English and German (International Rules of Zoological Nomenclature, Paris, 1905, F. R. de Rudeval) a set of rules finally codified by M. R. Blanchard, von Machenrath and C. W. Stiles, which appears to be a close approach to an international system applicable to every group in the animal kingdom. At subsequent meetings of the Congress minor modifications have been made, and new rules to be proposed and occasionally adopted, but with one important exception, to be referred to later, fundamental lines of agreement appear to have been reached, and many of the most active workers have accepted the international code as binding. It is possible here to give only a short summary of the more important rules.

The goal to be reached is that the connotation and denotation of every zoological designation should be definite. One name is to designate one and only one species, each species having one, and only one, scientific name (following the invention of Linnaeus) and three names for each sub-species (a refinement not necessary in the time of Linnaeus). The scientific names must be Latin or Latinized forms. The names are to be written, even in English, in italic type, thus Felis catus, the feline as distinct from the felvine for Felis. When a generic name is itself a compound, a corresponding change in the name of the family or sub-family derived from it. A generic name must consist of a single word, written with a capital initial letter, and treated as a substantive in the nominative singular. When a genus is divided into subgenera the name of the typical sub-genus must be the same as the name of the genus, and when it is desired to cite the name of a sub-genus this name must be placed in parentheses between the generic and the specific names, as, for instance, Vanessa (Vesica) cardui and Vanessa (myraineis) cardui respectively, for the typical sub-genus and another sub-genus of the genus Vanessa. The specific name is written in a lower case with a capital initial letter, corresponding to the generic name or substantives in the generic; they are written with a small initial letter except when they are substantives derived from the name of a person, but even in the latter case it is permitted and is becoming usual to employ the small initial letter, as Gazella caprae. If it be desired to cite the sub-specific name, such name is written immediately following the specific name without the interposition of any mark of punctuation, as Rana esculenta marina, or more briefly, Rana esculenta marina. When it is to be cited, the author's name is always placed immediately after the scientific name, and may, if it be desired, follow the name of a person, and the interposition of any mark of punctuation, e.g. Felis catus Linnaeus. Names are merely designations, or recognition marks, and not descriptions, and hence a name is not to be rejected or changed if it is otherwise valid, because it gives a wrong description; there is no more reason why Felis rufus should be a redder cat than Felis rufus John Black a person of swarthy complexion; nor is a name to be rejected
because of tautonomy, and thus *Apsu apus apus* may be a valid designation of a sub-species if the names are otherwise valid.

It has happened frequently and continues to happen that a creature is discovered to have been given more than one name. Which of these is valid? The decision of this is one of the most difficult andcontroverted problems in nomenclature. In the hope of settling it by some system which should be as nearly as possible automatic and should leave the least possible to the inclination or choice of the individual worker, there was formulated what is called the rule of priority. The valid name of a genus, species, or sub-species is the one which was first described and published and with the conditions first that the name was published and accompanied by an indication, definition or description, and second that the author applied the principles of binary nomenclature. The tenth edition of Linnaeus' *Systema naturae* (1758) is the work that first consistently applied the binary system to zoology generally and is accepted as the starting-point of zoological nomenclature. Beginning from this the oldest available name is therefore to be retained. The application of the rule of priority is in many cases very difficult, but the labours of zoologists in many groups are rapidly succeeding in making the necessary direct and incidental changes in nomenclature, whilst, with regard to recent work, the rule is invariable. A special difficulty has, however, arisen and is pressing so acutely that a most important modification is likely to be introduced.

To systematists working with a large series of species in a museum or collection, one species is as important as another, and changes of names even of familiar animals are matters of little moment. But a comparatively small number of animals hold a prominent place in the attention of zoologists who are not specially systematists and of the public interested in natural history. It is complained that application of the rules of priority is changing the names of many familiar animals, designations that are sanctioned by long usage in museums and laboratories, in the famous treatises of comparative anatomy, of general biology, of travel, medicine, and the sciences and subjects closely related to zoology. There is being claimed, in fact, protection against the law of priority for a certain number of such familiar and customary appellations. The machinery for drafting such a list of exceptions exists in the permanent nomenclature commission of the International Congress of Zoology, and there is more than a hope that this change will come into operation.

To make the denotation of zoological names precise, exact workers are endeavouring to associate the conception of types with names, a process which can be made simple and definite with new work, but which presents great difficulties in the attempt to apply it to existing terms. Every family should have designated one of its genera as the type genus, every genus a type species and so forth. In the case of species or sub-species the type is a single specimen, either the one only before the author when writing his description, or one definitely selected by him, the others being paratypes. Such type specimens are the keynote of modern expert systematic work and their careful preservation and registration is of fundamental importance. A co-type is one of several specimens which have together formed the basis of a species, no one of them having been selected by the author as a type. A topotype is a specimen killed at the typical locality. (P. C. M.)

**Zoology** (from Gr. ἀνάγγειλ, a living thing, and λέγειν, theory), that portion of biology (q.v.) which relates to animals, as distinguished from that portion (Botany) which is concerned with plants.

**History**

There is something almost pathetic in the childish wonder and delight with which mankind in its earlier phases of civilization gathered up and treasured stories of strange animals from distant lands or deep seas, such as are recorded in the *Physiologus*, in Albertus Magnus, and even at the present day in the popular treatises of Japan and China. That omnivorous universally credulous stage, which may be called the "legendary," was succeeded by the age of collectors and travellers, when many of the strange stories believed in were actually demonstrated as true by the living or preserved trophies brought to Europe. The possibility of verification established verification as a habit; and the collecting of things, instead of the accumalating of reports, developed a new faculty of minute observation. The early collectors of natural curiosities were the founders of zoological science, and to this day the naturalist-traveller and his correlative, the museum curator and systematist, are the chief workers in the field of zoology. Indeed, the historical and present importance of this aspect or branch of zoological science is so great that the name "zoology" has until recently been associated entirely with it, to the exclusion of the study of minute anatomical structure and function which have been distinguished as anatomy and physiology. Anatomy and the study of animal mechanism, animal physics and animal chemistry, all of which form part of a true zoology, were excluded from the usual definition of the word by the mere accident that the zoologist had his museum but the garden of living specimens as the botanist had; and, whilst the zoologist was thus deprived of all the modern anatomical and physiological study—only later supplied by the method of preserving animal bodies in alcohol—the demands of medicine for a knowledge of the structure of the human animal brought into existence a separate and special study of human anatomy and physiology.

From these special studies of human structure the knowledge of the anatomy of animals has proceeded, the same investigator who had made himself acquainted with the structure of the human body desiring to compare with the standard given by human anatomy the structures of other animals. Thus comparative anatomy came into existence as a branch of inquiry apart from zoology, and it was only in the latter part of the 19th century that the limitation of the word "zoology" to a knowledge of animals which expressly excludes the consideration of their internal structure was rejected by the general consent of those concerned in the progress of science. It is now generally recognized that it is mere tautology to speak of zoology and comparative anatomy, and that museum naturalists must give attention as well to the inside as to the outside of all animals.

Scientific zoology really started in the 16th century with the awakening of the new spirit of observation and exploration, but for a long time ran a separate course uninfluenced by the progress of the medical studies of anatomy and physiology. The active search for knowledge by means of observation and experiment found its natural home in the universities. Owing to the connexion of medicine with these seats of learning, it was natural that the study of the structure and functions of the human body and of the animals nearest to man should take root there; the spirit of inquiry which now for the first time became general showed itself in the anatomical schools of the Italian universities of the 16th century, and spread fifty years later to Oxford.

In the 17th century the lovers of the new philosophy, the investigators of nature by means of observation and experiment, banded themselves into academies or societies for mutual support and intercourse. The first founded of surviving European academies, the *Academia Naturae Curiosorum* (1651), especially confined itself to the description and illustration of the structure of plants and animals; eleven years later (1662) the Royal Society of London was incorporated by royal charter, having existed without a name or fixed organization for

---

1. The medieval attitude towards both plants and animals had no relation to real knowledge but was a part of the popular and to some extent highly interesting mysticism. A fantastic and elaborate doctrine of symbolism existed which comprised all nature; witchcraft, alchemy and medicine were its practical expressions. Animals as well as plants were regarded as "simples" and used in medicine, and a knowledge of them was valued from this point of view.

2. The *Academia Secretorum Naturae* was founded at Naples in 1560, but was suppressed by the ecclesiastical authorities.
seventeen years previously (from 1645). A little later the Academy of Sciences of Paris was established by Louis XIV. The influence of these great academies of the 17th century on the progress of zoology and particularly to effect that bringing together of the museum-men and the physicians or anatomists which was needed for further development. Whilst the race of collectors and systematizers culminated in the latter part of the 18th century in Linnaeus, a new type of student made its appearance in such men as John Hunter and other anatomists, who, not satisfied with the superficial observations of the popular "zoologists," set themselves to work to examine anatomically the whole animal kingdom, and to classify its members by aid of the results of such profound study. Under the influence of this work, a new science, zoology, was developed; but, as no one could show a simple fact of observation that it had taken place, nor as a result of legitimate inference that it must have taken place, it was quite as likely that the past and present species of animals and plants had been separately created or individually brought into existence by unknown and inscrutable causes, and (it was held) the truly scientific man would refuse to occupy himself with such fancies, whilst ever continuing to concern himself with the observation and record of indubitable facts. The accurate information, if not the "natural philosopher," though right in their main conception, were premature.

It was reserved for Charles Darwin, in the year 1859, to place the whole theory of organic evolution on a new footing, and by his discovery of a mechanical cause actually existing and demonstrable by which organic evolution must be brought about, entirely to change the attitude in regard to it of even the most rigid exponents of the scientific method. Darwin succeeded in establishing the doctrine of organic evolution by the introduction into the web of the zoological and botanical sciences of a new and powerful subject-matter of this new science, on which biological science, had been neglected: it did not form part of the studies of the collector and systematist, nor was it a branch of anatomy, nor of the physiology pursued by medical men, nor again was it included in the field of microscopy and the cell-theory. The area of biological knowledge which Darwin was the first to subject to scientific method and to render, as it were, contributory to the great stream formed by the union of the various branches, is that which relates to the breeding of animals and plants, their congenital variations, and the transmission and perpetuation of those variations. This branch of biological science may be called the "zoology of evolution," or "animal breeding." Outside the scientific world an immense mass of observation and experiment had grown up in relation to this subject. From the earliest times the shepherd, the farmer, the horticulturist, and the "fancier" had for practical purposes made themselves acquainted with a number of biological laws, and successfully applied them without exciting more than an occasional notice from the academic students of biology. It is one of Darwin's great merits to have made use of these observations and to have formulated their results to a large extent as the laws of variation in a hereditary way. As the breeder selects a congenital variation which suits his requirements, and by breeding from the animals (or plants) exhibiting that variation obtains a new breed specially characterized by that variation, so in nature there is a selection amongst all the congenital variations of each generation of a species. This selection depends on the fact that more young are born than the natural provision of food will support. In consequence of this excess of births there is a struggle for existence and a survival of the fittest, and consequently an ever-present necessarily acting selection, which either maintains accurately the form of the species from generation to generation or leads to its modification in correspondence with changes in the surrounding circumstances which have relation to its fitness for success in the struggle for life.

Darwin's introduction of the doctrine of organic evolution into the domain of scientific biology was accompanied by a new and special development of a branch of study which had previously been known as teleology, the study of the adaptation of organic
structures to the service of the organisms in which they occur. It cannot be said that previously to Darwin there had been any very profound study of teleology, but it had been the delight of a certain type of mind—that of the lovers of nature or naturalists par excellence, as they were sometimes termed—to watch the habits of living animals and plants, and to point out the remarkable ways in which the structure of each variety of organic life was adapted to the special circumstances of life of the variety or species, including colossal and grotesque forms of some animals and plants which the museum zoologists described without comment were shown by these observers of living nature to have their significance in the economy of the organism possessing them; and a general doctrine was recognized, to the effect that no part or structure of an organism is without definite use and adaptation, being designed by the Creator for the benefit of the creature to which it belongs, or else for the benefit, amusement or instruction of his highest creature—man. Teleology in this form of the doctrine of design was never very deeply rooted amongst scientific anatomists and physiologists; it was considered for reasons both of evidence and of convenience to be somewhat vaguely on the subject of the utility of this or that startling variety of structure; but few attempts, though some of great importance, were made systematically to explain by observation and experiment the adaptation of organic structures to particular purposes in the case of the lower animals and plants. Teleology had, indeed, an important part in the development of physiology—the knowledge of the mechanism, the physical and chemical properties, of the parts of the body of man and the higher animals allied to him. But, as applied to lower and more obscure forms of life, teleology presented almost insurmountable difficulties; and consequently, in place of exact experiment and demonstration, the most reckless though ingenious assumptions were made as to the utility of the parts and organs of lower animals. Darwin's theory had as one of its results the reformation and rehabilitation of teleology. According to that theory, every organ, every part, colour and peculiarity of an organism, must either be of benefit to that organism itself or have been so to its ancestors;\(^1\) no peculiarity of structure or general conformation, no habit or instinct in any organism, can be supposed to exist for the benefit or amusement of another organism, not even for the delectation of man himself. Necessarily, according to the theory of natural selection, structures either are present because they are selected as useful or because they are still inherited from ancestors to whom they were useful, though no longer useful to the existing representatives of those ancestors. Structures previously inexplicable were now explained as survivals from a past age, no longer useful though once of value. Every variety of form and colour was urgently and absolutely called upon to produce its title to existence either as an active useful agent or as a survival. Darwin himself spent a large part of the later years of his life in thus extending the new teleology.

The old doctrine of types, which was used by the philosophically minded zoologists (and botanists) of the first half of the 19th century as a ready means of explaining the failures and difficulties of the doctrine of design, fell into its proper place under the new dispensation. The adherence to type, the favourite conception of the transcendental morphologist, was seen to be nothing more than the expression of one of the laws of heredity, the persistence of hereditary transmission of ancestral characters, even when they had ceased to be significant or valuable in the struggle for existence, whilst the so-called evidences of design which was supposed to modify the limitations of types assigned to Himself by the Creator were seen as the adaptations due to the selection and intensification by selective breeding of fortuitous congenial variations, which happened to prove more useful than the many thousand other variations which did not survive in the struggle for existence. Thus not only did Darwin's theory give a new basis to the study of organic structure, but, whilst rendering the general theory of organic evolution equally acceptable and necessary, it explained the existence of low and simple forms of life as survivals of the earliest ancestry of the highest animals, and revealed the classification as unconscious attempts to construct the genealogical tree or pedigree of plants and animals. Finally, it brought the simplest living matter or formless protoplasm before the mental vision as the starting-point whence, by the operation of necessary mechanical causes, the highest forms have been evolved, and it rendered unavoidable the conclusion that this earliest living material was itself evolved by gradual processes, the result also of the known and recognized laws of physics and chemistry, from material which we should call not living. It abolished the conception of life as an entity above and beyond the common properties of matter, and led to the conviction that the marvellous and exceptional qualities of that which we call "living" matter are nothing more nor less than an exceptionally complicated development of those chemical and physical properties which we recognize in a gradually ascending scale of evolution in the carbon compounds, containing nitrogen as well as oxygen, sulphur and hydrogen as constituent atoms of their enormous molecules. Thus mysticism was finally banished from the domain of biology and zoology became one of the physical sciences—the science which seeks to arrange and discuss the phenomena of animal life and form, as the outcome of the operation of the laws of physics and chemistry.

A subdivision of zoology which was at one time in favour is simple into morphology and physiology, the study of form and structure on the one hand, and the study of the activities and functions of the forms and structures on the other. But a logical division like this is not necessarily conducive to the ascertainment and remembrance of the historical progress and present significance of the science. No such distinction of mental activities as that involved in the division of the study of animal life into morphology and physiology has ever really existed: the investigator of animal forms has never entirely ignored the functions of the forms studied by him, and the experimental inquirer into the functions and properties of animals and organs has always taken very careful account of the forms of those tissues and organs. A more instructive subdivision must be one which corresponds to the separate currents of thought and mental preoccupation which have been historically manifested in western Europe in the gradual evolution of what is to-day the great river of zoological doctrine to which they have all been contributory.

It must recognize the following five branches of zoological study:

\(^1\) The word of the collector and systematicist: such a term is exemplified by Linnaeus and his predecessors, by Cuvier, and Agassiz, Haeckel.

**Effects of Darwin's theory upon zoology.**
ZOOLOGY

3. **Zoo-Dynamics, Zoo-Physics, Zoo-Chemistry.** The pursuit of the learned physician—anatomy and physiology: exemplified by Harvey, Haller, Hunter, Johann Müller.

4. **Plasmology.** The study of the ultimate corpuscles of living matter, their structure, development and properties, by the aid of the microscope; exemplified by Malpighi, Hook, Schwann, Kowalewsky.

5. **Philosophical Zoology.** General conceptions with regard to the relations (species or individuals) to the universe, to man, and to the Creator, their origin and significance: exemplified in the writings of the philosophers of classical antiquity, and of Linnaeus, Goethe, Lamarck, Cuvier, Lyell, H. Spencer and Darwin.

It is unnecessary to follow in this article all these subjects, since they are for the most part treated under separate headings, not indeed under these names—which are too comprehensive for that purpose—but under those of the more specific questions which arise under each. Thus **Bionomics** is treated in such articles as **Evolution, Heredity, Variation, Mendelism, Reproduction, Sex, &c.**—Zoo-dynamics under Medicine, Surgery, Physiology, Anatomy, Embryology, and allied articles; **Plasmology** under Cytology, Protoplasm, &c.; and **Philosophical Zoology** under numerous headings, Evolution, Biology, &c. See also **Zoological Distribution, Palaeontology, Oceanography, Microtomy, &c.**

It will be more appropriate here, without giving what would be a needless repetition of considerations, both historical and theoretical, which appear in other articles, to confine ourselves to two general questions, (1) the history of the various systems of classification, or Morphography, and (2) the consideration of the main tendencies in the study of zoology since Darwin.

**SYSTEMS OF CLASSIFICATION**

Morphography includes the systematic exploration and tabulation of the facts involved in the recognition of all the recent and extinct kinds of animals and their distribution in space and time. (1) The museum-makers of old days and their modern representatives the curators and describers of zoological collections, (2) early explorers and modern naturalists-travellers and writers on zoo-geography, and (3) collectors of fossils and palaeontologists are the chief varieties of zoological workers coming under this head. Gradually since the time of Hunter and Cuvier anatomical study has associated itself with the more superficial morphography until to-day no one considers a study of animal form of any value which does not include internal structure, histology and embryology in its scope.

The real dawn of zoology after the legendary period of the middle ages is connected with the name of an Englishman, **Edward Wotton.** Edward Wotton, born at Oxford in 1492, who practised as a physician in London and died in 1555. He published a treatise, *De Generantis animalium* at Paris in 1552. In many respects Wotton was simply an exponent of Aristotle, whose teaching, with various fanciful additions, constituted the real basis of zoological knowledge throughout the middle ages. It was Wotton's merit that he rejected the legendary and fantastic accretions, and returned to Aristotle and the observation of nature.

The most ready means of noting the progress of zoology during the 16th, 17th and 18th centuries is to compare the classificatory conceptions of successive naturalists, which are to be found in the works of Aristotle himself. Aristotle did not definitively and in tabular form propound a classification of animals, but from a study of his treatises *Historia animalium, De generatione animalium,* and *De paribus animalium* the following classification can be arrived at:

A. **Eura.** blood-holding animals (= Vertebrata).

1. Malacota, soft-bodied Anaema (= Cephalopoda).

3. Erytta, insected Anaema or Insects (= Arthropoda, exclusive of Crustacea).

B. **Aeura,** bloodless animals (= Invertebra.ata).

1. Molcha, in-bed, viviparous Euraema (= Mammals, including Whales).

2. *Eothes,* (Birds).

3. *Terapoa* & *Erua* seroecrura, four-footed or legless Euraema which lay eggs. (Reptiles and Amphibia).

**XVIII. 33**
considerable use of anatomical characters in his definitions of large groups, and may thus be considered as the father of modern zoology. Associated with Ray in his work, and more especially occupied with the study of the Worms and Mollusca, was Martin Lister (1638-1722), celebrated also as the author of the first geological map.

After Ray's death the progress of anatomical knowledge, and of the discovery and illustration of new forms of animal life from distant lands, continued with increasing vigour.

From Ray to Linnaeus.
We note the names of Valsiineri (1661-1730) and Alexander Monro (1697-1767); the travellers Tournefort (1656-1708) and Shaw (1660-1753); the collectors Rumphius (1627-1700) and Hans Sloane (1660-1753); the entomologist Réaumur (1683-1757); Lhwyd (1703) and Linck (1674-1734), the students of Star-Fishes; Peyssonel (b. 1694), the investigator of Pylops and the opponent of Marsigli and Réaumur, who held them to be plants; Woodward, the palaeontologist (1665-1722)—not to speak of others of less importance.

Two years after Ray's death Carl Linnaeus (1707-1778) was born. Unlike Jacob Theodore Klein (1685-1739), whose careful treatises on various groups of plants and animals were published during the time between Ray and Linnaeus, the latter had his career marked out for him in a university, that of Upsala, where he was first professor of medicine and subsequently of natural history. His lectures formed a new departure in the academic treatment of zoology and botany, which, in direct continuity from the middle ages, had hitherto been subjected to the traditions of the medical profession and regarded as mere branches of "materia medica.

Linnaeus taught zoology and botany as branches of knowledge to be studied for their own intrinsic interest. His great work, the Systema naturae, ran through twelve editions during his lifetime (1st ed. 1735, 12th 1768). Apart from his special discoveries in the anatomy of plants and animals, and his descriptions of new species, the great merit of Linnaeus was his introduction of a method of enumeration and classification which may be said to have created systematic zoology and botany in their present form, and establishes his name for ever as the great organizer, the man who recognized a great practical want in the use of language and supplied it. Linnaeus adopted Ray's conception of species, but he made species a practical reality by insisting that every species should have a double Latin name—the first half to be the genus name, the genus name common to several species, and the second half to be the specific name. Previously to Linnaeus long-winded names had been used, sometimes with one additional adjective, sometimes with another, so that no true names were fixed and accepted. Linnaeus by his binomial system made it possible to write and speak with accuracy of any given species of plant or animal. He was, in fact, the Adam of zoological science. He proceeded further to introduce into his enumeration of animals and plants a series of groups, viz. genus, order, class, which he compared to the subdivisions of an army or the subdivisions of a territory, the greater containing several of the less, as follows:
ZOOLOGY

Class V. Insecta.
Order 1. Coleoptera.

Genera: (a) Scarabaeus, Lucanus, Dermestes, Hister, Byrrhus, Gyrinus, Atelabus, Carabus, Silpha, Coccinelle; (b) Bruchus, Cavisda, Pinnis, Chrysolina, Hispa, Meloe, Tenebrion, Lampyris, Modella, Staphylinus; (c) Cerambyx, Leptura, Campathus, Elater, Cercidela, Buprestis, Dilusis, Carabus, Neocyclus, Prionus.

2. Hemiptera

Genera: Blatto, Manits, Gyrulis, Fulgora, Cicada, Noleauta, Nepo, Cimex, Aphis, Cimex, Coc; Yrips.

3. Lepidoptera

Genera: Papilio, Sphynx, Phalaena.

4. Neuroptera

Genera: Libellula, Ephemerina, Myrmeleon, Phrygana, Heberus, Penanor, Harphida.

5. Hymenoptera

Genera: Cynips, Thenthredo, Sirex, Ichneumon, Sphe, Cristy, Vesp, Apis, Formica, Mutilla.

6. Diptera

Genera: Oestrus, Tipula, Musco, Tabanus, Culex, Empus, Conops, Asilus, Bombayus, Hippobosca.

7. Aptera

Genera: (a) Pedilbus sex; capit a thorace discr. Lepisma, Podura, Termes, Pedilbus, Pulex. (b) Pedilbus 8-14; capit a thorace que unitis: Acras, Phalangium, Aranea, Scorpio, Cancer, Monomous, Oonius. (c) Pedilbus pluribus; capit a thorace discr.: Solenopera, Julus.

Class VI. Vermes.
Order 1. Intestina.

Genera: (a) Pertusa laterali poro: Lumbicia, Stipunculis, Fascio. (b) Imperforata poro laterali nullo: Gordius, Ascaris, Hirudo, Mynxe.

2. Mollusca

Genera: (a) Ore supero; basi se affigens: Actinia, Ascidia. (b) Ore antico; corpore pertuso laterali fora: Limax, Aplysia, Doris, Tellis. (c) Ore antico; corpore tentaculis antico cinto: Holothuria, Terellæ. (d) Ore antico; corpore brachiato: Triton, Sepia, Clf, Lernæa, Scyllæa. (e) Ore antico; corpore pedato: A. phrodita, Nereis. (f) Ore infero centrali: Medusa, Asteria, Echinus.

3. Testacea

4. Lithophyta

Genera: Tubipora, Madrepore, Millepora, Cellpora.

5. Zoophyta

The characters of the six classes are thus given by Linnaeus:—

Cor biloculare, biuratum; viviparis, Mammalibus.
Cor uniloculare, uniuratum; oviparis, Arbus.
Cor uniloculare, uniuratum; pulmones abortar. Amphi. brachii externs, Piscibus.
Cor uniloculare, inauritum; antennatis, Insectis.
Sanie frigid, albidæ; tentaculatis, Verminibus.

The anatomical error in reference to the auricles of Reptiles and Batrachians on the part of Linnaeus is extremely interesting, since it shows to what an extent the most patent facts may escape the observation of even the greatest observers, and what an amount of repeated dissection and unprejudiced study is necessary before the structure of the commonest animals has become known.

Between Linnaeus and Cuvier there are no very great names; but under the stimulus given by the admirable method and system of Linnaeus observation and description from new forms of all parts from the world, both recent and fossil, accumulated. We can only cite the names of Charles Bonnet (1720-1793), the entomologist, who described the reproduction of Aphids; Banks and Solander, who accompanied Captain Cook on his first voyage (1768-1771); Thomas Pennant (1726-1798), the describer of the English fauna; Peter Simon Pallas (1741-1811), who especially extended the knowledge of the Linnaean Vermin, and under the patronage of the empress Catherine explored Russia and Siberia; De Geer (1720-1778), the entomologist; Lyonnet (1707-1759), the author of the monograph of the anatomy of the caterpillar of Cossus ignigillus; Cavolini (1756-1819), the Neapolitan and founder of Della Chieia (6, 1828); O. F. Müller (1730-1784), the describer of fresh-water Oligochaeta; Abraham Trembley (1700-1784), the student of Hydro; and O. F. Ledermüller (1719-1766), the inventor of the term Inse-}

Invertebrata.

Class I. Insumoria.

Orders: Nuda, Appendiculata.

Class II. Polypl. Orders: Clithium (Rotifera), Denudati (Hydroz), Vaginati (Animakozy and Polyzoa), Natantes (Crinoids).

Class III. Radiaria.

Orders: Mollia (Accelapha), Echinoderma (including Actinioidea).

Class IV. Tunicata.

Orders: Bothryolia, Ascidia.

Class V. Vermes.

Orders: Holos (Tape-Worms and Flukes), Rigidula (Nematoids), Hispidula (Naisy, &c.), Episoriae (Larvae, &c.).

2. Sensilis. Animals.

Class VI. Insecta (Hexapoda).

Orders: Apheria, Diptera, Hemipera, Lepidiperia, Neuroperia, Orthoptera, Coleoptera.

Class VII. Arachnida.

Orders: Antennal-Teachia (Sycanthura and Myriopoda), Exantennatal-Teachia, Exantennatal-Branchialia.

Class VIII. Crustacea.

Orders: Heterobranchia (Branchiopoda, Isopoda, Amphiopoda, Stomopoda), Hemobranchia (Decapoda).

Class IX. Cephalidea.

Orders: Apoda, Antennata, Sedoraria.

Class X. Cirripedia.

Orders: Sessilia, Pedunculata.

Class XI. Conchifera.

Orders: Dimyaria, Monomoria.

Class XII. Mollusca.

Orders: Pteropoda, Gastropoda, Trachelipoda, Cephalopoda, Heteropoda.

Vertebrata.

Class XIII. chorda.

Class XV. Birds.

Class XVI. Mammals.
The enumeration of orders above given will enable the reader to form some conception of the progress of knowledge relating to the lower forms of life during the fifty odd years which intervened between Linnaeus and Lamarck. The number of genera recognized by Lamarck is more than ten times as great as that recorded by Linnaeus.

We have mentioned Lamarck before his great contemporary Cuvier because, in spite of his valuable philosophical doctrine of development, he was, as compared with Cuvier and estimated as a systematic zoologist, a mere enlargement and logical outcome of Linnaeus.

The distinctive merit of G. L. Cuvier (1769-1832) is that he started a new view as to the relationship of animals, which he may be said in a large measure to have originated in his very fundamental researches. He opposed the scala naturae theory, and recognized four distinct and divergent branches or embranchements, as he called them, in each of which he arranged a certain number of the Linnaean classes, or similar classes. The embranchements were characterized each by a different type of anatomical structure. Cuvier thus laid the foundation of that branching tree-like arrangement of the classes and orders of animals now recognized as being the necessary result of attempts to represent what is practically a genealogical tree or pedigree. Apart from this, Cuvier was a keen-sighted and enthusiastic investigator of great skill and industry. Von Baer, astonishing how many good observers it requires to dissect and draw and record over and over again the structure of an animal before an appr imately correct account of it is obtained. Cuvier dissected many mollusces and other animals which had not previously been anatomized; of others he gave more correct accounts than had been given by earlier writers. Another special distinction of Cuvier is his remarkable work in comparing extinct with recent organisms, his descriptions of the fossil Mammalia of the Paris basin, and his general appreciation of the knowledge of recent animals, the relationships of extinct ones, as indicated by fragmentary remains.

It was in 1812 that Cuvier communicated to the Academy of Sciences of Paris his views on the classification of animals. He says—

"Si l'on considère le règne animal d'après les principes que nous venons de poser, en se débarrassant des préjugés établis sur les divisions, enfin aménées, en n'ayant égard qu'à l'organisation et à la nature des animaux, et non pas à leur grandeur, à leur utilité, au plus ou moins de connaissance que nous en avons, ni à toutes les autres circonstances accessoires, on trouvera qu'il existe quatre formes principales, quatre plans généraux, si l'on peut s'exprimer ainsi, d'après lesquels tous les animaux semblent avoir été modelés et dont les divisions ultérieures, de quelque titre que les naturalistes les aient décorées, ne sont que des modifications de logres, fondées sur l'adoption ou l'addition de quelques parties qui ne changent rien à l'essence du plan."

Cuvier's classification. His classification as finally elaborated in Le Règne Animal (Paris, 1829) is as follows:

First Branch. Animalia Vertebrata.

Class I. Mammalia.
Orders: Carnivora, Cetacea, Ruminantia, Artiodactyla, Rodentia, Chiroptera, Pinnipedia, Proboscidea, Primates.

Class II. Aves.
Orders: Passeres, Passeriformes, Galliformes, Galloidae, Palaeognathae, Ratitae.

Class III. Reptilia.
Orders: Crocodilia, Testudinaria, Sauria, Urodela, Chelonia, Testudinaria.

Class IV. Pisces.
Orders: (a) Osteichthyes, Actinopterygii, Sarcopterygii; (b) Osteichthyes, Agnathae, Chondrichthyes.

Class I. Cephalopoda.
Orders: Cephalopods, Nautili, Sepiolidae, Sepiidae, Octopoda, Argonautae, Conidae.

Class II. Pteropoda.
Orders: Pteropoda, Heteropoda, Clioneidae.

Class III. Gastropoda.
Orders: Pulmonata, Allostechna, Neobranchia, Prosobranchia, Clausilia, Scaphopoda, Scaphitacea.

Class IV. Acanthidea.

Class V. Brachiopoda.
Orders: Brachiopoda, Univalvia, Bivalvia.

Class VI. Cirripedia.

Third Branch. Animalia Articulata.

Class I. Annelidae.
Orders: Polychaeta, Clitellata, Capitulata.

Class II. Crustacea.
Orders: (a) Malacostraca: Decapoda, Stomatopoda, Amphipoda, Malacostraca, Isopoda; (b) Mecostomata: Branchiopoda, Pycnogonida, Trilobita.

Class III. Arachnidae.
Orders: (a) Arachnida, Opilionidae, Onychophora, Tardigrada, Chilopoda, Scalpulidae, Crustacea, Echinodermata, Talpidae.

Class IV. Insecta.
Orders: Tracheata, Homoptera, Hymenoptera, Diptera, Lepidoptera, Orthoptera.

Fourth Branch. Animalia Radiata.

Class I. Echinodermata.
Orders: Echinoidea, Asteroidea, Ophiuroidea, Echinoidea.

Class II. Intestinal Worms.
Orders: Nematoda, Trematoda, Cestoda.

Class III. Acelphata.
Orders: Ctenophora, Ctenophora, Hydrozoa.

Class IV. Polypii (including the Coelentera of later authorities and the Polyzoa).
Orders: Caryophyllida, Calostraca, Polyzoa.

Class V. Infusoria.
Orders: Radiata, Homoeoneura (this includes the Protozoa of recent writers and some Protophyta).

The leading idea of Cuvier, his four embranchements, was confirmed by the Russo-German naturalist Von Baer (1792-1870), who adopted Cuvier's divisions, speaking of them as the peripherical, the longitudinal, the massive, and the vertebral type. Von Baer, however, has added another to the history of zoology, being the first and most striking figure in the introduction of embryology into the consideration of the relations of animals to one another.

Cuvier may be regarded as the zoologist by whom anatomy was made the one important guide to the understanding of the relations of animals. But the belief, dating from Malpighi (1657) that there was but one class of structures in all animals, that of the body, was now regarded as the essential core to which they endeavoured to add for existing animal forms. The noble aim of F. W. J. Schelling, "das ganze System der Naturlehre von dem Gesetze der Schwere bis zu den Bildungstrieben der Organismus als ein organisches Ganze darzustellen," which has ultimately been realized through Darwin, was a general one among the scientific men of the year 1800. Lamarck accepted the development theory fully, and pushed his speculations far beyond the realm of fact. The more cautious Cuvier adopted a view of the relationships of animals which, whilst denying genetic connexion as the explanation, recognized an essential identity of structure in the principal parts of all animals. This identity was held to be due to an ultimate law of nature or the Creator's plan. The tracing out of this identity in diversity, whether regarded as evidence of blood-relationship or as a remarkable display of skill on the part of the Creator and the details whilst retaining the essential, came at this period a special pursuit, to which Goethe, the poet, who himself contributed importantly to it, gave the name morphology. C. F. Wolff, Goethe and Oken share the credit of having initiated these views, in regard especially to the structure of flowering plants and the Vertebrae skull. Cuvier's doctrine of four plans of structure was essentially a morphological one, and so was the single-scale doctrine of Buffon and Lamarck, to which it was opposed. Cuvier's morphological doctrine received its fullest development in the principle of the "correlation of parts," which he applied to paleontological investigation, namely that every animal is a definite whole, and that no part can be varied without entailing correlated and law-abiding variations in other parts, so that from a fragment it should be possible, had we a full knowledge of the laws of animal structure or morphology, to reconstruct the whole. Here Cuvier was imperfectly formulating, without recognizing the real physical basis of the phenomena, the results of the laws of heredity, which were subsequently investigated and brought to bear on the problems of animal structure by Darwin.

Sir Richard Owen (1804-1892) may be regarded as the foremost of Cuvier's disciples. Owen not only occupied himself with the dissection of rare animals, such as the Pearly Nautilus, Lingula, Limulus, Protocterus, Aptychus, &c., and with the description and reconstruction of extinct reptiles, birds and mammals—following the Cuvierian tradition—but gave precision and currency to the morphological doctrines which had taken their rise in the beginning of the century by...
the introduction of two terms, "homology" and "analogy," which were defined so as to express two different kinds of agreement in animal structures, which, owing to the want of such "counters of thought," had been hitherto continually confused. Homologous structures in any two animals compared were by Owen defined as structures performing similar functions, but not necessarily derived from the modification of one and the same part in the "plan" or "archetype" according to which the two animals compared were supposed to be constructed. Homologous structures are therefore generally derived in appearance and detail from one another, and though performing widely different functions, yet were capable of being shown by adequate study of a single form, whether isolated from the same part or organ of the "plan-form" or "archetype." It is not easy to exaggerate the service rendered by Owen to the study of zoology by the introduction of this apparently small piece of verbal mechanism; it takes place with the classificatory terms of Linnaeus. And, though the conceptions of "archetypal morphology," to which it had reference, are now abandoned in favour of a genetic morphology, yet we should remember, in estimating the value of this and of other speculative thoughts which have given place to new views in the history of science, the words of the great reformer himself. "Erroneous observations are in the highest degree injurious to the process of science, since they often persist for a long time. But erroneous theories, when they are supported by facts, do little harm, since every one takes a healthy pleasure in proving their falsity" (Darwin). Owen's definition of analogous structures as structures performing identical functions in different animals is now spoken of as "homogenetic" structures, the idea of community of representation in an archetype giving place to the present from which the single representative structure present in a common ancestor. Darwinian morphology has further rendered necessary the introduction of the terms "homoplasy" and "homoplastic" (E. Ray Lankester, in Ann. and Mag. Nat. Hist. 1867) to express that close agreement in form which may be attained in the course of evolutionary changes by organs or parts in two animals which have been subjected to similar moulding conditions of the environment, but have not a close genetic community of origin. They account for their similarity in form and structure, although they have a certain identity in primitive quality which is accountable for the agreement of their response to similar moulding conditions.

The classification adopted by Owen in his lectures (1855) was not sufficiently comprehensive to indicate the progress of zoological knowledge between Owen's death and that date, but, such as it is, it is worth citing here.

**Province: Vertebrata (Myelencephala, Owen).**

**Provinces:**
- Mammalia, Aves, Reptilia, Pisces.

**Province: Articulata.**

- Classes: Archichord, Insecta (including Sub-Classes Myriapoda, Hexapoda), Crustacea (including Sub-Classes Entomorhiza, Malacostraca), Epiplora (Epiplotic Crustacea), Annelida (Chaetopoda and Leeches), Cephalopoda.

**Province: Mollusca.**

- Classes: Cephalopoda, Gastropoda, Pteropoda, Lamellibranchia, Brachipoda, Tunicata.

**Province: Articulata.**

- Sub-Province: Hydropoda.
- Sub-Province: Entozoa.
- Sub-Province: Radiaria.

**Sub-Provinces:**
- Cerebellum, Stereum.

**Sub-Provinces: Infusoria.**

- Classes: Rotifera, Polygastria (the Protozoa of recent authors).

The real centre of progress of systematic zoology was no longer in France nor with the disciples of Cuvier in England, but after his death moved to Germany. The wave of morphological speculation, with its outcome of new systems and new theories of classification (see Agassiz, Essay on Classification, 1850), which were as numerous as the professors of zoological science, was necessarily succeeded in the true progress of the science by a period of minuter study in which the microscope, the discovery of embryological histories, and the all-important cell-theory came to swell the stream of exact knowledge.

The greatest of all investigators of animal structure in the 19th century was Johann Muller (1801-1858), the successor in Germany of the anatomists Rathke (1793-1860) and Meckel (1781-1833). His true greatness can only be estimated by a consideration of the fact that he was a great teacher not only of human and comparative anatomy and zoology but also of physiology, and that nearly all the most distinguished German zoologists and physiologists of the period 1850 to 1870 were his pupils and acknowledged his leadership. The most striking feature about Johann Müller's work, apart from the comprehensiveness of his point of view, in which he contributed to the anatomical and morphological ideas of Cuvier, a consideration of physiology, embryology and microscopic structure, was the extraordinary accuracy, facility and completeness of his recorded observations. He could do more with a single specimen of a rare animal (e.g. in his memoir on Amphioxus, Berlin, 1844) in the way of making out its complete structure than the ablest of his contemporaries or successors could do with a plethora. His power of rapid and exhaustive observation and of accurate pictorial reproduction was phenomenal. His most important memoirs, besides that just mentioned, are those on the anatomy and classification of Fishes, on the Caecilians and on the developmental history of the Echinoderms.

A name which is apt to be forgotten in the period between Cuvier and Darwin, because its possessor occupied an isolated position in England and was not borne up by any great school or university, is that of John Vaughan Thompson (1779-1847), an army surgeon, who in 1816 became district medical inspector at Cork, and then took to the study of marine Intericrabela by the aid of the microscope. Thompson made great discoveries, which seem to have fallen in his way in the most natural and simple manner, but must be regarded as the outcome of extraordinary genius. He showed (1830) that the organisms like Flustra are not hydroid Polyps, but of a more complex structure resembling Mollusca, and he gave them the name Polyzoa. He discovered (1833) the Pentacrinus europeus, and showed that it was the larval form of the feather-star Antron (Comatula). He upset (1830) Cuvier's retention of the Cirripedes among Mollusca, and his subsequent treatment of them as an isolated class, by showing that they begin life as free-swimming Crustacea identical with the young forms of other Crustacea. Vaughan Thompson is a type of the marine zoologists, such as Dalvey, Michael Sars, P. J. Van Beneden, Claparéde, and Allman, who during the 19th century approached the study of the lower marine organisms in the same spirit as that in which Trembley and Schäffer in the 18th century, and Swammerdam in the 17th, gave themselves to the study of the minute fresh-water forms of animal life.

It is impossible to enumerate or to give due consideration to all the names in the army of anatomical and embryological students of the middle third of the 19th century whose labours bore fruit in the modification of zoological theories and in the building up of a true classification of animals. Their results are best summed up in the three schemes of classification which follow—those of Rudolph Leuckart (1832-1860), Henri Milne-Edwards (1800-1884), and T. H. Huxley (1825-1895), all of whom individually contributed very greatly by their special discoveries and researches to the increase of exact knowledge.

Contemporaneous with these were various schemes of classification which were based, not on a consideration of the entire structure of each animal, but on the variations of a single organ, or on the really non-significant fact of the structure of the egg. All such single-fact systems have proved to be anatomical from the true line of growth of the zoological system which was shaping itself year by year—unknown to those who so shaped it—as a genealogical tree. They were attempts to arrive at a true knowledge of the relationships of animals by "royal roads"; their followers were landed in barren wastes.

R. Leuckart's classification (Die Morphologie und Leuckart's die Vermöandtschaftsverhältnisse der Wirbellosen Thiere, Brunswick, 1848) is as follows:

**Type 1. Coelenterata.**

Class 1. Polyphe.

Orders: Anthoza and Cystoza.

II. Acalephie.

Orders: Discophora and Ctenophora.
### Type 2. Echinodermata
Class I. Pelmatozoa.
   - Orders: Cystidea and Crinoidea.
   - II. Actinidea.
     - Orders: Echinida and Asteroidea.
   - III. Scyphomedus.
     - Orders: Holothuriace and Siphonulida.

### Type 3. Vermes
Class I. Annelidaet.
   - Orders: Cestodes and Acanthacephali.
   - II. Apodotes.
     - Orders: Nemertini, Turbellarii, Trematosodes and Hirudineline.
   - III. Ciliata.
     - Orders: Bryoza and Rotifera.
   - IV. Annelides.
     - Orders: Nematoidea Lumbricini and Branchiata.

### Type 4. Arthropoda
Class I. Crustacea.
   - Orders: Entomostraca and Malaesostraca.
   - II. Insecta.
     - Orders: Myriapoda, Arachnida (Acera, Latre.), and Hexapoda.

### Type 5. Mollusca
Class I. Tunicata.
   - Orders: Ascidiae and Salpae.
   - II. Acephala.
     - Orders: Lamellibranchiate and Brachiopoda.
   - III. Gastropoda.
     - Orders: Heterobranchia, Dermatobranchia, Heteropoda, Ctenobranchia, Pulmonata, and Cyclobranchia.
   - IV. Cephalopoda.

### Type 6. Vertebrata.
   - Not specially dealt with.

#### Milne-Edwards’s classification
- The classification given by Henri Milne-Edwards (Cours Elémentaire d’Histoire Naturelle, Paris, 1855) is as follows:

### Branch I. Osteozaoria or Vertebrata
#### Sub-Branch 1. Allantodontia.
   - Class I. Mammalia.
     - Orders: (a) Monodelphia: Bimana, Quadrumana, Chiroptera, Insectoidea, Rodentia, Edentata, Carnivora, Amphibia, Pachyderma, Ruminantia, Cetacea; (b) Didelphia: Marsupialia, Monotremata.
   - II. Birds.
     - Orders: Rapaces, Passeres, Scansores, Gallinace, Gruelles, Palmipedes.
   - III. Reptiles.
     - Orders: Chelonians, Sauria, Ophidia.

#### Sub-Branch 2. Anallantoisodonia.
   - Class I. Batrachians.
     - Orders: Amura, Urodela, Perennibranchia, Cacilda.
   - II. Fishes.
     - Section 1. Ossei.
     - Section 2. Chondropterygii.
       - Orders: Sturgeon, Sclarchii, Cyclostomi.

### Branch II. Entomozaoria or Annelata
#### Sub-Branch 1. Arthropoda.
   - Class I. Insecta.
   - II. Myriapoda.
     - Orders: Chilognatha and Chilopoda.
   - III. Arachnida.
     - Orders: Pulmonaria and Trachearia.
   - IV. Crustacea.
     - Section 1. Podophthalmia.
       - Orders: Decapoda and Stomatopoda.
     - Section 2. Euproochothelium.
       - Orders: Amphipoda, Leptomisopoda and Isopoda.
     - Section 3. Branchiopoda.
       - Orders: Ostracoda, Phyllopoda and Trilobitae.
     - Section 4. Entomostraca.
       - Orders: Copepoda, Cladocera, Siphonosta, Lernaeida, Cirripedia.
     - Section 5. Xiphosura.

(The orders of the classes which follow are not given in the work quoted.)

### Branch III. Malacozaoria or Mollusca
#### Sub-Branch 1. Mollusca proper.
   - Class I. Cephalopoda.
     - II. Pteropoda.
   - Sub-Branch 2. Molluscoidea.
     - Class I. Tunicata.

#### Branch IV. Zoophytes
#### Sub-Branch 1. Radiaaria.
   - Class I. Echinodermata.
     - II. Acalephes.
   - Sub-Branch 2. Sarcidaria.
     - Class I. Infusoria.

In England T. H. Huxley adopted in his lectures (1866) a classification which was in many respects similar to both of the foregoing, but embodied improvements of his own. It is as follows:

#### Sub-Kingdom I. Protozoa
   - Classes: Rhizopoda, Gregarina, Radiolaria, Spongida.

#### Sub-Kingdom II. Infusoria
   - Sub-Kingdom III. Coelenterata.
     - Classes: Hydrozoa, Anthozoa.
   - Sub-Kingdom IV. Annuolida.
     - Classes: Scolcidia, Echinodermata.
   - Sub-Kingdom V. Anullosa.
     - Classes: Crustacea, Arachnida, Myriapoda, Insecta, Chelognatha, Annelida.
   - Sub-Kingdom VI. Molluscoidea.
     - Classes: Polyzoa, Brachiopoda, Tunicata.
   - Sub-Kingdom VII. Mollusca.
     - Classes: Lamellibranchiate, Branchiogastropoda, Pulmo-gastropoda, Pteropoda, Cephalopoda.

#### Sub-Kingdom VIII. Vertebrata.
   - Classes: Pisces, Amphibia, Reptilia, Aves, Mammalia.

We now arrive at the period when the doctrine of organic evolution was established by Darwin, and when naturalists, being convinced by him as they had not been by the transmutationists of fifty years’ earlier date, were compelled to take an entirely new view of the significance of all attempts at framing a “natural” classification.

Many zoologists—prominent among them in Great Britain being Huxley—had been repelled by the airy fancies and assumptions of the “philosophical” morphologists. The efforts of the best minds in zoology had been directed for thirty years or more to ascertaining with increased accuracy and minuteness the structure, microscopic and gross, of all possible forms of animals, and not only of the adult structure but of the steps of development of that structure in the growth of each kind of organism from the egg to maturity. Putting aside fantastic theories, these observers endeavoured to give in their classifications a strictly objective representation of the facts of animal structure and of the structural relationships of animals to one another capable of demonstration. The groups within groups adopted for this purpose were necessarily wanting in symmetry: the whole system presented a strangely irregular character. From time to time efforts were made by those who believed that the Creator must have followed a symmetrical system in his production of animals to force one or other artificial, neatly balanced scheme of classification upon the zoological world. The last of these was that of Louis Agassiz (1807–1873), who, whilst surveying all previous classifications, propounded a scheme of his own (Essay on Classification, 1859), in which, as well as in the criticisms he applies to other systems, the leading notion is that sub-kings, classes, orders and families have a real existence, and that it is possible to ascertain and distinguish characters which are of class value, others which are only of ordinal value, and so on, so that the classes of one sub-kingdom should on paper, and in nature actually do, correspond in relative value to those of another sub-kingdom, and the orders of any one class similarly should be so taken as to be of equal

---

**Note:**

The classification is based on evolutionary theories and naturalistic principles. It reflects the efforts of 19th-century zoologists to classify organisms based on their structural and evolutionary relationships, aiming for a more objective and natural representation of the diversity of life. The approach contrasts with earlier classifications that were often artificial and based on superficial similarities rather than evolutionary history. The classification aims at reflecting the evolutionary history of life, grouping organisms into categories that correspond to their evolutionary lineages and relationships. This approach is foundational to modern classification systems in zoology. 

---

**Reference:**

Huxley’s classification is mentioned as an example of a classification approach that was more focused on natural evolutionary relationships, emphasizing the systematization of life based on common ancestry and evolutionary history. Huxley’s classification was developed in the context of the 19th-century debates on evolution and classification, offering a more systematic approach to grouping organisms than some of his contemporaries. The details of Huxley’s classification are not provided here, but it is noted as an example of the evolution of classification methods, moving towards a more naturalistic and evolutionary understanding of biological diversity.
value with those of another class, and have been actually so created.

The whole position was changed by the acquirement, which became universal, in the doctrine of Darwin. That doctrine took some few years to produce its effect, but it became evident at once to those who accepted Darwinism that the natural classification of animals, after which collectors and anatomists, morphologists, paleontologists and embryologists had been so long striving, was nothing more nor less than a genealogical tree, with breaks and gaps of various extent in its record. The facts of the relationships of animals to one another, which had been regarded as the outcome of the inscrutable laws of the zoologists and gibbly explained by the transcendental morphologists, were amongst the most powerful arguments in support of Darwin's theory, since they, together with all other vital phenomena, received a sufficient explanation through it. It is to be noted that, whilst the zoological system took the form of a genealogical tree, with main stem and numerous diverging branches, the actual form of that tree, its limitation to a certain number of branches corresponding to a limited number of divergences in structure, came to be regarded as the necessary consequence of the operation of the physico-chemical phenomena of the universe, and it was recognized that the ultimate explanation of that limitation is to be found only in the constitution of matter itself.

The first naturalist to put into practical form the consequences of the new theory, in so far as it affected zoological classification, was Ernst Haeckel of Jena (b. 1834), who in 1866, seven years after the publication of Darwin's *Origin of Species*, published his suggestive *Generelle Morphologie*. Haeckel introduced into classification a number of terms intended to indicate the branching of a genealogical tree. The whole "system" or scheme of classification was termed a genealogical tree (Stammbaum); the main branches were termed "phyla," their ramifications "sub-phyla"; the great branches of the sub-phyla were termed "cladi," and the "cladi" divided into "classes," these into sub-classes, these into into orders, families, genera, species. Additional branching could be indicated by similar terms where necessary. There was no attempt in Haeckel's use of these terms to make them exactly or more precisely applicable in biological terms than the traditional arrangement, which at that time was merely futile and unimportant where the purpose was the exhibition of lines of descent, and where no natural equality of groups was to be expected *ex hypothesi*. Haeckel's classification of 1866 was only a first attempt. In the edition of the *Natürliche Schöpfungsgeschichte* published in 1868 he made a great advance in his genealogical classification, since he now introduced the results of the extraordinary activity in the study of embryology which followed on the publication of the *Origin of Species*.

The pre-Darwinian systematists since the time of Von Baer had attached very great importance to embryological facts, holding that the stages in an animal's development were of classic significance of its true nature and structure. Von Baer had gained unanimous support for his dictum, "Die Entwickelungsgeschichte ist der wahre Lichtträger für Untersuchungen über organischer Körper." Thus J. Müller's studies on the larval forms of Echinoderms and the discoveries of Vaughan Thompson were appreciated. But it was only after Darwin that the cell-theory of Schwann was extended to the embryology of the animal kingdom generally, and that of Asciidians and Amphioxus (1866), who really made knowledge of the way in which the millions of cells of which its body is composed take their origin by fission from a smaller number of cells, and the other from the single egg, such a fundamental break in zoologists see that a strict and complete embryological anatomy of animals was as necessary and feasible a factor in the comprehension of their relationships as at the beginning of the century the coarse anatomy had been shown to be by Cuvier. Kovalevsky's work appeared between the dates of the *Generelle Morphologie* and the

Zoology

**Schöpfungsgeschichte.** Haeckel himself, with his pupil Mikhail-Maclay, had in the meantime made studies on the growth from the egg of Sponges—studies which resulted in the complete separation of the unicellular or equinucleated *Protocorpus* from the Sponges, hitherto confused with them. It is this introduction of the consideration of cell-structure and cell-development which, subsequently to the establishment of Darwinism, has most profoundly modified the views of systematists, and led to its conjunction with the biological doctrine to the greatest activity in research—an activity which culminated in the work (1873-1882) of F. M. Balfour, and produced the profoundest modifications in classification.

Haeckel's second pedigree is as follows:

In representing pictorially the groups of the animal kingdom as the branches of a tree, it becomes obvious that a distinction may be drawn, not merely between the individual main branches, but further as to the level at which they are given off from the main stem, so that one branch or set of branches may be marked off as belonging to an earlier or lower level than another set of branches; and the same plan may be adopted with regard to the cladcs, classes and smaller branches. The term "grade" was introduced by Ray Lankester ("Notes on Embryology and Classification," in *Quart. Journ. Micr. Sci.*, 1877), to indicate this giving off of branches at a higher or lower, i.e. a later or earlier, level of a main stem.1 The mechanism for the statement of the genealogical relationships of the groups of the animal kingdom was thus completed. Renewed study of every group was the result of the acceptance of the genealogical idea and of the recognition of the importance

---

1 Sir Edwin Ray Lankester (b. 1847) was the eldest son of Edwin Lankester (1814-1874), a physician and naturalist (F.R.S. 1845), who became well known as a scientific writer and lecturer, editor of the *Quarterly Journal of Microscopical Science* from 1853 to 1871, and in succession to Thomas Walker, coroner for Central Middlesex. Educated at St Paul's and both at Downing College, Cambridge, and Christ Church, Oxford. E. R. Lankester obtained the Radcliffe Travelling Fellowship at Oxford in 1870, and became fellow and lecturer at Exeter College in 1874. To 1890 he was professor of zoology and comparative anatomy at University College, London; and from 1891 to 1898 Linacre professor of comparative anatomy at Oxford. From 1898 to 1907 he was director of the Natural History Department of the British Museum. He was made K.C.B. in 1907. [Ed. E. B].
of cellular embryology. On the one hand, the true method of arriving at a knowledge of the genealogical tree was recognized as lying chiefly in attacking the problem of the genealogical relationships of the smallest twigs of the tree, and proceeding from them to the larger branches. Special studies of small families or orders of animals with this object in view were taken in hand by many zoologists. On the other hand, a survey of the facts of cellular embryology which were accumulated in regard to a variety of classes within a few years of Kovalevsky's work led to a generalization, independently arrived at by Haeckel and Lankester; to the effect that the post-graion of animals may be distinguished, the Protozoa or Plasmodia, which consists either of single cells or colonies of equiform cells, and a higher grade, the Metazoa or Enteropoda, in which the egg-cell by "cell division" gives rise to two layers of cells, the endoderm and the ectoderm, surrounding a primitive digestive chamber, the archenteron. Of these latter, two grades were further distinguished by Lankester—those which remain possessed of a single archenteric cavity and of two primary cell-layers (the Coelentera or Diploblastica), and those which by rifting off the archenteron give rise to two cavities, the coelom or body-cavity and the metenteron or gut (Coelomata or Triploblastica). To the primitive two-cell-layered form, the hypothetical ancestor of all Metazoa or Enteropoda, Haeckel gave the name Gastraea; the embryonic form which represents in the individual growth from the egg this ancestral condition he called a "gastrula." The term "diblastula" was subsequently adopted in England for the gastrula of Haeckel. The tracing of the exact mode of development, cell by cell, of the diblastula, the coelom, and the various tissues of examples of all classes of animals was in later years pursued with immense activity and increasing instrumental facilities.

Two names in connexion with post-Darwinian taxonomy and the ideas connected with it require brief mention here. Fritz Müller, by his studies on Crustacea (Für Darwin, 1864), showed the way in which genealogical theory may be applied to the minute study of a limited group. He is also responsible for the formulation of an important principle, called by Haeckel "biogenetic fundamental law," viz. that an animal in its growth from the egg to the adult condition tends to pass through a series of stages which are recapitulative of the stages through which its ancestry has passed, in the historical development of the species from a primitive form; or, more shortly, that the development of the individual (ontogeny) is an epitome of the development of the race (phylogeny). Pre-Darwinian zoologists had been aware of the class of facts thus interpreted by Fritz Müller, but the authoritative view on the subject had been that there is a parallelism between (a) the series of forms which occur in individual development, (b) the series of existing forms from lower to higher, and (c) the series of forms which succeed one another in the strata of the earth's crust, whilst an explanation of this parallelism was either not attempted, or was illusively offered in the shape of a doctrine of harmony of plan in creation. It was the application of Fritz Müller's law of recapitulation which gave the chief stimulus to embryological investigations between 1865 and 1890; and, though it is now recognized that "recapitulation" is vastly and bewilderingly modified by special adaptations in every case, yet the principle has served, and still serves, as a guide of great value.

Another important factor in the present condition of zoological knowledge as represented by classification is the doctrine of degeneration propounded by Anton Dahrn. Lamark believed in a single progressive series of forms, whilst Cuvier introduced the conception of branches. The first post-Darwinian systematists naturally and without reflexion accepted the idea that existing simpler forms represent stages in the gradual progress of development—are in fact survivors from past ages which have retained the exact grade of development which their ancestors had reached in past ages. The assumption made was that (with the rare exception of parasites) all the change of structure through which the successive generations of animals have passed has been one of progressive elaboration. It is Dahrn's merit to have pointed out\(^1\) that this assumption is not warranted, and that degeneration or progressive simplification of structure may have, and in many lines certainly has, taken place, as well as progressive elaboration and in other cases continuous maintenance of the status quo. The introduction of this conception necessarily had a most important effect in the attempt to unravel the genealogical affinities of animals. It renders the task a more complicated one; at the same time it removes some serious difficulties and throws a flood of light on every group of the animal kingdom.

One result of the introduction of the new conceptions dating from Darwin was a healthy reaction from that attitude of mind which led to the regarding of the classes and orders recognized by authoritative zoologists as sacred institutions which were beyond the criticism of ordinary men. That state of mind was due to the fact that the groupings so recognized did not profess to be simply the result of scientific reasoning, but were necessarily regarded as the expressions of the "insight" of some more or less gifted persons into a plan or system which had been arbitrarily chosen by the Creator. Consequently there was a tinge of theological dogmatism about the whole matter.

To deny the Linnaean, or later the Cuvierian, classes was very much like denying the Mosaic cosmogony. But systematic zoology is now entirely free from any such prejudices, and the Linnaean taint which is apparent even in Haeckel and Gegenbaur may be considered as finally expunged.

There are, and probably always will be, differences of opinion as to the exact way in which the various kinds of animals may be divided into groups and those groups arranged in such an order as will best exhibit their probable genealogical relationships. The main divisions which, writing in 1910, the present writer prefers, are those adopted in his Treatise on Zoology (Part II. ch. ii.) except that Phylum 17, Diplocordata (a name doubtfully applicable to Phoronis) is replaced by Podaxonia, a term employed by Lankester in the 9th edition of this encyclopedia and now used to include a number of groups of doubtful but possible affinity. The terms used for indicating groups are "Phylum" for the large diverging branches of the genealogical tree as introduced by Haeckel, each Phylum bears secondary branches which are termed "classes," classes again branch or divide into orders, orders into families, families into genera, genera into species. The general purpose is to give something like an equivalence of importance to divisions or branches indicated by the same term, but it is not intended to imply that every phylum has the

\(^1\) Ursprung der Wirbeltiere (Leipzig, 1875); and Lankester, Degeneration (London, 1880).
same range and distinctive character as every other, nor to make such a proposition about classes, orders, families and genera. Where a further subdivision is desirable without descending to the next lower term of grouping, the prefix "sub" is made use of, so that a class may be divided first of all into subclasses each of which is divided into orders, and an order into sub-orders each of which bears a group of families. The term "grade" is also made use of for the purpose of indicating the conclusion that certain branches on a larger or smaller stem of the genealogical tree have been given off at an earlier period in the history of the evolution in question than have others marked off as forming a higher grade. Thus, to begin with, the animal pedigree is divided into two very distinct grades, the Protozoa and the Metazoan. The Metazoan form two main branches; one, Parazoa, is but a small unproductive stock comprising only the Phylum Porifera or Sponges; the other, the great stem of the animal series Enterozoa, gives rise to a large number of diverging Phyla which it is necessary to assign to two levels or grades—a lower, Enterocoeola (often called Coelentera), and a higher, Coelomocoeola (often called Coelomata). These relations are exhibited by the following two following diagrams.

**Diagram showing the primary grades and branches of the Animal Pedigree.**

---

**Branch A. ENTEROCOEOLA.**

**Branch B. ENTEROCOEOLA.**

Diagram to show the division of the great branch Enterozoza into two grades and the Phyla given off theretofrom.

The Phylum Vertebrata in the above scheme branches into the sub-phyla Hemichorda, Urochorda, Cephalochorda and Crania. The Phylum Appendiculata similarly branches into sub-phyla, viz. the Rotifera, the Chaetopoda and the Arthropoda. Certain additional small groups should probably be recognized as independent lines of descent or phyla, but their relationships are obscure—they are the Mesozoa, the Polyzoa, the Acanthocephala and the Gastrotricha.

We may now enumerate these various large groups in tabular form.

**BIONTA—PHYTA, ANIMALIA.**

**Grade A. Protozoa (various groups included).**

**Grade B. Metazoa.**

Branch a. Parazoa.

Phylum 1. Porifera.

---

**Branch b. Enterozoa.**

**Grade 1. ENTEROCOEOLA.**

**Phylum 2. HYDROMEDUSA.**

3. SCYPHOMEDUSA.

4. ANTHOZOA.

5. CTENOPHORA.

**Grade 2. COELOMOCOEOLA.**

**Phylum 6. PLATYELMIA.**

7. NEMATODIA.

8. CHAETOGNATHIA.

9. NEUMERINA.

10. MOLLUSCA.

11. APENDICULATA.

Sub-phyla: Rotifera, Chaetopoda, Arthropoda.

12. ECHINODERMATA.

13. VERTEBRATA.

Sub-phyla: Hemichorda, Urochorda, Cephalochorda, Craniana.

14. MESOZOA.

15. POLYZOA.

16. ACANTHOCEFALIA.

17. PODAXONIA.

18. GASTROTRICHA.

A statement may now be given of the classes and orders in each group, as recognized by the writers of the various special zoological articles in the Eleventh Edition of the Encyclopaedia Britannica. These subdivisions of the larger groups are not necessarily those theoretically approved by the present writer, but they have the valuable sanction of the individual experts who have given special attention to different portions of the vast field represented by the animal kingdom.^

**Classification adopted in the present work.**

**Grade A. Protozoa (q.v.).**

**Phylum 1. Sarcodina (q.v.).**

**Class 1. PROTHEMYS (q.v.).**

Class 2. RHIZOPODA (q.v.).

Orders: Lobosa, Filosa.

Class 3. HELIOZOA (q.v.).

Class 4. FORAMINIFERA (q.v.).

Insetae sedis: Xenophyophoridae (see Foraminitera).

Class 5. Radiolaria.

Orders: Spumellaria (= Periploca), Acantharia (= Actinocyclus), Nassellaria (= Monoploca), Phaeodaria (= Trypinia).

Class 6. LABYRINTHULIDEA (q.v.).

No Orders.

Class 7. MYXOMYCETES.

No Orders.

Phylum 2. Mastigophora (q.v.).

Class 1. FLAGELLATA (q.v.).

Sub-class A. Rhizoflagellata.

Orders: Holomastigatae, Rhiomatosaiga.

Sub-class B. Euflagellata.

Orders: Protomasiga, Chrysonomades, Cryptomonadaceae, Chloromonadaceae, Euglenaceae, Volvocaceae.

Class 2. DINOFLAGELLATA.

Orders: Gymnamidae, Prorocentrae, Peridiniae.

No Orders.

Phylum 3. Sporozoa (q.v.).

Class 1. ENDOZOA (q.v.).

Orders: Myxosporidia, Actinomyci, Sarcomastigophora.

Class 2. ECTOSPOREA (q.v.).

Orders: Gregarina (see Gregarinae), Coccidia (q.v.), Hymenosporidia (q.v.).

Phylum 4. Infusoria (q.v.).

Class 1. CILIATA.

Orders: Gymnosophistidae, Trichostomatidae, Aspirotrichidae, Sirotrichidae, Heterotrichidae, Oligotrichidae, Hypotrichidae, Peritrichidae.

Class 2. Suctoria.

No Orders.

---

1 It is to be noted that the terms used for designating categories in the classification are not always identical in this summary and separate articles, as authors differ as to the use of these.

Grade b. Embodothricha (or Aeropoeustea).
Section. Pectinifera.
Order: Scorpionidea.
Section. Epecinifera.
Order: Pediopelopa, Araneae, Palpigradi, Solitaires, Tendacorpon, Podogama, Opiliones, Rhynchosori (Acari).

Class 3. Tardigrada (g.v.).
No Orders.

Class 4. Lingualata (see Pentastomodan).
No Orders.

Phylum 12. Echinoderm (see Echinozoa).
Branch A. Pelmatozoa.
Class 1. Cystidea.
Orders: Amphioidae, Carpoidea, Rhabmifera, Aponeura, Diplopoidea.
Class 2. Blastidea.
Divisions: Proteoblastidea, Eublastidea.
No Orders.

Class 3. Crinoidea.
Orders: Monocelis Inadunata, Adunata, Monocyclus Camerata, Dicyclus Inadunata, Flexibilia, Dicyclus Camerata.
Class 4. Echinoidea.
No Orders.

Branch B. Eleutherotroza.
Class 1. Holothuroidea.
Orders: Aspidochirole, Dendrochirole.

Class 2. Stellariformia.
Sub-class 1. Asteridea.
Orders: Phaneropoma, Cryptopoma.
Sub-class 2. Ophiurida.
Orders: Streptophiurias, Zygoophiurias, Cladophiurias.

Class 3. Echinoidea.
Orders: Bothriocorida, Melonimida, Cystoidea, Cidarida, Diademaidea, Holostei, Spatangoidea, Clypeasteroids.

Phylum 13. Vertebrata (g.v).
Sub-phylum a. Hemichordata (g.v.).
Class. Enteropneusta (see Balanoglossus).
No Orders.

Sub-phylum b. Urochordata.
Class. Tunicata (g.v.).
Orders: Larvae, Thalaeae (Sub-Orders: Cyclo- myaria, Hemimyaria), Ascidiae (Sub-orders: Ascidiae Simplices, Ascidiae Compositae, Ascidiae Luciae).

Sub-class b. Cephalochorda (see Amphioxus).
Class. Cephalochorda.
No Orders.

Sub-phylum d. Chordata.
Class 1. Pisces (see Ichthyology).
Sub-class 1. Cyclostomata (g.v.).
Orders: Myxineformes (or Hyperoteto), Petromyzonides (or Hyoeropote).
Sub-class 2. Selachia or Elasmobranchi (see Seal- chians).
Orders: Pleuronectygi, Acanthodii, Ichthyotomi, Plagostomi, Holocephali.
Sub-class 3. Teleostoma.
Orders: Canoidea, Crossopterygii, Dipnoi, Te- latoii.

Class 2. Batrachia (g.v.).
Orders: Sphenobaia, Apoda (or Peromela), Caudata (or Urodela), Echidna (or Anura).

Class 3. Reptilia (see Reptiles).
Orders: Ammochordata, Chelonia, Samopterygia, Ichthyopterygia, Rhynchopterygia, Dinosauria, Cro- codilia, Ornithosaurs, Synapsa.

Class 4. Aves (see Bird and Ornithology).
Sub-class 1. Archacornithes.
No Orders.

Sub-class 2. Neornithes.
Division 1. Ratitea.
Orders: Struthiones, Rhei, Casuarinae, Apteryges, Dinornithes, Aepyornithes.
Division 2. Ondotolae.
No Orders.

Division 3. Carinatae.
Ardeiformes (Sub-orders: Paleomedii, Anserae).
Falconiformes (Sub-orders: Catharinae, Accipitres, Tinamiformes, Galliformes (Sub-orders: Meleagrii, Turdus, Galli, Dendropteris, Columbae), Cuculiformes (Sub-orders: Cuculac, Psitacae). Coraciiformes (Sub-orders: Cor- aci, Strigiformes, Cypodi, Colii, Tro- genes, Pici), Passeriformes (Sub-orders: Passeres, Pycroptera, Passeres, Diactylostyloidea).

Class 4. Mammalia (g.v.).
Sub-class i. Monotrema (g.v.) (Protoderm). No Orders.
Sub-class 2. Marsupialia (g.v.) (Metatheria).
One Order: Marsupialia.
Sub-orders: Polyprotodactyla, Pseuduciberculata, Diurodonta.
Sub-class 3. Placentalia (Monodelphia, q.v.; or Eutheria).
Orders: Insectivora, Chiroptera, Dermoptera, Eden- tata (Sub-orders: Xenarthra, Pholidota, Tubulidentata), Rodentia (Sub-orders: Duplicidentata, Sim- plicidentata), Tadodontina, Carnivora (Sub-orders: Fissipedia, Pinnipedia, Cetacea (Sub- orders: Archaeoceti, Odontoceti, Mysticoceti), Sirenia, Ungulata (Sub-orders: Proboscidea, Hypacoceti, Baryoceto, Baryoceto, Amblyoceto, Lioptera, Insectivora, Condylartha, Perissodactyla, Artiodactyla), Primates (Sub-orders: Pro- simiae, Anthropoidea).

Phylum 14. Mesozoa (g.v.).
Class 1. Rhabdomozoa.
No Orders.

Class 2. Ostheoctecta.
No Orders.

Phylum 15. Polyzoa (g.v.).
Class 1. Entofocta.
No Orders.

Class 2. Ectoprocta.
Orders: Gymnolaemata (Sub-orders: Tryptomatoni, Cryptocelotomi, Cyclodactyla, Cheilostomata), Physocyctida (g.v.).

Phylum 16. Acanthocephala (g.v.).
Class. Acanthocephala.
No Orders.

Phylum 17. Podazoa.
Class 1. Spineculodea (g.v.).

Class. Gastrotrecha.
Sub-orders: Ichthyotina, Cepodina. (Possibly Kin- rhynca (g.v) with only Echinoderes to be placed here)."

GENERAL TENDENCIES SINCE DARWIN

Darwin may be said to have founded the science of taxonomy, at the same time to have given new stimulation and new direction to morphology, physiology, and plasmology, by uniting them as contributing parts to one comprehensive biological doctrine—the doctrine of organic evolution—itself but a part of the wider doctrine of universal evolution based on the laws of physics and chemistry. The immediate result was, as pointed out above, a reconstruction of the classification of animals upon a genealogical basis, and an investigation of the individual development of animals in relation to the steps of their gradual building up by cell-division, with a view to obtaining evidence of their genetic relationships. On the other hand, the studies which occupied Darwin himself so largely subsequently to the publication of "The Origin of Species," viz. the explanation of animal form (and vegetable) mechanism, colouring, habits, &c., as advantageous to the species or to its ancestors, are only gradually being carried further. The most important work in this direction has been done by Fritz Müller (Für Darwin), by Herman Müller (Fertilisation of Plants by Insects).
by August Weismann (memoirs translated by Meldola) by Edward B. Poulton (see his addresses and memoirs published in the Transactions of the Entomological Society and elsewhere), and by Abbot Thayer (Concealing Coloration in the Animal Kingdom, Macmillan & Co. 1910). In the branch of bionomics, however, concerned with the laws of variation and heredity (thromatolog), there has been considerable progress. In the first place, the continued study of human population has thrown additional light on some of the questions involved, whilst the progress of microscopical research has given us a clear foundation as to the structural facts connected with the origin of the egg-cell and sperm-cell and the process of fertilization.

Great attention has been given lately to the important experiments upon the results of hybridizing certain cultivated varieties of plants which were published some time ago as 1865, by the Abbé Mendel, but failed to attract notice until thirty-five years later, sixteen years after his death (see Mendelism).

Mendel's object was to gain further knowledge as to the result of mixing by cross-fertilization or interbreeding two strains exhibiting diverse characters or structural features. The whole question is as to the mixture of characters in offspring thus produced was—and remains—very imperfectly observed. Mendel's observations consist in an attempt to throw light on the matter, and in the opinion of some biologists have led to the discovery of an important principle. Mendel made his chief experiments with cultivated varieties of the self-fertilizing edible pea. He selected a variety with one marked structural feature and crossed it with another variety in which that feature was absent. Instances of his selected varieties are the tall variety which he hybridized with a dwarf variety, a yellow-seeded variety which he hybridized with a green-seeded variety, and again a smooth-seeded variety which he hybridized with a wrinkled-seeded variety. In each set of experiments he concentrated his attention on the one character selected for observation. Having obtained a first hybrid generation, he allowed the hybrids to self-fertilize, and recorded the result in a large number of instances (a thousand or more) as to the number of individuals in the first, second, third and fourth generations in which the character selected for experiment made its appearance. In the first hybrid generation formed by the union of the reproductive germ of the positive variety (that possessing the structural character selected for observation) with that of the negative variety (that possessing the opposite characters to the positive variety), it is not surprising that all or nearly all the individuals were found to exhibit, as a result of the mixture, the positive character. In subsequent generations produced by self-fertilization of the hybrids it was found that the positive character was not present in all the individuals, but that a result was obtained showing that in the formation of the reproductive cells (ova and sperms) of the hybrid, half were endowed with the positive character and half with the negative. Consequently the result of the haphazard pairing of a large number of these two groups of reproductive cells was to yield, according to the regular law of chance combination, the proportion 1P, 2PN, 1NN, where P stands for the positive character and N for its absence or negative character—the positive character being accordingly present in three-fourths of the offspring and absent from one-fourth. The fact that in the formation of the reproductive cells of the hybrid generation the material which carries the positive quality is not subdivided so as to give a half-quantity to each reproductive cell, but on the contrary is apparently distributed as an undivided whole to half only of the reproductive cells and not at all to the remainder, is the important inference from Mendel's experiments. Whether this inference is applicable to other classes of cases than those studied by Mendel and his followers is a question which is still under investigation. The failure of the material carrying a positive character to divide so as to distribute itself among all the reproductive cells of a hybrid individual, and the limitation of its distribution to half only of those cells, must prevent the "swamping" of a newly appearing character in the course of the inter-breeding of those individuals possessed of the character with those which do not possess it. The tendency of the proportions in the offspring of 1P, 2PN, 1NN to give in a series of generations a regular reversion from the hybrid form PN to the two pure races, viz. the race with the positive character simply and the race with the total absence of it. It has been maintained that this tendency to a separation of the hybrid stock into its components must favour the persistence of a new character of large volume suddenly appearing in a stock, and the observations of Mendel have been held to favour in this way the views of those who hold that the variations upon which natural selection has acted in the production of new species are not small variations, but large "discontinuous." It does not, however, appear that "large" variations would thus be favoured any more than small ones, nor that the eliminating action of natural selection upon an unfavourable variation could be checked.

A good deal of confusion has arisen in the discussions of this latter topic, owing to defective nomenclature. By some writers the word "mutation," is applied only to large and suddenly appearing variations which are found to be capable of hereditary transmission, whilst the term "fluctuation" is applied to small variations whether capable of transmission or not. The term "inheritance" is apparently applied only to those small "acquired" variations due to the direct action of changes in food, moisture and other features of the environment. It is no discovery that this latter kind of variation is not hereditary, and it is not the fact that the small variations, to which Darwin attached great but not exclusive importance as the material upon which natural selection operates, are of this latter kind. The most instructive classification of the "variations" exhibited by fully formed organisms consists in the separation in the first place of those which arise from hereditary causes, innate, constitutional or germinal variations from those which arise merely from the operation of environmental laws, and the secondly, of such variations into those due to accident, and those which are due to selection. The former are "innate" variations, the latter are "superimposed" variations (so-called "acquired variations"). Both innate and superimposed variations are capable of division into those which are more and those which are less obvious to the human eye. Scarcely perceptible variations of the innate class are regularly and invariably present in every new generation of every species of higher organization. The process by which they are transmitted is not of much significance; their real importance in regard to the origin of new species depends upon whether they are of value to the organism and therefore capable of selection in the struggle for existence. An absolutely imperceptible physiological difference arising as a variation may be of selective value, and it may carry with it correlated variations which appeal to the human eye but are of no selective value themselves. The present writer has, for many years, urged the importance of this consideration.

The views of de Vries and others as to the importance of "sallatory variation," the soundness of which was still by no means generally accepted in 1910, may be gathered from the articles Mendelism and Variation. A due appreciation of the far-reaching results of "correlated variation" must, it appears, give a new and distinct explanation to the phenomena which are referred to as "large mutations," "discontinuous variation," and "sallatory evolution." Whatever value is to be attached to Mendel's observation of the breaking up of self-fertilized hybrids of cultivated varieties into the two pure kinds, viz., 1P, 2PN, 1NN, it cannot be considered as more than a contribution to the extensive investigation of heredity which still remains to be carried out. The analysis of the specific variations of organic form so as to determine what is really the nature and limitation of a single "character" or "individual variation," and whether two such true and strictly defined single variations of a single structural unit can actually "blend" when one is transmitted by the male parent and the other by the female.
parent, are matters which have yet to be determined. We do not yet know whether such absolute blending is possible or not, or whether all apparent blending is only a more or less minutely subdivided "mosaic" of non-combinable characters of the parents, in fact whether the combinations due to heredity in reproduction are ever analogous to chemical compounds or are always comparable to particulate mixtures. The attempt to connect Mendel's observation with the structure of the sperm-cells and egg-cells of plants and animals has already been made. The suggestion is obvious that the halving of the number of nuclear threads in the reproductive cells as compared with the number of those present in the ordinary cells of the tissues—a phenomenon which has now been demonstrated as universal—may be directly connected with the facts of segregation of hybrid characters observed by Mendel. The suggestion requires further experimental testing, for which the case of the parthenogenetic production of a portion of the offspring, in such insects as the bee, offers a valuable opportunity for research.

Another important development of Darwin's conclusions deserves special notice here, as it is the most distinct advance in the department of bionomics since Darwin's own writings, and at the same time touches questions of fundamental interest. The matter strictly relates to the consideration of the "causes of variation," and is as follows. The fact of variation is a familiar one. No two animals, even of the same brood, are alike: whilst exhibiting a close similarity to their parents, they yet present differences, sometimes very marked differences, from their parents and from one another. Lamarck had put forward the hypothesis that structural alterations transmitted by (that is to say, superimposed upon) a parent in the course of its life are transmitted to the offspring, and that, as these structural alterations are acquired by an animal or plant in consequence of the direct action of the environment, the offspring inheriting them would as a consequence not unfrequently start with a greater fitness for those conditions than its parents started with. In its turn, being operated upon by the conditions of life, it would acquire a greater development of the same modification, which it would in turn transmit to its offspring. In the course of several generations, Lamarck argued, a structural alteration concurring to such difference as we call "specific" might be thus acquired. The familiar illustration of Lamarck's hypothesis is that of the giraffe, whose long neck might, he suggested, have been acquired by the efforts of a primitively short-necked race of herbivores who stretched their necks to reach the foliage of trees in a land where grass was deficient, the effort producing a distinct elongation in the neck of each generation, which was then transmitted to the next. This process is known as "direct adaptation"; and there is no doubt that such structural adaptations are acquired by an animal in the course of its life, though such changes are strictly limited in degree and rare rather than frequent and obvious.

Whether such acquired characters can be transmitted to the next generation is a separate question. It was not proved by Lamarck that they can be, and, indeed, never has been proved by actual observation. Nevertheless it has been assumed, and also indirectly argued, that such acquired characters must be transmitted. Darwin's great merit was that he excluded from his theory of development any necessary assumption of the transmission of acquired characters. He pointed to the admitted fact of congenital variation and he showed that congenital variations are arbitrary and, so to speak, non-significant. Their causes are extremely difficult to trace in detail, but it appears that they are largely due to a "shaking up" of the living matter which constitutes the fertilized germ or embryo-cell, by the process of mixture in it of the substance of two cells—the germ-cell and the sperm-cell—derived from two different individuals. Other mechanical disturbances may assist in this production of congenital variation. Whatever its causes, Darwin showed that it is all-important. In some cases a pair of animals produce ten million offspring, and in such a number a large range of congenital variation is possible. Since on the average only two of the young survive in the struggle for existence to take the place of their two parents, there is a selection out of the ten million young, none of which are exactly alike, and the selection is determined in nature by the survival of the congenital variety which is fittest to the conditions of life. Hence there is no necessity for an assumption of the perpetuation of direct adaptations. The selection of the fortuitously (fortuitously, that is to say, so far as the conditions of survival are concerned) produced varieties is sufficient, since it is ascertained that they will tend to transmit those characters with which they themselves were born, although it is not ascertained that they could transmit characters acquired on the way through life. A simple illustration of the difference is this: a man born with four fingers only on his right hand is ascertained to be likely to transmit this peculiarity to some at least of his offspring; on the other hand, there is not the slightest ground for assuming that a man who has had one finger chopped off, or has even lost his arm at any period of his life, will produce offspring who are defective in the slightest degree in regard to fingers, hand or arm. Darwin himself, influenced by the consideration of certain classes of facts which seem to favour the Lamarckian hypothesis, was of the opinion that acquired characters are in some cases transmitted. It should be observed, however, that Darwin did not attribute an essential part to this Lamarckian hypothesis of the transmission of acquired characters, but expressly assigned to it an entirely subordinate importance.

The new attitude which has been taken since Darwin's writings on this question is to ask for evidence of the asserted transmission of acquired characters. It is held that the Darwinian doctrine of selection of fortuitous congenital variations is sufficient to account for all cases, that the Lamarckian hypothesis of transmission of acquired characters is not supported by experimental evidence, and that the latter should therefore be dismissed. Weismann has also ingeniously argued from the structure of the egg-cell and sperm-cell, and from the way in which, and the period at which, they are derived in the formation of the embryo from the egg—from the fertilized egg-cell—that it is impossible (it would better be to say highly improbable) that an alteration in parental structure could produce any exactly representative change in the substance of the germ or sperm-cells.

The one fact which the Lamarckians can produce in their favour is the account of experiments by Brown-Séquard, in which he produced epilepsy in guinea-pigs by section of the large nerves or spinal cord, and in the course of which he was led to believe that in a few rare instances the artificially produced epilepsy and mutilation of the nerves was transmitted. This instance does not stand the test of criticism. The record of Brown-Séquard's original experiment is not satisfactory, and the subsequent attempts to obtain similar results have not been attended with success. On the other hand, the vast number of experiments in the cropping of the tails and ears of domestic animals, as well as of similar operations on man, are attended with negative results. No case of the transmission of the results of an injury can be produced. Stories of tailless kittens, puppies and calves, born from parents one of whom had been thus injured, are abundant, but they have hitherto entirely failed to test any valuable data. Whilst simple evidence of the fact of the transmission of an acquired character is wanting, the a priori arguments in its favour break down one after another when discussed. The very cases which are advanced as only to be explained on the Lamarckian assumption are found on examination and experiment to be better explained, or only to be explained, by the Darwinian principle. Thus the occurrence of blind animals in caves and in the deep sea was a fact which Darwin himself regarded as best explained by the atrophy of the organ of vision in successive generations through the absence of light and

1 Weismann, Vererbung, &c. (1886).
ZOLOGY

consequent diseuse, and the transmission (as Lamarck would have supposed) of a more and more weakened and structurally impaired eye to the offspring in successive generations, until the eye finally disappeared. But this instance is really fully explained (as the present writer has shown) by the theory of natural selection or the doctrine of inheritance. It is definitely ascertained that many animals are thus born with distorted or defective eyes whose parents have not had their eyes submitted to any peculiar conditions. Supposing a number of species of arthropod or fish to be swept into a cavern or to be carried from less to greater depths in the sea, those individuals with perfect eyes would follow the glimmer of light and eventually escape to the outer air or the shallower depths, leaving behind those with imperfect eyes to breed in the dark place. A natural selection would thus be effected. In every succeeding generation this would be the case, and even those with weak but still seeing eyes would in the course of time escape, until only a pure race of eyeless or blind animals would be left in the cavern or deep sea.

It is a remarkable fact that it was overlooked alike by the supporters and opponents of Lamarck’s views until pointed out by the present writer (Nature, 1894, p. 127), that the two statements called by Lamarck his first and second laws are contradictory one of the other. Lamarck’s first law asserts that a past history of indefinite duration is powerless to create a bias by which the present can be controlled. He declares that “the inherited habits or capacities of an animal may be acquired by the parent as the result of experience, and continuously elaborated and added to in successive generations. It is, however, to be noted, in the first place, that the imitator of the parent by the young possibly accounts for some part of these complicated actions, and, secondly, that there are cases in which curiously elaborate actions are performed by animals as a characteristic of the species, and as subserving the general advantage of the race or species, which, nevertheless, may be explained as resulting from the transmission of acquired experience, and must be supposed to be due to the natural selection of a fortuitously developed habit which, like fortuitous colour or form variation, happens to prove beneficial. Such cases are the habits of “shamming dead” and the combined posturing and colour peculiarities of certain caterpillars (Lepidopterous larvae) which cause them to resemble dead twigs or similar surrounding objects. The advantage to the animal of this imitation of surrounding objects is that it escapes the pursuit of (say) a bird which would, were it not deceived by the resemblance, attack and eat the caterpillar. Now it is clear that preceding generations of caterpillars cannot have acquired this habit of posturing by experience. Either the caterpillar postures and escapes, or it does not posture and is eaten; it is not half eaten and allowed to profit by experience. We seem to be justified in assuming that there are many movements of stretching and posturing possible to caterpillars, and that some caterpillars had a congenital fortuitous tendency to one position, sometimes to that of the caterpillar, and finally that among all the variety of habitual movements thus exhibited one has been selected and perpetuated because it coincided with the necessary conditions of safety, since it happened to give the caterpillar an increased resemblance to a twig.

The view that instinct is the hereditarily fixed result of habit derived from experience long dominated all inquiry into the subject, but we may now expect to see a renewed and careful study of animal instincts carried out with the view of testing the applicability to each instance of the pure Darwinian theory without the aid of Lamarckism.

Nothing can be further from the truth than the once favourite theory that instincts are the survivals of lapsed reasoning processes. Instincts, or the inherited structural mechanisms of the nervous centres, are in antagonism to the results of the reasoning process, which are not capable of hereditary transmission. Every higher vertebrate animal possesses the power of forming for itself a series of cerebral mechanisms or reasoned conclusions based on its individual experience, in proportion as it has a large cerebrum and has got rid of or has acquired the power of controlling its inherited instincts. Man, compared with other animals, has the fewest inherited mental mechanisms or instincts and at the same time the largest cerebrum in proportion to the size of his body. He builds up, from birth onwards, his own mental mechanisms, and forms more of them, that is to say, is more "educable," and takes longer in doing so, that is to say, in growing up and maturing his experience, than any other animal. The later stages of evolution leading from his ape-like ancestors to man have consisted definitely in the acquirement of a larger cerebrum, and the development of "educable" brain, thus a consequent education of that brain. A new and most important feature in organic development makes its appearance when we set out the facts of man’s evolutionary history. It amounts to a new and unprecedented factor in organic development, external to the organism and yet produced by the activity of the organism upon which it permanently reacts. This factor is the Record of the Past, which grows and develops by laws other than those affecting the perishable bodies of successive generations of mankind, and exerts an incomparable influence upon the educable brain, so that man, by the interaction of the Record and his educability, is removed to a large extent from the status of the organic world and placed in a new and unique position, subject to new laws and new methods of development unlike those by which the rest of the living world is governed. That which we term the Record of the Past comprises the "taboos,"
the customs, the traditions, the beliefs, the knowledge which are handed on by one generation to another independently of organic propagation. By it a new heredity, free from the limitations of protoplasmic continuity, is established. Its first beginnings are seen in the imitative tendencies of animals by which the young of one generation acquire some of the habits of their parents, and by which gregarious and social animals acquire a community of procedure ensuring the advantage of the group. "Taboo," the systematic imposition by the community of restrictions upon the conduct of the individual, is one of its earliest manifestations in primitive man and can be observed even in animal communities. But with the development of the power of inter-communication by the use of language, the Record rapidly acquired an increased development, which was enormously extended by the continuous growth in mankind of the faculty of memory. To the mere tradition preserved by memory and handed on by speech was then added the written record and its later multiplication by the mechanical arts of printing, by which it acquired permanence and universal distribution. The result is the creation of an almost inconceivably vast body of traditional custom, law and knowledge into which every human being is born, less in the more isolated and barbarous communities, but large everywhere. Education is not in its essential nature a training administered to the young by an older generation, but is the natural and unaided assimilation of the Record of the Past by the automatically educable brain—an assimilation which is always in all races very large but becomes far larger in civilized communities. It is among them so important whilst the Record in all its details is so far beyond the receptive capacity of the brain, that selection and guidance are employed by the elders in order to enable the younger generation to benefit to the utmost by the absorption (so to speak) in the limited span of a lifetime of the most valuable influences to be acquired from this prodigious envelope of Recorded Experience. The imperishable Record invests the human race like a protective atmosphere, a new and yet a natural dispensation, giving to man, as compared with his animal ancestry, a new heaven and a new earth.

A result of the very greatest importance arising from the application of the generalizations of Darwinism to human development and to the actual phase of existing human population is that education has no direct effect upon the mental or physical features of the race or stock; it can only affect those of the individual. Educability, defects or excellences, or peculiarities of mind or body, can be handed on from parent to offspring by protoplasmic continuity in reproduction. But the results of education cannot be so handed on. The educated man who has acquired new experiences, new knowledge, can place these on the great Record for his young. The Record for all its limitations of men, but he cannot bodily transmit his acquisitions to his offspring. Were acquired (superimposed) characters really transmissible by breeding, then every child born would inherit, more or less completely, the knowledge acquired by both its parents. But we know this is not the case: the child has to begin with a clean slate and learn for itself. Aptitudes and want of aptitude, which are innate and constitutive, are transmitted to offspring, but not the results of experience, education and training. Bleedings in the stock, defects of mind or body, though they may be to some extent corrected in the individual by training, cannot be got rid of from the stock by any such process. A defective stock, if allowed to breed, will perpetuate its defects, in spite of the concealment of those defects in an individual by training or other treatment. Equally it must be concluded that the weakness and degradation produced by semi-starvation and insanitary conditions of life are only an effect on the individual and cannot affect the stock. The stock may be destroyed, killed out by adverse conditions, but is equally not directly affected, and fitted for more favourable conditions it will show no hereditary results of the previous adversity; indeed it will probably have been strengthened in some ways by the destruction in severe conditions of its weaker members and the survival of the stronger individuals.

Such considerations have the very greatest importance for the guidance of the action of civilized man in seeking the health and happiness of the community. But it must not be forgotten that the problems presented by human communities are extremely complex, and that the absence of any selection of healthy or desirable stock in the breeding of human communities leads to undesirable consequences. The most thrifty and capable people at the present day are not (it has been shown) in overcrowded areas, producing offspring at such a rate as to contribute to the increase of the population. That increase, it has been shown, is due to the early marriage and excessive reproduction of the reckless and hopeless, the poorest, least capable, least desirable members of the community. The questions raised by these considerations have attracted much public attention under the newly invented name of "eugenics," but they are of an exceedingly difficult and delicate nature.

(Z.E.R.L.)

ZORILLA, MANUEL RUIZ, DON (1834-1895), Spanish politician, was born at Burgos de Osma in 1834. He began his education at Valladolid, and studied law afterwards at Madrid University, where he leaned towards Radicalism in politics. In 1856 he was elected deputy, and soon attracted notice among the most advanced Progressists and Democrats. He took part in the revolutionary propaganda that led to the military movement in Madrid on the 22nd of June 1866. He had to take refuge in France for two years, like his fellow-conspirators, and only returned to Spain when the revolution of 1868 took place. He was one of the members of the first cabinet after the revolution, and in 1869, under a new agency of Madrid, Serrano, he became minister of grace and justice. In 1870 he was elected president of the House of Deputies, and seconded Prim in offering the throne to Amadeus of Savoy. He went to Italy as president of the commission, carrying to the prince at Florence the official news of his election. On the arrival of Amadeus in Spain, Ruiz Zorilla became minister of public works for a short time, and resigned by way of protesting against Serrano and Topete entering the councils of the new king. Six months later, in 1871, he was invited by Amadeus to form a cabinet, and he continued to be the principal councillor of the king until February 1873, when the monarch abdicated in disgust at the resistance he met with in the army, and at the lack of sincerity on the part of the very politicians and generals who had asked him to ascend the throne. After the departure of Amadeus, Ruiz Zorilla advocated the establishment of a republic. Notwithstanding this, he was not called upon either by the Federal Republicans to help them during the year 1873, or by Marshal Serrano during 1874 to join Martos and Sagasta in his cabinet. Immediately after the restoration of the throne to the house of Sforza, Ruiz Zorilla went to France. He was for nearly eighteen years the soul of the republican conspiracies, the prompter of revolutionary propaganda, the chief inspirer of intrigues concerted by discontented military men of all ranks. He gave so much trouble to the Madrid governments that they organized a watch over him with the assistance of the French government and police, especially when it was discovered that the two military movements of August 1883 and September 1886 had been prepared and assisted by him. During the last two years of his life Ruiz Zorilla became less active; failing health and the loss of his wife had decreased his energies, and the Madrid government allowed him to return to Spain some months before he died at Burgos, on the 13th of June 1895, of heart disease.

ZORNORD, a village of Prussia, in the Oder valley, north-east of Cüstrin. It is famous as the scene of a battle in which the Prussians under Frederick the Great defeated the Russians commanded by Fermor, on the 25th of August 1758 (see Seven Years' War).

ZOROASTER, one of the great teachers of the East, the founder of what was the national religion of the Perso-Indian people from the time of the Achaemenidae to the close of the Sassanian period. The name (Zoroastra) is the corrupt Greek form of the old Iranian Zoroastha (new Persian,
ZOROASTER

Zoroaster. Its significance is obscure; but it certainly contains the word uikithra, "camel."

Zoroaster was already famous in classical antiquity as the founder of the widely recognized Magi. His name is mentioned in the Persian text "Herodotus of the Avesta, the Medo-Persian, and Near East lc."

Evidence for his existence is found in the Avesta, the whole Magian system (Plut. des. et. Osiris, 46; Plat. loc. cit.; Diog. Laërt. proem. 23; other passages in Jackson's Zoroaster, 6 seq.). They sometimes call him a Bactrian, sometimes a Median or Persian (cf. Jackson, op. cit. 186). The ancients also recount a few points regarding the childhood of Zoroaster and his hermit-life. Thus, according to the "Hecatist," he lived with horses, like the Persian, in a chariot, and he dwelled in the wilderness on mount Ararat (xi. 97). Plutarch speaks of his intercourse with the deity, and compares him with Lycurgus and Numa (Numa, 4). Dio Chrysostom, Plutarch's contemporary, declares that neither Homer nor Hesiod sang of the chariot and horses of Zeus so worthily as Zoroaster, of whom the Persians tell that, out of love to wisdom and righteousness, he withdrew himself from men, and lived in solitude upon a mountain. The mountain was consumed by fire, but Zoroaster escaped with his chariot and horses. This vagabond life, says Plutarch, drawing partly on Theopompus, speaks of his religion in his Isis and Osiris (cc. 46-47). He gives a faithful sketch of the doctrines, mythology and dualistic system of the Magian Zoroaster.

As to the period in which he lived, most of the Greeks have already lost the true perspective. Herodotus and Herodippus of Smyrna place him 5000 years before the Trojan war, Xanthus 6000 years before Xerxes, Eusebios and Aristotle 6000 years before the death of Plato. Agathas remarks (ii. 24), with perfect truth, that it is no longer possible to determine with any certainty when he lived and what he taught. "There is no reason," says Chrysostom, "why we should not believe that Zoroaster lived under Hystaspes, and that he did not make it clear whether by this name they mean the father of Darius or another Hystaspes. But, whatever may have been his date, he was their teacher and instructor in the Magian religion, modified their former religious customs, and introduced a variegated and composite belief."

He is nowhere mentioned in the cuneiform inscriptions of the Achaemenidae, although Darius and his successors were without doubt connected with the Zoroastrians. The first reliable evidence of the Avestan is our principal source for the doctrine of Zoroaster; on the subject of his person and his life it is comparatively reticent; with regard to his doctrines, it is absolutely silent. The 7th section, or Spend Násh, which was mainly consecrated to the description of his life, has perished; while the biographies founded upon it in the 7th book of the Dinkard (9th century a.d.), the Sháih-Áyeshtah of Aschahrán (10th century), are legendary—full of wonders, fabulous histories and miraculous deliverances.

Under all circumstances we must imitate the ancient authors in holding fast to the historic personality of Zoroaster; though he—like many another name of the dim past—has failed to escape the fate of being regarded as a purely mythical creation (for instance, by for Kern and by Darmesteter, in the Sacred Books of the East, transl. 1880, introd. 76). According to Darmesteter, the Zarathushtra of the Avesta is a mere myth, a divinity invested with human attributes, an incarnation of the storm-god, who with his divine word, the fire, the wind, the water, etc., animates the demons. Darmesteter has failed to realize sufficiently the distinction between the Zoroaster of the later Avesta and the Zoroaster of the Gathas. It cannot be denied that in the later Avesta, and still more in writings of more recent date, he is presented in a legendary light and endowed with superhuman powers. At his appearing all nature rejoices (Yasht, 13, 93); he enters into conflict with the demons and rides the earth of their presence (Yasht, 17, 19); Satan approaches him as tempter to make him renounce his faith (Vendidad, 19, 6).

The Gathás alone within the Avesta make claim to be the ipsissima verba of the prophet; in the rest of that work they are put into the mouths of the mouth of the holy Gathás, called "the Gathás of the holy Zoroaster" (Yasna, 57, 8). The litigations of the Yasna, and the Yashts, refer to him as a personage belonging to the past, the Verišahr, and give merely the recipe of the dialogues between Ormazd and Zoroaster. The Gathás alone claim to be authentic utterances of Zoroaster, his actual expressions in person of the assembled congregation. They are the last genuine survivals of the Zoroastrian dialect in which the promulgator of a new religion—his appearance at the court of King Vštásápa

The person of the Zoroaster whom we meet with in these hymns differs from the other Zoroasters in having a sort of the exact opposite of the miraculous personage of later legend—a mere man, standing always on the solid ground of reality, whose only arms are trust in his God and the protection of his powerful allies. At times his position is righteous enough, range of the emotions in the Gathás has to face, not merely all forms of outward opposition and the unbelief and lukewarmness of adherents, but that the world around reviving, is to be of truth and final victory of his cause. At one time hope, at another confidence, now assured confidence, now doubt and despair, here a firm faith in the speedy coming of the kingdom of heaven, there the thought of his suffering, his heavenly glory, his final victory, which find their immediate expression in these hymns. And the whole breaths such a genuine originality, all is psychologically so accurate and just, the earliest beginnings of the new religious movement, the character of a community of faith, as are the personages so naturally in them all, that it is impossible for a moment to think of a later period of composition by a priesthood whom we know to have been devoid of any historical sect, and incapable of constructing the spiritual conditions under which Zoroaster lived. So soon as the point of view is clear—that in the Gathás we have firm historical ground on which Zoroaster and his surroundings may rest, that here we have the beginnings of the Zarostrian religion—it becomes impossible to answer otherwise than affirmatively every general question as to the historical character of Zoroaster. Yet we must not expect too much from the Gathás in the way of definite clue. They give us no historical account, no chronological account of their prophet, but rather are, so to say, versus memorialis, which recapitulate the main points of interest, often again in brief outlines. There are more or less the legendary prophecies, sometimes directed to the faithful flock or to the princes, but generally cast in the form of dialogues with God and the angels, whom he repeatedly invokes as witnesses to his veracity. Moreover, they cast no clue as to the period in which he lived, nor later generations have forgotten. It must be remembered, too, that their extent is limited, and their meaning, moreover, frequently dubious or obscure.

The Person of the Prophet.—As to his birthplace the testimonies are conflicting. According to the Avesta (Yasna, 9, 17), Aryanem Vajó, on the river Dáltah, the old sacred county of the gods, was the home of Zoroaster, and the scene of his first appearance. There, on the river Dareyja, assuming that the passage (Yend, 14, 4) is correctly interpreted, he was the house of his father; and the Bundabish (20, 32 and 24, 15) says expressly that the river Dárjíja lay in Aryan Vei, on its bank was the dwelling of his father, and that thence Zoroaster was born. Now, according to the Bundabish (29, 12), Aryan Vei was situated in the direction of Atropatene, and consequently Aryanem Vajó is for the most part identified with the district of Árrán on the river Aras (Araxes), close by the north-western frontier of Media. Other traditions, however, make him a native of Rágh (Ragha, Páyáh). According to Yasna, 19, 18, the zaraitshárenta, or supreme head of the most western of the Persian provinces, at a still later time, in the residence of Ragha. The Arabic writer Shahrestáni endeavours to bridge this divergence between the two traditions by means of the following theory: his father was a man of Atropatene, while the mother was from Rail. In his home tradition recounts he enjoyed the celestial visions and the conversations with the archangels and Ormazd which are mentioned already in the Gathás. There, too, according to Yasht, 5, 105, he prayed that he might succeed in converting King Vštásápa. He then appears to have quitted his native district, and to have travelled for some years about, until he found one obscure passage (Yasna, 53, 9) seems to intimate that he found an ill reception in Rail. Finally, in the person of Vštásápa, who seems to have been a prince resident in east Iran, he gained the powerful protector and faithful disciple of the new religion whom he desired—though after almost superhuman dangers and difficulties, which the later books depict in lively colours. According to the epic legend, Vštásápa was king of Bactria. Already in the later Avesta he has become a half-mythical figure, the last in the series of heroes of the Persian legend, in which his name appears of which series priestly tradition declares that he was unmistakably evident. He stands at the meeting-point between the old and new world which begins with Zoroaster. In the Gathás he appears as a quite historical personage; it is essentially to his power and good example that the prophet is indebted for his success. In Yasna, 53, 2.
he is spoken of as a pioneer of the doctrine revealed by Ormazd.
In the relation between Zoroaster and Vishtāspa already lies the germ of the state church which afterwards became completely subservient to the interests of the dynasty and sought its protection from it.

Among the grandees of the court of Vishtāspa mention is made of two brothers, Frashoehstra and Jámaspa; both were, according to the later legend, vizirs of Vishtāspa. Zoroaster was nearly related to both: his wife, Hvōvī, was the daughter of Frashoehstra, and the husband of his daughter, Pourucista, was Jámaspa. The actual rôle of intermediary was played by the pious queen Hutaosa. Apart from this connexion, the new prophet relies especially upon his own kindred (avetātush). His first disciple, Māidyōmāngōa, was his cousin: his father was, according to the later Avesta, Pourushaspa, his mother Dughdvī, his great-grandfather Ḥāēataspā, and the ancestor of the whole family Spītama, for which reason Zarathushtra usually bears this surname. His sons and daughters are repeatedly spoken of. His death is, for reasons easily intelligible, nowhere mentioned in the Avesta; in the Škēh-Nāma he is said to have been murdered at the altar by the Turanians in the storming of Balkh.

We are quite ignorant as to the date of Zoroaster; King Vishtāspa does not seem to have any place in any historical chronology, and the Gāthās give no hint on the subject. In former times the assertion often was, and even now is often put forward, that Vishtāspa was one and the same person with the historical Cyrus, father of Darius I. This identification can only be purchased at the cost of a complete renunciation of the Avestan genealogy. Hutaosa is the same name as Atossa: but in history Atossa was the wife of Cambyses and Darius. Otherwise, not one single name in the entourage of our Vishtāspa can be brought into harmony with historical nomenclature. According to the Arda Virāf, 1, 2, Zoroaster taught, in round numbers, some 300 years before the invasion of Alexander. The testimony of Assyrian inscriptions relegates him to a far more ancient period. If these prove the name Māzdaka to have formed part of Median proper names in the year 715 B.C., Eduard Meyer (v. Ancient Persia) is justified in maintaining that the Zoroastrian religion must even then have been predominant in Media. Meyer, therefore, conjecturally puts the date of Zoroaster at 1000 B.C., as had already been done by Duncker (Geschichte des Altertums, 4, 78). This, in its turn, may be too high: but, in any case, Zoroaster belongs to a prehistoric era. Probably he emanated from the old school of Median Magi, and appeared first in Media as the prophet of a new faith, but met with sacerdotal opposition, and turned his steps eastward. In the east of Iran the novel creed first acquired a solid footing, and subsequently reacted with success upon the West.

Zoroastrianism.—Zoroaster taught a new religion; but this must not be taken as meaning that everything he taught came, so to say, out of his own head. His doctrine was rooted in the old Iranian—or Aryan—folk-religion, of which we can only form an approximate representation by comparison with the religion of the Veda. The newly discovered Hititite inscriptions have now thrown a welcome ray of light on the primitive Iranian creed (Ed. Meyer, Sitzungsberichte der Preuss. Akademie, 1908). In these inscriptions Median proper names are mentioned as deities of the Iranian kings of Mitani at the beginning of the 14th century—all of them names with which we are familiar from the Indian pantheon. The Aryan folk-religion was polytheistic. Worship was paid to popular divinities, such as the war-god and dragon-slayer Indra, to natural forces and elements such as fire, but the Aryan also believed in the ruling of moral powers and of an eternal law in nature (v. Ed. Meyer in the article Persia: History, § Ancient). On solemn occasions the inspiring drink soma (haoma) ministered to the enjoyment of the devotee. Numerous coincidences with the Indian religion survive in Zoroastrianism, side by side with astonishing diversities.

The most striking difference between Zoroaster's doctrine of God and the old religion of India lies in this, that while in the Avesta the evil spirits are called daeva (Modern Persian dīv), the Aryans of India, in common with the Italians, Celts and Letts, gave the name of devo to their good spirits, the spirits of light. An alternative designation for deity in the Rig-Veda is asura. In the more recent hymns of the Rig-Veda and in later India, on the other hand, only evil spirits are understood by asuras, while in Iran the corresponding word ahura was, and ever has continued to be, the designation of God the Lord. Thus ahura-daeva, dēva-asura in Zoroastrian and in later Brahman theology are in their meanings diametrically opposed.

Asura-daeva represent originally two distinct races of gods (like the Northern Aser and Vaner)—two different aspects of the conception of deity, comparable to dvājāvā and dēos. Asura indicates the more sublime and awful divine character, for which man entertains the greater reverence and fear: dēa denotes the kind of gods of light, the vulgar—more sensuous and anthropomorphically—deities. This twofold development of the idea of God formed the point of leverage for Zoroaster's reformation. While in India the conception of the asura had veered more and more towards the dreadful and the dreaded, Zoroaster elevated it again—at the cost, indeed, of the daivas (daēnas), whom he degraded to the rank of malicious powers and demons. In one Asura, whose Aryan original was Varuna, he concentrated the whole of the divine character, and conferred upon it the epithet of "the wise" (māzdā). This culminating stage in the asura-conception is the work of Zoroaster. The Asura (Ahura) is the "principle of the world, the arch-type of the essential, the embodiment of spiritual being, the All-father, who was existent before ever the world arose. From him that world has emanated, and its course is governed by his foreseeing eye. His guiding spirit is the Holy Spirit, which wills the good: yet it is not free, but restricted, in this temporal epoch, by its antagonist and own twin-brother (Yasna, 30, 3), the Evil Spirit (aŋgro mainyush, Ahriman), who in the beginning was banished by the Good Spirit by means of the famous ban contained in Yasna, 45, 2, and since then drags out his existence in the darkness of Hell as the chief of the world of evil. In the Gāthās the Good Spirit of Mazda and the Evil Spirit are the two great opposing forces in the world, and Ormazd himself is to a certain extent placed above them both. Later the Holy Spirit is made directly equivalent to Ormazd; and then the great watchword is: "Here Ormazd, there Ahriman!" The very daēnas are only the inferior instruments, the corrupted children of Ahriman, from whom come all that is evil in the world. The daēnas, unmasked and attacked by Zoroaster as the true enemies of mankind, are still, in the Gāthās, without doubt the perfectly definite gods of old popular belief—the idols of the people. For Zoroaster they sink to the rank of spurious deities, and in his parlance the priests and votaries are idolaters and heretics. In the later, developed system the daēnas are the evil spirits in general, and their number has increased to millions. Some few of these have names; and among those names of the old Aryan divinities emerge here and there, e.g. Indra and Nārōnhaitya. With some of course—such as the god of fire—the connexion with the good deity was a priori indissoluble. Other powers of light, such as Mitra the god of day (Iranian Mihrā), survived unforgotten in popular belief till the later system incorporated them in the Mazda body. That without, which had no room either for the cult of Mithra or for that of the Haoma. Beyond the Lord and his Fire, the Gāthās only recognize the archangels and certain ministers of Ormazd, who are, without exception, personifications of abstract ideas. This hypostatization and all-egotization is especially characteristic of the Zoroastrian religion. The essence of Ormazd is Truth and Law asa = Vedic rīta: this quality he embodies, and its personification (though conceived as sexless) is always by his side, a constant companion and intimate. The essence of the wicked spirit in falsehood and falsehood, as the embodiment of the evil principle, is much more frequently mentioned in the Gāthās than Ahriman himself.

Zoroaster says of himself that he had received from God a
commission to purify religion (Yasna, 44, 9). He purified it from the grossly sensual elements of daeva worship, and uplifted the idea of religion to a higher and purer sphere. The motley body of Aryan folk-belief, when subjected to the unifying thought of a speculative brain, was transformed to a self-contained theory of the universe and a logical dualistic principle. But this dualism is a temporally limited dualism—not as much as a bipolarity in the transcendental world. It is destined to terminate in monothemonism. Later sects sought to rise from it to a higher unity in other ways. Thus the Zarvanites represented Ormazd and Ahriman as twin sons proceeding from the fundamental principle of all—Zorwan Akaranra, or limitless time.

Ethically, too, the new doctrine stands on a higher plane, and represents, in its moral laws, a superior civilization. The devil-worshippers, at their sacrifices, slay the ox; and this the daeva favour, for they are foes to the cow and to cattle-breeding, and friends to those who work ill to the cow. In Zoroaster's eyes this is an abomination; for the cow is a gift of Ormazd to man, and the religion of Mazda protects the sacred animal. It is the religion of the settled grazer and the peasant, while the ruider daeva-cult holds its ground among the uncivilized nomadic tribes. In an old confession of faith, the convert is pledged to abjure the theft and robbery of cattle and the ravaging of villages inhabited by worshippers of Mazda (Yasna, 10, 2).

Zoroaster's teachings show him to have been a man of a highly speculative turn, faithful, however, with all his originality, to the Iranian national character. With His faith, and combined diplomatic skill in his dealings with his exalted protectors. His thinking is consecutive, self-restrained, practical, devoid of everything that might be called fantastic or excessive. His form of expression, tangible and concrete, is such that a system is constructed on a clearly conceived plan and stands on a high moral level; for its time it was a great advance in civilization. The doctrine of Zoroaster and the Zoroastrian Church may be summed up in essence thus:--

At the beginning of things there existed the two spirits who represented good and evil (Yasna, 30, 3). The existence of evil in the world is thus presupposed from the beginning. Both spirits possess creative power, which manifests itself positively in the one and negatively in the other. Ormazd is light and life, and creates all that is pure and good—in the ethical world of law, order and truth. His anahita's darkness, faith, death, and produces all that is evil in the world. Until then the two spirits had counterbalanced one another. The ultimate triumph of the good spirit is an ethical demand of the religious consciousness and the quintessence of human character.

The evil spirit with his wicked hosts appears in the Gathas much less endowed with the attributes of personality and individuality than does Ahuramazda. Within the world of the good Ormazd is what the man alone. In this sense Zoroastianism is often referred to as the faith of Ormazd or as Mazdaism. Ormazd in his exalted majesty is the ideal figure of an Oriental king. He is not alone in his domain. He is associated with a host of angels for the most part personifications of ethical ideas. These are his creatures, his instruments, servants and assistants. They are comprehended under the general name of ameshaspeenta ("immortal holy ones") and are the prototypes of the seven ameshaspeandas of a later date. These are—(1) Vohu Mano (goodness), good sense, i.e. the good principle, the idea of the good, the principle that works in man inclining him to what is good; (2) Asha, afterwards Astaras Vahishten (Astaras haoma), the genius of truth and the embodiment of all that is true, good and right, uprightness and rule—ideas practically identical for Zoroaster; (3) Khshathra, after- wards Ahura Mazda (ruler, protector, ruler) the substratum of all evil, which have subsisted from the first but not in integral completeness, the evil having crept in like tares among the wheat; the time is yet to come when it shall be fully manifested in all its completeness. We find that Ahura Ormazd in His Zoroastrian prototype, orbacandic, spoken of as daughter of Ormazd and regarded as having her abode upon the earth; (5) Haurvatat (asha, perfect, happiness), the glory, the splendour, the moral grandeur, and the angels Garas Urvan ("the genius and defender of animals"), and Sraosha, the genius of obedience and faithful hearing.

As soon as the two separate spirits (cf. Barnabish, 1, 4) encounter one another, their respective battalions, the armies of the good and the evil, come to the permanent conflict begin. The history of this conflict is the history of the world. A great clef runs right through the world; and it is the divine division that which is Ahura's and that which is Ahriman's. Not that the two are personal persons; they leave it to be fought out by their respective creations and creatures which they sent into the field. The field of battle is the present world.

In the centre of battle is man: his soul is the object of the war. Man is a creation of Ormazd, or, what is the same thing, a being created by Ahuramazda. The war of the two principles is waged in and through him, and in his actions, wherefore he is accessible to the influences of the evil powers. This freedom of the will is clearly expressed in the idea of the human soul as the throne of Ahuramazda. This is the throne of the life, the knowing, and the ignorant each after his own heart and understanding. Artaimit searches, feeling thy spirit, where errors are found. Man takes part in this conflict by all his life and actions: the world is his battle-field. If he acts in a righteous and good deed, word and thought, by continually keeping pure his body and his soul, he impairs the power of Satan and strengthens the might of goodness. He who, in a true confession, by every evil deed, word and thought and defilement, he increases the evil and renders service to Satan.

The life of man falls into two parts—its earthly portion and that which is lived after death is past. The lot assigned to him after death is the result and consequence of his life upon earth. No religion has so clearly grasped the ideas of guilt and of merit. On the works of men here below a strict reckoning will be held in heaven (according to later representations, by Rashnu, the genius of justice, and Mithra). All the thoughts, words and deeds of the life are weighed in the balance after death—soul, heart and body. The word of Ormazd knows nothing, whilst the later Zoroastrian Church admitts repentance, expiation and remission. After death the soul arrives at the sarmath, the sarmath, or sarmath, the judge (Vd. 2, 1), Ormazd at first wished to entrust this task to Yima (Jemshid), the ideal of an Iranian king. But Yima, the secular man, felt himself unfitted for it and declined it. He consented to take upon himself the burden of the judgment; but he gave a rule of procedure, a code of justice as an illustration of the heavenly kingdom in miniature, to serve at the same time as a pattern for the heavenly kingdom that was to come. Zoroaster then forewent the matter as a separate work, and was confirmed in his teaching. He had been experienced within himself the inward call to seek the amelioration of mankind and their deliverance from ruin, and regarded this inner impulse, intensified as it was by long, contemplative solitude and by visions, as being the call addressed to him by God Himself. Like Mahomed after him he often speaks of his conversations with God and the archangel. He calls himself most frequently manishan ("prophet"), rash ("spiritual authority"), and sohna ("the coming helper")—that is to say, when men come to be judged according to their deeds.

The full contents of his dogmatic and ethical teaching we cannot give here. The Gathas and his Zoroastrian compendium contain general references of the divine commands and of good and evil works. Among the former those most inculcated are renovation of Satan, adoration of Ormazd, purity of soul and body, and care for one's relations. The latter comprised the whole system of Zoroastrian doctrine. A ceremonial worship is hardly mentioned. He speaks more in the character of prophet than in that of legislator. The religious ideas of the Gathas are used in many theological. Revelations concerning the last things and the future lot, whether bliss or woe, of human souls, promises for true believers, threatenings for unbelievers, his firm confidence as to the future triumph of truth and the salvation of the soul, are the themes continually dwelt on with endless variations.

It was not without special reason—so Zoroaster believed—that the calling of a prophet should have taken place when and where it did. The authority of the new dispensation was considered so large. Like John the Baptist and the Apostles of Jesus, Zoroaster also believed that the fulness of time was near, that the kingdom of heaven was at hand. Through the whole of the Gathas runs
the pious hope that the end of the present world is not far distant. He himself hopes, with his followers, to live to see the decisive turn in the history of the world. Their faith and better future will summon together all his powers for a final decisive struggle and break the power of evil for ever; by his help the faithful will achieve the victory over their detested enemies, the dharma worshippers, and render their fires powerless. Thereupon Ormuz will hold a judicium universale, in the form of a general ordeal, a great test of all mankind by fire and molten metal, and will judge strictly according to the teachings of the Avesta about the doers of good and evil, and the hoped-for reward. Satan will be cast, along with all those who have been delivered over to him to suffer the pains of hell, into the abyss, where he will henceforward lie powerless. Fortbith will begin the destruction of the idolatrous God and the heavens, called Ahura. This is called, sometimes the good kingdom, sometimes simply the kingdom. Here the sun will for ever shine, and all the pious and faithful will live a happy life, which no evil power can disturb, in the presence of the holy gods and with the good spirits of the saints. There will receive as his guerdon the inexhaustible cow and the gracious gifts of the Veha mans. The prophet and his princely patrons will be accorded special honour.

History and Later Development.—For the great mass of the people Zoroaster’s doctrine was too abstract and spiritualistic. The vulgar fancy requires sensuous, plastic deities, which admit of visible representations. The idols did go and receive honour again and new gods won acceptance. They are the angels (yazala) of New Zoroastrianism. Thus, in the later Avesta, we find not only Mithra but also purely popular divinities such as the angel of victory, Verethragna, Anahita (Anatis), the goddess of the water, Tishrya (Sirius), and other heavenly bodies, invoked with special preference. The Gathas has nothing of a new belief which afterwards arose in the Fravashi, or guardian angels of the faithful. Fravashi properly means “confession of faith,” and when personified comes to be regarded as a protecting spirit. Unbelievers have no fravashi.

On the basis of the new teaching arose a widely spread priesthood. The holy men, the fravashi, carried the doctrine, and carried its worship, and laid down the minutely elaborated laws for the purifying and keeping clean of soul and body, which are met with in the Vendidad. To these ecclesiastical precepts and usages of a very particular kind a doubtful and barbarous character, love of truth, beneficent works, support of comrades in the faith, alms, chastity, improvement of the land, arboriculture, breeding of cattle, agriculture, protection of useful animals, as the dog, the destruction of noxious animals, and the prohibition either to burn or to bury the dead. These are to be left on the appointed places (dakhmas) and exposed to the vultures and wild dogs. ZORRILLA Y MORAL, JOSÉ (1817-1893), Spanish poet and dramatist, son of a magistrate in whom Ferdinand VII. placed special confidence, was born at Valladolid on the 21st of February 1817. He was educated by the Jesuits at the Real Seminario de Nobles in Madrid, wrote verses when he was twelve, became an enthusiastic admirer of Scott and Chateaubriand, and took part in the school performances of plays by Lope de Vega and Calderon. In 1833 he was sent to read law at the University of Toledo, but, after a year of idleness, he fled to Madrid, where he horrified the friends of his absolutist father by making violent speeches and by founding a newspaper which was promptly suppressed by the government. He narrowly escaped transportation to the Philippines, and passed the next few years in poverty. The death of the satirist Larra brought Zorrila into notice. His elegiac poem, declaimed at Larra’s funeral in February 1837, served as an introduction to the leading men of letters. In 1837 he published a book of verses, mostly imitations of Lamartine and Hugo, which was so favourably received that he printed six more volumes within three years. His subjects are treated with fluency and grace, but the carelessness which disfigures much of his work is prominent in these juvenile poems. After collaborating with Garcia Gutierrez, in a piece entitled Juan Dandole (1839) Zorrilla began his individual career as a dramatist with Cada cuál con su razón (1840), and during the following five years he wrote twenty-two plays, many of them extremely successful. His Cantos del trovador (1841), a collection of national legends versified with infinite spirit, showed a decided advance in skill, and secured for the author the place next to Espronceda in popular esteem. National legends also supply the themes of his dramas, though in this department Zorrilla somewhat imitates the representa- tion of the authors of the repertory of the Teatro de la Comedia; but these plays which had fallen out of fashion. For example, En El Zapatero y el Rey he recasts El montañés Juan Pascual by Juan de la Hoy y Mata; In La mejor razón la espada he borrows from Moreto’s Travesuras del estudiante Pantajo; in Don Juan Tenorio he adapts from Tirso de Molina’s Burtalde de Seville and from the elder Dumas’ Don Juan de Marona (which itself derives from Les aines du purgatoire ou Prosper Mériche). But his rearrangements usually contain original elements, and in Sancho Garcia, El Rey loco, and El Alcalde Ronquillo he apparently owes little to any predecessor. The last and (as he himself believed) the best of his plays is Traidor (1845) y morder (1845). Upon the death of his mother in 1847 Zorrilla left Spain, resided for a while at Bordeaux, and settled in Paris, where his incomplete Granada, a striking poem of gorgeous local colour, was published in 1852. In a fit of depression, the causes of which are not known, he emigrated to America three years later, hoping, as he says, that yellow fever or small- pox would carry him off. During eleven years spent in Mexico he produced little, and that little was of no merit. He returned in 1866, to find himself a half-forgotten classic. His old fidelity to the patriotic and new faith to the Christian was then en joyed by their unaided efforts only. The head of the Church (Zara-Shuhirotema) had his seat at Rai in Media and was the first person in the state next to the king. The formation of sects was at this period not infrequent (cf. MANICHISM). The Mohammedan invasion (636), with the terrible persecutions of the following centuries, was the death-blow of Zoroastrianism. In Persia itself, a few fraternities of Zoroastrians are still found (in Kerimeh and Yezdi). The Parsees (g s.) in and around Bombay hold by Zoroaster as their prophet and by the ancient religious usages, but their doctrine has reached the stage of a pure monothelism. minister. He was always poor, and for some twelve years after 1871 he was in the direst straits. The law of copyright was not retrospective, and, though some of his plays made the fortunes of managers, they brought him nothing. In his untrustworthy autobiography, Recuerdos del tiempo viejo (1880), he complained of this. A petition of 30 of the best managers having his firm, at the age of 70, and the protection in his favour became an apotheosis.

In 1885 the Spanish Academy, which had elected him a member many years before, presented him with a gold medal of honour, and in 1889 he was publicly crowned at Granada as the national laureate.

He died at Madrid on the 23rd of January 1893.

Zorilla is so intensely Spanish that it is difficult for foreign critics to do him justice. It is certain that the extraordinary rapidity of his output did not injure his work. He declares that he wrote El Caballo del Rey Don Sancho in three weeks, and that he put together El P事物al del Gato (which, like La Coaletura, owes much to Southey) in two days; if so, his deficiencies need no other explanation. An improvisator with the characteristic faults of redundancy and verbosity, he wrote far too much, and in most of his numbers there are numerous technical flaws. Yet in the less of his imagery, the movement, the turn of his versification, will preserve some few of his poems in the anthologies. His appeal to patriotic pride, his accurate dramatic instinct, together with the fact that he invariably gives at least one of his characters the role of a modern poet, acting without a mask, enables him to hold the stage. It is by Don Juan Tenorio, the play of which he thought so meanly, that Zorilla will be best remembered. (J. F. K.)

ZOSIMUS, bishop of Rome from the 15th of March 417 to the 26th of December 418, succeeded Innocent I. and was followed by Boniface I. For his attitude in the Pelagian controversy, see Pelagius. He took a decided part in the protracted disputes by way of Ostia as the jurisdiction of the see of Arles over that of Vienne, giving energetic decisions in favour of the former, but without settling the controversy. His fraticious temper coloured all the controversies in which he took part, in Gaul, Africa and Italy, including Rome, where at his death the clergy were very much divided.

ZOSIMUS, Greek historical writer, flourished at Constantinople during the second half of the 5th century A.D. According to Photius, he was a count, and held the office of "advocate" of the imperial treasury. His New History, mainly a compilation from previous authors (Dexippus, Eunapius, Olympiodorus), is in six books: the first sketches briefly the history of the early emperors from Augustus to Diocletian (305); the second, third and fourth deal more fully with the period from the accession of Constantius and Galerius to the death of Theodosius; the fifth and sixth cover the period between 395 and 410. The work, which is apparently unfinished, must have been written between 450-502. The style is characterized by Photius as concise, clear and pure. The historian's object was to account for the decline of the Roman empire from the pagan point of view, and in this undertaking he at various points treated the Christians with some unfairness.

The best edition is by Mendelssohn (1857), who fully discusses the question of the authorities used by Zosimus; there is an excellent appreciation of him in Ranke's Weltgeschichte, iv. French translation by Cousin (1678); English (anonymous), 1684, 1814.

ZOSTEROPS, originally the scientific name of a genus of birds found by N. A. Vigors and T. Horsfield (Trans. Linnean Society, 1825) in Australia, and species called by them Z. dorsalis, but subsequently shown to be identical with the Certhia caerulescens, and also with the Sylvia lateralis, previously described by J. Latham. The name has been Anglicized in the same sense, and, whether as a scientific or a vernacular term, applied to a great number of species of little birds which inhabit for the most part the tropical districts of the Old World, from Africa to most of the islands in the Indian and Pacific Oceans, and northwards in Asia through India and China to the Amur regions and Japan.

The derivation is fructo-pus and dol, whence the word should be properly applied to the round of white feathers round the eyes, which is very conspicuous in many species.

1. In Gadow, B. R. B. Sharpe (Cat. B. Brit. Museum, ix. pp. 146-205) admitted 83 species, besides 3 more which he had not been able to examine.

2. By most English-speaking people the prevalent species of Zosterops is commonly called "White-eye" or "Silver-eye."
ZOUCH—ZRNÝ

ZOUCH, RICHARD (c. 1500–1661), English jurist, was born at Anstey, Wiltshire, and educated at Winchester and afterwards at Oxford, where he became a fellow of New College in 1600. He was admitted at Doctor's Commons in January 1618, and was appointed regius professor of law at Oxford in 1620. In 1625 he became principal of St Alban Hall and chancellor of the diocese of Oxford; in 1641 he was made judge of the High Court of Admiralty. Under the Commonwealth, having submitted to the parliamentary visitors, he retained his university appointments, though not his judgments. This last he resumed at the Restoration, dying soon afterwards at his apartments in Doctor's Commons, London, on the 1st of March 1661.

He published *Elementa jurisprudentiae* (1629), *Descripto juris et judicii feudalis, secundum consuetudines Mediolani et Normanniae, pro introductione ad jurisprudentiam Anglicanam* (1634), *Descripto juris et judicii temporalis, secundum consuetudines feudales et Normannicas* (1636), *Descripto juris et judicii ecclesiastic, secundum canonum et consuetudines Anglicanam* (1636), *Descripiones juris et judicii societ. militaris et maritimi* (1640). *Juris et judicii feodalius sie juris inter geni . . . explicatio* (1650), and *Solutio questionis de legati delinquentibus judice competente* (1657). In virtue of the last two he has the distinction of being one of the earliest systematic writers on ecclesiastical, and also of being the author of a poem, *The Dove, or Passages of Cosmography* (1613).

ZOUCHE, or Zouc, the name of an English family descended from Alan la Zouche, a Breton, who is sometimes called Alan de Porrochet. Having settled in England during the reign of Henry II., Alan obtained by marriage Ashby in Leicestershire (called after him Ashby de la Zouche) and other lands. His grandson, another Alan la Zouche, was justice of Chester and justice of Ireland under Henry III.; he was loyal to the king during the struggle with the barons, fought at Lewes and helped to arrange the peace of Westminster. As the result of a judgment on some lands with John, Earl Warrenne, he was seriously injured in Westminster Hall by the earl and his retainers, and died on the 10th of August 1270. Alan's elder son Roger (d. 1285) had a son Alan la Zouche, who was summoned to parliament as a baron about 1298. He died without sons, and this barony fell into abeyance between his daughters and has never been revived. The elder Alan's younger son, Eades or Ivo, had a son William (c. 1276–1352), who was summoned to parliament as a baron in 1308, and this barony, which is still in existence, is known as that of Zouche of Haryngworth. John Zouche of Haryngworth (c. 1462–1526), was attainted in 1485 as a supporter of Richard III., but was restored to his honours in 1495. His descendant, Edward, the 11th baron (c. 1556–1625), was one of the peers who tried Mary, queen of Scots, and was sent by Elizabeth as ambassador to Scotland and to Denmark. He was president of Wales from 1602 to 1615 and lord warden of the Cinque Ports from 1615 to 1624. He was a member of the council of the Virginia Company and of the New England council. He had many literary friends, among them being Ben Jonson and Sir Henry Wotton. Zouche left no sons, and the barony remained in abeyance among the descendants of his two daughters until 1815, when the abeyance was terminated in favour of Sir Cecil Bissop, Bart. (1753–1828), who became the 12th baron. He died without sons, a second abeyance being terminated in 1829 in favour of his daughter Harriet Anne (1787–1870), wife of the hon. Robert Curzon (1771–1863). In 1873 her grandson, Robert Nathaniel Curzon (b. 1851), became the 15th baron.

Two antiquaries, Henry Zouch (1725–1795) and his brother, Thomas Zouch (1737–1815), claimed descent from the family of Zouche. Both were voluminous writers. Thomas's works included a *Life of Isaac Walton* (1823) and *Memoirs of Sir Philip Sidney* (1808).

ZOUTPANSBERG, the north-eastern division of the Transvaal. This was the district to which Louis Trichardt and Jan van Rensburg, the forerunners of the Great Trek, journeyed in 1835. In 1845 Hendrik Potgieter, a prominent leader of the Trek Boers, removed thither. The Zoutpansberg Boers formed a semi-independent community, and in 1857 Stephanus Schoeman, their commandant-general, sided against Marthinus Pretorius and Paul Kruger when they invaded the Orange Free State. It was not until 1864 that Zoutpansberg was definitely incorporated in the South African Republic. Trichardt and his companions had been shown gold workings by the natives, and it was in this district in 1867–70, and in the neighbouring region of Lydenburg, that gold mines were first worked by Europeans south of the Limpopo. The white settlers in Zoutpansberg had for many years a reputation for lawlessness, and were later regarded as typical of South African Boers. Zoutpansberg contains no other region of the Transvaal.

It is highly mineralized, next to gold, copper, found near the Limpopo (where is the Messina mine) being the chief metal worked. The district long suffered from lack of railway communications, but in 1910 the completion of the Selati line giving it direct access to Delagoa Bay was begun. The chief towns are Pietersburg and Leidsdorp.

ZRNÝ, MIKLÓS, COUNT (1568–1666), Hungarian hero, was a son of Miklós Zrný and Ilona Karlovec. He distinguished himself at the siege of Vienna in 1529, and in 1542 saved the imperial army from defeat before Pest by intervening with 400 Croats, for which service he was appointed ban of Croatia. In 1542 he routed the Turks at Smolýo. In 1543 he married Catherine Frangipán, who placed the whole of her vast estates at his disposal. The Emperor Ferdinand also gave him large possessions in Hungary, and henceforth the Zrnýs became as much Magyar as Croatian magnates. In 1556 Zrný won a series of victories over the Turks, culminating in the battle of Babocsá. The Croats, however, overwhelmed their ban with reproaches for neglecting them to fight for the Magyars, and the emperor simultaneously deprived him of the captenacy of Upper Croatia and sent 10,000 men to aid the Croats, while the Magyars were left without any help, whereupon Zrný resigned the banship (1561). In 1563, on the coronation of the Emperor Maximilian as king of Hungary, Zrný attended the ceremony at the head of 3000 Croatian and Magyar mounted noblemen, in the vain hope of obtaining the dignity of palatinate, vacant by the death of Thomas Nadasdy. Shortly after marrying (in 1564) his second wife, Evesa Rosenberg, a great Bohemian heiress, he hastened southwards to defend the frontier, defeated the Turks at Segesd, and in 1566 from the 5th of August to the 7th of September heroically defended the little fortress of Szigetvár against the whole Turkish host, led by Suleiman the Magnificent in person, perishing with every member of the garrison in a last desperate sortie.

See P. Salamon, *Ungarn im Zeitalter der Türkenherrschaft* (Leipzig, 1887); J. Coudé, *The Zrnys in Hungarian History* (Budapest, 1885), 3 vols. (R. N. B.)

ZRNÝ, MIKLÓS, COUNT (1620–1664), Hungarian warrior, statesman and poet, the son of George Zrný and Magdalena Széchy, was born at Csákvrás. At the court of Péter Pázmány the youth conceived a burning enthusiasm for his native language and literature, although he always placed arms before arts. From 1635 to 1637 he accompanied Szenteczky, one of the canons of Eastrergom, on a long educative tour through Italy. During the next few years he learnt the art of war in defending the Croatian frontier against the Turks, and approved himself one of the first captains of the age. In 1645 he acted against the Swedes in Moravia, equipping an army corps at Gmunden. At the battle of Sventyago he was left with 5000 men, and took 2000 prisoners. At Eger he saved the emperor, who had been surprised at night in his camp by Wrangel. Subsequently he routed the army of Rákóczy on the Upper Thess. For his services the emperor appointed him captain of Croatia. On his return from the war he married the wealthy Eusebia Draskovics. In 1646 he distinguished himself in the Turkish war. At the coronation of Ferdinand IV. he carried the sword of state, and was made ban and captain-general of Croatia. In this double capacity he presided over many Croatian diets, always strenuously defending the political rights of the Croats.
and steadfastly maintaining that as regarded Hungary they were to be looked upon not as partes annexeae but as a regnum. During 1622–53 he was continually fighting against the Turks, yet from his castle at Csákornya he was in constant communication with the learned world; the Dutch scholar, Jacobus Tollius, even visited him, and has left in his Epistolae itinerariae a lively account of his experiences. Tollius was amazed at the linguistic resources of Zrínyi, who spoke German, Croatian, Hungarian, Turkish and Latin with equal facility. Zrínyi’s Latin letters (from which we learn that he was married a second time, to Sophia Löbel) are fluent and agreeable, but largely interspersed with Croatian and Magyar expressions. The last year of his life was also its most glorious one. He set out to destroy the strongly fortified Turkish bridge at Esseg, and thus cut off the retreat of the Turkish army, re-capturing all the strong fortresses on his way. He destroyed the bridge, but the further pursuance of the campaign was frustrated by the refusal of the imperial generals to co-operate. Still the expedition had covered many miles, and showed the political and the commercial possibilities of Széchenyi’s great dream. It is said that only the Zrínyis had the secret of conquering the Turks.

The emperor offered him the title of prince. The pope struck a commemorative medal with the effigy of Zrínyi as a field-marshal. The Spanish king sent him the Golden Fleece. The French king created him a peer of France. The Turks, to wipe out the disgrace of the Esseg affair, now laid siege to Uj-Zerűn, a fortress which Zrínyi had built, and the imperial troops under Montecuccli looked on while he hastened to relieve it, refusing all assistance, with the result that the fortress fell. It was on the 13th of August 1651 that Zrínyi’s great defensive period of Vásár was concluded. Zrínyi hastened to Vienna to protest against it, but in vain. Zrínyi quitted Vienna in disgust, after assuring the Venetian minister, Sagridino, that he was willing at any moment to assist the Republic against the Turks with 6000 men. He then returned to Csákornya, and there, on the 18th of November, was killed by a wild boar which had twice wounded and recklessly pursued to its lair in the forest. Swamps, armed only with his hunting-knife.

His poetical works first appeared at Vienna in 1651, under the title of The Siren of the Adriatic (Hung.); but his principal work, Olavio Szécsényi, the protagonist of the great hero, is a self-sacrifice of his heroic ancestor of the same name, only appeared in fragments in Magyar literature till Arany took it in hand. It was evidently written under the influence of both Virgil and Tasso, though the author had no time to polish and correct its rough and occasionally somewhat wooden, versification. But the fundamental idea—the duty of Hungarian valour to shake off the Turkish yoke, with the help of God—is sublime, and the whole work is intense with martial and religious enthusiasm. It is an unworthy companion of the other epics of the Renaissance period, and hardly worthy of mention. First, in 1848, began to recast the Zrínyiud, as he called it, on modern lines, and the work was completed by Antal Vékony in 1892.

See J. Arany and Kazmir Greksa, Zrínyi and Tasso (Hung.), Eger, 1892; Karoly Széchy; Life of Count Nicholas Zrínyi, the poet (Hung.), Budapest, 1896; Sándor Körösi, Zrínyi and Macchialvi (Hun.), Budapest, 1893.

ZSCHOKKE, JOHANN HEINRICH DANIEL (1771–1848), German author, was born at Magdeburg on the 22nd of March 1771. He was educated at the monastical (kloster) school and at the Alstädter gymnasium of his native place. He spent some time as playwright with a company of strolling actors, but afterwards studied philosophy, theology and history at the university of Frankfurt-on-the-Oder, where in 1792 he established himself as Privatdozent. He created much sensation by an extravagant novel, Abällina, der grosse Bandit (1773; subsequently also dramatized), modelled on Schiller’s Räuber, and the melodramatic tragedy, Julius von Sasson (1796). The Prussian government having declined to make him a full professor, Zschokke went to Switzerland, where he conducted an educational institution in the castle of Reichenau. The authorities of the Grisons admitted him to the rights of a citizen, and in 1798 he published his Geschichte des Freistaats der drei Bünde im hohen Rätien. The political disturbances of this year compelled him to close his institution. He was, however, sent as a deputy to Aarau, where he was made president of the educational department, and afterwards as government commissioner to Unterwalden, his authority being ultimately extended over the cantons of Uri, Schwyz and Zug. Zschokke distinguished himself by the vigour of his administration and the prudence of his advice. He proposed to reforms the education of the poorer classes of the country. In 1800 he reorganized the institutions of the Italian cantons and was appointed lieutenant-governor of the canton of Basel. Zschokke retired from public life when the central government at Bern proposed to re-establish the federal system, but after the changes effected by Bonaparte he entered the service of the canton of Aargau, with which he remained connected. In 1801 he attracted attention by his Geschichte vom Kämpe und Untergänge der schweizerischen Berg- und Wald-Kantone. Through his Schweizerlyrik, the publication of which began in 1804, he exercised a wholesome influence on public affairs; and the like may be said of his Miscellen für die neueste Weltkunde, issued from 1807 to 1813. In 1811 he also started a monthly periodical, Erkterungen. He wrote various historical works, the most important of which is Des Schweizerlandes Geschichte für das Schweizervolk (1822, 8th ed. 1849). Zschokke’s tales, on which his literary reputation rests, are collected in several series, Bilder aus der Schweiz (5 vols., 1824–25), Ausgewählte Novellen und Dichtungen (16 vols., 1838–39). The best known are: Adriatic Market (1828; 2nd ed. 1837; Der Creole (1802); Alamentode (1802); Zschokke’s letters, (1794); and Meister Jordan (1845). In Stunden der Andacht (1809–1816; 27 editions in Zschokke’s lifetime), which was widely read, he expounded in a rationalistic spirit the fundamental principles of religion and morality. Eine Selbstschau (1842) is a kind of autobiography. Zschokke was not a great original writer, but he secured an eminent place in the literature of his time by his enthusiasm for modern ideas in politics and religion, by the sound, practical judgment displayed in his works, and by the energy and lucidity of his style. He died at his country house of Blumenhalde on the Aar on the 27th of June 1848.

An edition of Zschokke’s selected works, in forty volumes, was issued in 1824–28. In 1851–54 an edition in thirty-five volumes was published. A new edition of the Novellen was published by the University of Berlin in two volumes, 1859–60. Zschokke, by E. Münch (1831); Emil Zschokke (3rd ed. 1876); R. Sauerländer (Aarau, 1884); and W. Wernly (Aarau, 1894). See also M. Schneiderreit, Zschokke, sein Weltanschauung und Lebensweisheit (1904).

ZSPAHU, a town in the kingdom of Saxony, on the left bank of the Zschopau, 18 m. S.E. from Chemnitz by the railway to Annaberg. Pop. (1900) 7548. It contains a handsome parish church dedicated to St Martin, a town hall and a castle (Wilddeck), built by the Emperor Henry I. in 932. The industries include ironfounding, cotton and thread-spinning, clothing and furniture making.

ZUCARELLI, FRANCESCO (1702–1758), Italian painter, was born at Pitigliano in Tuscany, and studied in Rome under Onesti, Morandi, and Nelli. At Rome, and later in Venice, he became famous as one of the best landscape painters of the classicizing 18th century. Having visited England on a previous occasion, he was induced by some patrons to return thither in 1752, remaining until 1773, when he settled in Florence, dying there in 1758. Zucarelli, who was one of the foundation members of the Royal Academy, enjoyed the patronage of royalty and of many wealthy English collectors, for whom he executed his principal works—generally landscapes with classic ruins and small figures. A large number of them are at Windsor Castle, and of the seven examples which formed part of the John Samuel collection two are now at the National Gallery. The royal palace in Venice contains as many as twenty-one, and the academy four. Others are at the Vienna Gallery, and at the Louvre in Paris. His work was very unequal, but at his
best he rivals the leading landscape painters of his time. His paintings often bear a mark representing a pumpkin, a pictorial representation of his name, which signifies "little pumpkin."

ZUCCARO, or ZUCCHERO,1 the name of two Italian painters.

I. TADDEO ZUCCARO (1520-1566), one of the most popular painters of the so-called Roman mannerist school, was the son of Ottaviano Zuccaro, an almost unknown painter at St Angelo in Vado, where he was born in 1529. Taddeo found his way to Rome, and he succeeded at an early age in gaining a knowledge of painting and in finding patrons to employ him. When he was seventeen a pupil of Correggio, named Daniele da Parma, engaged him to assist in painting a series of frescoes in a chapel at Vitto near Sora, on the borders of the Abruzzi. Taddeo began his career as a fresco painter, by executing a series of scenes in monochrome from the life of Furius Camillus on the walls of a new palace at Caprarola, built for Cardinal Alessandro Farnese, for which Taddeo also designed a great quantity of rich decorations in stucco relief behind the style of Giulio Romano and other pupils of Raphael. All the paintings were in fresco, very large in scale, and often in chiaroscuro or monochrome; they were more remarkable for rapidity of execution and a certain boldness of style than for any higher qualities. His work is in a mannered style, artificial and pompous in conception, and lacks any close or accurate knowledge of the human form and its movements. He died in Rome in 1566, and was buried in the Pantheon, not far from Raphael.

Taddeo's easel pictures are less common than his decorative frescoes. A small painting on copper of the Adoration of the Shepherds, formerly in the collection of James I., is now at Hampton Court; it is a work of very small merit. The Caprarola frescoes were engraved and published by Prenner, Illustri Fatti Fornacini Coloriti nel Real Palazzo di Caprarola (Rome, 1749-50).

II. FEDERIGO ZUCCARO (1543-1609) was in 1550 placed under his brother Taddeo's charge in Rome, and worked as his assistant; he completed the Caprarola frescoes. Federigo attained an eminence far beyond his very limited merits as a painter, and was perhaps the most popular artist of his generation. Probably no other painter has ever produced so many enormous frescoes crowded with figures on the most colossal scale, all executed under the unfortunate delusion that grandeur of effect could be attained merely by great size combined with extravagance of attitude and exaggeration of every kind. Federigo's frescoes, in consequence of this, were not the completion of the painting of the dome of the cathedral at Florence; the work had been begun by the art-historian Vasari, who wrote in the most generous language about his more successful rival. Regardless of the injury to the apparent scale of the interior of the church, Federigo painted about 300 figures, each nearly 50 ft. high, sprawling with violent contortions all over the surface. Happily age has so dimmed these pictures that their presence is now almost harmless. Federigo was recalled to Rome by Gregory XIII. to continue in the Pauline chapel of the Vatican the scheme of decoration begun by Michelangelo during his last failing years, but a quarrel between the painter and members of the papal court led to his departure from Italy. He visited Brussels, and there made a series of cartoons for the tapestry-weavers.

In 1574 he passed over to England, where he received commissions to paint the portraits of Queen Elizabeth, Mary, queen of Scots, Sir Nicholas Bacon, Sir Francis Walsingham, Lord High Admiral Howard, and others. A curious full-length portrait of Elizabeth in fancy dress, now at Hampton Court, is attributed to this painter, though very doubtfully. Another picture in the same collection appears to be a replica of his painting of the "Allegory of Calvary," as suggested by Lucian's description of a celebrated work by Apelles; the satire in the original painting, directed against some of his courtier enemies, was the immediate cause of Federigo's temporary exile from England. His success as a producer of monochrome frescoes, as well as in oil was more than the admiration expressed for his colossal frescoes. A portrait of a "Man with Two Dogs," in the Pitti Palace at Florence, is a work of some real merit, as is also the "Dead Christ and Angels" in the Borghese Gallery in Rome. Federigo was soon recalled to Rome to finish his work on the vault of the Pauline chapel. In 1585 he accepted an offer by Philip II. of Spain to decorate the new Escorial at a yearly salary of 2000 crowns, and worked at the Escorial from January 1586 to the end of 1588, when he returned to Italy. Federigo then formed a new circle of followers and was confirmed in his position by Sixtus V., the Academy of St Luke, of which he was the first president. His organization suggested to Sir Joshua Reynolds his scheme for founding the English Royal Academy.

Like his contemporary Giorgio Vasari, Federigo aimed at being an art critic and historian, but with very different success. His chief book, L'Idea de' Pittori, Scultori, ed Architetti (Turin, 1607), is a senseless mass of the most turgid bombast. Little can be said in praise of his smaller works, consisting of two volumes printed at Bologna in 1568, describing his visit to Parma and a journey through central Italy. Federigo was raised to the professorship of painting at a court not long before his death, which took place at Ancona in 1609.

For both Taddeo and Federigo Zuccaro, see Vasari, pt. iii., and Lanzi, Storia Pittorica, Roman School, epoch iii. (J. H. M.)

ZUG (Fr. Zueg), a canton of central Switzerland. It is the smallest undivided canton, both as regards area and as regards population. Its total area is but 92-3 sq. m., of which, however, no fewer than 75-1 sq. m. are reckoned as "productive," forests covering 19-9 sq. m. Of the rest 10 sq. m. are occupied by the cantonal share of the lake of Zug (q.v.), and 24 sq. m. by the lake of Aegeri, which is wholly within the canton.

It includes the fertile strips on the eastern and western shores of the lower portion of the lake of Zug, together with the alluvial flood plain at its northern extremity. The lower range, culminating in the Zugberg (3255 ft.), and the Wildspitz (5194 ft.), the highest summit of the Rosseggen, that rises east of the lake of Zug, separates it from the basin and lake of Aegeri, as well as from the hilly district of Mendingen. The Lorzé issues from the lake of Aegeri, forces its way through moraine deposits in a deep gorge with fine stelactite caverns and falls into the lake of Zug, issuing from it very soon to flow into the Reuss. The canton thus belongs to the hilly, not to the plain, district of Switzerland, but as it is traversed by the eastern slopes of the great range of the Swiss mountains, it is separated from the higher ground by a certain strategical position. Railways connect it both with Lucerne and with Zürich, while lines running to the eastern shore of the lake of Zug have descended to the level of the station of the St Gotthard railway. On the eastern shore of the lake of Aegeri, and within the territory of the canton, is the true site of the famous battle of Morgarten (999) won by the Swiss in 1315. Till 1814 Zug was in the diocese of Constance, but on the reconstruction of the diocese of Basel in 1828 it was assigned to it. In 1900 the population of the canton was 25,092, of whom 24,942 were German-speaking, 819 Italian-speaking, and 157 French-speaking, while 23,362 were Romanists, 1701 Protestants, and 19 Jews. Its capital is Zug, while the manufacturing village of Baar, 2 m. N., had 4484 inhabitants, and the village of Cham, 3 m. N.W., had 3053 inhabitants. In both cases the environs of the villages are included, and this is even more the case with the wide-spreading parishes of Unter Aegeri with 2593 inhabitants, of Menzingen with 2395 inhabitants, and the great school for girls and female teachers, founded by Giacomo Zuccheri, and that of the smaller parishes of Reuss, and of Unter Aegeri with 1891 inhabitants.

In the higher regions of the canton the population is mainly engaged in pastoral pursuits and cattle-breeding. There are 61 "alps," or high pastures, in the canton. At Cham is a well-known factory of condensed milk, now united with that of Nestlé of Vevey. At Baar there are extensive cotton-spinning mills and a spinning factory of Zuccheri, and at Cham a factory for fruit trees, and "Kirschmoser" (cherry-water) and cider are largely manufactured. Apiculture too flourishes greatly. A number of factories have sprung up in the newer quarter of the town, but the prevailing industry is tanning of leather, and the town forms a single administrative district, which comprises eleven communes. The legislative, or Kantonrat, has one member to every 1500 inhabitants; the executive, or Regierungsrat, are elected directly by popular vote, proportional representation obtaining in both cases if more than two members are to be elected in the same electoral district to posts in the same
authority. The term of office in both cases is four years. Besides the "facultative Referendum" by which, in case of a demand by one-third of the members of the legislative assembly, or by 800 citizens, any law, and any resolution involving a capital expenditure of 50,000 francs, must be submitted to a direct popular vote, and the "initiative" at the demand of 1000 citizens in case of amendments to the cantonal constitution; there is an "initiative" in case of a demand of 800 citizens. The two members of the Federal Ständerat, as well as the one member of the Federal Nationalrat, are also elected by a popular vote.

The earlier history of the canton is practically identical with that of its capital Zug (see below). From 1728 to 1738 it was distracted by violent disputes about the distribution of the land. In 1742, during the Austrian war, the canton was invaded by the French army, but was even more devastated by the riots of 1744. In 1748 the inhabitants opposed the new council and the canton formed part of the Teltiag, and later of one of the districts of the huge canton of the Waldstätten in the Helvetic republic. In 1803 it regained its independence as a separate canton, and by the constitution of 1814 the "Landsge- meinde," or assembly of all the citizens, which had existed for both districts since 1736, became a body of electors to choose a cantonal council. The reform movement of 1850 did not affect the canton, which in 1853 was a member of the Sonderbund and shared in the war of 1847. In 1848 the remaining functions of the Landsgemeinde were abdicated. Both in 1851 and 1871 its inhabitants opposed the revision of the federal constitutions. The constitution of 1873-76 was amended in 1881, and was replaced by a new one in 1894.

Semmler, Die Alp und Handwerkswirtschaft im Kant. Zug (Soleure, 1901); and the Zugersche Neujahrssblätter (Zug from 1882).

ZUG, capital of the Swiss canton of that name, a picturesque little town at the N.E. corner of the lake of Zug, and at the foot of the Zugerberg (1355 ft.), which rises gradually, its lower slopes thickly covered with fruit trees. Pop. (1900) 6568, mainly German-speaking and Romanist. The lake shore has been embanked and forms a promenade, whence glorious views of the snowy peaks of the Bernese Oberland, as well as of the Rigi and Platus, are gained. Towards its northerly end a monument marks the spot where a part of the shore slipped into the lake in 1887. The older part of the town is rather crowded together, though only four of the wall towers and a small part of the town walls still survive. The most striking old building in the town is the parish church of St Oswald (late 15th century), dedicated to St Oswald, king of Northumbria (d. 642), one of whose arms was brought to Zug in 1485. The town hall, also a 15th-century building, now houses the Historical and Antiquarian Museum. There are some quaint old painted houses close by. A little higher up the hill-side is a Capuchin convent in a striking position, close to the town wall and leaning against it. Still higher, and outside the old town, is the fine new parish church of St Michael, consecrated in 1902. The business quarter is on the rising ground north of the old town, near the railway station. Several fine modern buildings rise on or close to the shore in the town and to its south, whilst to the south-west is a convent of Capuchin nuns, who manage a girls' school, and several other educational establishments. The town, first mentioned in 1240, is called an "oppidum" in 1242, and a "castrum" in 1255. In 1273 it was bought by Rudolph of Habsburg from Anna, the heiress of Kyburg and wife of Elio, count of the other line of Habsburg, and in 1278 part of its territory, the valley of Aegeri, was pledged by Rudolph as security for a portion of the marriage gift he promised to Joanna, daughter of Edward I. of England, who was betrothed to his son Hartmann, whose death in 1281 prevented the marriage from taking place. The town of Zug was governed by a bailiff, appointed by the Habsburgs, and a council, and was much favoured by that family. Several country districts (Baar, Menzingen, and Aegeri) had each its own "Landsge- meinde" but were governed by one bailiff, also appointed by the Habsburgs; these were known as the "Aeuser Amt," and were always favourably disposed to the Confederates. On the 27th of June 1352 both the town of Zug and the Aeuser Amt entered the Swiss Confederation, the latter being received on exactly the same terms as the town, and not, as was usual in the case of country districts, as a subject land; but in September 1352 Zug had to acknowledge its own lords again, and in 1355 to break off its connexion with the league. About 1364 the town and the Aeuser Amt were recovered for the league by the men of Sennwald, and finally in 1373 the town was in all the acts of the league. In 1379 the German king Wences- laus exempted Zug from all external jurisdictions, and in 1389 the Habsburgs renounced their claims, reserving only an annual payment of twenty silver marks, and this came to an end in 1415. In 1400 Wenceslaus gave all criminal jurisdiction to the town only. The Aeuser Amt then, in 1404, claimed that the banner and seal of Zug should be kept in one of the country districts, and were supported in this claim by Schwyz. The matter was finally settled in 1414 by arbitration and the banner was to be kept in the town. Finally in 1415 the right of electing the town magistrates to the "Gammann" was given to Zug by the league, and a share in the criminal jurisdiction was granted to the Aeuser Amt by the German king Sigismund. In 1385 Zug joined the league of the Swabian cities against Leopold of Habsburg and shared in the victory of Sempach, as well as in the various Argovian (1415) and Thurgovian (1468) conquests of the Confederates, and later in those in Italy (1512), having already taken part in the occupation of the Val d'Ossola. Between 1370 (Walchwil) and 1477 (Cham) Zug had acquired various districts in her own neighbourhood, principally to the north and the west, which were ruled till 1798 by the town alone, over subject lands. At the time of the Reformation Zug clung to the old faith and was a member of the "Christliche Vereinigung" of 1529. In 1586 it became a member of the Golden League. (W. A. B. C.)
a family of poetical power; his stepfather, Aus ibn Hajur, his sister, Khans, and his son, Ka'b ibn Zuhair, were all poets of eminence. He is said to have lived long, and at the age of one hundred to have met Mahomet. His home was in the land of the Frisians. These poems are characterized by their peaceful nature and a sententious moralizing. One of them is contained in the *Moulabbat*.

As a whole his poems have been published by W. Abhardt in his *The Divans of the six Ancient Arabic Poets* (London, 1876); and with the commentary of al-Alam (died 1083) by Count Landberg in the second part of his *Primeurs arabes* (Leiden, 1888). Some supplementary poems are contained in *Zuluf* von der Oberlieferung des Zuhairidwans* (Munich, 1892). (G. W. T.)

**ZUIDER ZEE,** or ZUIDER ZEE, a land-locked inlet on the coast of Holland, bounded N. by the chain of the Frisian Islands, and W., S., and E. by the provinces of North Holland, Utrecht, Gelderland, Overysel, and Friesland. It is about 85 m. long N. to S., and from 10 to 45 m. broad, with an area of 2072 sq. m., and contains the islands of Marken, Schokland, Urk, Wieringen, and Griend. In the early centuries of the Christian era the Zuiden (i.e. Southern) Zee was a small inland lake situated in the present province of South Holland. It was called by Tacitus, Terschelling, Pliny, and other early writers. It was separated from the sea by a belt of marsh and fen unifying Friesland and North Holland, the original coast-line being still indicated by the line of the Frisian Islands. Numerous streams, including the Vecht, Eem, and Yssel, discharged their waters into this lake and issued thence as the Vlie (Latin *Pleus*), which reached the North Sea by the Vliegat between the islands of Vlieland and Terschelling. In the *Lex Frisonum* the Vlie (Fli, Flih) is accepted as the boundary between the territory of the East and West Frisians. In time, however, and especially during the 12th century, high tides and north-west storms swept away the western banks of the Vlie and submerged great tracts of land. In 1170 the land between Stavoren, Texel, and Medemblik was washed away, and a century later the Zuiden Zee was formed. The open waterway between Stavoren and Enkhuizen, however, as it now exists, dates from 1400. In the south and east the destruction was arrested by the high sandy shores of Gool, Veluwe, Voorst, and Gasterland in the provinces of Utrecht, Gelderland, Overysel, and Friesland respectively.

The mean depth of the Zuiden Zee is 11.48 ft.; depth in the southern basin of the former lake, 19 ft.; at Val van Urk (deep water) is the bed of the Zuiden Zee 14 ft. If, however, we compute from the island of Urk to Marken, and thence westwards to Hoorn (North Holland) and N.N.E. to Lemmer (Friesland), these lines will connect parts of the Zuiden Zee. Receding a distance of 10 ft. from the shores of the coast on all sides 3 ft. deep or less. This shallowness of its waters served to protect the Zuiden Zee from the invasion of large ships of war. It also explains how many optimists of inundations, improvement of communication between Enkhuizen, Hoorn, Mornikendam, declined to the rank of provincial trading and fishing ports. The fisheries of the Zuiden Zee are of considerable importance. Eighty per cent. of the bottom consists of sea clay and the more recent silt of the Yssel; 20 per cent. of sand, partly in the north about Urk and Enkhuizen, partly in the south along the high shores of Gool, Veluwe, &c. The shallowness of the sea and the character of its bottom, promising fertile soil, occasioned various projects of drainage. The scheme recommended by the Zuiden Zee Vereeniging (1886) formed the subject of a report in 1894 by a state commission. The principal feature in the scheme was the building of a dike from the island of Urk to Amsterdam, and, by sluices near Wieringen, to the northern part of the sea. The four polders with their areas of fertile soil would be:—

1. North-west polder, area 53,599 acres: fertile soil, 46,189 acres.
2. South-west : 77,854 : 68,167
3. South-east : 125,599 : 122,773
4. North-east : 120,783

The Lake Ysselmeer would have an area of 560 sq. m. The gain would be the addition to the kingdom of a new and fertile province of the area of North Brabant, a saving of expenses on dikes, diminution of inundations, improvement of communication between the south and the north of the kingdom, protection of isles of the sea, &c. The costs were calculated as follows: (1) enclosing dike, sluices, and regulation of Zuiden Zee, £1,760,000; (2) reclamation, £5,200,000; (3) dike works, £400,000; (4) indemnity to fishermen, £180,000; total, £7,540,000.

In 1901 the government introduced a bill in the States General, based on the recommendations of the commission for executing the project, which would cost £4,370,000, or £7,580,000: the Zuiden Zee would be drained by a dike from the North Holland coast, through the Amstel to Wieringen and from that island to the Friesian coast at Haam; and further providing for the draining of two portions of the enclosed area, namely the N.W. and the S.W. polders shown in the table. The entire work was to be completed in 18 years at an estimated cost of £7,916,000. The bill failed to become law and in consequence of financial difficulties the project had not, up to 1910, advanced beyond the stage of consideration.

With the exception of Griend and Schokland, the islands of the Zuiden Zee are inhabited by small fishing communities who retain the picturesque customs and picturesqueness of the Urk and Zee population. The Zuider Zee is mentioned as an island in 966. The inhabitants of Schokland were compelled to leave the island by order of the state in 1830, it being considered insecure from inundation. The island of Griend (or Grind) once boasted a walled town, which was destroyed by flood at the end of the 13th century. But the island continued for some centuries to serve as a pastureage for cattle, giving its name to a well-known description of cheese. Like some of the other islands, sheep are still brought to graze upon it in summer, and a large number of birds’ eggs are collected upon it in spring. Several of the islands were once the property of religious houses on the mainland.

**Zula,** a small town near the head of Annesley Bay on the African coast of the Red Sea. It derives its chief interest from ruins in its vicinity which are generally supposed to mark the site of an ancient Egyptian settlement. The town Zula is mentioned as an island in 966. The inhabitants of Schokland were compelled to leave the island by order of the state in 1830, it being considered insecure from inundation. The island of Griend (or Grind) once boasted a walled town, which was destroyed by flood at the end of the 13th century. But the island continued for some centuries to serve as a pastureage for cattle, giving its name to a well-known description of cheese. Like some of the other islands, sheep are still brought to graze upon it in summer, and a large number of birds’ eggs are collected upon it in spring. Several of the islands were once the property of religious houses on the mainland.

**ZULÓAGA,** Ignacio (1787— ), Spanish painter, was born at Elbar, in the Basque country, the son of the metal-worker and damascener Placido Zuloga, and grandson of the organizer and director of the royal armoury in Madrid. The career chosen for him by his father was that of an architect, and with this object in view he was sent to Rome, where he immediately followed the strong impulse that led him to painting. After only six months’ work he completed his first picture, which was exhibited at the Paris Salon of 1809. Continuing his studies in Paris, he was strongly influenced by Gauguin and Toulouse Lautrec. Only on his return to his native soil he found his true style, which is based on the national Spanish
ZULULAND

To the young artist who sought the decaying, ragged style was the very negation of the aims of such well-known modern Spanish artists as Fortuny, Madrazo, and Benlliure. It was first in Paris, and then in Brussels and other continental art centres, that Zululand was hailed by the reformers as the regenerator of Spanish national art and as the leader of a school. He is now represented in almost every great continental gallery. Two of his canvases are at the Luxembourg, one at the Brussels Museum ("Avant la Corrida"), and one ("The Poet Don Miguel") at the Vienna Gallery. The Pau Museum owns an interesting portrait of a lady, the Barcelona Municipal Museum the "Siesta," and the Musée d'Art Moderne de la Ville de Paris the "Madame Louise"; the Berlin Gallery, "The Tapers." Other examples are in the Budapest, Stuttgart, Ghent and Posen galleries and in many important private collections.

A fully illustrated account of the artist and his work, by M. Utrillo, was published in a special number of Forma (Barcelona, 1907).

ZULULAND, a country of south-east Africa, forming the N.E. part of the province of Natal in the Union of South Africa. The "Province of Zululand," as it was officially styled from 1898 to 1910, lies between 26° 50' and 29° 15' S. and 30° 40' and 33° E., and has an area of 10,450 sq. m. It includes in the north the country of the Ama Tonga, Zaanbanian, and other small territories not part of the former Zulu kingdom and still farther away the Nguni country east of the south coast of Portuguese East Africa. Bounded S.E. by the Indian Ocean, it has a coast line of 210 m. North and north-west it is bounded by the Utrecht and Vryheid districts of Natal and by Swaziland. Its greatest length in a direct line is 185 m., its greatest breadth 105 m. (For map see South Africa.)

Physical Features.—Zululand is part of the region of hills and plateaus which descend seaward from the Drakensberg,—the great mountain chain of South Africa, which stretches from the eastern territory of the country to South-West Africa. The coast, which curves to the N.E., is marked by a line of sandhills covered with thick bush and rising in places to a height of 500 ft. There are occasional outcrops of rock and low perpendicular cliffs. Behind the sandhills is a low-lying plain in which are a number of shallow lagoons. Of these St Lucia Lake and Kosi Lake are of considerable size and communicate with the sea by estuaries. St Lucia, the larger of the two, is some 35 m. long by 10 m. broad, with a depth of 9 to 10 ft. It runs parallel to the ocean, from which it is separated by sandhills. The opening to the sea, St Lucia river, is at the south end. Kosi Lake lies further inland. It is connected with the sea by the channel of St Lucia and its opening to the sea is northward. Between Kosi and St Lucia lakes lies Lake Sibayi, close to the coast but not communicating with the sea. The coast plain extends inland from the sandhills, varying in width with the wave action, the width of the sandhills and the level of the coastal plain. The coastland is gently rolling. The rest of the country is occupied by ranges of hills and plateaus 2000 to 3000 ft. above sea level. Behind Estuary Plateau, the vegetation is comparatively simple, consisting in the main of plateaus formed of sedimentary rocks, resting on a platform of granite and metamorphic rocks (see NATAL: Geology).

Climate.—The climate of the coast belt is semi-tropical and malaria is prevalent; that of the highlands temperate. The annual rainfall is moderate and is greatest in the rainy season, but in the higher country snow and sleet are not uncommon in July. On the coast about 40 in. of rain fall in the summer months and about 7 in. in the winter months. A fresh S.E. wind is fairly constant in the inland regions during the middle of the day. A hot wind from the N.W. is occasionally experienced in the highlands.

Flora and Fauna.—The coast plain (in large part), the river valleys, and the eastern sides of the lower hills are covered with mimosa and other thorn trees. This is generally known as thorn-bush and has little undergrowth. "Coast forests" grow in small patches along the courses of the rivers, at their mouths, and on the sandhills along the coast. The trees are low, conical timber trees, palms, mangroves and other tropical and sub-tropical plants and have an almost impenetrable undergrowth. The largest and most distinct of these forests is that of Kosi and St Lucia. In extent, adjacent to St Lucia Bay. The upland regions are thickly wooded with timber forests, the trees including the yellow-wood and iron-wood. The most noteworthy timber forests are those of Nkandla and the small land of Lebombo, south of Kwa-Bhaca. They are covered with grass and occasional thorn trees. Orchids are among the common flowers. The island includes the lion and elephant, found in the near-by bushland of the Portuguese frontier (the lion was also found as late as 1895 in the Ndwandwe district), the white and the black rhinoceros, the leopard, panther, jackal, spotted hyena, aard-wolf, dassie, dassie, wild boar, giraffe, gnu, impala, kudu, springbok, waterbuck, eland, roan antelope, ducker, &c., and some birds. The Hippopotami are found on the coast, and alligators are common in the rivers and lagoons of the low country. Venomous snakes are found. The great kori bustard, the kooban, turkey buzzards (known as insinges), wild duck, and paaw are among the game birds. The ostrich and secretary-bird are also found. Of domestic animals the Zulus possess a dwarf breed of smooth-skinned humped cattle. Locusts are an occasional pest.

Inhabitants.—The population in 1904 was estimated at 250,000. Of these only 5635 lived outside the area devoted to native locations. The white population numbered 1663. The population of the country of the Zulus is about 1,000,000 and the country is a settlement of some 2000 Basutos in the Ntuzi district. After the establishment of the Zulu military ascendency early in the 19th century various Zulu hordes successively invaded and overran a great part of east-central Africa, as far as and even beyond the Lake Nyasa district. Throughout these regions they are variously known as Ma-Zitu, Ma-Ravi, Wa-Ngoni (Angoni), Matabele (Ame-Ndebehi), Ma-Vit, and Aba-Zanzi. Such was the terror inspired by these fierce warriors that many of the tribes, such as the Wa-Nindi of Mozambique, adopted their enemies or oppressors. Hence the impression that the true Zulus are far more numerous north of the Limpopo than has ever been the case. In most places they have become extinct or absorbed in the surrounding populations owing to their habit of incorporating prisoners in the tribe. But they still hold their ground as the ruling element in the region between the Limpopo and the middle Zambezi, which from them takes the name of Matabeleland. The circumstances and history of the two chief migrations of Zulu peoples northward are well known; the Matabele were led by Mosilikatze (Masilionjazi), and the Angoni by Sungandaba, both chiefs of Chief kaZulu, who revolted from him in the early 19th century.

The Zulu possess an elaborate system of laws regulating the inheritance of property, the laws of descendent (or chief), the complexity arising from the practice of polygamy and the exchange of cattle made upon marriage. The giving of cattle in the latter case is generally referred to as a barter and somewhat of the bride, from which indeed it is not easily distinguishable. But it is regarded in a different light by the natives. The kraal is
under the immediate rule of its headman, who is a patriarchal
responsible for the welfare of all its members. Over the headman,
whose authority may extend to marriage, inheritance, and the
chieftainship, and above the tribal chief was the king, whose
authority is now exercised by a British commissioner. Under the
command of a British officer, the colonial magistrates have
brought to trial and punished an undue number of venal or
the utterance of any word which occurs in the names of the
principal members of her husband's family: e.g., if she has a
brother-in-law named U Xomo, she would not use the Zulu for
"brother" instead of inventing some other word for it. The
husband observes the same custom with regard to his mother-in
law. The employment of "witch doctors" for "smelling out"
caulpins and their treatment by witchcraft or execrations or
viledoers of any kind, as poisoners, once common in Zululand,
and in neighbouring countries, was discouraged by Cetywayo,
who established "kraals of refuge" for the reception of persons
wrongfully accused from Boer Courts. Somkela was finally
suppressed by the British in the early years of the
20th century. (For the Zulu speech, see Bantu Languages.)

The Zulu live in kraals, circular enclosures with
walls, generally a ring fence inside forming a typical kraal. Near
the fence and the outer fencing are the huts of the inhabitants.
The royal kraal for a considerable period was at Ulundi, in the
valley of the White Umfolozi. The last king to occupy it was
Dininzi, Dinizulu's kraal was farther north near the Ndawndwa
magistracy. The chief white settlements are Eshowe and Melmoth. Eshowe (pop. 1904, 1855 of whom 570 were whites) is about 95 m. N.E.
of Durban, and a lake of the same name in which Col. Pearson was slain by the Zulus in 1879, and was later named in his memory. It is situated on a hilltop and has a
bracing climate. Two hundred acres of forest
land in the centre of the town have been reserved as a national
park. Melmoth, 23 m. N.E. of Eshowe, lies in the centre of a
district, farmed by Boers. Somkela is the headquarters of
the St Lucia coal-fields district. Xandibula is a small settlement in the
south-west of the country.

Communications. Notwithstanding its 210 m. of coast-line Zululand
possesses no harbours. This is the result of its parents of the Tugela there is, however, fairly safe anchorage, except in
S.S.W. or W. winds, about 1500 yds. from the shore. The
landing-place is on the open sandy beach, where a small stream enters the sea. The landing-place is dignified with the name of Port
Durburford. It was used to land stores in the war of 1879. Well-made
roads connect all the magistracies. The Tugela is crossed by
seven wooden bridges, which roads from Natal and Zululand
converge. Two long lagoons in front of Bond's Delirium, are both near
the mouth of the river. The Mluldrift is 36 m. in a direct line
above the mouth of the Tugela. Korkes Drift, 48 m., also in a direct line
above the Mluldrift, is a crossing of the Buquyana river a little above the Tugela confluence. A railway, completed
1904, which begins at Durban and crosses into Zululand by a
bridge over the Tugela near the Lower Drift, runs along the coast between Port Durburford and the Umzimkulu. The railway-line
is 167 m. from Durban, of which 98 are in Zululand. There is
geographic communication between the magistracies and towns by
western railways.

Industries. The Zulu give little attention to the cultivation of
the soil. Their main wealth consists in their herds of cattle and
flocks of sheep. They raise, however, crops of maize, millet, sweet
potatoes and tobacco. Sugar, tea and coffee are grown in the
country. The Zulu are good agriculturists. Abaca is mined in the St Lucia Bay
district, and bituminous coal is found in the Nqutu and Kyundwi
hills. Gold, iron, copper and other minerals have also been found,
but their mineral wealth of the country is undeveloped. There is
a considerable trade with the natives in cotton goods, &c., and numbers
of Zulu seek service in Natal (Trade statistics are included in
those of Natal.)

Administration. Zululand for provincial purposes is governed by
the provincial council of Natal; otherwise it is subject to the
House of Assembly. It was represented in the House of Assembly
in 1904, two Members for the Legislative Assembly, one
for the Natal Native Assembly, and two for the Legislative
Assembly, one for the districts of Eshowe and Melmoth. Their selection
and election were governed by the same laws as in Natal proper,
and finally, in the franchise qualifications—which practically exclude natives—remained unaltered.
The parliamentary voters in 1910 numbered 1427. The executive
power is vested in the Governor of Natal, who is the representative of the
Queen in the country, and of the British Government—of the civil
administration. The Ingwawuma magistracy, like Tongland, formed no part of the dominions of the
Zulu kings, but was ruled by independent chiefs until its annexa-
tion by Great Britain in 1895.

With the exception of the townships and a district of Eshowe
magistracy known as "Proviso B," mainly occupied by
Boer farmers, all the land was vested in the crown and very little
has been parted with to Europeans. The crown lands are, in
effect, native reserves. A hut tax of 14s. per annum is levied on all
houses of more than 8 feet square, whether inhabited by a Zulu who
possess, whether or not each wife has a separate hut. Since 1906
a poll tax of 1£, a head is also levied on all males over eighteen,
European or native.

History.—At what period the Zulu (one of a number of closely
related septs) first reached the country to which they have
given their name is uncertain; they were probably settled in the
valley of the Tugela in the second half of the 19th century,
and the name of the Zulu race is believed to be the
account of the wreck of the "Doddington" in 1756. The
survivors met with hospitable treatment at the hands of
the natives of Natal, and afterwards proceeded up the coast to
St Lucia Bay. They describe the natives as "very proud and
haughty, and not so accommodating as those lately left." They
differed from the other natives in the superior neatness of
their food of preparing their food, and were more cleanly
in their persons, habits, and dress. Their manner of life,
their chief pride seemed to be to keep their hair in
order. It is added that they watched strictly over their
women.

At the close of the 18th century the Zulu were an unimportant
tribes numbering a few thousands only. At that time the most
powerful of the neighbouring tribes was the Umtetwa (mTetwa
or Aba-Tetwa) which dwelt in the country north-east of the
Tugela. The ruler of the Umtetwa was a chief who had lived an adventurous career and was known as Dingiswayo
(The Wanderer). Chaka, who in 1818 was at the head of a
tribe, as is supposed, had observed the manners in which the whites formed their soldiers into disciplined
regiments. He too divided the young men of his
tribe into impis (regiments), and the Umtetwa became a formidable
military power. Dingiswayo also encouraged trade and
opened relations with the Portuguese at Delagoa Bay, bartering
ivory and oxen for brass and beads. In 1805 he was joined by
Chaka, otherwise Tshaka (born c. 1783), the son of the Zulu
chief Senzangakona; on the latter's death in 1810 Chaka,
who was influenced by Dingiswayo, was chosen as ruler of
the Ama-Zulu, though not the rightful heir. Chaka
then formed his own impis, which were armed with a
patron's raids, and in 1812 the Umtetwa and Zulu drove
the Amangwana across the Buffalo river. About this time Dingis-
wayo was captured and put to death by Zvijo, chief of the
Undwande clan, with whom he had waged constant war. The
Umtetwa army then placed themselves under Chaka, who not
long afterwards conquered the Undwande. By the incorpora-
tion of these tribes Chaka made of the Zulu a powerful
nation. He strengthened the regimental system adopted by Dingiswayo and perfected the discipline of his army.
A new order of battle was adopted—the troops being massed
in formation, with a reserve in the shape of a parallel-
gram ready to strengthen the weakest point. Probably Chaka's
greatest innovation was the introduction of the stabbing assegai.
The breaking short of the shaft of the assegai when the
weapon was used at close quarters was already a common practice among
the Ama-Zulu, but Chaka had the shaft of the assegai made
short, and their blades longer and heavier, so that they could be
used for cutting or piercing. At the same time the size of the
shield was increased, the more completely to cover the body of
the warrior. Military kraals were formed in which the warriors
formed

The Boers had the right to settle in this district in virtue of
Proviso B of an agreement made, on the 2nd of October 1886,
between the settlers in the "New Republic" and Sir A. E. Have
lock, governor of Natal.

The river called the Umkelwayo is to be noted. It states that the ancestors of the tribes
living in what is now Natal and Zululand were acquainted with the
regimental system and the method of attack in crescent shape
formation in the 17th century. Memories of these customs lingered even if the practice had died out. Among the Ama-Xosa section of Kaffirs they appear to have been quite unknown.

Rise of the Zulu nation.

Chaka.
were kept apart. Members of a regiment were of much the same age, and the young warriors were forbidden to marry until they had distinguished themselves in battle.

Chaka had but two ways of dealing with the tribes with whom he came in contact; either they received permission to be incorporated in the Zulu nation or they were practically exterminated. In the latter case the only persons spared were young girls and growing lads who could serve as carriers for the army. No tribe against which he waged war was able successfully to oppose the Zulu arms. At first Chaka turned his attention northward. Those who could fled before him, the first of importance so to do being a chief named Swangendaba (Sungandaba), whose tribe, of the same stock as the Zulu, was known as Angoni. He was followed by another tribe, which under Manikusa for many years ravaged the district around and north of Delagoa Bay (see GAELAND). Chaka next attacked the tribes on his southern border; and by 1820 had made himself master of Natal, which he swept almost clear of inhabitants. It was about 1820 that Mosilikatze (properly Umsilikazi), a general in the Zulu army, having incurred Chaka's wrath by keeping back part of the booty taken in an expedition, fled with a large following across the Drakensberg and began to lay waste a great part of the country between the Vaal and Limpopo rivers. Mosilikatze was not of the Zulu tribe proper, and he and his followers styled themselves Abakali-Zulu. Chaka's own dominions, despite his conquests, were not very extensive. He ruled from the Pongolo river on the north to the Umkomazi river on the south, including the higher ground near the base of the Drakensberg; thus his territory coincided almost exactly with the limits of Zululand and Natal as constituted in 1903.

His influence, however, extended from the Limpopo to the borders of Cape Colony, and through the ravages of Swangendaba and Mosilikatze the terror of the Zulu arms was carried far and wide into the interior of the continent.

Chaka seems to have first come into contact with Europeans in 1824. In that year (see NATAL) he was visited by F. G. Farewell and a few companions, and to them he made a grant of the district of Port Natal. Farewell found the king at Umgungumlovu, the royal kraal on the White Umfolosi, "surrounded by a large number of chiefs and about 8000 or 9000 armed men, observing a state and ceremony in our introduction little expected." At this time an attempt was made to murder Chaka; but the wound he received was cured by one of Farewell's companions, a circumstance which made the king very friendly to Europeans. Anxious to open a political connexion with the Cape and British governments, Chaka entrusted early in 1828 one of his principal chiefs, Sobti, and a companion to the care of J. S. King, one of the Natal settlers, to be conducted on an embassy to Cape Town, Sobti being commissioned to proceed to the king of England. But they were not allowed to proceed beyond Port Elizabeth, and three months later were sent back to Zululand. In July of the same year Chaka sent an army westward which laid waste the Pondo country. The Zulu force did not come into contact with the British troops guarding the Cape frontier, but much alarm was caused by the invasion. In November envoyos from Chaka reached Cape Town, and it was determined to send a British officer to Zululand to confer with him. Before the embassy started, news came that Chaka had been murdered (23rd of September 1828) at a military kraal on the Umvota about fifty miles from Port Natal. Chaka was a victim to a conspiracy by his half brothers Dingaan and Umthlangana, while a short time afterwards Dingaan murdered Umthlangana, overcame the opposition of a third brother, and made himself king of the Zulu.

Bloodstained as had been Chaka's rule, that of Dingaan appears to have exceeded it in wanton cruelty, as is attested by several trustworthy European travellers and merchants who soon after frequently visited Zululand. The British settlers at Port Natal were alternately terrorized and conciliated. In 1835 Dingaan gave permission to the British settlers at Port Natal to establish missionary stations in the country, in return for a promise made by the settlers not to harbour fugitives from his dominions. In 1836 American missionaries were also allowed to open stations; in 1837 he permitted the Rev. F. Owen, of the Church Missionary Society, to reside at his great kraal, and Owen was with the king when in November 1837 he received Pieter Retief, the leader of the first party of Boer immigrants to enter Natal.

Coming over the Drakensberg in considerable numbers during 1837, the Boers found the land stretching south from the mountains almost deserted, and Retief went to Dingaan to obtain a formal cession of the country west of the Tugela, which river the Zulu recognized as the boundary of Zululand proper. After agreeing to Retief's request Dingaan caused the Boer leader and his companions to be murdered (6th of February 1838), following up his treachery by slaying as many as possible of the other Boers who had entered Natal. After two unsuccessful attempts to avenge their slain, in which the Boers were aided by the British settlers at Port Natal, Dingaan's army was totally defeated on the 16th of December 1838, by a Boer force under Andries Pretorius. Operating in open country, mounted on horseback, and with rifles in their hands, the Boer farmers were able to inflict fearful losses on their enemy, while their own casualties were few. On "Dingaan's day" the Boer force received the attack of the Zulu while in laager; the enemy charged in dense masses, being met both by cannon shot and rifle fire, and were presently attacked in the rear by mounted Boers. After the defeat Dingaan set fire to his kraal and moved to the Vaal, where he again found refuge in the bush; on the Boers recrossing the Tugela he established himself at Ulundi at a little distance from his former capital. His power was greatly weakened and a year later was overthrown, the Boers in Natal (January 1840) supporting his brother Mpande (usually called Panda) in rebellion against him. The movement was completely successful, several of Dingaan's regiments going over to Panda. Dingaan passed into Swaziland in advance of his retreating forces, and was there murdered, while Panda was crowned king of Zululand by the Boers.

When in 1843 the British succeeded the Boers as masters of Natal they entered into a treaty with Panda, who gave up to the British the country between the upper Tugela and the Buffalo rivers, and also the district of St. Lucia Bay. (The bay was not then occupied by the British, whose object in obtaining the cession was to prevent its acquisition by the Boers. Long afterwards the treaty with Panda was successfully invoked to prevent a German occupation of the bay.) No sooner had the British become possessed of Natal than there was a large immigration into it of Zulu fleeing from the misgovernment of Panda. That chief was not, however, as warlike as his brothers Chaka and Dingaan; and he remained throughout his reign at peace with the government of Natal.1 With the Boers who had settled in the Transvaal, however, he was involved in various frontier disputes. He had wars with the Swazis, who, in 1855 ceded to the Boers of Lydenburg a tract of land on the north side of the Pongolo in order to place Europeans between themselves and the Zulu. In 1856 a civil war broke out between two of Panda's sons, Cetywayo and Umbulazi, who were rival claimants for the succession. A battle was fought between them on the banks of the Tugela in December 1856, in which Umbulazi and many of his followers were slain. The Zulu crown remained vacant, however, and disturbed until the government of Natal in 1861 obtained the formal nomination of a successor to Panda; and Cetywayo was appointed. The agent chosen to preside at the nomination ceremony was Mr. (afterwards Sir) Theophilus Shepstone, who was in charge of native affairs in Natal and had won in a

1 Bishop Schreuder, a Norwegian missionary long resident in Zululand, gave Sir Bartle Frere the following estimate of the three brothers who successively reigned over the Zulu—"Chaka was a really great man, cruel and unmitigatedly wild, who did great things. Dingaan was simply a beast on two legs. Panda was a weaker and less able man, but kindly and really grateful, a very rare quality among Zulus. He used to kill sometimes, but never wantonly or continuously."
remarkable degree the respect and liking of the Zulu. Panda died in October 1872, but practically the government of Zululand had been in Cetewayo's hands since the victory of 1856, owing both to political circumstances and the falling health of his father. In 1873 the Zulu nation appealed to the Natal government to preside over the installation of Cetewayo as king; and this request was acceded to, Shepstone being again chosen as British representative. During the whole of Panda's reign the condition of Zululand showed little improvement. Bishop Colenso visited him in 1857 and obtained a grant of land for a mission station, which was opened in 1860, by the Rev. R. Robertson, who laboured in the country for many years, gaining the confidence both of Panda and Cetewayo. German, Norwegian and other missions were also founded. The number of converts was few, but the missionaries exercised a very wholesome influence and to them in measure was due the comparatively mildness of Panda's later years.

The frontier disputes between the Zulu and the Transvaal Boers ultimately involved the British government and were one of the causes of the war which broke out in 1879. They concerned, chiefly, territory which in 1854 was proclaimed the republic of Utrecht, the Boers who had settled there having in that year obtained a deed of cession from Panda. In 1860 a Boer commission was appointed to reconnait, and to obtain, if possible, from the Zulu a road to the sea at St Lucia Bay. The commission, however, effected nothing. In 1861 Umtonga, a brother of Cetewayo, was captured by the Boers and taken to Utrecht, bringing with him several Zulu prisoners assembled an army on that frontier. According to evidence brought forward later by the Boers, Cetewayo offered the farmers a strip of land along the border if they would surrender his brother. This they did on the condition that Umtonga's life was spared, and in 1861 Panda signed a deed making over the land to the Boers. The southern boundary of the strip added to Utrecht ran from Rorke's Drift on the Buffalo to a point on the Pongolo. The boundary was beaconed in 1864, but when in 1865 Umtonga fled from Zululand to Natal, Cetewayo's people seeing that he had lost his part of the bargain (for he feared that Umtonga might be used to supplant him as Panda had been used to supplant Dinga an), caused the beacon to be removed, the Zulu claiming also the land ceded by the Swazis to Lydenburg. The British asserted that the Swazis were their vassals and denied their right to part with the territory. During the year a Boer commando under Paul Kruger and an army under Cetewayo were posted along the Utrecht border. Hostilities were avoided, but the Zulu occupied the land north of the Pongolo. Questions were also raised as to the validity of the documents signed by the Zulu concerning the Utrecht strip; in 1869 the services of the lieut.-governor of Natal were accepted by both parties as arbitrator, but the attempt then made to settle the difficulty proved unsuccessful.

Such was the position when by his father's death Cetewayo (q.v.) became absolute ruler of the Zulu. As far as possible Cetewayo revived the military methods of his uncle Chaka, and even succeeded in equipping his regiments with firearms. It is believed that he instigated the Kaffirs in the Transkei to revolt, and he sided Sikukini in his struggle with the Transvaal. His rule over his own people was tyrannous. By Bishop Schreuder he was described as an able man, but for cold, selfish pride, cruelty and untruthfulness worse than any of his predecessors." In September 1876 the massacre of a large number of girls (who had married men of their own age instead of the men of an older regiment, for whom Cetewayo had designed them) provoked a strong remonstration from the government of Natal, inclined as that government was to look leniently on the doings of the Zulu. The tension between Cetewayo and the Transvaal over border disputes continued, and when in 1877 Britain annexed the Transvaal the dispute was transferred to the new owners of the country. A commission was appointed by the lieut.-governor of Natal in February 1878 to report on the boundary question. The commission reported in July, and found almost entirely in favour of the contention of the Zulu. Sir Bartle Frere, then High Commissioner, who thought the award "one-sided and unfair to the Boers" (Martineau, Life of Frere, ii. 216), stipulated that, on the land being given to the Zulu, the Boers living on it should be compensated if they left, or protected if they remained. Cetewayo (who now found no defender in Natal save Bishop Colenso) was in a defiant humour, and permitted outrages by Zulu both on the Transvaal and Natal borders. Frere was convinced that the peace of South Africa could be preserved only if the power of Cetewayo was curtailed. Therefore in forwarding his award on the boundary dispute the High Commissioner demanded that the military system should be remodelled. The youths were to be allowed to marry as they came to man's estate, and the regiments were not to be called up except with the consent of the council of the nation and also of the British government. Moreover, the missionaries were to be un molested and a British resident was to be accepted. These demands were made to Zulu deputies on the 11th of December 1878, a definite reply being required by the 31st of that month.

Cetewayo returned no answer, and in January 1879 a British force under General Thesiger (Lord Chelmsford) invaded Zululand. Lord Chelmsford had under him a force of 500 Europeans and 8,500 natives; 3,000 of the latter were employed along the frontier; 300 Europeans and 400 natives were stationed in the Utrecht district. Three columns were to invade Zululand, from the Lower Tugela, Rorke's Drift, and Utrecht respectively, their objective being Ulundi, the royal kraal. Cetewayo's army numbered fully 40,000 men. The entry of all three columns was unopposed. On the 22nd of January the centre column (1,600 Europeans, 2,500 natives), which had advanced from Rorke's Drift, was encamped near Isandhlwana; on the morning of that day Lord Chelmsford moved out with a small force to support a reconnoitring party. After he had left, the camp, in charge of Col. Durnford, was surprised by a Zulu army nearly 10,000 strong. The British were overwhelmed and almost every man killed, the casualties being 806 Europeans (more than half belonging to the 24th regiment) and 471 natives. All the transport was also lost. Lord Chelmsford and the reconnoitring party returned to find the camp deserted; next day they retreated to Rorke's Drift, which had been the scene of an heroic and successful defence. After the victory at Isandhlwana several imps of the Zulu army had moved to the Drift. The garrison stationed there, under Lieuts. Chard and Bronhead, numbered about 80 men of the 24th regiment, and they had in hospital between 30 and 40 men. Late in the afternoon they were attacked by about 4,000 Zulu. On six occasions, the Zulu got within the entrenchments, to be driven back each time at the bayonet's point. At dawn the Zulu withdrew, leaving 350 dead. The British loss was 17 killed and 10 wounded.

In the meantime the right column under Colonel Pearson had reached Eshowe from the Tugela; on receipt of the news of Isandhlwana most of the mounted men and the native troops were sent back to the Natal, leaving at Eshowe a garrison of 1,300 Europeans and 65 natives. The force was hemmed in by the enemy. The left column under Colonel (afterwards Sir) Evelyn Wood, which had done excellent work, found itself obliged to act on the defensive after the disaster to the centre column.2 For a time an invasion of Natal was feared. The Zulu, however, made no attempt to enter Natal, while Lord Chelmsford awaited reinforcements before resuming his advance. During this time (March the 12th) an escort of stores marching to Luneberg, the headquarters of the Utrecht force, was attacked when encamped on both sides of the Intombe river. The camp was surprised, 62 out of 106 men were killed, and all the stores were captured.

With the column were 40 Boers, the Uys clan, under Piet Uys, whose father had been killed in 1858 in the wars with Dinga an.
lost. News of Isandhlwana reached England on the 11th of February, and on the same day about 10,000 men were ordered out to South Africa. The first troops arrived at Durban on the 17th of March. On the 29th a column, under Lord Chelmsford, consisting of 3,400 Europeans and 2,300 natives, marched to the relief of Elandslaagte, and was joined by Wood's Column. On the 26th of April the camp was attacked at Ginginlhovo, the Zulu being repulsed. Their loss was estimated at 1,200 while the British had only two killed and 52 wounded. The next day Eshowe was relieved. Wood, who had been given leave to make a diversion in northern Zululand, on the 28th of March occupied Hlobane (Inhlabane) mountain. The force was, however, compelled to retreat owing to the unexpected appearance of the main Zulu army, which nearly outflanked the British. Besides the loss of the native contingent (those not killed deserted) there were 200 casualties among the 1,000 engaged. At mid-day next day the Zulu army made a desperate attack, lasting over four hours, on Wood's camp at Kamabula; the enemy—over 20,000 strong—was driven off, losing fully 1,000 men, while the British casualties were 18 killed and 65 wounded.

By the middle of April nearly all the reinforcements had reached Natal, and Lord Chelmsford reorganized his forces. The 1st division, under major-general Crealock, advanced along the coast belt and was destined to act as a support to the 2nd division, under major-general Newdigate, which was to march on Ulundi from Rorke's Drift and Kamabula. Owing to difficulties of transport it was the beginning of June before Newdigate was ready to advance. On the 1st of that month the prince imperial of France (Louis Napoleon), who had been allowed to accompany the British troops, was killed while out with a reconnoitring party. On the 1st of July Newdigate and Wood had reached the White Umfolosi, in the heart of the enemy's country. During their advance messengers were sent by Cetywayo to treat for peace, but he did not accept the terms offered. Meantime Sir Garnet (afterwards Lord) Wolseley had been sent out to super-
sede Lord Chelmsford, and on the 7th of July he reached Crealock's headquarters at Port Durnford.

But by that time the campaign was practically over. The 2nd division (with which was Lord Chelmsford) and Wood's column crossed the White Umfolosi on the 4th of July—the force numbering 4,200 Europeans and 1,000 natives. Within a mile of Ulundi the British force, formed in a hollow square, was attacked by a Zulu army numbering 12,000 to 15,000. The battle ended in a decisive victory for the British, whose losses were 20 killed and 95, while of the Zulu some 1,500 men were killed (see Ulundi).

After this battle the Zulu army dispersed, most of the leading chiefs tendered their submission, and Cetywayo became a 

Wolseley's fugitive. On the 27th of August the king was cap-
tured and sent to Cape Town. His deposition was officially announced to the Zulu, and Wolseley drew up a new scheme for the government of the country. The Chaka dynasty was deposed, and the Zulu country portioned among eleven Zulu chiefs, John Dunn, a white adventurer, and Hebebe, a Zulu chief who had been appointed a Resident. A Resident, who was to be the channel of communication between the chiefs and the British government. This arrangement was productive of much bloodshed and disturbance, and in 1882 the British government determined to restore Cetywayo to power. In the meantime, however, blood feuds had been engendered between the chiefs Ubhepu (Zibebeu) and Hamu on the one side and the tribes who supported the ex-king and his family on the other. Cetywayo's party (who now became known as Usutu) suffered severely at the hands of the two chiefs, who were aided by a band of white freebooters.

When Cetywayo was restored Usibepu was left in possession of his territory, while Dunn's land and that of the Basuto chief (the country between the Tugela and the Umhlwatu, i.e. adjoining Natal) was constituted a reserve, in which locations were to be provided for Zulu unwilling to serve the restored king. This new arrangement proved as futile as had Wolseley's. Usibepu, having created a formidable force of well-armed and trained warriors, and being left in independence on the borders of Cetywayo's territory, viewed with displeasure the re-installation of his former king, and Cetywayo was desirous of humbling his relative. A collision very soon took place. Usibepu's force was victorious, and on the 22nd of July 1884, led by a troop of mounted whites, he made a sudden descent upon Cetywayo's kraal at Ulundi, which he destroyed, massacring such of the inmates of both sexes as could not save themselves by flight. The king escaped, though wounded, into the Reserve; there he died in February 1884.

Cetywayo left a son, Dinizulu, who sought the assistance of some of the Transvaal Boers against Usibepu, whom he defeated and drove into the Reserve. These Boers, led by Lukas Meyer (1848-1900), claimed as a stipulated reward for their services the annexation of the Zulu country. On the 21st of May the Boer adventurers had proclaimed Dinizulu king of Zululand; in August following they founded the "New Republic," carved out of Zululand, and sought its recognition by the British government. The Usutu party now repented of their bad bargain, for by the end of 1885 they found the Boers claiming some three-fourths of their country. The British government intervened, took formal possession of St Lucia Bay (to which Germany as well as the Transvaal advanced claims), caused the Boers to reduce their demands, and within boundaries agreed to recognize the New Republic—whose territory was in 1888 incorporated in the Transvaal and has since 1903 formed the Vryheid division of Natal.

Seeing that peace could be maintained between the Zulu chiefs only by the direct exercise of authority, the British government annexed Zululand (minus the New Republic) in 1887, and placed it under a commissioner responsible to the governor of Natal. In the following year Dinizulu, who continued his feud with Usibepu, rebelled against the British. After a sharp campaign (June to August 1888), the Usutu losing 300 killed in one encounter. Dinizulu fled into the Transvaal. He surrendered himself to the British in November; in April 1889 he and two of his uncles (under whose influence he chiefly acted) were found guilty of high treason and were exiled to St Helena.

Under the wise administration of Sir Melmoth Osborn, the commissioner, whose headquarters were at Eshowe, and the district magistrates, the Zulu became reconciled to British rule, especially as European settlers were excluded from the greater part of the country. Large numbers of natives sought employment in Natal and at the Rand gold mines, and Zululand enjoyed a period of prosperity hitherto unknown. Order was maintained by a mounted native police force.

At the end of 1888 and at the beginning of 1889 some small tracts of territory lying between Zululand and Tongaland, under the rule of petty semi-independent chiefs, were added to Zululand; and in 1895 the territories of the chiefs Zamba (Sambana) and Umtegza, 685 sq. m. in extent, lying between the Portuguese territories, Swaziland, Zululand and Tongaland, were also added. In the same year a British protectorate was declared over Tongaland. The coast-line was thus secured for Great Britain up to the boundary of the Portuguese territory at

1 For his action on this occasion Colonel (afterwards General Sir) Redvers Buller, who was Wood's principal assistant, received the V.C. Piet Uys was among the slain.

2 Dunn was a son of one of the early settlers in Natal and had largely identified himself with the Zulu. In 1856 he commanded Umbaluzi against Cetywayo, but was high in that monarch's favour at the time of his coronation in 1873. When Frere's ultimatum was delivered to Cetywayo, Dunn, with 2,000 followers, crossed the Tugela into Natal (10th of January 1879). In 1888 he fought against Dinizulu.

8 Both these chiefs were members of the royal family.
Delagoa Bay. At that time the Transvaal government—which had been the first to reap the benefit of Great Britain’s defeat of the Zulu by acquiring the ‘New Republic’—was endeavoring to obtain the territories of Zamba and Umtogia, hoping also to secure a route through Tongaland to Kosi Bay. President Kruger protested in vain against this annexation, Great Britain being determined to prevent another Power establishing itself on the south-east African seaboard.

In 1893 Sir M. Osborn was succeeded as resident commissioner by Sir Marshal Clarke, who gained the confidence and good will of the Zulu. At the close of 1897 Zululand, in which Tongaland had been incorporated, was handed over to the imperial government to Natal, and Sir (then M.) C. J. R. Saunders was appointed civil commissioner. Lord Ludlow was appointed military commander. They returned to Natal in 1897. Zululand was under the command of Sir Dingane, as the Zulu leader in charge of the border districts. On the 28th of October, 1897, he received a vote of thanks from the legislature of Natal. In February, 1898, he was made a “government induna.” Officially one of several chiefs subject to the control of the resident magistrate, he was, in fact, regarded by most of the Zulu as the head of their nation. His influence appeared to be in the main exercised on the side of order. During the war of 1899-1902 there was some fighting between the Zulu and the Boers, provoked by the Boers entering Zulu territory. A Zulu kraal having been raided, the Zulu retaliated and, surrounding a small Boer commando, succeeded in killing every member of it. In September, 1901, the British promised to return the land to Bechuana.

Natal by way of Zululand, but the stubborn defence made by the small posts at Itala and Prospect Hill, both within the Zulu border, caused him to give up the project. Throughout the war the Zulu showed marked partiality for the British side.

At the close of the war the Natal government decided to allow white settlers in certain districts of Zululand, and a Lands Delimitation Commission was appointed. The commission, however, reported (1905) that four-fifths of Zululand was unfit for European habitation, and the remaining fifth already densely populated. The commission urged that the tribal system should be maintained. Meantime the coal mines near St. Lucia Bay were opened up and connected with Durban by railway. At this time rumours were current of disaffection among the Zulu, but this was regarded as the effervescence natural after the war. In 1905 a poll tax of £1 on all adult males was imposed by the Natal legislature; this tax was the ostensible cause of a revolt in 1906 among the natives of Natal, who were largely of Zulu origin. Bambaota, the leader of the revolt, fled to Zululand. He took refuge in the dense bush in the Ngweza goldfields, where Cetewayo’s grave became the rallying-point of the rebels, who in April were joined by an aged chief named Sigananda and his tribe. After an arduous campaign, the Natal force (about 5000 strong) being commanded by Col. Sir Duncan McKenzie, the rebellion was crushed by July 1906, without the aid of imperial troops. Bambaota was killed in battle (June 10th); his head was cut off for purposes of identification, but afterwards buried with the body. Sigananda surrendered. In all some 3300 Zulus were killed and about 5000 taken prisoners, the majority of the prisoners being released under a promise to become members of the British Army. Zululand was subsequently made a native reserve, and the Zulus were not deprived of their land. He was sentenced to four years’ imprisonment and deprived of his position as a government induna. Other Zulu chiefs were convicted of various offences and sentenced to imprisonment. The history of Dingane was written by W. P. Schreiner, ex-premier of Cape Colony, while Miss H. E. Colenso (a daughter of Bishop Colenso) constituted herself his champion in the press of Natal and Great Britain. On the day that the Union of South Africa was established (31st of May 1910), the Botha ministry released Dinizulu from prison. He was subsequently settled on a farm in the Transvaal and given a pension of £50 a year.

ZULUMACÁRREGUI

ZULUMACÁRREGUI, THOMAS (1788-1835), Spanish Carlist general, was born at Ormaiztegui in Navarre on the 29th of August 1788. His father was a lawyer who possessed some property, and the son was articled to a solicitor. When the French invasion took place in 1808 he enlisted at Saragossa. He served in the first siege, at the battle of Tudela, and during the second siege until he was taken prisoner in a sortie. He succeeded in escaping in and reaching his family in Navarre. For a short time he served with Gaspar de Jauregui, known as “The Shepherd” (“El Pastor”), one of the minor guerrilla leaders. But Zulumacáregui, who was noted for his grave and silent disposition and his strong reverence for principles, disliked the atmosphere of the guerrillas, and when regular forces were organized in the north he entered the 1st battalion of Guipuzcoa as an officer. During the remainder of the war he served in the regular army. In 1812 he was sent with despatches to the Regency at Cadiz, and received his commission as captain. In that rank he was present at the battle of San Marciá (31st of August 1813). After the restoration of Ferdinand VII. he continued in the army, and is said to have made a careful study of the theory of war.

Zulumacáregui had no sympathy with the liberal principles which were spreading in Spain, and became noted as what was called “a man of strong theories,” who had no regard for headquarters; and was still a captain when the revolution of 1820 broke out. His brother officers, whose leanings were liberal, denounced him to the revolutionary government, and asked that he might be removed. The recommendation was not acted on, but Zulumacáregui knew of it, and laid up the

1 Lient.-Col. Sir Marshal James Clarke, R.A. (1841-1909) was A.D.C. to Sir Theophilus Shepstone when the Transvaal was annexed in 1877. He served in the Boer war of 1880-81; was resident commissioner of Bechuana land from 1883, and later leaving Zululand became resident commissioner in the southern Zululand (1889). He was made a K.C.M.G. in 1886.
offence in his mind. Finding that he was suspected (probably with truth) of an intention to bring the soldiers over to the royalist side, he escaped to France. In 1825 he returned as an officer in one of the royalist regiments which were organized on French soil by the consent of the government. He was now known as a thoroughly trustworthy servant of the despotic royalty, but he was too proud to be a courtier. For some years he was employed in bringing regiments which the government distrusted to order. He became lieutenant-colonel in 1825 and colonel in 1829. In 1832 he was named military governor of Ferrol. Before Ferdinand VII. died in 1833, Zumalacáregui was marked out as a natural supporter of the absolutist party which favoured the king's brother, Don Carlos. The proclamation of the king's daughter Isabella as heiress was almost the occasion of an armed conflict between him and the naval authorities at Ferrol, who were partisans of the constitutional cause. He was put on half pay by the new authorities and ordered to live under police observation at Pamplona. When the Carlist rising began on the death of Ferdinand he is said to have held back because he knew that the first leaders would be politicians and talkers. He did not take the field till the Carlist cause appeared to be at a very low ebb, and until he had received a commission from Don Carlos as commander-in-chief in Navarre. The whole force under his orders when he escaped from Pamplona on the night of the 20th of October, 1833, and had been organized the next day in the Val de Araquil, was a few hundred ill-armed and dispirited guerrilleros. In a few months Zumalacáregui had organized the Carlist forces into a regular army. The difficulty he found in obtaining supplies was very great, for the coast towns—and notably Bilbao—were constitutional in politics. It was mainly by captures from the government troops that he equipped his forces. He gradually obtained full possession of Navarre and the Basque provinces, outside of the fortresses, which he had not the means to besiege. Whether as an officer of small means and of small rank, or as a private soldier in the mountains, he proved unconquerable. By July 1834 he had made it safe for Don Carlos to join his headquarters. The pretender was, however, a narrow-minded, bigoted man, who regarded Zumalacáregui with suspicion, and was afraid of his immense personal influence with the soldiers. Zumalacáregui had therefore to drag behind him the whole weight of the distrust and intrigues of the court. Yet by the beginning of June 1835 he had made the Carlist cause triumphant to the north of the Ebro, and had formed an army of more than 30,000 men, of much better quality than the constitutional forces. If Zumalacáregui's general had died on the 24th of June 1835—not without suspicion of poison—Zumalacáregui was a fine type of the old royalist and religious principles of his people. The ferocity with which he conducted the war was forced on him by the government generals, who refused quarter.

An engaging account of Zumalacáregui will be found in *The Most Striking Events of a Twelvemonth Campaign with Zumalacáregui in Navarre and the Basque Provinces*, by C. F. Henningsen (London, 1836). A pamphlet called *Vida politica y militar de Don Tomas Zumalacáregui*, which gives the facts of his life with fair accuracy, is still very popular in Spain.

ZUMPT, the name of two German classical scholars. Karl Gottlob Zumpt (1792-1894), who was educated at Heidelberg and Berlin, was from 1812 to 1827 a schoolmaster in Berlin, and in 1827 became professor of Latin literature at the university. His chief work was his *Lateinische Grammatik* (1818), which stood as a standard work until superseded by Madvig's in 1844. He edited Quintilian's *Institutio oratoria* (1831), Cicero's *Verine* and *De officiis* (1837), and Curtius. Otherwise he devoted himself mainly to Roman history, publishing *Annales veterum regnumor of popularum* (3rd ed. 1869), a work in chronology down to A.D. 476, and other antiquarian studies. His nephew, August Wilhelm Zumpt (1815-1877), studied in Berlin, and in 1851 became professor in the Friedrich Wilhelm Gymnasium. He is known chiefly in connexion with Latin epigraphy, his papers on which (collected in *Commentationes epigraphicae*, 2 vols., 1850-54) brought him into conflict with Mommsen in connexion with the preparation of the *Corpus inscriptionum Latinarum*, a scheme for which, drawn up by Mommsen, was approved in 1847. His works include *Monumentum Anysorum* (1841), *De grammatica* (1840), *Studia Romana* (1859); *Das Kriminalrecht der römischen Republik* (1865-69); *Der Kriminalprozess der römischen Republik* (1871); editions of Namatianus (1840), Cicero's *Pro Munera* (1859) and *De lege agraria* (1861). Thine incorporated materials left by him in the 7th and 8th vols. of his *Römische Geschichte* (1840).

ZUNZ, LEOPOLD (1794-1880), Jewish scholar, was born at Detmold in 1794, and died in Berlin in 1886. He was the founder of what has been termed the "science of Judaism," the critical investigation of Jewish literature, hymnology and ritual. Early in the 19th century he was associated with Gans Moser and Heine in an association which the last named called "Young Palestine." The ideals of this *Verein* were not destined to bear religious fruit, but the "science of Judaism" survived. Zunz took no large share in Jewish reform, but never lost faith in the regenerating power of "science" as applied to the traditions and literary legacies of the ages. He had thoughts of becoming a preacher, but found the career uncongenial. He influenced Judaism from the study rather than from the pulpit. In 1832 appeared what E. H. Hirsch rightly regards as the most important of Zunz's works, *Nachahmung der Antike* (1835). This was Zunz's *Gottesdienstliche Vorträge der Jüden*, i.e. a history of the Sermon. It lays down principles for the investigation of the Rabbinic exegesis (Midrash, q.v.) and of the prayer-book of the synagogue. This book raised Zunz to the supreme position among Jewish scholars. In 1840 he was appointed director of a Lehrerseminar, a post which relieved him from pecuniary troubles. In 1845 appeared his *Zur Geschichte und Literatur*, in which he threw light on the literary and social history of the Jews. Zunz was always interested in politics, and in 1848 addressed many public meetings. In 1850 he became director of the Teachers' Seminary, and in 1856 was awarded a pension. He had visited the British Museum in 1846, and this confirmed him in his plan for his third book, *Synagogale Poesie des Mittelellers* (1855). It was from this book that George Eliot translated the following opening of a chapter of *Daniel Deronda*:

"If there are ranks in suffering, Israel takes precedence of all the nations" . . . &c. After its publication Zunz again visited England, and in 1859 issued his *Ritas*. In this he gives a masterly survey of synagogaal rites. His last great book was his *Literaturgeschichte der synagogalen Poesie* (1865). A supplement appeared in 1869. Besides these works, Zunz published a new translation of the Bible, and wrote many essays which were afterwards collected as *Gesammelte Schriften*. Throughout his early and married life he was the champion of Jewish rights, and he did not withdraw from public affairs until 1874, the year of the death of his wife Adelheil Beerman, whom he had married in 1822.

ZURBARAN, FRANCISCO (1598-1664), Spanish painter, was born at Fuente de Cantos in Estremadura on the 7th of November 1598. His father was Luis Zurbaran, a country labourer, his mother Isabel Marquet. In childhood he set about imitating objects with charcoal; and his father sent him, still young, to the school of Juan de Roelas in Seville. Francisco soon became the best pupil in the studio of Roelas, surpassing the master himself; and before leaving him had achieved a
solid reputation, full though Seville then was of able painters. He may have had here the opportunity of copying some of the paintings of Michelangelo da Caravaggio; at any rate he gained the name of "the Spanish Caravaggio," owing to the forcible realistic style in which he excelled. He constantly painted direct from nature, following but occasionally improving in his model; and he made great use of the lay-figure in the study of draperies, in which he was peculiarly proficient. He had a special gift for white draperies; and, as a consequence, Car- thusian houses are abundant in his paintings. To these rigid methods Zurbaran is said to have adhered throughout his life, which was prosperous, wholly confined to Spain, and varied by few incidents beyond those of his daily labour. His subjects were mostly of a severe and ascetic kind—religious vigils, the flesh chastened into submission to the spirit—the compositions seldom throned, and often reduced to a single figure. The style is more reserved and chastened than Caravaggio's, the tone of colour often bluish to excess. Exceptional effects are attained by the precise finish of foregrounds, largely massed out in light and shade. Zurbaran married in Seville Leonor de Jalal (by whom he had several children), and was appointed painter to Philip IV.; and there is a story that on one occasion the sovereign laid his hand on the artist's shoulder, saying, "Painter to the king, king of painters." It was only late in life that Zurbaran made a prolonged stay in Madrid, Seville being the chief scene of his operations. He died, probably in 1661, in Madrid.

In 1657 he painted the great altarpiece of St. Thomas Aquinas, now in the Seville museum; it was executed for the church of the college of that saint there. This is Zurbaran's largest composition, containing figures of Christ and the Madonna, various saints, Charles V. with knights, and Archbishop Deza (founder of the college) with monks and servants, all the principal personages being beyond the size of life. It had been preceded by the numerous pictures of the screen of St Peter Nolasco in the cathedral. In the church of Guadalupe he painted various large pictures, eight of which relate the history of the church, and six of St Paul, Seville, a famous figure of the Crucified Saviour, in grisaille, presenting an illusive effect of marble. In 1663 he finished the paintings of the high altar of the Carthusians in Jerez. In the palace of Buenaventura, Madrid, are four large canvases representing the Labours of Hercules, an unusual instance of non-Christian subjects from the hand of Zurbaran. A fine specimen is in the National Gallery, London, a whole-length, life-sized figure of a kneeling Franciscan holding a skull. It seems probable that another picture in the same gallery, the "Dead Roland," which used to be ascribed to Velasquez, is really by Zurbaran. His principal school is known as that of Seville, and in that of Caravaggio's, were Bermabe de Ayala and the brothers Polanco.

W. M. R.)

ZURICH (Fr. Zurich; Ital. Zurigo), the capital of the Swiss canton of the same name. It is the most populous, the most important, and on the whole the finest town in Switzerland, and till 1845 was practically the capital of the Swiss Confederation. It is built on both banks of the Limmat (higher up called "Sihl") and on islands in the river; the island in the middle is made up by the Federal and Municipal administrations. The Sihl, that joins it just below the town. That portion of the town which lies on the right bank of the Limmat is called the "Grosse Stadt" and that on the left bank the "Kleine Stadt." Till 1803 the central portion of the town on either bank of the Limmat formed the "city" and ruled the outlying communes or townships that had sprung up around it. But at that time the eleven outer districts (including Auseersihl, the workmen's quarter on the left bank of the Sihl) or suburbs were incorporated with the town, which is now divided into a town proper and 19 districts (each containing from 2,105 to 2,596 inhabitants), and an executive of 6 members, both chosen direct by a popular vote. Much land has been rescued from the lake, and is the site of fine quays, stately public buildings, and splendid private villas. The older quarters are still crowded. But the newer quarters stretch up the slope of the Zürichberg (above the right bank of the Limmat) while the fine Bahnhofstrasse (extending from the railway station to the lake) has the best shops and is in the neighbourhood of the more important public buildings.

Zürich has always been wealthy and prosperous. It has increased enormously, as is shown by the following figures. Its population in 1900 (including the eleven suburbs above named) was 150,703, while (without these) in 1888 it was 91,129; in 1880, 78,345; in 1870, 68,675; in 1860, 44,078; and in 1850 only 33,483. Of the people in 1900, 41,921 were Swiss (including 38,138 citizens and 3,783 foreigners), 7,933 were Romans (including 7,685 citizens and 248 foreigners), 4,206 were Protestants, and 1,565 were Catholics. In 1900 the greater part of the people lived in houses (including those above 20 ft. high). In 1888 and 1900 (315,555 in 1880) were not Swiss citizens, Germans numbering 41,245, Austrians 4210, Russians 683, French 682, British subjects 137; and citizens of the United States 232. In
ZÜRICH

19th century, there were in the town 140,803 German-speaking persons, 5100 Italian-speaking, 2586 French-speaking, and 415 Romansch-speaking. In 1888 the corresponding figures were 90,500, 1135, 1320 and 490 respectively. In 1888 the town numbered 102,704 Protestants, 43,655 "Catholics" (Roman or "Old") and 2712 Jews. In 1888 the religious figures were 79,970, 20,571 and 1231 respectively, with the additional fact of manufacture of jewelry and for gold and silver. The international character of the town has thus become much more marked. It is partly due to the immigration of many foreign workmen, and partly to the arrival of Russian and Polish exiles. Both have added to the cosmopolitan element to the town, in which the Socialist party is strong, and is increasing in power and influence, even in matters concerned with civic government.

Of the old buildings the finest and most important is the Gross Münster (or Propstei), on the right bank of the Limmat. This was originally the church of the king's tenants, and in one of the chapels the bodies of Felix, Regula and Exuperantius, the patrons saints of the city, were buried, the town treasury being formerly kept above this chapel. The present building was erected at two periods (c. 1050-1550 and c. 1250-1300), the high altar having been consecrated in 1278. The towers were raised above the roof at the end of the 15th century and took their present form in 1770. The chapter consisted of twenty-four secular canons; it was reorganized at the Reformation (1526), and suppressed in 1832. On the site of the canons' houses stands a girls' school (opened 1853), but the fine Romanesque cloisters (12th and 13th centuries) still remain. There is a curious figure of Charlemagne in a niche on one of the towers; to him is attributed the founding or reform of the chapter. On the left bank of the Limmat stands the other great church of Zürich, the Gross Münster (or Minster), previously known by Louis the German. The high altar was consecrated in 1170; but the greater part of the buildings are of the 13th and 14th centuries. It was in this church that the relics of the three patron saints of the town were preserved till the Reformation, and it was here that the burgomaster Waldmann was buried in 1489. There were only twelve nuns of noble family, comparatively free from the severer monastic vows; the convent was suppressed in 1534. Of the other old churches may be mentioned St Peter's, the oldest parish church, though the present buildings date in part from the 13th century only (mainly 14th century), and formerly the meeting-place of the citizens; the Dominican church (13th century), in the choir of which the cantonal library of 80,000 volumes has been stored since 1873; the church of the Austin friars (14th century), now used by the Old Catholics, and the Wasserkirche. The last-named church is on the site of a pagan holy place, where the patron saints of the city were martyred; since 1631 it has housed the Town Library, the largest in Switzerland, which contains 170,000 printed volumes and 4500 MSS. (among these being letters of Zwingli, Bullinger and Lady Jane Grey), as well as a splendid collection of objects from the lake dwellings of Switzerland. The building itself was erected from 1479 to 1484, and near it is a statue of Zwingli, erected in 1885. The existing town-hall dates from 1608, while the gild houses were mostly rebuilt in the 18th century. One of the most magnificent of the newer buildings is the Swiss National Museum, behind the railway station. This museum, which was opened in 1898, contains a wonderful collection of Swiss antiquities (especially medieval) and art treasures of all kinds, some of which are placed in rooms of the actual date, removed from various ancient buildings. There are some fine fountains (the oldest dating back to 1568). There are several good bridges, Roman traces being seen in the case of the Niederbrücke (now called the Rathausbrücke). The mound of the Lindenhof was formerly crowned by the king's house, which disappeared in the 13th century, and the hillock was planted with limes as early as 1422.

The town is noted for its numerous clubs and societies, and is the intellectual capital of German-speaking Switzerland. Cotton-spinning and the manufacture of machinery are two leading industries, but by far the most important is the silk-weaving industry. This flourished in Zürich in the 12th and 13th centuries, but disappeared about 1520; it was revived by the Protestant exiles (such as the Muralti and Orelli families) from Locarno (1555) and by the Huguenot refugees from France (1682 and 1685). The value of the silk annually exported (mainly to France, the United States and England) is estimated at over three millions sterling.

Zürich is the banking centre of Switzerland, and the centre of the excellent primary and secondary schools, there are the Cantonal School, including a gymnasium and a technical side (opened 1842), and a high school for girls (opened 1875). The Cantonal University and the Federal Polytechnic School are housed in the same building, but have no other connexion. The university was opened in 1833, on no doubt as a successor to the ancient chapter school at the Gross Münster, said to date back to Charlemagne's time—hence its name the Carolinum—reorganized at the Reformation, and suppressed in 1832. The Polytechnic School, opened in 1855, includes seven main sections (industrial chemistry, industrial mechanics, engineering, mining of scientific and mathematical practical, forestry and agriculture, and the military sciences), besides a general philosophical and political science department. The Polytechnic School has good collections of botanical specimens and of rare animals. Near it is the university garden (opened 1842), with greenhouses and arboretum, and a 26,640 ft. coast. There are also in Zürich many institutions for special branches of education—e.g. veterinary surgery, music, industrial art, silk-weaving, &c.

The earliest inhabitants of the future site of Zürich were the lausitzli or lusi, the Celtic Helvetians. A settlement in the Lindenhof when they were succeeded by the Romans, who established a custom station here for goods going to and coming from Italy; during their rule Christianity was introduced early in the 3rd century by Felix and Regula, with whom Exuperantius was afterwards associated. The district was later occupied by the Alamanni, who were conquered by the Franks.

The name Zürich is possibly derived from the Celtic ēur (water). It is first mentioned in 807 under the form Turicus, turned in 853 as Turicium. The true Latinized form is Turicum. It is said to have been founded as a military camp by Glaranus and held its ground from 1521 to 1478. It is not till the 9th century that we find the beginnings of the Teutonic town of Zurich, which arose from the union of four elements: (1) the royal house and castle on the Lindenhof, with the king's tenants around, (2) the Gross Münster, (3) the Frau Münster, (4) the community of "free men" (of Alamannian origin) on the Zürichberg. Similarly we can distinguish four stages in the constitutional development of the town: (1) the gradual replacing (c. 1250) of the power of the abbess by that (real, though not nominal) of the patricians, (2) the admittance of burghers and patricians into the government of the town, (3) the granting of equal political rights (1831) to the country districts, hitherto ruled as subject lands by the burgheis, and (iv) the reception as burgheis of the numerous immigrants who had settled in the town (town schools opened in 1860, full incorporation in 1893). The Frankish kings had special rights over their tenants, were the protectors of the two churches, and had jurisdiction over the free community. In 870 the sovereign placed his powers over all four in the hands of a single official (the Reichsvogtei), and the towns of Lenzburg, Lenzlingen, Lenzburg, and the four settlements in the 15th century as a safeguard against Saracen marauders and feudal barons. The "Reichsvogtei" passed to the counts of Lenzburg (1003-1173), and then to the dukes of Zähringen (extinct 1218). Meanwhile the abbess of the Benedictine Frau Münster had been acquiring extensive rights and privileges over all the inhabitants, though she never obtained the criminal jurisdiction. The town flourished greatly in the 12th and 13th centuries, the silk trade being introduced from Italy. In 1218 the "Reichsvogtei" passed back into the hands of the king, whom appointed one of the burgheis as his deputy, the town as becoming a free imperial city under the nominal rule of a distant sovereign. The abbess in 1254 became a princess of the empire, but power rapidly passed from her to the council which she had originally named to look after police, &c., but which came to be elected by the burgheis, though the abbess was still "the lady of Zürich." This council (all powerful since 1304) was made up of the representatives of certain knightly and rich mercantile families (the "patricians"), who excluded the craftsmen from all share in the government, though it was to these last that the town was largely indebted for its rising wealth and importance.

In October 1291 the town made an alliance with Uri and
Schwyz, and in 1392 failed in a desperate attempt to seize the Habsburg town of Winterthur. After that Zürich began to display strong Austrian leanings, which characterize much of its later history. In 1351 the men of Zürich fought against the Swiss Confederates at Morgarten. The year 1356 marks the admission of the craftsman to a share in the town government, which was brought about by Rudolf Brun, a patrician. Under the new constitution (the main features of which lasted till 1798) the Little Council was made up of the burgomaster and thirteen members from the Constable (which included the old patricians and the wealthiest burghers) and the thirteen masters of the craft guilds, each of the twenty-six holding office for six months. The Great Council of 200 (really 212) members consisted of the Little Council, plus 78 representatives each of the Constable and of the guilds, besides 3 members named by the burgomaster. The office of burgomaster was created and given to Brun for life. Out of this change arose a quarrel with one of the branches of the Habsburg family, in consequence of which Brun was induced to throw in the lot of Zürich with the Swiss Confederation (1st May 1356). The double position of Zürich as a free imperial city and a canton of the Swiss Confederation was soon found to be embarrassing to both parties (see Switzerland). In 1373 and again in 1393 the powers of the Constable were limited and the majority in the executive secured to the craftsmen, who could then aspire to the burgomastership. Meanwhile the town had been extending its rule far beyond its walls—a process which began in the 14th, and attained its height in the 15th century (1362-1467). This thirst for territorial aggrandizement brought about the first civil war in the Confederation (the "Old Zürich War" 1356-60), in which, at the sight of St. Jacob on the Sihl (1449), under the walls of Zürich, the men of Zürich were completely beaten and their burgomaster Süssi slain. The purchase of the town of Winterthur from the Habsburgs (1467) marks the culmination of the territorial power of the city. It was to the men of Zürich and their leader Hans Waldmann that the victory of Morat (1476) was due in the Burgundian war; and Zürich took a leading part in the Italian campaign of 1512-15, the burgomaster Schmid naming the new duke of Milan (1512). No doubt her trade connexions with Italy led her to pursue a southern policy, traces of which are seen as early as 1331 in an attack on the Val Leventina and in 1478, when Zürich men were in the van at the fight of Giornico, won by a handful of Confederates over 12,000 Milanese troops.

In 1400 the town obtained from the Emperor Wenceslaus the Reichsvogtei, which carried with it complete immunity from the empire and the right of criminal jurisdiction. As early as 1393 the chief power had practically fallen into the hands of the Great Council, and in 1408 this change was formally recognized. This transfer of all power to the guilds had been one of the aims of the burgomaster Hans Waldmann (1483-86), who wished to make Zürich a great commercial centre. He also introduced many financial and moral reforms, and subordinated the interests of the country districts to those of the town. He practically ruled the Confederation, and under him Zürich became the real capital of the League. But such great changes excited opposition, and he was overthrown and executed. His main ideas were embodied, however, in the constitution of 1408, by which the patricians became the first of the guilds, and which remained in force till 1798; some special rights were also given to the subjects in country districts. It was the prominent part taken by Zürich in adopting and propagating (against the strenuous opposition of the Constable) the principles of the Reforma- tion (the Frau Münster being suppressed in 1524) which finally secured for it the lead in the Confederation (see Switzerland and Zwinglei).

The environs of Zürich are famous in military history on account of the two battles of 1799. In the first battle (4th June) the French under Masséna, on the defensive, were attacked by the Austrians under the Archduke Charles, Masséna retiring behind the Linmat before the engagement had reached a decisive stage. The second and far more important battle took place on the 25th and 26th of September. Masséna, having forced the passage of the Limmat, attacked and totally defeated the Russians and their Austrian allies under Korsakov's command. (See French Revolutionary Wars.)

In the 17th and 18th centuries a distinct tendency becomes observable in the town government to limit power to the actual holders. Thus the country districts were consulted for the last time in 1626 and 1640; and a similar breach of the charters of 1459 and 1531 (by which the consent of the cantons was required for the conclusion of important alliances, war and peace, and might be asked for as to other matters) occasioned disturbances in 1777. The council of 200 came to be largely chosen by a small committee of the members of the guilds actually sitting in the council—by the constitution of 1713 it consisted of 30 members of the Little Council (named for a fixed term by the Great Council), 18 members named by the Constable, and 144 selected by the 12 guilds, these 162 (forming the majority) being co-opted for life by those members of the two councils who belonged to the guild to which the deceased member himself had belonged. In the contemporary literature the term guild was made to stand for means of heavy duties the flourishing rival silk trade in Winterthur. It was reckoned that about 1650 the number of privileged burghers was 9000, while their rule extended over 170,000 persons. The first symptoms of active discontent appeared later among the dwellers by the lake, who founded in 1794 a club at Stäfa and claimed the restoration of the liberties of 1489 and 1531, a movement which was put down by force of arms in 1795. The old system of government perished in Zürich, as elsewhere in Switzerland, in February 1798, and under the Helvetic constitution the country districts obtained political liberty. The cantonal constitution was rather complicated, and under it the patrician party obtained a small working majority. That constitution was meant to favour the town as against the country districts. But under the cantonal constitution of 1814 matters were worse still, for the town (18,000 inhab.) had 130 representatives in the Great Council, while the country districts (200,000 inhab.) had only 82. A great meeting at Uster on the 22nd of November 1830 demanded that two-thirds of the members of the Great Council should be chosen by the country districts; and in 1831 a new constitution was drawn up on these lines, the town getting 71 representatives as against 141 allotted to the country districts, though it was not till 1837-38 that the town finally lost the last relics of the privileges which it had so long enjoyed as compared with the country districts. From 1803 to 1814 Zürich was one of the six "directory cantons," its chief magistrate becoming for a year the chief magistrate of the Confederation, while in 1813 it was one of the three cantons, the government of which acted for two years as the Federal government when the diet was not sitting. In 1833 Zürich tried hard to secure a revision of the Federal constitution and a strong central government. The town was the Federal capital for 1830-40, and consequently the victory of the Conservative party there in 1839 (due to indignation at the nomination by the Radical government to a theological chair in the university of D. F. Strauss, the author of the famous Life of Jesus) caused a great stir throughout Switzerland. But when in 1845 the Radicals gained power at Zürich, which was again the Federal capital for 1845-46, that town took the lead in opposing the Sonderbund cantons. It of course voted in favour of the Federal constitutions of 1848 and of 1874, while the cantonal constitution of 1860 was remarkably advanced for the time. The enormous immigration from the country districts into the town from the "thirties onwards created an industrial class which, though "settled" in the town, did not possess the privileges of burghership, and consequently had no share in the municipal government. First of all in 1860 the town schools, hitherto open to "settlers" only on paying high fees, were made accessible to all, next in 1875 ten years' residence _habitato_ conferred the right of burghership, while in 1863 the eleven outlying districts (largely peopled by working folk) were incorporated with the
ZÜRICH, LAKE OF—ZWEIBRÜCKEN

ZURICH, LAKE OF—A Swiss lake, extending S.E. of the town of Zürich. It is formed by the river Linth, which, rising in the glaciers of the Tödi range in Glarus, was diverted by the Escher canal (completed in 1811) into the Walensee, whence, by means of the Linth canal (completed in 1816), its waters are carried to the east end of the lake of Zürich. This river issues from the lake at its north-west end, passing through the town of Zürich, but is then called the Limmat. No streams of importance flow into the lake. Its area is about 34 sq. m., its extreme length 25 m., its greatest breadth 23 m., and its greatest depth 60 ft., while its surface is 1342 ft. above sea-level. It is included, or the greater portion, in the Canton of Zürich, but at its east end 53 sq. m. towards the southern shore are in that of Schwyz, and 4 sq. m. towards the northern shore in that of St. Gall. The great dam of masonry, carrying the railway line and carriage road from Rapperswil to Pfäffikon, which cuts off the extreme eastern part of the lake from the rest, is passed only by small boats; steamers (of which the first was placed on the line in 1889) go no farther up the dam, as the eastern portion of the lake is shallow and choked by weeds. West of this dam is the small island of Ufenau, where in 1523 Ulrich von Hutten took refuge and died. Both shores are well cultivated and fertile. There are many villas, particularly near Zürich, and elsewhere numerous factories in the various flourishing villages. Zürich, at the north end of the lake, is the principal place on it. On the west shore (which gradually becomes the south shore) are Thalwil, Horgen, Wädenswil, Rüti, Pfäffikon, and Lachen. On the opposite shore are Metten (near which the first lake dwellings were discovered in 1833-54), Stäfa, and the quaint town of Rapperswil, the castle of which shelters a Polish museum, where is the heart of Kosciusko and Schimmel. This is close to the east end of the lake, and a little beyond is the more important town of Uznach.

ZURITA Y CASTRO, JERÓNIMO (1512-1580), Spanish historian, was born at Saragossa, and studied at Alcalá de Henares under the celebrated Hellenist, Hernán Nuñez. Through the influence of his father, Miguel de Zurita, physician to Charles V., he entered the public service as magistrature at Barbastro, and in 1537 was appointed assistant-secretary of the Inquisition. In 1548 Zurita was nominated official chronicler of the kingdom of Aragon, and in 1566 Philip II. attached him as secretary to the council of the Inquisition, delegating to him the conduct of all matters sufficiently important to require the king's signature. Zurita resigned these posts on the 21st of January 1571, obtained a sinecure at Saragossa, and dedicated himself wholly to the composition of his Anales de la corona de Aragón, the first part of which had appeared in 1562; he lived to see the last volume printed at Saragossa on the 22nd of April 1580, and died on the 3rd of November following. Zurita's style is somewhat crabbed and dry, but his authority is unquestionable; he displayed a new conception of an historian's duties, and, not content with the ample materials stored in the archives of Aragon, continued his researches in the libraries of Rome, Naples and Sicily; he founded the school of historical scholarship in Spain.

ZUTPHEN, or ZUTTEN, a town in the province of Gelderland, Holland, on the right bank of the Yssel at the influx of the Berkel, and a junction station 18 m. by rail N.N.E. of Arnhem. Pop. 15,900. It is a picturesque old town with several brick houses of the 16th and 17th centuries. The most important building is the Grote Kerk, of St. Walpurgis, which dates from the 12th century and contains monuments of the former counts of Zutphen, a 13th-century candelabrum, an elaborate copper font (1527), and a fine modern monument to the van Heeckeren family. The chapter-house contains a pre-Reformation library which includes some valuable MSS. and incunabula. There are some remains of the old town walls. The place has an active trade, especially in grain and in the timber floated down from the Black Forest by the Rhine and the Yssel; the industries include tanning, weaving, and oil and paper manufactures. Not far from Zutphen on the west at Munnikhuizen once stood the Carthusian convent founded by Reinald III., duke of Gelderland, in 1342 and dissolved in 1572. About 3 m. to the north of Zutphen is the agricultural colony of Nederlandsch-Mettray, founded by a private benefactor for the education of poor friendless boys in 1851, and since that date largely extended.

In the middle ages Zutphen was the seat of a line of counts, which became extinct in the 12th century. Having been fortified the town stood several sieges, specially during the wars of freedom against the Netherlands; the garrison of the Dutch was under its walls being the one in September 1586 when Sir Philip Sidney was mortally wounded. Taken by the Spaniards in 1587 Zutphen was recovered by Maurice, prince of Orange, in 1591, and except for two short periods, one in 1672 and the other during the French Revolutionary Wars, it has since then remained a part of the United Netherlands. Its fortifications were dismantled in 1874.

ZWEIBRÜCKEN, a town of Germany, in the Palatinate, on the Schwarzbach, and on the railway between Germersheim and Saarbrücken. Pop. (1905) 14,711. The town was the capital of the former duchy of Zweibrücken, and the Alexander-Kirche contains the tombs of the dukes. The ducal castle is now occupied by the chief court of the Palatinate. There is a large and well equipped railway colliery and brewing and the manufacture of machinery, chimy, cigars, malt, boots, furniture and soap are the chief industries.
ZWICKAU—ZWINGLI

ZWICKAU, a town of Germany, in the kingdom of Saxony, situated in a pleasant valley at the foot of the Erzgebirge, on the left bank of the Zwickauer Mulde, 41 m. S. of Leipzig and 20 m. S. of Chemnitz on the main line of railway Dresden-Hof and at the junction of several other lines. Pop. (1854) 6701; (1866) 7505; (1870) 44,498; (1895) 68,502. Among the manufactures of Zwickau, in the fine Gothic church of St. Augustine (1451 and restored 1885-91), there is a spire 285 ft. high and a bell weighing 53 tons, is remarkable. The church contains an altar with wood-carving and eight pictures by Michael Wolgemuth and a remarkable Pietà in carved and painted wood, probably by Veit Stoss. The late Gothic church of St. Catharine (restored 1893-94) has an altarpiece ascribed to Lucas Cranach the Elder, and is memorable for the pastorate (1520-22) of Thomas Münzer. Of the secular buildings the most noteworthy are the town-hall of 1581, with the municipal archives, including documents dating back to the 13th century and an autograph MS. of the works of Hans Sachs, and the late Gothic Gewandhaus (cloth merchants' hall), built 1522-24 and now in part converted into a theatre. The manufactures of Zwickau include spinning and weaving, machinery, motor-cars, chemicals, porcelain, paper, glass, dyestuffs, wire goods, tinware, stockings, and curtains. There are also steam saw-mills, diamond and glass polishing works, iron-foundries, and breweries. Though no longer relatively so important as when it lay on the chief trade route from Saxony to Bohemia and the Danube, Zwickau carries on considerable commerce in grain, wine, and cattle. The manufacture of the industrial prosperity of the town is the adjacent coalfield, which in 1906 employed 13,000 hands, and yields 23 million tons of coal annually. The mines are mentioned as early as 1348; but they have only been actively worked since 1823, during which time the population has increased more than tenfold.

Zwickau is of Slavonic origin, and is mentioned in 1118 as a trading place. The name is fancifully derived from the Latin Cygni, from a tradition that placed a "swan lake" here which had the property of renewing the youth of those who bathed in it. The Slavonic possession of the property was pledged to Henry the Illustrious, margrave of Meissen (d. 1288). The German king Charles VI. conferred it as a fief in 1348 on the margraves of Meissen, and it thus passed to their successors the electors of Saxony. The discovery of silver in the Schneeberg in 1470 brought it much wealth. The Anabaptist movement of 1525 began at Zwickau under the inspiration of the "Zwickau prophets." Robert Schumann (1580-1586), the musical composer, was born here in a house which still stands in the market-place.

See Herzog, Chronik der Kreisstadt Zwickau (2 vols., Zwickau, 1839-45); Geschichte der Zwickauer Steinkohlenhütte (Dresden, 1852); Hänsch, Das Zwickau-Chemnitz-Kohlengebiet (Meissen, 1908).

ZWIEDIECKE VON SÜDENHÖRST. HANS (1845-1906), German historian, was born at Frankfurt-on-the-Main on the 14th of April 1845. He studied at the university of Gratz, where he became a professor in 1885, and died at Gratz on the 22nd of November 1906.

Südenerst's principal writings are Dorferben im 18 Jahrhundert (Vienna, 1885); Hans Ulrich; Partizan (Bielefeld, 1886); Geschicht der Erzherzogthums der Erzherzogtum, 2nd ed. (Stuttgart, 1885-1886); Venedig in der Zeit des Hochkrieges (Stuttgart, 1888-1889); Kämpfe um den 1683, in the series, Deutsche Geschichte der deutschen Geschichte (Stuttgart, 1892-93); and Die Politik der Republik Venedig während des dreißigjährigen Krieges (Stuttgart, 1888-1889; Venedig als Weltmacht und Weltsitz (Bielefeld, 1899 and 1906); Kriegsbilder aus der Zeit der Landeskunst (Stuttgart, 1883); Porträt des Zähringer Ludwigs XVI. (1507-1700) (Stuttgart, 1888); Die Zähringer Johann im Feldzuge von 1809 (Gratz, 1892; and Maria Theresa (Bielefeld, 1900). He edited the Bibliothek der deutschen Geschichte, and Deutsche Geschicht der von der Entdeckung des alten bis zur Gründung des neuen Reiches (Stuttgart, 1897-1905). He completed A. Wolf's Ortsregister unter Maria Theresa, Joseph II. and Leopold II. (Berlin, 1882-1884), and edited the Zeitschrift für allgemeine Geschichte (Stuttgart, 1864-1888).

ZWINGLI, Huldreich (1484-1531), Swiss reformer, was born on the 1st of January 1484, at Wildhaus in the Toggenburg valley, in the canton of St Gall, Switzerland. He came of a free peasant stock, his father being amtmann of the village; his mother, Margarete Meli, was the sister of the abbots of Fischingen in Thurau. His uncle, Bartholomew Zwingli, afterwards dekan or superintendent of Wesen, had been elected parish priest of Wildhaus. As he was keen at his books and fond of music he was destined for the Church, and when eight years old was sent to Zürich, where he spent seven years (1503-10). Two years later he was sent to a school in Basel, where he remained three years, passing thence to the high school at Bern, where his master, Heinrich Wölflin, inspired him with an enthusiasm for the classics. After some two years there the boy took up his abode in the Dominican monastery. But his father had no thoughts of letting him become a monk, and in 1500 he was sent to the university of Vienna, where he remained for another two years and "included in his studies all that philosophy embraces. He then returned to Basel, where he graduated in the university and became a teacher of the classics in the school of St Martin's church.

The circumstances and surroundings of Zwingli's early life were thus dissimilar from those of his contemporaries, Martin Luther. Zwingli, moreover, never knew anything of those spiritual experiences which drove Luther into a cloister and goaded him to a feverish "searching of the Scriptures" in the hope of finding spiritual peace. Zwingli was a humanist, a type abhorred of Luther; and he was far more ready for the polite Erasmian society of Basel than for a monastery. Luther was a monk, while Zwingli heen to the papal cause. He spent his youth in his study and in his lectures at the University of Vienna, and the knowledge he gained there from the works of Thomas Wyttenbach that the time was at hand when scholastic theology must give place to the purer and more rational theology of the early Fathers and to a fearless study of the New Testament. He heard from this same teacher bold criticisms of Romanish teaching concerning the sacraments, monastic vows and papal indulgences, and unconsciously he was thus trained for the great remonstrance of his mature life.

At the age of twenty-two Zwingli was ordained by the bishop of Constance (1506), practiced for five years at Rapaddawil, and said his first mass among his own people at Wildhaus. In the same year he was elected parish priest of Glarus, in spite of the pope's nomination of Heinrich Goldli, an influential pluralist of Zürich, whom Zwingli found it necessary to buy off at an expense of more than a hundred gulden. The Holy See, much dependent at that time on its Swiss mercenaries in the pursuit of its secular ends, expressed no resentment on this occasion. Zwingli indeed seemed still to be devoted to the pope, whom he styled "beatissimus Christi vicarius," and he publicly proclaimed the mercenary aid given by the Swiss to the papal cause to be its rightful support of the Holy See. The Curia, following its accustomed policy, rewarded his zeal with a pension of 50 gulden.

The ten years which Zwingli spent at Glarus laid the foundations of his work as a reformer. He there began the study of
Greek that he might "learn the teaching of Christ from the original sources," and gave some attention to Hebrew. He read also the older Church Fathers and soon won for himself fame as a student, whilst his skill in the classics led his friends to hail him as "the undoubted Cicero of our age." He had an unbounded admiration for Erasmus, with whom he entered into correspondence, and from whom he received a somewhat chilling patronage; whilst the brilliant humanist, Pico della Mirandola (1463-1494), taught him to criticize, in a rationalizing way, the medieval doctrines of Rome. His first publications, which appeared as rhymed allegories, were political rather than religious, being aimed at what he deemed the degrading Swiss practice of removing heretics in their lifetime. Zwingli was on the side of the victors on this matter were so much intensified by his later experiences as army chaplain that in 1531 he prevailed upon the authorities of the canton of Zürich to renounce the practice altogether. Especially did he oppose alliances with France; but the French party in Glarus was strong, and it retaliated so fiercely that in 1516 Zwingli was glad to accept the post of people's priest at Einsiedeln. He always in later days dated his arrival at evangelical truth from the three years (1516-19) which he spent in this place. There he studied the New Testament and the editorship of Erasmus and began to found his preaching on "the Gospel," which he declared to be simple and easy to understand. He held that the Bible was the sufficient revelation of the will of God, and he threw away the philosophy and theology of the later Roman Church, whereas he declared that the early Church Fathers were helpful, though still fallible, interpreters of the Word. In his definite recognition of the theological place of Scripture he showed, says Dr T. M. Lindsay (History of the Reformation), clearer insight than the Lutherans, and Zwingli rather than Luther was in this matter Calvin's guide, and the guide of the reformed churches of Switzerland, France, England, and the Netherlands. All these feats in their symbolic books the supreme place of Scripture, accepting the position which Zwingli laid down in 1536 in The First Helvetic Confession, namely, that "Canonic Scripture, the Word of God, given by the Holy Spirit and set forth to the world by the Prophets and Apostles, the most perfect and ancient of all philosophies, alone contains perfectly all piety and the whole rule of life."

Zwingli began to preach "the Gospel" in 1516, but a contemporary says that he did it so cunningly (listiglich) that none could catch him. He still used his own method of argument. He declared that the older Church Fathers had been simple in their new exposition on "the old doctrine"; however much they had at times pained me, rather than on to the purer and clearer"; for he hoped that the reformation of the Church would proceed quietly and from within. The papal curia had no wish to bring things to a quarrel with him. The Swiss, who furnished them with troops, were to be treated with consideration; and the pope sought to silence the reformer by offers of promotion, which he refused. He held himself, as did the Swiss in general, very free of papal control. They had lorn been used, in their orderly democratic life, to manage their own ecclesiastical affairs. Church property paid its share of the communal taxes, and religious houses were subject to civil inspection. Zwingli looked rather to the City Fathers than to the pope, and as long as he had them with him he moved confidently and laboured for reforms which were as much political and moral in character as religious. He had none of Luther's distrust of "the common man" and fear of popular government, and this fact won for his teaching the favour of the towns of South Germany not less than of Switzerland.

As yet he had preached his Gospel without saying much about corruptions in the Roman Church, and it was his political denunciation of the fratricidal wars into which the pope, not less than others, was drawing his fellow-countrymen, that first led to rupture with the papal see. Three visits which he had paid to Italy in his capacity of army chaplain had done much to open his eyes to the worldly character of the papal rule, and it was not long before he began to attack at Einsiedeln the superstitions which attended the great pilgrimages made to that place. Zwingli denounced the publication of plenary indulgence to all visitors to the shrine, and his sermons in the Swiss vernacular drew great crowds, and attracted the attention of Rome. His quarrel was turned more immediately against the pope himself when in August 1518 the Franciscan monk Bernardin Samson, a pardon-seller like Johann Tetzel, made his appearance in Switzerland as the papally commissioned seller of indulgences. Zwingli prevailed on the council to forbid his entrance into Zürich; and even then the pope argued that, so long as the preacher was still receiving a papal pension, he could not be a formidable adversary, and he gave him a further sop in the form of an acolyte chaplain.

Zwingli had never meant to remain at Einsiedeln long, and he now threw himself into a competition for the place of people's priest at the Great Minster of Zürich, and obtained it (1518) after some opposition. He stipulated that his liberty to preach the truth should be respected. In the beginning of 1519 he began a series of discourses on St Matthew's Gospel, the Acts of the Apostles, and the Pauline epistles; and with these it may be said that the Reformation was fairly begun in Zürich. He made a copy of St Paul's epistles and committed them to memory, and from this arsenal of Scripture he attacked the pretensions of the papal hierarchy, and the unprecedented assertion of papal power in the Church. His correspondence of this year shows him jealous of the growing influence of Luther. It was his claim that he had discovered the Gospel before ever Luther was heard of in Switzerland, and he was as anxious as Erasmus to make it clear that he was not Luther's disciple. Towards the end of September he fell a victim to the plague which was ravaging the land, and his illness soothed his spirit and brought into his message a deeper note than that merely moral and common-sense one with which, as a polite humanist, he had hitherto been content. He proposed to preach against fasting, saint worship and the celibacy of priests; and some of his hearers began to put his teachings into practice. The monasteries raised an outcry when people were found eating flesh in Lent, and the bishop of Constance accused them before the council of Zürich. Zwingli was heard in their defence and the accusation was abandoned. His first Reformation tract, April 1522, dealt with this subject: "Von Erkiesen und Fryheil der Spysen." The matter of the celibacy of the clergy was more serious. Zwingli had joined in an address to the bishop of Constance calling on him no longer to send him monks, friars, priests and nuns, but his own husbands and wives, or, at least, to wink at their marriages. He and his co-signatories confessed that they had lived unchastely, but argued that priests could not be expected to do otherwise, seeing that God had not seen fit to give the gift of continence. Pope Adrian VI. interfered and asked the Zürchers to abandon Zwingli, but the reformer persuaded the council to allow a public disputation (1523), when he produced sixty-seven theses1 and vindicated his position so strongly that the council decided to uphold their preacher and to separate the canton from the bishopric of Constance. Thus legal sanction was given in Zürich to the Reformation. In 1522 Zwingli produced his first considerable writing, the Archites, "the beginning and the end," in which he sought by a single blow to win his spiritual freedom from the control of the bishops, and in a sermon of that year he contended that only the Holy Spirit is requisite to make the Word intelligible, and that there is no need of Church, council, or pope in the matter.

The progress of the Reformation attracted the attention of all Switzerland, but there was a strong opposition to it, especially in the five Forest Cantons: Lucerne, Zug, Schwyz, Uri, and Unterwalden; and the Zürchers felt it necessary to form a league in its defence. They were especially anxious to gain Bern, and Zwingli challenged the Romansians to a public disputation in that city. No less than 350 ecclesiastics came to Bern from the various cantons to hear the pleadings, which began on the 2nd of January 1523 and lasted nineteen days. Zwingli

ZWINGLI

1063

and his companions undertook to defend the following pro-
positions:

(1) That the Holy Christian Church, of which Christ is the only
Head, is born of the Word of God, abides therein, and does not
listen to the voice of a stranger; (2) that this Church imposes
no laws on the conscience of persons; (3) that it is not unlawful
for us, so far as the law of the Church is concerned, to belong
to another Church; (4) that the laws of the Church are binding only in
so far as they agree with the Word; (5) that Christ alone is our
righteousness and our salvation, and that to trust to any other
means of salvation is to deny Him; (6) that it cannot be proved
from the Holy Scripture that the body and blood of Christ are
corporeally present in the bread and in the wine of the Lord's
Supper; (7) that the mass, in which Christ is offered to God the
Father, as a sacrifice, for the living and of the dead, is contrary
to Scripture and a gross affront to the sacrifice and death of the
Saviour; (8) that we should not pray to dead mediators and inter-
cessors, but to Jesus Christ alone; (9) that there is nothing
purgatory in Scripture; (10) that to set up pictures and to adore
them is also contrary to Scripture, and that images and pictures
ought to be destroyed where there is danger of giving them adora-
tion; (11) that marriage is lawful to all, to the clergy as well as
to the laity; (12) that shameful living is more disgraceful among the
clergy than among the laity.

The result of the discussion was that Bern was won over to the
side of the reformer, who apprehended the whole struggle
of Protestantism as turning directly on the political decisions
of the various units of the Confederation. He had enunciated in
his theses the far-reaching new principle that the congregation,
and not the hierarchy, was the representative of the Church;
and he sought henceforward to reorganize the Swiss constitution
on the principles of representative democracy so as to reduce
the wholly disproportionate voting power, which, then, was
enjoyed by the cantons. He urged that the administration
of the Church belongs, like all administration, to the state
authorities, and that if these go wrong it then lies with Christian
people to depose them.

On the 2nd of April 1524 the marriage of Zwingli with Anna
Reinhard was publicly celebrated in the cathedral, though for
some two years already he had had her to wife. Many of his
colleagues followed his example and openly made profession
of marriage. In the August of that year Zwingli printed a pamphlet
in which he set forth his views of the Lord's Supper. They
proved the occasion of a conflict with Luther which was never
settled, but in the meantime more attention was attracted by
Zwingli's denunciation of the worship of images and of the
Roman doctrine of the mass. These points were discussed at a
fresh congress where about 900 persons were present, and where
Vadian (Joachim von Watt, the reformer of St Gall) presided.
It was decided that images were forbidden by Scripture and
that the mass is not a sacrifice. Shortly afterwards the images
were removed from the churches, and many ceremonies and festivals
were abolished. When a solemn embassy of rebuke was sent to
Zürich from a diet held at Lucerne, on the 26th of January 1524,
the city replied that in matters relating to the Word of God
and the salvation of souls she would brook no interference.
When a new embassy threatened Zürich with exclusion from
the union she began to make preparations for war.

It was at this moment that the controversy between Luther
and Zwingli took on a deeper significance. In March 1525 the
latter brought out his long Commentary on the True and False
Religion, in which he goes over all the topics of practical theology.
Like others of the Reformers he had been led independently to preach justification by faith and to declare
that Jesus Christ is the only Mediator between God and man;
but his construction rested upon what he regarded as
biblical conceptions of the nature of God and man rather than
upon such personal experiences as those which Luther
had made familiar. In this Commentary there appear the mature
views of Zwingli on the subject of the Elements of the Lord's
Supper. He was quite as clear as Luther in repudiating the
medieval doctrine of transsubstantiation, but he declined to
accept Luther's teaching that Christ's words of institution re-
quired the belief that the real flesh and blood of Christ co-exist in
and with the natural elements. He declared that Luther
was in a fog, and that Christ had warned His disciples against
all such notions, and had proclaimed that by faith alone could
His presence be received in a feast which He designed to be
commemorative and symbolic. Efforts to reach agreement
failed. The landgrave of Hesse brought the two Reformers
together in vain at Marburg in October 1526, and the whole
Protestant movement broke into two camps, with the result that
the attempt made at Schmalkalden in 1530 to form a com-
prehensive league of defence against all foes of the Reformation
was doomed.

But the close of Zwingli's life was brought about by trouble
near his home. The long-felt strain between opposing cantons
led at last to civil war. In February 1531 Zwingli himself urged
the Evangelical Swiss to attack the Five Cantons, and on the
10th of October there was fought at Kappel a battle, disastrous
to the Protestant cause and fatal to its leader. Zwingli, who as
chaplain was carrying the banner, was struck to the ground,
and was later despatched in cold blood. His corpse, after suffering
every indignity, was quartered by the public hangman, and
burnt with dung by the Romish soldiers. A great boulder,
roughly squared, standing a way off the road, marks the
place where Zwingli fell. It is inscribed, 'They may hang
the body but not the soul'; so spoke on this spot Ulrich Zwingli,
who for truth and the freedom of the Christian Church died a
hero's death, Oct. 11, 1531.'

Zwingli's theological views are expressed succinctly in the sixty-
seven theses published at Zürich in 1523, and at greater length in the First Helvetic Confession, compiled in 1536 by a number of his
friends. In these they condemned the teaching of Luther, and
from Lutheran doctrine. As opposed to Luther, Zwingli insisted
more firmly on the supreme authority of Scripture, and broke
more thoroughly and radically with the medieval Church. Luther
was content with changes in one or two fundamental doctrines;
Zwingli aimed at a reformation of government and discipline as
well as of theology. Zwingli never faltered in his trust in the
Word of God, and was careful to make it clear that salvation
was by repentance and faith, by a call spiritual simply because
they were selected to perform certain functions. He thoroughly
believed also that it was the duty of all in authority to rule in Christ's name and to obey His laws. He was led from these ideas to think that there should be no
government in the Church separate from the civil government
which ruled the commonwealth. All rules and regulations about
the public worship, doctrines and discipline of the Church were
made in Zwingli's time, and with his consent, by the council of
Zürich, which was the supreme civil authority in the state.
This was the ground of his quarrel with the Swiss Anabaptists, for the
former asserted the necessity of the laying on of hands, which
was the modern thought of a free Church in a 16th century. Like all the
Reformers, he was strictly Augustinian in theology, but he dwelt
chiefly on the positive side of predestination—the election to salva-
tion. He insisted on the salvation of infants and of the
prosperous. His most distinctive doctrine is perhaps his theory
of the sacrament, which involved him and his followers in a long
and, on Luther's part, an acrimonious controversy. His most
noteworthy achievement was that the sacrament of the Lord's
Supper was not the repetition of the sacrifice of Christ, but
the faithful remembrance that sacrifice had been made once for
all, and his deeper idea of faith, which included in the act of
faith a real union and communion of the faithful soul with Christ,
really preserved what was also most valuable in the distinctive
Lutheran doctrine. His peculiar theological opinions were not at
all very wide, and the somewhat prolix views of Calvin. The
publication of the Zürich Consensus (Consensus Tigurinus) in 1549
marks the adherence of the Swiss to Calvinist theology.

Zwingli's writings are collected in: Ergänzung und Ersetzung des
Dritten (April 1522); De Canone Missae Episcopis (September
1523); Commentarius de Vera et Falsa Religione (1523); Vom
Tont, vom Wiederton, und vom Kindertont (1525); Ein klare
Unterrichtung vom Nachtmahl Christi (1526); De Previdentia Dei
(1530); and Christianae Fidei Expositio (1531). For a full biblio-
graphy see G. Finsser, Zwingli-Bibliographie (Zürich, 1897).

Works.—Collected editions, 4 vols. (Zürich, 1549, 1581); by M.
Ries and J. Calvin, 3 vols. (Paris, 1562-69); by B. Finsler,
8 vols. (Eng. and Fr., 1831-59); by C. von Hesse, 5 vols.
(1857, 1861); by E. Egli and G. Finsser, 8 vols. (Zürich, 1867-69); by J.
Cochran, 2 vols. (Eng., 1861); by J. Finsler, 5 vols. (Eng.
and Fr., 1861); by H. Ungerer, 4 vols. (Eng., 1865); by E. Egli and G. Finsser,
3 vols. (Eng., 1867); by E. Schuler, 4 vols. (Eng., 1869); by E. Voegli,
3 vols. (Eng., 1870); by A. M. Eng, 4 vols. (Eng., 1871); by J. H."
ZWOLLE—ZYMOTIC DISEASES

published twice a year since 1897 at Zürich. S. M. Jackson’s book gives a chapter on Zwingli’s Theology by Prof. F. H. Foster, and full details of further information on the subject, together with a list of modern English translations of Zwingli’s works.

(E. A. R.)

ZWOLLE, the capital of the province of Overysel, Holland, on the Zwaire Water, and a junction station 24¹/₂ m. N.E. of Harderwyk. Pop. (1905) 23,773. It is the centre of the whole northern and eastern canal systems, and by means of the short canal, the Willemsvaart, which joins the Zwaire Water and the Yssel, has regular steamboat communication with Kampen and Amsterdam. The Grote Kerk, of St Michael (first half of the 13th century) occupies the site of an earlier church of which an interesting 11th-century bas-relief remains. The church contains a richly carved pulpit, the work of Adam Straes van Weilborch about 1620, and there is besides some good carving and a fine organ (1721). The Roman Catholic church, also dedicated to St Michael, dates from the end of the 14th century. The modernized town hall was originally built in 1448. Mention should also be made of the Sassen Poort, one of the old city gates; a gild-house (1571); the provincial government offices, containing the archives; and a museum of antiquities and natural history. Three miles from Zwolle, on a slight eminence called the Agnietenberg, or hill of St Agnes, once stood the Augustinian convent in which Thomas à Kempis spent the greatest part of his life and died in 1471. Zwolle has a considerable trade by river, a large fish market, and the most important cattle market in Holland after Rotterdam. The more important industries comprise cotton manufactures, iron works, boat-building, dyeing and bleaching, tanning, rope-making and salt-making.

ZYMOTIC DISEASES (Gr. τίγμη, ferment), a term in medicine, formerly applied to the class of acute infectious maladies. As originally employed by Dr W. Farr, of the British Registrar-General’s department, the term included the diseases which were “epidemic, endemic and contagious,” and were regarded as owing their origin to the presence of a morbic principle in the system, acting in a manner analogous to, although not identical with, the process of fermentation. A large number of diseases were accordingly included under this designation. The term, however, came to be restricted in medical nomenclature to the chief fevers and contagious diseases (e.g. typhus and typhoid fevers, smallpox, scarlet fever, measles, erysipelas, cholera, whooping-cough, diphtheria, &c.). The science of bacteriology has displaced the old fermentation theory, and the term has practically dropped out of use.
